Amyotrophic lateral sclerosis is a condition which is dependent on a gradual degeneration and disappearance of the anterior cornual cells of the spinal cord, associated with sclerosis of the upper motor neuron tracts. The muscular atrophy begins insidiously and progresses gradually. It often commences in the intrinsic hand muscles (Aran-Duchenne type), less commonly in the shoulder and upper arm muscles. The loss of power is in proportion to the amount of atrophy. The alteration in electrical reactions is usually more a quantitative diminution of excitability to both currents than a true reaction of degeneration. Fibrillary contractions are common. The atrophy usually begins in one limb before the other, but soon becomes more or less symmetrical. The tendon-jerks of all muscles which are not atrophied are exaggerated. The abdominal reflexes may be absent, and the plantar reflexes may be of the extensor type. There are no pains, no sensory loss, and no oculo-pupillary phenomena.

In *syringomyelia* the spinal changes frequently begin in the cervical enlargement of the cord, with the result that atrophic paralysis is first noticed in the upper extremity, generally in the intrinsic muscles of the hand and the flexor muscles on the ulnar aspect of the forearm. The onset is insidious and the progress gradual. One limb is generally affected many months, perhaps years, before the other. Manual deformities are common. (See CLAW-HAND, *Fig. 30*, p. 127.) The electrical reactions vary like those of amyotrophic lateral sclerosis. The knee- and ankle-jerks are increased as a rule, and spastic paralysis of the lower extremities usually develops in the later stages, with extensor plantar responses. Pains shooting down the arms from the neck occur, but are not common. Trophic changes develop in the skin, subcutaneous tissues, and joints. There is sensory loss of a dissociative type, i.e., loss of sensibility to pain, heat, and cold, with preservation of tactile sensibility. Oculo-pupillary phenomena and nystagmus are common. Spinal curvature, in the form of a dorsal scoliosis, is another frequent physical sign.

It is not necessary that all these signs and symptoms should be present for the purpose of making a diagnosis. The combination of muscular atrophy, dissociative anæsthesia, and trophic changes in the skin is usually sufficient.

Within the last few years it has become recognized that a supernumerary *cervical rib* may be responsible for atrophic palsy in the upper extremity. Paralysis is usually preceded by pain, chiefly referred to the inner aspect of the arm, and sometimes shooting into the little and ring fingers. The pain is worse after exertion, and often relieved by placing the hand behind the head.

Muscular atrophy begins in the hand muscles, the interossei, thenar, and hypothenar eminences, and often involves the flexors of the wrist and fingers. It develops gradually and does not spread beyond the distribution just described. There is often sensory loss in regions corresponding to the cutaneous areas supplied by the 1st dorsal and 8th cervical spinal roots. The loss is usually less marked to touch than to painful thermal stimuli. The atrophied muscles show the electrical reaction of degeneration. There are no oculo-pupillary phenomena and no signs of disease in other parts of the body. The condition is usually one-sided, occasionally bilateral, and the chief point in diagnosis is the discovery of the ribs by means of skiagraphy. (See also PAIN IN THE EXTREMITY, UPPER; and CLAW-HAND.)

Another disease in which atrophic palsy of the intrinsic hand muscles is a prominent feature is so-called *Peroneal atrophy*. As the name suggests, the muscular atrophy and paralysis generally begin in the lower, before they affect

the upper, extremities, and further details concerning the condition may be found under PARALYSIS OF THE EXTREMITY, LOWER; and ATROPHY, MUSCULAR (Figs. 8 and 9, p. 71).

The diagnosis of muscular atrophy in the arm dependent on a preceding *acute poliomyelitis* (Fig. 7, p. 70) is not a difficult matter, especially if an accurate history can be obtained. This will show that the onset was acute and associated with some degree of constitutional disturbance, varying from a transient and perhaps overlooked malaise to a condition in which pyrexia up to 104° F., generalized pains all over the body, vomiting, and convulsions were conspicuous features. It is an almost invariable rule to learn that the initial paralysis was more extensive than that which remained permanent. Attention to the distribution of the paralysis shows that it is irregular and different in every case, but there is more liability on the part of the shoulder and upper arm muscles to suffer than those of the forearm and hand. If both arms are affected there is little likelihood of finding any great degree of symmetry in the distribution of the atrophy. With regard to the electrical reactions, much will depend on the stage at which the case comes under observation. Some muscles may show the reaction of degeneration, others may respond fairly well, and others show no response whatever to either faradism or galvanism. Vasomotor changes, general defects in the growth of the limb, deformities, and contractures are common, but no sensory changes can be detected and no oculo-pupillary phenomena are to be observed. Only those reflexes are altered or lost which are concerned with atrophied muscles.

Hæmorrhage into the spinal cord, or *hæmatomyelia*, due to injury, occurs more often at the level of the 8th cervical and 1st dorsal segments than at any other. The resulting paralysis has much the same distribution as that described in Klumpke's palsy, but the diagnosis may be made from the fact that the former also produces spastic paralysis of the trunk and legs, and frequently gives rise to areas of dissociated anæsthesia. Oculo-pupillary phenomena are usually seen as well in cases of hæmatomyelia at this level. Moreover, it is obvious that injuries to the cord result in bilateral symptoms, whereas the results of a Klumpke's palsy are confined to one arm.

Various forms of root palsies may be caused by *tuberculous* or *malignant disease of the vertebræ*, and also by *pachymeningitis*, which is frequently syphilitic in origin. The diagnosis of the nature of such lesions depends on the results of the examination of the vertebral column and of the cerebrospinal fluid. Here again the symptoms are more often bilateral than unilateral, and may be complicated by the results of pressure on the spinal cord, the latter leading to spastic paralysis of parts below the level of the disease.

Tumours originating in the meninges or in the spinal cord at the level of the cervical enlargement are rare, but they may produce atrophic paralysis of the arm muscles, with spastic paralysis of the trunk and lower extremities. These phenomena may be more marked on one side at first, but they tend to become bilateral with the gradual growth of the tumour.

In the group of diseases to which the name *myopathy* or *muscular dystrophy* is applied, the upper extremity is often more or less completely paralyzed. The diagnosis of this condition depends on a consideration of various factors. The gradual onset and the bilateral symmetry of the affection, the marked involvement of the shoulder and upper arm as compared with the forearm and hand, are important characteristics. The absence of fibrillary contraction and of the reaction of degeneration are also to be noted, while the history of a similar affection in other members of the family, and the presence of muscular atrophy or muscular pseudo-hypertrophy in other parts of the body, serve to confirm the diagnosis.

TABLE SHOWING THE MUSCULAR DISTRIBUTION OF THE VARIOUS NERVE ROOTS OF THE BRACHIAL PLEXUS.

C. 5.	<i>Deltoid. Spinati. Teres minor. Rhomboids. Diaphragm. Biceps. Supinator longus. Serratus magnus. Pectoralis major. Brachialis anticus. Coraco-brachialis.</i>
C. 6.	<i>Biceps. Coraco brachialis. Brachialis anticus. Supinator longus. Deltoid. Spinati. Teres major. Serratus magnus. Pectoralis major. Subscapularis. Pronators of forearm. Extensors of wrist.</i>
C. 7.	<i>Triceps. Extensors of wrist and fingers. Pronators of forearm. Pectoralis major. Subscapularis. Latissimus dorsi. Teres major.</i>
C. 8.	<i>Flexors of wrist and long flexors of fingers. Interossei and lumbricales. Muscles of thenar and hypothenar eminences.</i>
D. I.	<i>Muscles of the thenar and hypothenar eminences. Interossei and lumbricales. Flexor carpi ulnaris. Oculo-pupillary fibres.</i>

A glance at this list shows that nearly all muscles derive innervation from more than one spinal segment, generally from two or three. The table does not purport to give a complete anatomical list of all the muscles of the arm, but provides a guide to clinicians in their endeavours to localize spinal or root lesions from the distribution of atrophic muscular paralysis. Those muscles which clinical experience has taught us to regard as the most useful "landmarks" for individual segments are printed in italics.

E. Farquhar Buzzard.

PARALYSIS OF THE HAND.—(See PARALYSIS OF THE EXTREMITY, UPPER; CLAW HAND; ATROPHY, MUSCULAR; and HEMIPLEGIA.)

PARAPLEGIA.—Paraplegia is a term arbitrarily restricted to imply partial or complete paralysis of both legs, with or without part of the trunk. It does not, however, include inability to walk owing to mechanical defects, such as old fractures, joint disease and so forth; it is due, as a rule, to changes either in the brain, the spinal cord, the peripheral nerves, or in the muscles themselves, though sometimes it is caused by errors of function without any structural change in the neuro-muscular system.

For clinical purposes, although naturally a paraplegia that has arisen in childhood may persist into adult life, and thus cause overlapping of the classification, paraplegia in children may be discussed separately from paraplegia in adults.

Let us suppose that the patient is a child, and that the chief complaint is weakness or paralysis of both legs. The following table indicates some of the causes that may produce this condition.

I.—THE CAUSES OF PARAPLEGIA IN CHILDREN.

(A). *Conditions in which there is no definite local disease, though there may be some general pathological condition:—*

(1) Simple delayed walking; (2) Rickets; (3) Cretinism; (4) Idiocy.

(B). *Paraplegia associated with a definite nerve lesion of the upper neurone type:—*

1. Infantile diplegia due to: (a) Congenital defect of the cortex: por-encephalus; (b) Infantile encephalitis; (c) Injury, for example by forceps at delivery; (d) Superior longitudinal sinus thrombosis; (e) Meningitis; (f) Congenital hydrocephalus; (g) Acquired hydrocephalus.
2. Congenital malformation, such as meningocele, spina bifida, or spina bifida occulta.

3. Spinal caries, with compression of the spinal cord.
 4. Friedreich's ataxy.
- (C). *Paraplegia due to a lesion of the lower neurone type* :—
1. Acute anterior poliomyelitis, leading to infantile paralysis.
 2. Tooth's peroneal type of progressive muscular atrophy.
 3. Peripheral neuritis.
- (D). *Paraplegia of the primary muscular type* :—
1. Pseudo-hypertrophic muscular paralysis.
 2. The infantile type of primary muscular dystrophy.
 3. The juvenile type of primary muscular dystrophy.

In arriving at the diagnosis, the first point to pay attention to is the history ; the case will belong to one or other of two main groups, the first containing those that have never been able to use the legs properly, the second those that have lost the use of the legs after having been at one time able to walk, or otherwise use them efficiently.

To the first group belong all cases of congenital malformation, such as hydrocephalus or meningocele, and most cases of infantile diplegia. Before diagnosing any of these, however, it is necessary to exclude rickets, cretinism, idiocy, and simple delayed walking, as causes of an apparent rather than real paraplegia. These cannot be the sole diagnosis if there is absolute flaccidity on the one hand, or if there is spasticity upon the other. It is important to remember how deceptive the reflexes may be ; almost any illness in an infant or young child—bronchopneumonia for example, or simple diarrhoea—may so depress the knee-jerk that it is often unobtainable until the patient's general health is restored ; the plantar reflex is normally more often extensor than flexor in infants ; ankle-clonus, however, does not occur except when there is degeneration of the lateral columns. If there is neither absolute flaccidity nor intermittent spasticity, and if the limbs are moved spontaneously, the mere fact that the child is late in walking by no means necessarily indicates nerve disease ; the delay may commonly extend to the second year, and occasionally even to the third or fourth. The main factor in making a diagnosis in such a case is time, for, until with the lapse of time the little patient begins to walk, it may sometimes be difficult to exclude organic paraplegia. If there are definite signs of rickets, or if the patient is a cretin or an idiot, the diagnosis is more obvious. The good effects of giving thyroid extract over a prolonged period may be the only conclusive means of distinguishing cretinism from idiocy, and this remedy should be employed in all such cases, however hopelessly idiotic the infant may seem to be. If there is congenital optic nerve blindness, the case is one of idiocy and not cretinism.

Having excluded the above, the next thing to consider is whether there is any congenital malformation of the brain or cord. Cases of meningocele, myelocele, or spina bifida will generally be obvious enough ; even spina bifida occulta will often suggest itself from the presence of a pigmented or hairy mole over the lower part of the lumbar spinal region, and the diagnosis may be confirmed by careful palpation there. Congenital hydrocephalus makes itself evident from the characteristic enlargement of the head, which in extreme cases can be mistaken for nothing else, and which in lesser degrees can be distinguished from the enlargement due to rickets or to congenital syphilis by the fact that it is more uniform, and that the bones are fragile and thin, and separated at the sutures. The only doubt that arises in a case of infantile hydrocephalus is, as to whether it is truly congenital or was caused by an early but post-natal posterior basal meningitis. There is increasing evidence to show that the majority of these cases are not really congenital, that the head is not large

at birth, and that the enlargement follows some febrile illness, with or without convulsions—really a meningococcal meningitis.

Congenital defect of the cortex would suggest itself as the cause of infantile diplegia in a case in which delivery had taken place without difficulty and without the use of forceps, the head and spine not being hydrocephalic or deformed, and yet the limbs being paralyzed from birth; they may be flaccid or they may be spastic, and there is no constant type of reflex, though there is a tendency to increased knee-jerk, ankle-clonus, and extensor plantar reflex. Intelligence will very likely be defective at the same time. In rare cases the kidneys may be so large and cystic that they can be palpated, and the brain may then be cystic also—porencephalus.

Paraplegia due to injury at birth, either by the use of forceps or by excessive compression in a contracted maternal pelvis, is a diagnosis that can only be made when there has been an unusual amount of difficulty at birth, for it is remarkable to what extreme degrees the child's head may be squeezed and altered in shape without apparent detriment. Seeing that it is the lateral aspects, especially the arm areas of the Rolandic cortex, that will be most affected by forceps, these instruments are more likely to cause bilateral arm paralysis than ordinary paraplegia. Just the converse of this is true of superior longitudinal sinus thrombosis, for the leg areas of the brain lie close up against either side of this sinus, whilst the arm areas, being more distant from it, are likely to be less affected. The symptoms of superior longitudinal sinus thrombosis, of acute encephalitis, and of meningitis, may be so similar—pyrexia, general head symptoms, vomiting, and convulsions—that it is almost a matter of guess-work to choose between them when they are actually in progress; if death occurs in a few days, suppurative meningitis is likely; if in a few weeks, tuberculous meningitis; if the patient lingers for many weeks before dying, or if recovery occurs with hydrocephalus, posterior basal or cerebrospinal meningitis; if recovery occurs without hydrocephalus, it may be almost impossible to decide between meningococcal meningitis, acute encephalitis, and superior longitudinal sinus thrombosis; nor is the distinction material, except in so far that it is important to remember always that a favourable issue may occur even in a case that seems to be hopelessly comatose and dying—a diagnosis of meningitis may have been made erroneously when the condition was really one of acute encephalitis only. If it seems to be of great importance to arrive at the accurate diagnosis in the acute stages, it may be justifiable to perform lumbar puncture. A cytological examination of the cerebrospinal fluid may show many polymorphonuclear cells in a suppurative case, or many lymphocytes in a tuberculous case. Of more value than the cytological examination, however, is the bacteriological test, which may succeed in isolating the causal organism.

If one is able to exclude the infantile diplegias, and the conditions which simulate them, the probability is the patient will have shown obvious signs of being able to use the legs, or may even have been able to walk before the paraplegia set in. In that case, if the paralysis is of the upper neurone type, with spasticity, no wasting except such as may be due to disuse and non-development, no reaction of degeneration, increased knee-jerks, extensor plantar reflexes, ankle-clonus, and probably bladder and rectal trouble—especially if there is anæsthesia in the legs at the same time—by far the commonest cause for the condition is spinal caries with compression of the cord.

If, on the other hand, the patient develops a lower neurone type of paralysis, with wasting of the affected muscles and reaction of degeneration, the chances will be greatly in favour of acute anterior poliomyelitis followed by infantile paralysis, particularly if diphtheria can be excluded, and if a clear history can

be obtained that the child was perfectly well until he developed an obscure febrile complaint, which may at first have been regarded as of gastric origin, but which, in a day or two, led to one or more limbs, possibly all four, becoming limp and paralyzed, with rapid subsidence of the fever and great improvement in the paralysis during the next few weeks. It is possible for a child to have had absolute paralysis of all four limbs from acute anterior poliomyelitis, and yet for complete recovery to occur; more often, however, one or another group of muscles remains weak; in a typical case, the extensors of the toes and ankle are permanently affected, the consequent contraction of the unparalyzed calf muscles leading to talipes equinus or equino-varus. Weakness of other groups of calf muscles leads in a similar way to other forms of club-foot, such as T. calcaneus, T. valgus, and so on. In other cases, the muscles below the knee recover completely, but some other group is involved—the quadriceps extensor femoris for instance, or the adductors of the thigh. It is of course possible for the legs to recover completely, whilst paresis of some group of muscles in the shoulder, arm, or forearm persists.

The infantile paralysis which follows acute anterior poliomyelitis is nearly always asymmetrical, but it is by no means necessarily so, and it may cause persistent partial paraplegia. It is important to remember that the knee-jerk is deficient or absent only when the quadriceps extensor femoris muscle is affected; and also that reaction of degeneration is no longer obtainable in the muscles when the disease is of sufficiently long standing for all the degenerate fibres to have become fibrous, by which time the only muscle and nerve fibres that remain are normal, though they are fewer in number than they should be.

Peripheral neuritis in a child is decidedly uncommon, except as the result of diphtheria; it should not be lightly diagnosed. Being an affection of the lower neurone type, with wasting of the muscles, flaccidity, reaction of degeneration, and deficiency in the tendon reflexes, it may be difficult to distinguish between it and acute anterior poliomyelitis. It might be urged that the occurrence of pain or other sensory symptoms is in favour of peripheral neuritis and against poliomyelitis, but this is not really the case; the inflammation in poliomyelitis is by no means necessarily restricted to the grey matter of the anterior cornua, and the acute stage of the disease is often accompanied by severe pains referred to the peripheral parts. There may, however, be bacteriological or other evidence of the patient's having had diphtheria during the preceding few weeks, in which case peripheral neuritis would be diagnosed; if there is paresis of the soft palate, as evidenced by the regurgitation of fluids through the nose when the patient tries to swallow them, or by the nasal character of the voice, then diphtheritic neuritis would almost certainly be the correct diagnosis.

There remain for discussion the following causes of paraplegia in children: Friedrich's ataxy, Tooth's peroneal type of progressive muscular atrophy, and the primary muscular dystrophies, particularly pseudo-hypertrophic muscular paralysis. There are two points common to all these, namely, that they all are insidious in onset, slowly progressive for years before the end comes as the result of an intercurrent malady; and that they are familial diseases, the family history having an important bearing upon their diagnosis.

Friedrich's ataxy is characterized by paraplegia, often associated with deformity, such as talipes and scoliosis, owing to persistent error of posture, without wasting except such as may be due to disuse or non-development; the knee-jerks are absent; there is no sphincter trouble unless quite late; ankle-clonus is absent, but there is generally a remarkable condition of hallux erectus, which amounts to a sort of permanent extensor plantar reflex; there are no sensory disturbances; the arms may not be affected at all, or they may present

some degree of ataxy, with or without intention tremors—that is to say, tremors which are increased when the patient tries to perform voluntary movements—sometimes even choreiform movements are present; speech is monotonous, nystagmus is sometimes present, and occasionally there is optic atrophy. If progressive paraplegia develops at about 8 or 9 years of age in a child with a family history of similar trouble; if the knee-jerks are absent, whilst the big toes are permanently erect, and if there is neither atrophy nor pseudo-hypertrophy of the muscles, the diagnosis is in all probability Friedreich's ataxy. The patient may survive to puberty or even longer, but is liable to death from phthisis, pneumonia, or other intercurrent malady—the same applying to all the familial diseases now under discussion.

Tooth's peroneal type of progressive muscular atrophy is apt to develop after some simple specific fever, such as whooping-cough or measles. The first point the mother notices is that the child—hitherto normal—is unable to bend the big toes upwards; a condition of permanent plantar flexion of the big toes ensues; inability to extend the other toes follows; and presently the patient cannot dorsiflex the ankles. It is chiefly the muscles supplied by the external popliteal nerve, formerly called the *peroneal* nerve, that are affected; hence the name of the disease. Talipes may result. The lesion is not primarily in the muscles, but in the anterior cornual cells of the lumbo-sacral part of the cord, so that reaction of degeneration is obtainable in the wasted muscles. The knee-jerks remain normal so long as the quadriceps extensor femoris is unaffected, there is no ankle-clonus, and the big toe may not move at all when the sole is stimulated. A brother or a sister is very likely to have suffered from the same complaint (see *Figs. 8, 9, p. 71*).

In the *primary muscular dystrophies* the nerves are normal, so that there is no reaction of degeneration; if a muscle has become entirely atrophied, there will be no reaction in it at all; but as long as any reaction is obtainable it is of the normal type. The same applies to the reflexes. The most easily recognized of all the primary muscular dystrophies is pseudo-hypertrophic muscular paralysis, the only difficulty being when no family history is obtainable, and when the case is still in too early a stage to be typical. Boys are affected more often than girls, but it is generally inherited from the mother's side. It is possible for some members to have presented atrophic myopathy, whilst others suffer from the pseudo-hypertrophic form. When fully developed, the most striking feature of the case is the marked weakness of the legs, notwithstanding the apparent firmness and great size of the calves. The muscles are really atrophied, their apparent enlargement being due to extensive deposition of intramuscular interstitial fat. Ultimately, if the patient survives, all the muscles in the body become wasted and fibrous; but whereas some of them atrophy from the first, others exhibit marked pseudo-hypertrophy before they atrophy—particularly the gastrocnemii, the solei, the glutei, the deltoids, the supra- and infra-spinati, and portions of the triceps. The muscles of the hands and feet are generally unaffected. The muscles most frequently atrophied are the lower half of the pectoralis major, the latissimus dorsi, the serratus magnus, the biceps, and the flexors of the knee. There are no sensory or sphincter troubles. When the case is well advanced, the way in which the patient gets up from a lying posture is very characteristic; it is generally described as "climbing up himself." He first rolls over and rests on his hands and knees; then puts his head between his arms and raises the knees from the ground, so that he is now supported on his hands and feet; he next brings one hand nearer to his toes, and then, swinging his body over first to one side, places his opposite hand on the corresponding knee, straightens that leg, and repeats the performance on the other side, so that he now stands with his legs widely separated and with

a hand resting on each knee; he then works each hand alternately higher up his thighs, until finally, by a sudden backward movement of his shoulders, he attains the erect attitude. Another feature of the case is, that if one tries to lift the boy up by putting one's hands under his armpits, his shoulders rise right up to his ears, and he very easily slips through one's hands. He is also unable to stand on tip-toe, and the gait is waddling.

The two other types of muscular dystrophy mentioned above—the infantile and the juvenile—are but different varieties of the same malady; both are characterized by progressive wasting of the muscles without pseudo-hypertrophy; in the infantile form the muscles have been atrophic from the first, whereas in the juvenile form, the muscles develop in what seems to be a normal way up to a certain point, and then gradually waste away. The disease is distinguished from peripheral neuritis, (1) by the absence of reaction of degeneration; (2) by the persistence of the reflexes as long as any muscle tissue is left to respond; (3) by the family history as mentioned above; (4) by the absence of sensory changes; and (5) by the absence of improvement with time. An attempt is sometimes made to classify the primary muscular dystrophies into different kinds, according to the groups of muscles first affected. In the Landouzy-Dejerine type, for instance, the face muscles are first attacked, the trouble slowly spreading to the shoulder and upper arm. It is probable, however, that whatever groups of muscles may be the first affected, the differences are those of degree and type rather than of kind, and that the muscular wasting, wherever it may begin, ultimately becomes widespread, and finally involves all the muscles.

II.—THE CAUSES OF PARAPLEGIA IN ADULTS.

We may now pass on to a discussion of the differential diagnosis of paraplegia in adults. It is clear that a paraplegia that has arisen during infancy or childhood may persist into adult life, in which case the diagnosis will be made upon the lines indicated above. It is also possible for some of the causes of paraplegia that usually affect young patients not to do so until they have grown up. The chief causes, however, for paraplegia arising for the first time in adult life are as follows:—

(A). *Causes of the lower neurone type of paraplegia.*

1. Peripheral neuritis, which may be due to various different causes (p. 72)
2. Anterior poliomyelitis
3. A pelvic tumour interfering with the lumbo-sacral plexus
4. A tumour affecting the cauda equina
5. Compression of the lumbar enlargement of the cord.

(B). *Causes of the upper neurone type of paraplegia.*

1. Transverse myelitis.

(a). *Primary*

- (b). Due to compression by: (i) Spinal caries; (ii) New growth in the vertebræ or meninges; (iii) Injury; (iv) Aortic aneurysm

2. Disseminated sclerosis
3. Amyotrophic lateral sclerosis
4. Primary lateral sclerosis
5. Ataxic paraplegia
6. Combined sclerosis of the cord
7. Siringomyelia
8. Meningitis
9. Hæmorrhage into the cord

10. Cerebellar tumour or abscess
 11. Bilateral cerebral softening or hæmorrhage.
- (C). *Causes not conforming either to the lower or to the upper neurone type.*
1. Locomotor ataxy
 2. General paralysis of the insane
 3. Landry's paralysis
 4. Functional paraplegia
 5. Malingering.

The first points which call for attention in making a diagnosis are the history and progress of the case. In only a few of the above conditions is the onset sudden; these are certain cases of acute anterior poliomyelitis, transverse myelitis, meningeal hæmorrhage, Landry's paralysis, functional paraplegia, and malingering. If the paraplegia is of sudden onset, of the upper neurone type, and not the result of injury, it is almost certainly due to some form of transverse myelitis. The great majority of cases of paraplegia, however, have an onset that is not absolutely acute, and generally it is quite gradual.

There are certain conditions that can, as a rule, be either diagnosed or excluded at once. If the patient has Argyll Robertson pupils and no knee-jerks, *locomotor ataxy* can be diagnosed at once. It is necessary to remember, however, that the pupil may react neither to light nor to accommodation in some cases of peripheral neuritis, so that, if care be not exercised, the reaction may be mistaken for the Argyll Robertson type of locomotor ataxy, the latter being diagnosed when peripheral neuritis is the lesion really present. The converse mistake is also possible, especially if the actual strength of the leg muscles be not tested; in both conditions there may be patches of impaired sensation, but in peripheral neuritis with absent knee-jerks, there are absolute wasting, loss of power, and reaction of degeneration, whilst in locomotor ataxy there is no trophic wasting, and often no great loss of power in individual muscles, though there is apparent weakness owing to the action of opposing muscles being incoordinate, and there is no reaction of degeneration.

Another difficulty in connection with locomotor ataxy arises in anomalous cases in which either the pupil reaction has not yet become typical, or else the knee-jerks are not yet gone. If the reaction of the pupil is of the Argyll Robertson type, locomotor ataxy may sometimes be diagnosed even in the presence of knee-jerks, if there is an obvious history of other concomitants of the disease, such as lightning pains, gastric crises, or any of the rarer crises—laryngeal, rectal, urethral, vesical, renal, general abdominal, or sweating—marked ataxy, a history of syphilis, perforating ulcer of the foot, a Charcot's joint, or bladder or rectal trouble, particularly if the patient be a male who has had much brain wear. The tendo Achillis jerks may disappear before the knee-jerks do, and they should be carefully tested. There is also in many cases a remarkable deficiency or even complete absence of deep tenderness in such organs as the testis, tongue, larynx, or mamma.

If the paraplegia is obviously of the lower neurone type, with deficiency or absence of the superficial and deep reflexes, atrophy of the muscles, and reaction of degeneration, with or without paræsthesia, the probabilities are that it is due to one of the many different causes of peripheral neuritis that are discussed on page 72. If the onset has been sudden, however, and if the paralysis rapidly began to clear up again, except possibly in one group of muscles in one leg, there would necessarily be a suspicion of acute *anterior poliomyelitis* which occasionally occurs in adults.

It is important in all cases of suspected peripheral neuritis to make a rectal examination, lest there should be some pelvic mass, malignant or otherwise,

interfering with the lumbo-sacral plexus. Peripheral neuritis may also be closely simulated by either a tumour or a gumma interfering with the cauda equina, an uncommon condition that suggests itself if there is severe pain referred to the lower part of the spinal column behind, or if the paraplegia comes on in such a way as to affect one leg before the other, the pelvis being found free from growth. It is also important to remember that transverse myelitis due to lesions which, if they are situated a little higher up in the cord, cause a paraplegia of the upper neurone type, produces wasting, reaction of degeneration, and loss of reflexes when they affect the cord at the level of the lumbar enlargement.

When the paraplegia is definitely of the upper neurone type, with spasticity of the legs without wasting, with increased knee-jerks, extensor plantar reflexes, ankle-clonus, and perhaps retention of urine with overflow, and incontinence of fæces, the first step in arriving at the diagnosis is to determine if there is any sensory disturbance at the same time. The only diseases mentioned under heading *B*, that produce obvious sensory disorders, are transverse myelitis, syringomyelia, hæmorrhage into the cord, and very rarely meningitis or bilateral cerebral softening. The latter can only be diagnosed when there has been an apoplectic seizure associated with hemiplegia, followed after an interval by another cerebral seizure which, by producing hemiplegia of the opposite side to the one first involved, results in paraplegia, or rather diplegia. The arms and face are likely to be affected as well as the legs, and there will be either a history of syphilis to account for endarteritis and thrombosis in a young male, or a bruit, a history of acute rheumatism, or other evidence of a heart lesion, to account for embolism; or senile changes, with or without albuminuria, a high blood-pressure, retinitis, and other signs of renal and arterial degeneration, to account for hæmorrhage.

Hæmorrhage into the cord is hardly ever spontaneous; it may follow an injury, such as a bullet wound or a stab in the back, and then the history will indicate the diagnosis. *Acute meningitis*, whether tuberculous, suppurative, posterior basal, or cerebrospinal, seldom causes complete paraplegia until a late stage of the illness is reached, by which time the nature of the malady will generally be indicated by the cerebral symptoms, particularly headache, vomiting, convulsions, strabismus, and ophthalmoscopic changes such as optic neuritis or choroidal tubercles. Bacteriological investigations of the fluid obtained by lumbar puncture may assist the diagnosis materially. There is a chronic form of meningitis, however, of which the diagnosis is not so easy, and that is the *chronic hypertrophic hæmorrhagic pachymeningitis* which affects chiefly the vertex and the cervical portion of the cord. The condition is generally caused by chronic alcoholism in syphilitic subjects, especially if there has also been some injury; the diagnosis is difficult, but it may be suggested by the history, and by the degree of pain referred to the nerves that are involved in the meningeal thickening—the chief difficulty being to exclude spinal caries in cases involving the cord. In *syringomyelia*—a very slowly progressive disease that is by no means always associated with paraplegia—the nature of the symptoms depends upon the degree to which the central canal of the cord and the gelatinous substance around it are affected, and also upon the level in the cord at which the changes occur. The diagnostic symptom is that, in some region or another, the skin will be found to have lost its power of distinguishing heat from cold and pain from touch, though it still retains ordinary cutaneous sensibility. It is apt to give rise to skin lesions in the paræsthetic parts (Morvan's disease), and also to acute painless swelling of the joints, with deformity from destruction of the ends of the bones—Charcot's joints—precisely similar to those that may occur in locomotor ataxy.

If the patient has marked impairment of all kinds of sensation in both legs, with paraplegia of the upper neurone type, and no paralysis of the arms, the lesion is almost certainly *transverse myelitis* of some kind. The absence of sensory disturbance, however, does not exclude transverse myelitis, for when the conductivity of the spinal cord is interfered with, without being entirely inhibited, the sensory columns are able to transmit impulses longer than the pyramidal tracts, so that paralysis appears before anæsthesia. The same applies to a transverse myelitis that is getting better, the patient recovering sensation in his legs before he is able to move them. The chief difficulty will be to determine the nature of the transverse myelitis. There are two main types: (1) That due to causes outside the cord compressing it—especially spinal caries, secondary growth, the effects of such injuries as fractures of the spine, bullet wounds and stabs, or more rarely erosion of the bones by an aortic aneurysm; and (2) That due to softening from thrombosis of a spinal artery, the result of syphilis, or a fever such as enteric or scarlet. One of the first points to attend to is the presence or absence of pain. Lesions such as thrombosis, which affect the cord but not its posterior nerve roots, are painless, whereas swellings which compress the cord from without almost always produce pain, sometimes a typical girdle pain, on account of their irritating the posterior nerve roots. If, therefore, there is or has been any pain in the back other than what may be due to a known injury, it is probable that transverse myelitis is not primary but due to compression. If the spine presents an obvious Pott's curvature, or if the patient has other evidence of peripheral tuberculosis, such as enlarged or caseating glands in the neck; hip, knee, or other joint disease, a psoas abscess, lupus vulgaris, and so on, especially in a young person who has been in the habit of drinking much milk, compression by spinal caries is fairly certain. The main difficulty arises when the cord becomes compressed without deformity of the spinal column, and with no other tuberculous lesion apparent. Local tenderness over one or more vertebral spines will help to suggest the diagnosis, especially if local pain is complained of in the same region, and if the pain is increased by any jarring of the spine. Growth is fortunately much rarer, and it is to be excluded by a routine examination of all the viscera, most cases of spinal new growth being secondary to a neoplasm elsewhere, especially of the breast; primary growths of the spine are so rare that they are generally taken for caries at first, and the correct diagnosis is not always arrived at before post-mortem microscopical examination has been made. Aortic aneurysm is a still rarer cause of compression myelitis; if there is a distinct pulsatile tumour along the course of the aorta, the nature of the case may be obvious; more often, however, an aneurysm which erodes the vertebræ sufficiently to bulge into the spinal canal, does not at the same time enlarge forward to produce a tumour that can be recognized easily by palpation. The patient will generally be a man in the prime of life who has had syphilis, who is not a life abstainer, and who has worked hard. Apart from a pulsatile tumour, the symptoms will be very like those of paraplegia from spinal caries.

The relationship of injury to transverse myelitis is not always quite straightforward. If, for example, a patient who has syphilitic endarteritis of his spinal vessels receives a kick in the back from a horse, he may find that, by next day, he is unable to move his legs; it may at first seem obvious that the kick has been the sole cause of the paraplegia, when the real cause is syphilis—the kick having been the final factor which led to thrombosis in a diseased spinal artery. Transverse myelitis due to syphilis is exactly comparable in its mode of origin to the hemiplegia which results from endarteritis obliterans in a middle cerebral artery. There is no pain and no deformity of the spine, but in other respects the paraplegia presents the same features as does that which is due to com-

pression of the cord. Syphilis is by far the most important cause of this primary transverse softening, but there are a considerable number of other maladies in which a similar result occasionally ensues; almost any infective disease may lead to it; one may perhaps mention typhoid fever, scarlet fever, and influenza in particular. In infective endocarditis there may be an additional factor, namely embolism of the cord, though this is decidedly rare.

If it is found that the arms are affected as well as the legs, it is unlikely that the lesion is transverse myelitis, unless in rare and anomalous cases such as those mentioned on page 74. If the onset has been slow, the course progressive, and wasting is present, with reaction of degeneration in the muscles of the hands or arms, with increased knee-jerks, ankle-clonus, and extensor plantar reflexes, but no anæsthesia, the malady is almost certainly *amyotrophic lateral sclerosis*.

If there are increased knee-jerks, extensor plantar reflexes, ankle-clonus, ataxy, intention tremors in the hands, nystagmus, and a hesitancy in the voice, which may even be of the type described as "scanning," the disease is either *cerebellar abscess or tumour*, or *disseminated sclerosis*. If headache and vomiting have been severe, the former is the more probable, and the diagnosis may be clinched by finding double optic neuritis. Abscess will be more likely than tumour if there is otorrhœa or pyrexia. It is not uncommon to find optic atrophy, with either concentric diminution in the fields of vision or else a central scotoma, in disseminated sclerosis, but optic neuritis is uncommon. The difficulty in diagnosing disseminated sclerosis arises mainly when the complaint is in its early stages; the patches of sclerosis may be anywhere in the cord, and before the affected fibres atrophy there is a period when they are sometimes able to conduct impulses, sometimes not; when they are not able to conduct, there are numerous symptoms, and in a day or two, when conducting power recovers, these symptoms are gone again; this variation from day to day nearly always leads to a diagnosis of neurosis for months or years before the true nature of the malady becomes obvious. In some patients a central scotoma may develop early, leading to peculiar symptoms, such as the inability to distinguish a sovereign from a shilling if the light is not good, or the liability to run into people without seeing them when cycling. If ataxy is marked, the staggering gait may lead to a suspicion of alcoholism; the patient staggers alternately to either side in disseminated sclerosis, whereas in tumours of one cerebellar hemisphere the tendency is to stagger constantly to the same side. Bladder and rectal troubles are not common in either case, and yet they may be prominent. Paræsthesia may also develop in disseminated sclerosis, although as a rule there is no sensory disturbance at all.

If a patient has the symptoms of spastic paraplegia and ataxy, without anæsthesia, nystagmus, or changes in the voice, a diagnosis of *ataxic paraplegia* will usually be made. There is really no difference between this and what has been called *combined sclerosis of the cord*; in both conditions there is degeneration of the posterior columns, the crossed pyramidal, and the cerebellar tracts. Some observers use the term combined sclerosis only for syphilitic cases, reserving *ataxic paraplegia* for similar non-syphilitic cases.

Primary lateral sclerosis was a relatively common diagnosis until it was found that the more careful the examination the greater was the likelihood that more than simple degeneration of the crossed pyramidal tracts would be found. Partial compression of the cord produces spastic paraplegia without anæsthesia, and thus simulates primary lateral sclerosis as described above. Disseminated sclerosis may do so likewise, and so on. Primary lateral sclerosis should never be diagnosed, therefore, till all the other affections in which the lateral columns may be affected have been excluded. There is such a disease as primary lateral

Fig. 146.—Diagram of sensory localization in the spinal cord.

Fig. 147.—Diagram of localization of reflex centres in the spinal cord.

(From diagrams prepared by the late Dr. J. H. Bryant.)

sclerosis, however; it is generally syphilitic in origin, and it leads to typical spastic paresis of the legs, with increased knee-jerks, ankle-clonus, extensor plantar reflexes, no wasting, no R.D., no sensory disturbances, and in the later stages, retention of urine with overflow and incontinence of fæces; the disease is generally progressive, but after reaching a certain point it may remain stationary for years, or even improve to a slight extent for a time.

When lateral sclerosis is yet in an early stage, a valuable sign of it is the disappearance of the abdominal reflexes; the diagrams (*Figs. 146, 147*) may be of assistance in locating the level of the cord at which a lesion may be present.

The causes of paraplegia that remain for discussion are Landry's paralysis, general paralysis of the insane, functional paraplegia, and malingering.

Landry's paralysis is probably not a distinct entity, but rather a very acute type of perhaps more than one variety of paraplegia. It is rare. It affects young adults, who, hitherto strong and well, become rapidly affected by paralysis which starts in the legs and quickly ascends to the trunk and arms, and may even involve the neck and cranial nerves. It either gets well quite rapidly, or else kills the patients in a few hours or days by affecting the intercostal muscles and diaphragm, with consequent asphyxia. There may be slight pains in the affected parts shortly before paralysis sets in, but sensory symptoms are generally slight, or absent. The nature of the malady is obscure, but if one were to regard it as a very acute and widespread anterior poliomyelitis, one could account both for its main symptoms, its rapid fatality in some cases, and its equally rapid recovery in others. Moreover, seeing that the patient either dies or recovers so quickly, it is not surprising that there is no time for the development of obvious muscular wasting or reaction of degeneration.

Paraplegia in cases of *general paralysis of the insane* does not arise until the third stage of that malady is reached; by that time the diagnosis is generally obvious; it only remains to add that the paraplegia is part of a general and extreme weakness, and the patient is bedridden.

Functional paraplegia and *malingering* should never be diagnosed until all organic causes—particularly disseminated sclerosis and spinal caries—have been excluded. Malingering may be suggested by the particular circumstances of the case—the patient may be a nervous, self-conscious girl who desires to attract sympathy, or an out-of-work who wants to get a night's shelter in a hospital; careful observation generally leads to the detection of the fraud. Functional paraplegia is less easy to be sure of, and in many patients that which may at first be regarded as functional ultimately turns out to be organic; this is especially true in the case of disseminated sclerosis. The paraplegia is never of the primary muscular, or the lower neurone type, there being no wasting and no R.D. The muscles remain of good bulk as they do in the upper neurone type of paraplegia, but although the knee-jerks may be unduly brisk, the plantar reflexes remain flexor, and there is no maintained ankle-clonus. If there is anæsthesia, the distribution of the latter is sometimes obviously functional; it may, for instance, start sharply at the knee and cease suddenly at the ankle, or in some other way indicate that it corresponds neither to the segments of the spinal cord nor to the distribution of the peripheral nerves. It is by anomalies of this kind, which make it impossible to fit in the case with any organic lesion, that functional paraplegia is diagnosed by a process of exclusion.

Herbert French.

PARASITES, INTESTINAL. — *Tape-worms.* — The commonest symptom of the existence of a tape-worm is the passage of the detached terminal segments per rectum in longer or shorter tape-like strips. The only condition for which these might be mistaken is muco-membranous colitis, in which long, narrow,

white mucous casts of the bowel, a foot or more in length, may be passed with the motions (*Fig. 123*, p. 444). It is easy to distinguish these, however, if the suspected material is floated in water, for in the case of a cast of the bowel, a central lumen will be found which is not present in the tape-worm. There is, moreover, no regular segmentation in the case of muco-membranous colitis, whereas tape-worms are obviously segmented. If any doubt remains,

examination with a lens will show the glandular structure of the uterus in the tape-worm segments, and no such structure in the strips of mucus in muco-membranous colitis. It is sometimes stated that picking of the nose and a voracious appetite are symptoms of the presence of some kind of intestinal parasite; but this is hardly ever the case; if constitutional symptoms develop at all, they take the form of deficiency of appetite, with more or less anæmia, which may become profound; there is often considerable EOSINOPHILIA (*q.v.*). The three forms of tape-worm that occur in the human intestine are *Tænia solium*, *T. mediocanellata*, and *Bothriocephalus latus*, the commonest in Great Britain being the *T. mediocanellata*, the cystic stage of which is spent in cattle.

T. solium is derived chiefly from pig-meat, whilst *Bothriocephalus latus* occurs mainly in those who live much on fresh-water fish. It may be possible to make the diagnosis of *T. mediocanellata* by holding the segments up against a bright light and seeing a median streak or water-channel, in addition to one down either edge of each strip, this

Fig. 148.—Head of *Tænia solium*: showing four sucking discs and thirty-four hooklets, alternately long and short. (Medium power.) (From a specimen in the possession of Mr. Pillischer, New Bond Street, W.)

Fig. 150.—Head of *Tænia mediocanellata*. (Low power.) (From French's *Medical Laboratory Methods*.)

Fig. 151.—Lateral view of head of *Bothriocephalus latus*, showing longitudinal sucking disc. (Low power.) (From French's *Medical Laboratory Methods*.)

middle water-channel giving the name to the parasite. The ultimate proof of the nature of the tape-worm, however, is afforded by the characters of the head, that of *T. solium* having four sucking discs, with a rostellum surrounded by thirty-four hooklets (*Figs. 148, 149*); that of *T. mediocanellata* four circular sucking discs and no hooklets (*Fig. 150*); whilst that of the *Bothriocephalus*

latus has a more or less conical head, with two elongated lateral sucking discs and no hooklets (Fig. 151). The degree of anæmia, chlorotic in type, is usually greatest with *Bothriocephalus latus*, least with *T. mediocanellata*, and the same also applies to the degree of eosinophilia. The eggs of the tape-worm are unmistakable (Fig. 152); they are spherical, with a dark-brown central portion, and a lighter striated broad capsule.

Microscopical Examination of Fæces.—One of the best ways of preparing fæces for microscopical examination for the ova of parasites or for other solid particles, is to put about as much as would cover a shilling into a test-tube, filling the latter two-thirds full of normal saline solution ($1\frac{1}{2}$ dr. of salt to a pint of water), corking the tube, and shaking it vigorously in order to break up the fæces as much as possible; on allowing to stand for twenty minutes, the upper part of the fluid remains opaque with fine débris, whilst the heavier particles, including the ova of parasites, have sunk to the bottom; the supernatant opalescent or opaque fluid may now be poured off, and the more definite residue again shaken up with normal saline and allowed to stand for another twenty minutes; this process is repeated until the supernatant fluid becomes clear after it has stood for the twenty minutes, and then, when as much of the fluid as possible has been poured away, a drop of the sediment is taken up in a pipette, transferred to a microscope slide, covered, the excess of fluid removed with filter paper, and the specimen examined either with the $\frac{3}{8}$ in. or $\frac{1}{4}$ in. objective, preferably with the mechanical stage. Such a specimen exhibits all sorts of vegetable cells, keratin particles, and so forth, which may at first be regarded as ova, but when the actual ovum of an intestinal parasite is seen, there is seldom any doubt about it.

Fig. 152.—Ovum of *Taenia solium*, semi-diagrammatic. (High power.) (From French's *Medical Laboratory Methods*.)

Round-worms.—The only round-worm that occurs in Great Britain is the *Ascaris lumbricoides*. This parasite may or may not give rise to symptoms; if it does so, they take the form of slight and obscure nervous and gastro-intestinal disorders. More often the diagnosis is quite unsuspected until one of the worms is found in the bed, having crawled out per anum, especially when the patient, generally a child, falls ill of some febrile malady. If round-worms have been found previously, and if the existence of others is suspected, the diagnosis may be confirmed by discovering the typical ova (Fig. 153) in the fæces; their chief characters are their relatively large size, oval shape, and irregular membranous envelope outside the chitinous shell. This worm does not produce eosinophilia as a rule, but in exceptional cases it may do so.

Fig. 153.—Ovum of *Ascaris lumbricoides*. (High power.) (From French's *Medical Laboratory Methods*.)

Thread-worms.—*Oxyuris vermicularis*, if present at all, usually occurs in hundreds, and can be detected immediately by examination of the fæces with the naked eye. Each parasite is rather more than $\frac{1}{4}$ in. in length, without any colour; its extremities project from the fæcal mass, and move about slowly, like threads waving in the air. These parasites produce no eosinophilia. The patients are nearly always children, and there may be no symptoms at all; but more often there is considerable irritation around the anus, and in young girls about the vulva. Gonorrhœa has before now been suspected when the vulvar infection was really due to the *Oxyuris vermicularis*.

The *Whip-worm* (*Trichocephalus dispar*) is in itself an entirely unimportant parasite occurring in the cæcum and large intestine, and producing no symptoms whatever. The worm with its tail is about $1\frac{1}{2}$ in. in length, and it is often coiled up watch-springwise. Its appearances are unmistakable; its ovum

(Fig. 154) looks more or less like a running-cork, and, with its deep-brown central parts and clear ends, it is quite characteristic. Whip-worms are present to the extent of nearly 10 per cent of all the inhabitants of some cities. They produce no eosinophilia, blood-changes, or symptoms.

The *Hook-worm* (*Ankylostomum duodenale*).—This is not a general parasite in Great Britain, but has affected many persons in certain districts as the result

Fig. 154.—Ovum of *Trichocephalus dispar*. (High power.) (From French's *Medical Laboratory Methods*.)

of introduction from abroad, particularly amongst lead-miners in Cornwall. Outbreaks also occurred in the workers in the St. Gothard tunnel, and the disease is prevalent in many parts abroad, especially in India, Egypt, Brazil, and Jamaica. The infection is carried from fæces to soil, from the soil to the hands, thence to the mouth, and so to the alimentary canal. The symptoms are for the most part those of progressive anæmia and asthenia, inability to continue with work, œdema

of the lower extremities, shortness of breath, and the occurrence of boil-like skin eruptions, described popularly as the "flowers" of the disease. The appearance of the patient may suggest pernicious anæmia, and the blood-count may sometimes seem to confirm this diagnosis at first; for whereas a great many of the patients have a severe chlorotic type of anæmia, some have a marked reduction of the red corpuscles and a slightly less reduction of the hæmoglobin, so that there is a high colour-index such as is characteristic of pernicious anæmia. There is generally no leucocytosis, but the differential leucocyte-count may suggest the diagnosis at once, for nearly all the patients present a considerable degree of eosinophilia. The administration of anthelmintics such as thymol may lead to the evacuation of the mature worms, which may be recognized in the fæces (Fig. 14, p. 94), each being from $\frac{1}{8}$ in. to $\frac{3}{8}$ in. in length. The ova (Figs. 15 and 16, p. 94) are oval, with a clear transparent shell and coiled-up embryo parasite. Melæna is another symptom, which may be prominent in some of these cases.

The two intestinal parasitic affections which produce the most serious anæmias and other toxic effects in man are *Ankylostomum duodenale* and *Bothriocephalus latus*.

Herbert French.

PARESIS.—(See PARALYSIS.)

PERISTALSIS, VISIBLE.—The importance of visible peristalsis lies in the fact that it is always pathological except in a few cases in which its unimportant nature is immediately obvious. The two chief conditions which render the normal movements of the bowels visible are *divarication of the abdominal recti muscles*, and *ventral herniation* of a laparotomy scar. The latter is obvious at once; the former is best detected when the recumbent patient, who is generally a multiparous woman with a soft flabby abdomen, tries to raise her head and thorax from the couch without the use of her arms; the contracting recti come together then, and close over the gap in the middle line in which, under the stretched and unsupported skin, the bowel movements had been seen. Under almost all other circumstances visible peristalsis is pathological; it may then be divided into two types—gastric and intestinal.

Gastric Peristalsis takes the form of a comparatively large swelling in the upper part of the abdomen, coming and going, generally appearing from under the region of the left ribs, progressing slowly downwards and to the right, where it fades away and disappears; it corresponds more or less with the greater curvature of the stomach. It is often stated that a return wave, passing along the lesser curvature from right to left, can also be made out, but this is exceptional.

Sometimes, instead of progressing, it comes and goes almost in the same spot, varying in shape but scarcely in position. The exact site of the wave must depend mainly upon the size and position of the stomach. It indicates *pyloric* or *duodenal obstruction*, and its presence serves to exclude atonic gastrectasis. There may or may not be other signs of dilated stomach, particularly a widely distributed succussion splash, vomiting of large volumes of fermenting fluid at relatively long intervals, and a greatly increased bismuth x -ray shadow. Whether the pyloric stenosis is simple or malignant has to be decided upon other grounds.

Visible Intestinal Peristalsis is, with the limitations discussed above, one of the surest signs of grave intestinal obstruction. There are almost certain to be abdominal distention, vomiting, and constipation along with it, and the discussion of the differential diagnosis of the different causes of these symptoms will be found elsewhere. The great importance of visible peristalsis is seen in those doubtful or obscure cases in which the patient seems hardly ill enough to be suffering from intestinal obstruction. It may be thought that colic, the result of some indigestible article of diet, is a more likely diagnosis, and that a dose of castor oil will cure the malady. Rather than wait for increasing severity of the symptoms to clinch the diagnosis in these cases, it is most important to arrive at a diagnosis of the necessity for laparotomy at the earliest possible moment if life is to be saved. If the small intestine alone is involved, the waves are multiple, and they run more or less transversely across the abdomen—the ladder-rung type; when the colon is obstructed, vertical waves, especially in one or both flanks, are the chief form the peristalsis takes. Definite and visible intestinal peristalsis is, so far as any single sign can be relied on, an almost infallible indication of the need for laparotomy in any case in which the other symptoms and the history point to a possibility of intestinal obstruction.

Herbert French.

PERSPIRATION, ABNORMALITIES OF.—(See SWEATING.)

PHOSPHATURIA.—This is a term the precise significance of which is by no means clear; the meaning it conveys to one observer is not always that which it implies to another. Some restrict it to conditions in which the total quantity of phosphates in each day's urine is greater than the average maximum. Others use the term when there is a spontaneous deposit of phosphates in the specimen glass. Others would include cases in which, on applying the boiling test for albumin, a cloud of phosphates comes down. So loose is the application of the word phosphaturia that it is generally used whenever anything arises to remind the observer ocularly of the fact that the urine contains any phosphates at all.

What is really required is a series of *different* terms to express the following conditions:—

1. Circumstances under which a greater quantity of phosphates is habitually passed in the urine than is the average maximum in health.
2. The spontaneous deposition of phosphates in a urine that has stood in a specimen glass until cold.
3. The spontaneous deposition of phosphates in the bladder, so that the urine is thick and milk-like even when it is being passed per urethram.
4. The deposition of phosphates as a white cloud when the urine is heated.

Absolute Phosphaturia.—The phosphoric acid in the urine is chiefly exogenous, i.e., derived from phosphates in the food. It is chiefly in inorganic combination as salts of the alkalies and alkaline earths. There is a certain small percentage of urinary phosphorus derived from the katabolism of nuclein and lecithin, but the amount derived from these in healthy persons is very slight as compared with that which comes direct from the food, so that the phosphates

almost disappear from the urine during starvation. There are wide variations in the amounts excreted by normal persons; the average is 3·5 grams per diem, but the healthy limits are as far apart as 1 gram and 8 grams.

It has been asserted that persons whose business entails great wear and tear of the nervous system excrete more than the average amount of phosphates, and the same has generally been held to be true of sufferers from certain nervous disorders of the hysterical or neurasthenic type, particularly when sexual matters are in question. There is very little evidence, however, to show that there is any real increase in the urinary phosphates in these cases. There is often a very abundant deposit of phosphates on applying the heat test to the urine, and this may give the impression that the total quantity of phosphates present must be above the normal; but the impression has not been confirmed by exact analysis.

There is only one well-defined condition in which there is absolutely and persistently more phosphate in the urine than healthy limits would allow, and that is phosphatic diabetes—a very rare condition of which the main features are thirst, emaciation, aching in the loins and back, and polyuria without sugar but with an absolute excess of phosphates in the urine.

Physiology of Phosphatic Deposits.—In nearly every case the deposition of phosphates is a purely physiological process. A molecule of phosphoric acid, H_3PO_4 , contains three hydrogen atoms. Each of these can be separately replaced by an atom of any monobasic metal, such as sodium. Three types of salts are formed, according as one, two, or three of the hydrogen atoms have been replaced, as in the following examples:—

NaH_2PO_4	-	-	Sodium dihydric phosphate
Na_2HPO_4	-	-	Sodium monohydric phosphate
Na_3PO_4	-	-	Sodium phosphate

These salts may all be present in the same urine, the proportions of each varying with the amount of phosphoric acid present, on the one hand, and the total amount of bases (i.e., sodium, potassium, etc.), and the total quantities of other acids present in the form of chlorides, sulphates, and so forth, on the other. The greater the quantity of chlorides and sulphates, the greater will be the amount of the metallic bases required to form them, and consequently the less will be the amount of bases left to combine with phosphoric acid; the result must then be a relative excess of NaH_2PO_4 . Conversely, the scantier the chlorides and sulphates, and the more abundant the bases, the greater will be the proportion of Na_2HPO_4 and Na_3PO_4 .

Now the three sodium salts differ from one another in at least two physical respects—their action upon litmus, and their solubility in water. Sodium dihydrogen phosphate (NaH_2PO_4) turns blue litmus red—in other words, it is an acid phosphate. The acidity of ordinary urine is mainly due to it. Sodium monohydrogen phosphate (Na_2HPO_4) is also an acid salt technically speaking, and there are some colour tests which exhibit the acid reaction along with it; litmus, however, is not one of these, for Na_2HPO_4 turns red litmus blue. When a given urine contains more Na_2HPO_4 than NaH_2PO_4 , the reaction of that urine to litmus is alkaline; that is to say, it turns red litmus blue and does not turn blue litmus red. Some urines have what is known as an amphoteric reaction—they turn red litmus bluish and blue litmus reddish—a different thing from neutrality of reaction, in which neither red litmus nor blue is turned in colour at all. The cause of the amphoteric reaction of a urine is the even balance in that urine of the Na_2HPO_4 on the one hand and of the NaH_2PO_4 on the other.

Now the dihydrogen phosphate is much more soluble in water than is the monohydrogen phosphate, whilst the tribasic phosphates are as a rule far less soluble still. When it is stated, therefore, that phosphates are more soluble in acids

than they are in alkalies, it must be remembered that it is not a question of a difference of solubilities of the *same* salt of phosphoric acid, but of an acid urine containing the bulk of its phosphates in a salt *different* from the one present in an alkaline urine. The very fact of a urine being alkaline means that there is relatively little of the more soluble NaH_2PO_4 present, and relatively much of the less soluble Na_2HPO_4 and Na_3PO_4 . Conversely, the fact that a urine is acid implies that the phosphates are relatively more abundant in the soluble NaH_2PO_4 form than they are either as Na_2HPO_4 or Na_3PO_4 . As a matter of fact, the three degrees of phosphates of sodium, potassium, and ammonium are all so soluble that they practically never become spontaneously precipitated, nor do they take part in forming calculi. It is the phosphates of calcium and magnesium that form precipitates, but what has been said above of sodium phosphate applies equally to calcium and magnesium phosphates. The less acid a urine is, the more will the less soluble varieties of calcium and magnesium phosphate preponderate, and it is on this account that phosphates come down in alkaline or neutral rather than in acid urines.

Again, it is often stated that phosphates are less soluble in hot urine than they are in cold, and this is given as the reason for the cloud of precipitated phosphates that so often forms when a urine that is not already very acid is boiled. This, however, does not express the real reason for the cloud; the heat does not precipitate the same phosphate as the cold urine contained, but leads to the formation of a different, and less soluble, phosphate. The calcium monohydrogen phosphate dissociates into calcium dihydrogen phosphate and normal calcium phosphate; it is the latter which is so insoluble that it comes down:

Milky Urine.—The urine of many healthy people, especially children, and eaters of large public dinners, is sometimes milk-like when it is passed soon after a full meal. Many a person has become alarmed at the sight, and has feared some grave disorder of the sexual organs or functions, especially either gonorrhœa or spermatorrhœa. The condition is physiological. It results from increased quantities of hydrochloric acid being required in the stomach at the time, increased quantities of bases being passed in the urine in consequence. The result of this is that the urine temporarily contains such an abundance of bases in proportion to acids that the less soluble monohydrogen phosphates exceed the more soluble dihydrogen phosphates, and they may become precipitated even in the urine that is still within the bladder. The commonest salt to come down is calcium monohydrogen phosphate, CaHPO_4 , which is either amorphous, or else assumes the form familiar as “stellar phosphate.” MgHPO_4 may come down with it in the form of amorphous particles, or as needles.

Fig. 155.—Triple phosphate crystals.
($\frac{1}{6}$ in. objective.)

Ammonio-magnesium Phosphate.—This, generally known as triple phosphate, MgNH_4PO_4 , is comparatively insoluble, and when precipitated it nearly always assumes the form of prisms—the familiar “knife-rester” or “coffin-lid” crystals (Fig. 155). It is clear that these will only come down when the

urine contains ammonia. The latter may of course have been produced by ammoniacal decomposition of urea after the urine was passed. If urinary decomposition after passage can be excluded, however, it is usually stated that the presence of ammonio-magnesian phosphate crystals indicates a purulent lesion in the urinary tracts, especially in the bladder. It is quite true that ammoniacal urines from cases of cystitis often abound in crystals of triple phosphate. The diagnosis is given by the pus cells and so forth, however, and not by the triple phosphate crystals. It is important to remember, moreover, that each day's urine normally contains enough ammonia for ammonio-magnesian phosphate crystals to occur in an absolutely healthy urine, even apart from decomposition on standing. This fact detracts very greatly from the value formerly attributed to the detection of triple phosphate crystals in the urine. Indeed, the importance of phosphates in the urine lies almost entirely in the fact that errors of interpretation may arise unless their physiological behaviour is clearly understood. Microscopically they are often amorphous, but the three well-defined forms of crystals shown in *Fig. 155* may be recognized microscopically. The chief chemical test is the addition of dilute acetic acid, which causes a precipitate of phosphates to clear up. The main importance of recognizing them correctly is to avoid mistaking them for pus in the case of a spontaneous deposit, for spermatozoa, or gonorrhœa, when the urine comes milky from the urethra, and for albumin in the case of the boiling test for the latter.

Herbert French.

PHOTOPHOBIA may occur in all inflammatory affections of the conjunctiva, cornea, or iris. It is most extreme in children suffering from corneal affections, such as superficial corneal ulcers or interstitial keratitis. It may also occur in snow blindness, scurvy, or albinism, and in normal persons after staying for long periods in the dark.

It has no special diagnostic significance in differentiating between various forms of ocular inflammation.

Herbert L. Eason.

PIGMENTATION OF THE SKIN.—Anomalies of the natural pigmentation of the skin, on the side either of excess or deficiency, may be due to irritation of the abdominal sympathetic, and particularly the solar plexus, leading to *general* pigmentation, or to the exudation or extravasation of the colouring matter of the blood, producing *local* pigmentation. Local pigmentation may be brought about by the action of irritants, may result from a condition of hyperæmia, or may be a sequela of skin eruptions. The most familiar errors of pigmentation are covered by the term *chloasma*. This may be either idiopathic or symptomatic. *Idiopathic* chloasma is usually caused by counter-irritants, such as vesicants, or some other form of external irritation, especially scratching, as in vagabond's disease—*phtheiiriasis*; but in some cases it is impossible to trace the cause. *Symptomatic* chloasma is a sequela or an accompaniment of cutaneous eruptions, or is the result of abnormal conditions of the uterus or of other abdominal viscera, or of cachexia. It is most often met with as *chloasma uterinum*, which may occur not only in connection with pregnancy, but also in association with any form of uterine irritation. The smooth yellowish-brown patches are seen most commonly on the forehead, but almost the entire face may be involved, and also the trunk and limbs. Somewhat similar irregularities of pigmentation occur in *rheumatoid arthritis*, *pernicious anæmia*, *Hodgkin's disease*, *Graves' disease*, *abdominal tuberculosis*, and other disorders of the abdominal viscera, and in cases in which *arsenic* has been given over long periods. In *Addison's disease* there is a general bronzing of the skin, together with pigment deposits in the mucous membranes of the mouth, anus, vulva, and urethra;

and pigmentary abnormalities occur also in *cachexia* associated with malaria, cancer, nodular leprosy, and secondary syphilis—in malaria, a yellowish-brown to black; in cancer, a sallow tint; in nodular leprosy, a fawn colour early in the disease, and a general bronzing at a later stage; in secondary syphilis, an earthy tint affecting the face. In the rare condition known as *ochronosis*, the skin, cartilages, and sclerotics are blackened, as the result in some cases of alkaptonuria, in others of the prolonged absorption of carbolic acid. In *hæmochromatosis*, another rare condition, apparently due to diseases of the alimentary tract and liver, the patient may be pigmented from head to foot, the prevailing colour being a deep blue-grey slate tint. The diagnosis of *urticaria pigmentosa seu nigricans* is generally clear. Pigmentary deposits in the skin form only part of the skin changes characteristic of *Kaposi's disease*. The pigmentation of *bronzed diabetes* can scarcely be misinterpreted if, when the urine is examined, glycosuria be found; most cases of this form of diabetes have cirrhosis of the liver as well, so that there is a non-teetotal history.

The diagnosis of the various forms of chloasma is usually easy, though the particular cause of the pigmentation can only be deduced, of course, from the general symptoms. Chloasma can be differentiated from *chromidrosis*, by observing that in the latter condition the colour, which is derived from the exuded secretions, readily disappears if washed with ether or chloroform. In *tinea versicolor*, and some other fungous diseases which resemble chloasma, the patches are not smooth but scaly, and the discoloration can be scraped off. The *pigmentary syphilide*, which may take the form of a diffused brownish hue, brownish spots, or dappled patches, is seldom met with except on the neck. Question may arise between chloasma and *leucodermia* (vitiligo) when in the latter condition the white areas have spread over the greater part of the body, and are taken for the normal colour; but in leucodermia the border of the area is concave, whereas in chloasma it is convex. Moreover, in leucodermia the history is that of the formation of white patches surrounded by a pigmented border, which may spread until large areas, and even the whole surface of the body, are affected.

Leucodermia has in its turn to be distinguished from sclerodermia, morphœa, macular leprosy, pigmentary syphilide, and partial albinism. The skin is not stiff and thickened as it is in *sclerodermia*. The edges are not streaked with small dilated vessels, making a pink or violet border, as in *morphœa*, nor is there any intermingling of atrophic striæ. The patches are not destitute of sensation as in *nerve-leprosy*, nor, though it has been styled "white leprosy," has leucodermia any other resemblance to that affection save the colour of the patches. Doubt as between leucodermia and a congenital condition like *partial albinism* could only arise by disregarding the history. Of albinism itself, whether partial or universal, nothing more need be said here; for though it is an abnormality of pigmentation, its true character can never be in question. Nor need I speak of jaundice, for that condition forms the subject of a separate article.

Discoloration of the skin may be due to the prolonged administration of drugs. Thus picric acid may turn the skin and the conjunctivæ yellow, arsenic may cause a peculiar greyish, brownish or freckle-like pigmentation, nitrate of silver may set up the condition known as *argyria*, in which the integument and the mucous membrane, particularly in situations exposed to light, take on a bluish-grey or greyish-black colour, especially on the face and the flexor aspects of the limbs. This condition may closely resemble hæmochromatosis and similar abnormalities, but the history of protracted use of the drug will make the diagnosis clear. Since, however, arsenic may be derived from some unsuspected source, as was the case in the peripheral neuritis epidemic in and

around Manchester due to beer containing it as an impurity, chemical analysis of the hair should be made, which will serve to prove or disprove a suspicion that the patient has been ingesting arsenic, as the latter becomes stored up in the hair that grows whilst the arsenic is being taken.

Malcolm Morris.

PLANTAR REFLEX, EXTENSOR.—(See BABINSKI'S SIGN.)

PNEUMATURIA—or the passage of gas per urethram, either along with or independently of urine—is a rare symptom, but when it does occur it is a very striking one, particularly in males.

It may be due to one or other of two entirely distinct groups of causes, namely :

1. Communication between the rectum, cæcum, vermiform appendix, or other part of the alimentary canal and the bladder, ureter, or renal pelvis ; either directly, or *viâ* an intermediate gas-containing abscess cavity.
2. Infection of the bladder or other part of the urinary tract by micro-organisms that produce gas, without there necessarily being any breach of surface of the mucosa.

When the cause lies in the first group, the patient is very liable to pass fæcal material at the same time as the gas, and the differential diagnosis between the various possible lesions will be found discussed under *FÆCES PASSED PER URETHRAM*. It should be added, however, that the passage of gas without fæces per urethram by no means excludes there being a fistulous communication between some part of the alimentary canal and the urinary tract ; the fistula may be tortuous, so that gas gets along it, but not fæces. It may happen, moreover, that a lesion such as appendicitis has led to the formation of a local abscess which, owing to its infection by the *Bacillus coli communis*, contains gas ; this abscess may open into the bladder and cause the discharge of pus and gas, but no fæces, per urethram. The same applies to other abscesses which, though not arising primarily in connection with the bowel, nevertheless occasionally contain gas from infection by the *B. coli communis*—a suppurating ovarian dermoid cyst, for instance, a suppurating hydatid cyst, or a pyosalpinx.

Sometimes there may be serious doubts as to whether the gas is finding its way into the urinary passages from some external source, as above, or whether it is being produced *in situ*. In the absence of any rectal or other pelvic or abdominal evidence of disease outside the bladder, it will be remembered that several different organisms are able to produce gas when they grow in urine ; notably the *Bacillus coli communis*, and in glycosuric cases, various yeasts, including the common yeast. The urine will be examined for sugar, and if it be present, a catheter specimen will be obtained to see if *saccharomyces* are present in the bladder-urine ; if so, and if there is no pus or evidence of infection by other micro-organisms, the nature of the pneumaturia will be clear ; as a rule, in these cases the patient voids urine that is bubbly rather than distinct and separate from the gas. If, on the other hand, no sugar is present, a catheter specimen will be cultivated to find out whether the *B. coli communis* is present, and if so, in what quantity. If it is, and if no sign of any fistulous communication between any part of the bowel, or a gas-containing abscess cavity, and the urinary tracts, can be made out, then there will be a presumption that the pneumaturia is due to coli bacilluria, although the latter is far commoner without than with pneumaturia. The urine in these cases may contain very little obvious pus and only a trace of albumin ; it may be acid, and not foul smelling or ammoniacal ; on the other hand, it may sometimes be so foul and fæculent as to cause serious suspicions of a communication between the colon and the bladder, even when there is none. A cystoscopic

examination will serve to exclude a fistulous opening into the bladder, but it may be much more difficult to exclude a similar communication with the higher parts of the urinary tract, especially the renal pelvis. The latter condition is so rare, however, that it is wiser to diagnose coli bacilluria only unless there is direct evidence of a cause for communication between the bowel and the renal pelvis, such as a carcinoma coli.

Herbert French.

PNEUMOTHORAX, or gas in the pleural cavity, may exist with or without clear fluid, pus, or blood in the lower part of the pleura at the same time. If there is any kind of fluid in the cavity along with the air, the fact is generally made obvious at once, when the patient's thorax is auscultated whilst it is being actively or passively shaken, so as to produce the typical succussion splash, often followed by the ringing sounds made by drops of fluid falling from the compressed lung into the pool of fluid beneath. The nature of the fluid—hydro-pneumothorax, pyo-pneumothorax, or hæmo-pneumothorax, as the case may be—can seldom be diagnosed except by obtaining some of it by means of an exploring needle and syringe. Whether the pneumothorax is or is not associated with any of these fluids, the diagnosis is generally easy on account of the deficiency in movement of the affected side of the chest, the displacement of the heart in the opposite direction, and hyper-resonance to percussion, together with remarkable deficiency or complete absence of the vesicular murmur and voice sounds. The coin-tap sound, obtained by placing one silver coin on the chest wall, tapping it with another silver coin, and listening through the stethoscope for the ringing echo produced when the sign is positive, may serve to confirm the diagnosis, but it is not essential. Partial pneumothorax, in which complete collapse of the lung is prevented by former adhesions, is proportionately more difficult to diagnose, but the same type of physical signs, including the coin-tap sound or *bruit d'airain*, will generally be found in these cases, though in less degree than when the pneumothorax is complete. The *x*-rays show an abnormal clearness corresponding to the air in the pleural cavity. It is not sufficient, however, merely to diagnose pneumothorax; its cause has to be determined from amongst the following:—

Phthisis: (a) early, (b) late.

Rupture of an emphysematous bleb.

Gangrene of the lung with necrosis of the pleura.

Empyema ruptured through the lung.

Instrumental: e.g. after tapping a pleural effusion.

Stabs, or gunshot wounds of the chest wall.

Epithelioma of the œsophagus ulcerating into the pleura.

Gastric ulcer or carcinoma ventriculi, leaking so as to produce a gas-containing sub-diaphragmatic abscess, which in its turn may perforate the diaphragm and cause a pneumothorax.

Infection of the pleural cavity by gas-producing organisms, such as the *Bacillus coli communis*.

The commonest cause by far is *phthisis*; and when the occurrence of the pneumothorax does give rise to symptoms, it is generally due to comparatively early phthisis; indeed, when a sudden acute attack of pain in one side of the chest, associated with rapid shallow breathing, and cyanosis with or without hæmoptysis develops in a young adult without apparent cause, it is almost certain that the patient has a tuberculous focus at one apex, even though, as frequently happens, there have been no abnormal symptoms previously, such as cough or night sweats, and even though absolutely no abnormal physical signs can be detected at the apex of the other lung. There may be a little sputum, and in this tubercle bacilli may be detected.

When pneumothorax is attributed to *rupture of an emphysematous bleb*, there must always remain in the physician's mind a serious doubt as to whether it is not really due to a bleb in the immediate neighbourhood of an undiagnosable tuberculous deposit, and the case should be treated as one of potential phthisis.

If the tuberculous process in the lung has made considerable advance pneumothorax is far less common, because there will almost certainly have been pleurisy with thickening and adhesions sufficient to prevent pneumothorax occurring; nevertheless, in some such cases pneumothorax does develop, and the diagnosis of its cause is easy both on account of the abnormal physical signs and of the sputum with the tubercle bacilli in it. In a later stage still, the occurrence of pneumothorax may cause very little additional disturbance, on account of the extent of lung already diseased, and although its cause would be obvious enough, the occurrence of the pneumothorax often escapes detection.

When the patient has had a *pleuritic* or *pleural effusion* tapped, the detection of air free in the pleural cavity upon the next day is by no means an uncommon occurrence; it does not follow that this air has leaked in through the tapping instrument, for it is quite as commonly derived from the rupture of the superficial alveoli which have been re-expanded rather too rapidly in the withdrawal of fluid by the aspirator. The air generally becomes re-absorbed in a few days, and the temporary pneumothorax is of little significance.

Similar escape of air into the pleural cavity, as the result of cuts, stabs, fractured ribs, or gun-shot wounds, is remarkably rare; this rarity depends upon the fact that the two layers of pleura tend to cohere in a way similar to that which makes two thin sheets of Indian paper difficult to separate, so that when an injury from outside penetrates one layer, it nearly always perforates both, and air from within the lung escapes into the subcutaneous tissues instead of into the pleural cavity, and produces surgical emphysema instead of pneumothorax. It rarely happens that an injury separates a sufficient area of the two layers of pleura one from the other to cause a pneumothorax.

All the remaining causes of pneumothorax in the list above are uncommon, and none of them will arise without there having been other symptoms to indicate the nature of the malady. It is possible for an *empyema* to rupture into a bronchus, and so lead to the sudden expectoration of much foul pus, without any pneumothorax arising, or at least none of any extent, because for such an empyema to rupture into the lung it must have been shut off all round by firm pleural adhesions. *Gangrene of the lung*, such for instance as that which may follow upon a foreign body becoming impacted in a bronchus; septic bronchopneumonia due to inhalation of particles from a cancerous tongue or to septic emboli from thrombosis of a lateral sinus and jugular vein in connection with otitis media; growth of the lung breaking down, or lobar-pneumonia becoming entirely necrotic—these are only the terminal factors of an already serious disease, and pneumothorax due to these causes may even pass without recognition on account of the severity of the symptoms already existing in the case. *Gas-containing abscesses beneath the diaphragm*, such as may either perforate directly into the pleural cavity or lead to infection of that cavity by the *Bacillus coli communis* or other gas-forming organism, never arise suddenly, but are preceded by a simple or malignant ulceration of either the stomach, duodenum, or colon, the symptoms of which will generally have existed for days, weeks, or months; so that if the possibility of gas appearing in the pleural cavity in this way is borne in mind, the diagnosis of its origin need not be difficult. The x-rays may serve to show a large gas bubble below the diaphragm as well as gas in the pleural cavity, and that the gas bubble is not intragastric may be demonstrated by filling the stomach with a bismuth meal and finding that the gas bubble does not become blackened.

Herbert French.

POLYCYTHÆMIA.—The term polycythæmia is used to denote a material increase of the red corpuscles above their normal number per cubic millimetre of blood. In males they should average 5,000,000 per c.mm.; in females, 4,500,000. Any considerable increase above these figures, for instance up to 6,000,000 per c.mm., or more, constitutes polycythæmia. Figures as high even as 14,000,000 are sometimes reached. The following are some of the conditions in which polycythæmia occurs:—

1. Congenital heart disease of the type spoken of as *morbus cæruleus*—generally due to pulmonary stenosis (see *Fig. 50*, p. 184).
2. Persons who live in high altitudes.
3. Patients afflicted with chronic shortness of breath, with a tendency to periodic cyanosis, particularly cases of (*a*) mitral stenosis, (*b*) fibroid lung with and without bronchiectasis, (*c*) chronic bronchitis and emphysema, (*d*) spasmodic asthma, (*e*) some renal cases.
4. Patients who have recently lost a quantity of fluid from the tissues, the result of such conditions as (*a*) severe vomiting, e.g., the uncontrollable vomiting of pregnancy; (*b*) severe diarrhœa, e.g., the summer diarrhœa of infants, cholera, ptomaine poisoning, arsenic; (*c*) inability to obtain fluid to drink, especially if there exists already a disease tending to polyuria, such as diabetes mellitus, diabetes insipidus, or granular kidney.
5. Splenomegalic polycythæmia.

As a rule, the diagnosis of the cause of polycythæmia in a given case is not difficult. When it is due to *congenital heart disease* it is nearly always associated with an extreme degree of cyanosis without proportionate dyspnœa, and with clubbing of the fingers, both these dating from birth, or early childhood. The patient is generally young, though some survive into adult life. There is not always a cardiac bruit, and the precise lesion will then be obscure; often, however, percussion shows increased cardiac dullness to the right of the sternum, and upwards towards the second left rib, indicating increased size of the right auricle and ventricle; and in most cases there is either a loud rumbling or blattering systolic bruit of pulmonary stenosis, heard loudest in the second left space close to the sternum, but also audible over the greater part of the precordial region, and often over both sides of the chest in front and behind; or else a very similar universal systolic bruit, differing chiefly in having its maximum intensity either behind the sternum between the two fourth ribs, or else in the fourth left intercostal spaces close to the sternum, indicative of patent septum ventriculorum. These two lesions may both be present in the same patient, and they are the commonest cause in cases of *morbus cæruleus* that survive infancy. The red corpuscles seldom number less than 6,000,000 per c.mm., and in some cases they have been no fewer than 14,000,000 per c.mm. The percentage of hæmoglobin is also greatly increased, but usually to a less degree than are the red cells, so that the colour index falls below 1. This applies to nearly all causes of polycythæmia. There is no simultaneous increase in the number of leucocytes per c.mm., and the differential leucocyte count falls within the normal limits. It is noteworthy that cases of persistent ductus arteriosus seldom present either cyanosis, clubbed fingers, or polycythæmia.

Residence at *high altitudes* often causes polycythæmia. The increase is seldom extreme, but the red cells not infrequently reach 6,000,000 or more per c.mm. This rule is not by any means universal, however, though upon the whole the higher the altitude the higher the normal average number of red cells per c.mm., particularly in those who have resided long and continuously in the mountains. The individuals are not ill; it is merely that their red cells stand at a higher figure normally than do those of dwellers nearer sea level.

Quite apart from the presence or absence of anasarca, patients suffering

from chronic lesions which tend to produce dyspnœa are also very apt to have polycythæmia, particularly when the lesion causes marked redness of the lips. This is very well seen in many cases of *mitral stenosis* when there has been a tendency for some time past for failure of compensation to ensue. There is no similar polycythæmia in aortic cases unless mitral disease is present as well, and the red cells are much less increased in mitral regurgitation than in mitral stenosis. In the latter they often reach 6,000,000 or even 7,000,000 per c.mm., and it would seem to be an attempt on nature's part to try and compensate for the failing circulation by distributing the hæmoglobin over a larger corpuscular area. The same explanation probably accounts for the similar polycythæmia due to *morbus cæruleus*, and to high altitudes, and to certain cases of *fibroid lung*, *bronchiectasis*, *emphysema*, *chronic bronchitis*, *renal disease* with chronic dyspnœa, and *spasmodic asthma*, in which some degree of polycythæmia, though not the rule, is sometimes met with, just as it is in mitral stenosis. The colour index is less than 1, for although the hæmoglobin is increased, it is less so than are the red cells. The leucocytes remain unaltered. The polycythæmia will seldom if ever be the most prominent symptom in the case, so that the diagnosis will nearly always have been made upon other grounds—the presystolic bruit at the impulse; the displacement of the heart towards that side where the lung presents an impaired note, with or without crackling râles and bronchial breathing; and so on. The maintenance of the polycythæmia is important, however, and therapeutic measures should be directed to this end, for many cases of mitral stenosis with 5,000,000 red cells per c.mm. are relatively anæmic; they should have 6,000,000 or more.

The effect of *cholera*, *ptomaine poisoning*, *arsenic*, *summer diarrhœa* of infants, *severe thirst* that cannot be assuaged, *the toxæmia of pregnancy*, and so on, in concentrating the blood by withdrawing or withholding fluid from it, and thus producing some degree of polycythæmia, is an acute condition which is to be counteracted by continuous saline infusion or some similar method of restoring fluid to the tissues. The polycythæmia seldom reaches any marked degree except in quite early stages, for instance, in *cholera*; later, the red cells in the blood disintegrate more rapidly than they are replaced, and the polycythæmia is thereby masked. In measuring the concentration of the blood in these conditions, it is of less value to count the red cells than to measure the specific gravity. This is most readily done by the chloroform and benzene method. The specific gravity of chloroform is high, that of benzene is low, and by mixing the two in different proportions it is possible to obtain fluids of every intermediate specific gravity. A mixture of the two of the normal specific gravity of the blood, viz., 1056, is made, and poured into a specimen glass of sufficient depth to allow a urinometer to float in it. For strict accuracy, certain corrections in the readings of the ordinary urinometer are required, but for emergency use the instrument will serve. The lobule of the patient's ear is pricked, a large drop of blood is allowed to fall into a suitable small cup or other receiver containing some of the chloroform-benzene mixture, and thence transferred to the main bulk of the fluid in the specimen glass. If the blood-drop sinks, more chloroform must be added; if it floats, more benzene; ultimately a point is reached at which the blood-drop neither sinks nor floats; the specific gravity of the chloroform-benzene mixture is then the same as that of the blood. In cases of collapse from loss of fluid, there is a rise in the specific gravity of the blood, even when there is no polycythæmia,—and the greater the rise, the greater the need for infusion.

Splenomegalic polycythæmia is a somewhat rare condition that is also termed *erythræmia*, or *erythrocythæmia*. Its name suggests its main features, which are: Enlargement of the spleen, increase in the red cells up to as many as

10,000,000 per c.mm., or even more, and duskiness or lividity of the face and of the extremities. The nature of the malady is still obscure, though some regard it as due to disease of the bone-marrow. It affects adults and females rather than children and males, and its course is chronic. It only remains to add, that whereas to be typical the spleen must be enlarged, there are cases, probably of the same affection, in which, without the spleen becoming palpable, the only definite clinical signs are progressive lividity and polycythæmia.

Herbert French.

POLYDIPSIA.—(See THIRST, EXTREME.)

POLYURIA.—The term polyuria signifies the passage of more than the average amount of urine per diem. It may be either (I) *Transient* or (II) *Continued*. It is important not to mistake frequency of micturition for polyuria, for although the latter almost necessarily causes the former, there are many conditions that lead to frequency of micturition without polyuria—for example, tuberculous ulceration of the bladder, enlargement of the prostate, or urethral stenosis, in all of which urine may be passed frequently, but in small quantities at a time. In case of doubt the total amount of urine passed in each period of twenty-four hours should be measured. The normal limits are very wide, the average being about 50 ounces per diem, more being passed in cold weather than in warm, during rest than after exercise, waking than sleeping, and after drinking than after taking little fluid by the mouth. Under certain conditions the total amount exceeds 200 ounces per diem, or even two gallons. The point at which polyuria begins is arbitrary; if a patient passes 70 ounces or more per diem it is almost certain to attract attention, and therefore to merit the term polyuria.

In degree, the polyuria due to causes in Group I seldom exceeds 100 ounces a day; some of the causes in Group II, especially diabetes mellitus and diabetes insipidus, may cause polyuria to the extent of 200 ounces, or even 300, 400, 500, 600, or more, per diem.

In arriving at the differential diagnosis of the cause in any given case, one of the first points to note is whether the polyuria is persistent; or whether, even if recurrent, it is transient. Any of the causes that usually give persistent polyuria may in some individuals produce the symptom intermittently, but upon the whole one may classify the causes of polyuria as follows:—

I.—CAUSES OF TRANSIENT POLYURIA.

1. After drinking abundance of water or other fluid.
2. After drinking fluids containing diuretic principles, such as alcohol (beer, gin, whisky, hock); caffeine (tea, cocoa, coffee); citrates or tartrates (artificial lemonades).
3. As the result of nervousness, or of nervous attacks, such as:—
 - (a) Medical examination for life assurance
 - (b) Preparation for some physical or mental competition
 - (c) Hysteria, especially during recovery from an acute outburst
 - (d) Neurasthenia
 - (e) After an epileptic attack
 - (f) After migraine
 - (g) After an asthmatic attack
 - (h) After an attack of angina pectoris
 - (i) Periodic polyuria, apparently without cause.
4. Hydronephrosis, with periodic emptying of the renal sac, especially with movable kidney or with renal calculus.
5. The cold stage of a malarial attack.

6. In some cases of convalescence from a febrile illness, such as enterica or pneumonia.
7. As the result of the clearing up of extreme œdema or serous effusions,—for instance, during recovery from acute nephritis; mitral stenosis, with heart failure; cirrhosis of the liver, and so on; especially if the fluid clears up quickly after giving diuretic remedies, such as blue pill, digitalis, calomel, copaiba resin, potassium salts, uva ursi, broom tops, or dwarf elder.

When the cause lies in Group I its nature is generally obvious, though it is essential to examine the urine carefully for sugar, albumin, and renal tube-casts, for purposes of exclusion. Nevertheless, the diagnosis may be in doubt until the course of the symptom has been watched for a while. For instance, polyuria may seem to be due to profuse drinking, when really the kidneys are granular and contracted; or in a life insurance case, nervousness may seem to be the cause, when there has really been a bout of drinking; or, again, the drinking may be secondary to the extreme thirst produced by diabetes insipidus.

Excessive Drinking.—When due to drinking water, tea, wine, spirits, or artificial lemonades, the polyuria ceases when the drink in question is limited or avoided.

Nervousness.—The history and circumstances of the case, together with the absence of signs of gross disease of heart or kidneys, will be the main factors in deciding whether the polyuria is caused by excitement, nervousness, hysteria, or neurasthenia.

Epilepsy.—The character of the convulsive seizures, their recurrence at intervals, and the influence of bromides upon them, will serve to diagnose epilepsy, for polyuria in association with the latter nearly always follows immediately after an attack of grand mal. It may, however, be associated with petit mal, or even be the chief phenomenon in some cases of epilepsy.

Migraine.—The diagnosis of migraine depends on the history of the case and the absence of optic neuritis and other evidence of gross intracranial disease.

Asthma.—Asthma is sometimes easy to diagnose, sometimes very difficult; it may be mistaken for recurrent bronchitis, cardiac dyspnoea, renal dyspnoea or uræmic "asthma," mediastinal new growth, thoracic aneurysm, thymic "asthma," laryngeal papilloma or fibroma, foreign body in the air-passages, syphilitic stenosis of a bronchus, goitre, or hysteria. It so frequently develops into emphysema and bronchitis that one is apt to forget that the essential symptom of asthma is dyspnoea, and not cough. To diagnose a difficult case it may be necessary to examine the chest with the *x*-rays to exclude aneurysm and new growth; to examine the larynx and vocal cords, the heart, the retinae, and the urine; to exclude renal and cardiac mischief; and even then, doubt may remain unless there is a clear and typical account of the nature of the earlier attacks in a patient who has had recurrences for years, and who is relieved by cocaine sprays to the nose, by ethereal tincture of lobelia, by inhalations of stramonium fumes, or by other anti-asthmatic remedies; it may sometimes be of assistance to know that EOSINOPHILIA (*q.v.*) is more likely to be found during an attack of asthma than as the result of any of the other conditions that may simulate it. The polyuria occurs in by no means every case; when it does so, it generally follows immediately after an attack, and this applies also in cases of *angina pectoris*, the diagnosis of which is not difficult when the acute attacks of precordial pain radiate upwards and outwards to the left shoulder and down the left arm, and when there is evidence of an aortic lesion, or of atheroma, and arteriosclerosis with high blood-pressure.

Periodic Polyuria, apparently without cause, is a condition which is regarded by some as a clinical entity; the diagnosis must always be difficult to be sure of,

however, and the more carefully a cause is looked for, the fewer will be the cases remaining in this category; it will be found that some are due to epilepsy; others to secret drinking; others to granular kidney; others to hydronephrosis, and so on.

Hydronephrosis, with periodic emptying of the renal sac, is the chief cause of typically periodic polyuria. The diagnosis is arrived at by having the urine carefully measured each day, and by carefully palpating the loins bimanually for evidence of renal enlargement. When a kidney swelling can be detected, and when this increases in size at the same time that less urine is being passed, whilst it materially decreases on the days when the polyuria occurs, the diagnosis of hydronephrosis or pyonephrosis is clear; and the distinction between the two depends on whether there is or is not pyuria. The commonest causes for hydronephrosis are movable kidney and renal calculus; and the x -rays often serve to distinguish the latter from the former. It should be noted that the bowels should have been well emptied shortly before the x -rays are used in examining kidney for stone, for otherwise the dark and light areas due to alternating fæces and gas in the bowel render it impossible to be sure about the shadow cast by a calculus.

Fevers.—The polyuria that occurs during the cold stage of a malarial attack is speedily replaced by the opposite condition when the hot stage is reached; the diagnosis is afforded by the circumstances of the case, such as residence in a malarial district and previous attacks of the malady; by the discovery of malarial parasites in blood-films; by the absence of leucocytosis, the relative increase in the large lymphocytes in the differential leucocyte count, and by the beneficial effects of quinine upon the disease. Polyuria during convalescence from other fevers, such as enterica or pneumonia, is not uncommon; it is a phenomenon that may attract some attention at the time, but it seldom gives rise to difficulty in diagnosis.

Œdema and Diuretics.—The considerable polyuria that often results in renal or cardiac cases when œdema is clearing up under treatment is noteworthy, but the diagnosis is not, as a rule, difficult. If the polyuria is due merely to the excretion of accumulated fluid, it will cease when there is no longer any œdema; whilst if it is due to granular kidney, or other underlying malady, it will continue even after the œdema has gone.

II.—CAUSES OF CONTINUED POLYURIA.

1. Diabetes mellitus.
2. Red granular contracted kidneys.
3. Arteriosclerosis.
4. Pale granular contracted kidneys.
5. Lardaceous or amyloid kidneys.
6. Cystic kidneys.
7. Diabetes insipidus :
 - (a) Due to no gross nervous lesion
 - (b) Due to tumour or injury of the medulla oblongata
8. Incurable drinking of beer or spirits.
9. Phosphatic diabetes.
10. Azotic diabetes.
11. Some cases of acromegaly.
12. Some cases of myxœdema.

Diabetes Mellitus.—A very important step in the diagnosis is to examine the urine carefully. If sugar is present, a diagnosis of diabetes mellitus will be made, especially if diacetic acid and acetone are also present, and the specific gravity

is between 1035 and 1045. Some authorities distinguish in kind as well as in degree between what they term true diabetes mellitus on the one hand, and alimentary glycosuria on the other, though others hold that these differ only in degree; it is chiefly in severe diabetes of young people that polyuria is marked, something between 100 and 600 ounces of urine being passed per diem; in elderly people with glycosuria the polyuria is often slight; in these cases the specific gravity need not be above the normal, and diacetic acid and acetone are generally absent. If no sugar is present upon one occasion it may be on another, so that several examinations may be required.

Albuminuria.—If sugar is persistently absent, diabetes mellitus can be excluded, and special attention should be devoted to testing for albumin. If this is present, and the polyuria cannot at once be attributed to anything so obvious as the clearing up of oedema or the administration of a diuretic, the next thing is to make a very careful microscopic examination of the centrifugized deposit for renal tube casts; if the latter are absent, and if the patient is a young adult male, who seems to be in good health, whose heart and other organs present no abnormal physical signs, and whose polyuria troubles him chiefly at times of excitement, for instance when he is in for an examination, the diagnosis is very likely to be that of "functional" or "physiological" albuminuria, in which case repeated tests will show that the urine is often quite free from albumin, especially the first thing in the morning, and the blood-pressure would not be raised. If, on the other hand, more than an occasional renal tube-cast was found, and the albumin and polyuria were persistent, the diagnosis of one or other of the following renal lesions would suggest itself: red granular contracted kidney, arteriosclerosis, pale granular contracted kidney, lardaceous kidney, or cystic kidney. The differential diagnosis between these is discussed under ALBUMINURIA (*q.v.*).

Diabetes Insipidus.—If neither albumin nor sugar is found, even on repeated testing, and if the polyuria is extreme and persistent, whilst the specific gravity of the urine is constantly low (1004 to 1008), a diagnosis of diabetes insipidus will suggest itself, and it will probably be correct. Before this diagnosis is finally made, however, precautions must be taken to determine that the patient's thirst and polyuria are not due to habits of drinking to excess: it may be difficult to decide this in cases in which alcoholic beverages are consumed; but when the patient is a water-drinker, and yet cannot do with less than 8 or 10 pints a day, the drinking is probably a necessity, and not a habit; and diabetes insipidus is the probable diagnosis. In cases of doubt, the difficulty can be decided by restricting the intake of fluid and determining the specific gravity of the blood. This should be about 1056, and in a case where polyuria is due to drinking habits, restriction of fluids will not materially alter it; in a case of diabetes insipidus with restricted intake of fluids, however, the drain of the latter from the blood still goes on, and the specific gravity rises to 1060, or 1065, unless the patient is allowed fluid by the mouth again.

Phosphatic and Azotic Diabetes.—Another point that needs investigation in a case suspected to be diabetes insipidus, is the amount of solids excreted daily in the urine. In ordinary diabetes insipidus the total solids are normal, the only increase being in the water. There are rare cases in which, in addition to polyuria, there is a great increase in the total solids in the urine also—so-called *baruria*. Rare though these cases are, they have been divided into two types, namely, those in which the inorganic salts are most increased—phosphatic diabetes (*p. 572*), and those in which the nitrogenous constituents are mainly augmented—azotic diabetes. The diagnosis here depends mainly on quantitative estimation of the various urinary substances.

There are two groups of diabetes insipidus, according as there is, or is not, a

gross lesion of the central nervous system. If the malady follows on a fractured base of the skull, or if there are vomiting, headache, optic neuritis, or other symptoms of cerebral tumour, there is probably a gross lesion of the base of the brain in or near the medulla oblongata—thrombosis, softening, hæmorrhage, small aneurysm, gumma, glioma, or other neoplasm. In other cases, the complaint arises after a fright or shock, or even without any apparent cause, and there seems to be no gross lesion to account for it. It may be a familiar disease.

Acromegaly and **Myxœdema**.—It only remains to add that symptoms not unlike those of diabetes insipidus have sometimes arisen in cases of acromegaly and in myxœdema. There is probably a nervous factor in both cases, coupled in myxœdema with dryness of the skin, and consequent deficiency in perspiration; whilst in acromegaly there is the tumour-like enlargement of the pituitary body which may cause polyuria like any other lesion near the medulla oblongata. The diagnosis of acromegaly may be confirmed by the x -rays, which will show the great enlargement of the bones of the hands, feet, and head; whilst in myxœdema, if the general symptoms, the pseudo-œdema of the legs, the acquired dullness of intellect, the increasing weight, and the broadening of the features, the fingers, and the hands, do not at once indicate the nature of the complaint, the beneficial effects of treatment by thyroid extract may serve to clinch the diagnosis.

Herbert French.

PRECORDIAL PAIN.—(See PAIN IN THE CHEST.)

PRIAPISM signifies erection of the penis, continual, of troublesome degree, and not necessarily accompanied by sexual desire. Though generally spoken of in connection with the male sex, a precisely similar affection may occur in the female clitoris. The symptom is not often by itself of diagnostic importance, though it may be due to a considerable number of different causes. Most of the latter need be little more than enumerated, for if they are borne in mind they will nearly always lead to a speedy diagnosis. Two in particular merit special mention, however. The first of these is priapism in elderly men. The marriage of old men with relatively young wives is often spoken of as foolish, and doubtless in most instances this adjective is deserved; but in the case of some old men who are widowers or unmarried, it becomes a matter of physical necessity for the relief of priapism which is most troublesome, and which yet cannot be called pathological. In some such cases there may be enlargement of the prostate, or local inflammation such as gouty urethritis, but in many other cases the priapism seems to occur, without pathological cause, as a sort of final outburst of sexual energy before the onset of senile impotence.

The other special condition under which priapism may be exceedingly troublesome is after injury to the upper dorsal region of the spinal cord. The damage may be so serious as to have produced a fracture dislocation of the spine with paraplegia, in which case the diagnosis will be obvious; short of this, however, there may have been only a minor degree of injury, with contusion and perhaps multiple small hæmorrhages into the substance of the cord, in association with which priapism may in some instances be very pronounced and last for weeks or months before recovery occurs.

For the rest, the causes of priapism may be summarized briefly according to age periods, the chief being:—

Priapism in infancy:—

Phimosis

Oxaluria

Worms, especially oxyuris vermicularis

Balanitis

Posthitis

Calculus, urethral or vesical

Certain conditions of mental deficiency.

Priapism at puberty:—

The changes in the genital organs associated with the onset of puberty.

Priapism in young adult life:—

Sleeping on the back	Fracture of the dorsal spine
Non-emptying of the bladder when full	Transverse myelitis of the upper dorsal region
Ill-fitting trousers	Spinal meningitis
Sexual excitement	Certain aphrodisiac drugs:—
Gonorrhœa	Cantharides
Epilepsy	Turpentine
After circumcision	Alcohol, especially port wine in some persons, champagne in others
Masturbation	Strychnine
Convalescence from an acute disease	Cannabis indica
Tetanus	Camphor
Hydrophobia	Phosphorus
Leukæmia	Damiana.

Priapism in older men:—

The male menopause	
Local irritation as the result of:—	
Gouty urethritis	Hæmorrhoids
Enlarged prostate	A loaded rectum.
Hæmorrhage into the middle lobe of the cerebellum	
Lesions of the pons varolii.	

Very seldom indeed will priapism be the only symptom in the case; the diagnosis will be made from the history and from the other symptoms.

Herbert French.

PROLAPSE OF THE UTERUS.—As a matter of practical fact, the uterus only descends as a result of a much wider displacement of all the movable structures which go to make up the pelvic floor. This is composed of a movable or pubic portion, and a fixed or sacral portion, and it is descent of the pubic portion which produces the actual lesion known as prolapse of the uterus. In other words, the uterus only descends because it is a part of the pubic portion of the pelvic floor. Modern anatomical research has shown that the uterus, bladder, and anterior vaginal wall are normally kept in position chiefly by the connective tissue sheaths which accompany the blood-vessels supplying them, and that it is injury and stretching of this connective tissue which allows of descent of the organs named. There is no doubt, however, that injuries to the fixed portion of the pelvic floor, the perineal body, and levatores ani muscles and their fasciæ, will contribute something to the facility with which the structures mentioned may descend. In practice, therefore, prolapse of the uterus and descent of the pelvic floor lead to the appearance of a swelling at the vaginal orifice. There are other swellings which come down the vagina and appear at the vulva, and from them, therefore, prolapse of the uterus has to be diagnosed. These swellings are: (1) *Hypertrophic elongation of the cervix uteri*; (2) *A tumour protruding from the vagina*; (3) *Inversion of the uterus*; (4) *Cystocele and rectocele*; (5) *Extroversion of the bladder through an injury in its floor*.

1. **Hypertrophy of the Cervix.**—The hypertrophy may be of the vaginal, the intermediate, or the supravaginal portion. The first is always congenital, and consists of elongation of the portio vaginalis. It may protrude from the vaginal entrance, but the vaginal fornices will be found unaltered at their usual level, and the sound will pass an increased distance proportionate to the length of the

portio. The os uteri forms the apex of the protrusion. The fundus remains at its usual level. In hypertrophy of the intermediate portion, the anterior fornix of the vagina is carried downwards with the cervix, and may be obliterated, whilst the posterior fornix remains at its usual level, because the elongated portion lies between the insertion levels of the anterior and posterior vaginal walls. The sound passes an increased distance, and the os uteri forms the apex of the protrusion. The fundus remains at its usual level. In hypertrophy of the supravaginal portion, *both* fornices are carried down with the cervix, and both may be obliterated. The bladder is displaced downwards, but the rectum does not descend. The fundus uteri will be found on bimanual examination to be at its usual level, whilst in true prolapse, the fundus uteri descends as a whole with the rest of the uterus. It is common for some prolapse of the uterus as a whole to accompany elongation of the cervix, and this can only be appreciated by a careful bimanual examination.

2. **A Tumour** protruding into or from the vagina is most commonly a *fibromyoma of the uterus*. It may be either a pedunculated growth from the cervix, or a pedunculated growth protruding through the cervix, in either case hanging free in the vagina. It may grow from the cervix in the connective tissue in front, between the uterus, bladder, and anterior vaginal wall; or behind, between the uterus, rectum, and posterior vaginal wall. In either case the vaginal wall is stretched over the growth. In such cases the uterus will be felt high up, the growth hanging from or protruding through the cervix in the case of pedunculated growths. In the latter the hard ring of the cervix is felt encircling the pedicle. In the case of sessile interstitial growths, the cervix is high up in front or behind the growth, as the case may be, and if the tumour is a large one, may be out of reach altogether. In any case there is no descent of the uterus, and it may even be higher than usual. The growth may be a *fibroid growing from the vaginal wall*, a *mucous polypus of the cervix*, or a *malignant growth*.

3. **Inversion of the Uterus** may be chronic, or may be encountered immediately after labour as an acute condition which could hardly be mistaken for anything else, except perhaps extrusion of a fibroid immediately after delivery. In the latter case the tumour protrudes through the cervix, whilst the whole uterus can be felt above it bimanually, whereas in inversion the uterus turns inside-out, partially or completely, a cup-shaped depression is felt above instead of the rounded fundus, and a finger or the sound will only pass a short way by the side of the mass, or not at all if inversion is complete. Both conditions may be accompanied by hæmorrhage, but that with inversion may be exceedingly severe. Acute inversion is always accompanied by great shock, whilst extrusion of a fibroid is not.

Chronic inversion is more likely to be mistaken for prolapse or a polypoid fibromyoma. It is distinguished from prolapse in that the uterus does not necessarily descend as a whole, the cervical ring is felt high up in its usual position, and the sound will only pass a short distance all round the protruding mass, according to the degree to which the uterus is inverted. A cup-shaped depression, instead of the rounded fundus, is felt in the vaginal vault by a hand on the abdominal wall.

4. **Cystocele and Rectocele** more often accompany prolapse of the uterus, but may occur independently of it. They are essentially bulgings of the anterior or posterior vaginal walls towards or through the vaginal entrance, the bladder or rectum being attached, and following them of necessity. A sound passed into the bladder, or a finger in the rectum, will directly enter the bulging vaginal wall, whilst the uterus will be felt bimanually above in its normal position.

5. **Extroversion of the Bladder** can occur either through a congenital defect in its wall, or through an injury to its basal portion. For instance, in removing a

growth from the vaginal wall, a gap may be left in the bladder through which extroversion may occur. The mucous membrane will be exposed in the vagina, and on it will be seen the two orifices of the ureters, with urine issuing by intermittent jets. The uterus in such a case may have its normal position.

Thos. G. Stevens.

PROPTOSIS.—(See EXOPHTHALMOS.)

PRURITUS.—Itching may be a substantive affection, associated with no visible lesions of the skin, save those due to scratching, or a subjective symptom of a large number of cutaneous diseases. It is to the former condition that the word "pruritus" should be restricted; but in this article the subject of itching generally will be dealt with. In both senses of the term, the idiopathic and the symptomatic, hyperæsthesia appears to be the most important predisposing cause. The diseases of which itching is a symptom may be either neuroses, such as hysteria, hypochondriasis, and other affections of the nervous centres, or general nutritive disorders affecting the nervous system secondarily, such as arthritism and diabetes mellitus; or the irritation may be set up by the attacks of parasites, or by definite skin lesions. Itching varies in character: it may be interpreted by the patient as a tingling, or pricking, or as a formication—a feeling as of insects crawling on the skin. It varies also in degree, from a mild sensation which is welcome to the patient from the pleasure he finds in scratching, to an irritation so severe and persistent as to endanger his life from sleeplessness, or his reason from the nervous irritability which it sets up. The affections in which itching is slight are seborrhœa, erythema, pityriasis rubra pilaris, and pemphigus; it is more severe, in varying degrees, in eczema, prurigo, some cases of psoriasis, dermatitis herpetiformis and dermatitis gestationis, lichen planus, lichenization, and lichen urticatus, in pityriasis rubra, mycosis fungoides, and sometimes in pityriasis rosea, cheiropompholyx and chilblain, prickly heat, tinea marginata, urticaria, scabies, the various kinds of pediculosis, mosquito- and bug-bites, and jellyfish and other stings. Even in the affections in which it is usually severe, it varies much in degree in different cases. Itching seldom has any distinct diagnostic value, but in cases in which the cutaneous lesions may admit of more than one interpretation, its presence or absence may suffice to turn the balance.

Pruritus proper is an affection of which the diagnosis is as easy as the etiology is involved. It may be general or local. Of general pruritus there are four varieties—pruritus universalis, pruritus hiemalis, pruritus senilis, and bath pruritus. The local varieties affect chiefly the anus, the vulva, and the scrotum, but the nares, the palms of the hands, and the soles of the feet may be the seat of the irritation. One of the most curious forms of pruritus is that which is associated with bathing. According to Stelwagon, who has made it a subject of special study, it most commonly affects the legs from the hips downwards; but the forearms also may be involved, and it may have even wider range. It is an affection of adolescence and adult life, and is more frequent in males than in females.

If no lesions of the skin are present save those which can be accounted for, directly or indirectly, by the scratching, the diagnosis of pruritus "imposes itself." Care must, however, be taken to exclude all possible sources of parasitic irritation; and it must always be remembered that lice and acari sometimes find harbourage in the most unexpected quarters. If the scratches are on the shoulders, or in the genital region, the presence of lice must be suspected; if on the wrists and between the fingers the burrows of the *Acarus scabiei* must be sought for. Only when careful investigation fails to reveal any local source of irritation should the case be diagnosed as one of pruritus.

Malcolm Morris

PTOSIS is the term applied to drooping of the upper eyelid with inability to raise it to the full extent (*Figs. 156 and 157; 158 and 159*); it must not be

PARALYSIS OF THE LEFT THIRD NERVE.

Fig. 156.—The patient's face at rest; there is complete ptosis from paralysis of the left levator palpebræ superioris. Note the scar of the healed gumma on the left cheek near the left angle of the nose.

Fig. 157.—The patient is trying to look to his right; the left eyelid is being held up to show that the left eye is unable to look to the right owing to paralysis of the left internal rectus muscle.

LEFT-SIDED NUCLEAR AND INFRANUCLEAR 7TH NERVE PARALYSIS AND COMPLETE PTOSIS FROM PARALYSIS OF THE LEFT 3RD NERVE; THE RESULT OF CEREBRAL SYPHILIS.

Fig. 158.—At rest.

Fig. 159.—When voluntary effort was made to show the teeth and close the eyes.

confused with the inequality of the palpebral apertures sometimes observed in people accustomed to screw up one eye.

It is usually caused by *paralysis of the third nerve*, in which case it may also be associated with paralysis of other ocular muscles, either external or internal (*Fig. 157*). Sometimes it is accompanied by paralysis of other motor cranial nerves, the 7th for instance (*Figs. 158 and 159*), in which case the multiple cranial nerve paralyses immediately suggest a syphilitic cause, which may be verified in many cases by means of Wassermann's serum reaction.

In *paralysis of the cervical sympathetic*, slight ptosis may be associated with diminution in the size of the pupil on the affected side, and retraction of the eyeball or enophthalmos. It may also occur in *myasthenia gravis*.

Ptosis of the lids, associated with much œdema and infiltration of the lids, is also found in all *inflammatory affections* of the conjunctiva, and is a very constant symptom in *trachoma*.

Congenital ptosis is usually bilateral, and associated with smoothness of the upper lids and absence of all the usual cutaneous folds. The levator palpebræ is absent or ill-developed, and efforts to open the eye are made by the occipito-frontalis muscle.

Herbert L. Eason.

PTYALISM.—Ptyalism is the term generally employed to denote excessive secretion of saliva. It is not easy, however, to determine in every case whether there is really any excess, or whether the patient is not merely allowing the normal saliva to dribble from the corners of the mouth. It is difficult to draw an absolute distinction, therefore, between dribbling of saliva and ptyalism, though in practice the nature of the case may be obvious enough. One has but to consider the various conditions under which trouble with the saliva may arise, to see how in some cases the difficulty is solely one of swallowing the normal secretion, as in bulbar paralysis and in babies; how in others there are both excess of secretion and difficulty in swallowing it, as in mercurial stomatitis; and how in others, again, there is too much secretion but no difficulty in swallowing it, as in functional or hysterical cases of ptyalorrhœa.

When a case is being investigated, the first step in arriving at the diagnosis of the cause is to inquire carefully as to the nature of any *medicine* or *drug* that the patient may be taking orally or applying externally, especially:—

Mercury	Arsenic
Pilocarpine	Antimony
Jaborandi	Aconite
Iodide	Chlorate of potash
Bromide	Cantharides
Phosphorus	Copper salts.

Mercury is the most important of these; its effects are most serious when the mouth is not kept scrupulously clean, particularly when there is also nephritis, as is not uncommon in severe secondary syphilis.

If the salivation is not due to any drug, it may be the result of one of the many forms of *general stomatitis*:—

Apthous	Tuberculous
Dyspeptic	Due to sprue
Septic	„ scurvy
Suppurative	„ pyorrhœa alveolaris
Ulcerous	„ necrosis of the jaw
Malignant	„ angina Ludovici
Variolous	„ cancrum oris
Diphtheritic	„ pernicious anæmia
Syphilitic	„ hæmophilia.

The exact nature of a severe stomatitis in any given case will be diagnosed by making a careful local examination, ocular and digital, assisted by the history and, if need be, by bacteriological examination of swabbings from the mouth, by Wassermann's serum reaction for syphilis, or by microscopical examination of a fragment of the affected tissues. Tuberculous stomatitis is one of the rarest forms, but when it occurs it is very severe; it may be primary, but more often it is associated with obvious and rapidly progressive phthisis.

If drugs and general stomatitis can be excluded, local examination may still serve to detect a local cause acting by reflex irritation of the fifth nerve, especially :—

A jagged carious tooth	A ranula
A rough filling	A gumboil
A stump left beneath a tooth-plate	A myeloid sarcoma of the jaw
A broken or ill-fitting tooth-plate	An epulis
A foreign body, such as a fishbone, impacted in the gum	A salivary calculus
Neuralgia of the fifth nerve	An eschar left by some recent irritant or corrosive substance, or injury.

If careful examination serves to exclude all these, the salivation, apparent rather than real, may be found to result from *mechanical difficulties in swallowing*, the effect of such lesions as :—

Mumps	Fixation of the jaw, as by osteo-
Acute tonsillitis	arthritis of the temporo-maxillary
Quinsy	joint
Fracture of the jaw	Painful affections of the larynx, phar-
Dislocation of the jaw	ynx or œsophagus.

In the absence of any obvious structural lesion locally, it may yet be clear that inability to swallow, owing to paralysis of some kind, is the cause of the apparent salivation, for instance in cases of :—

Bulbar paralysis	Hypoglossal nerve paralysis
Pseudo-bulbar paralysis	Diphtheritic paralysis
Bilateral facial paralysis	Paralysis agitans
Myasthenia gravis	Hydrophobia.

The differential diagnosis of these conditions is discussed elsewhere, and of them all it is only in bulbar and pseudo-bulbar paralysis that the dribbling of much saliva is a prominent symptom. The sequence of events that is summarized by the term labio-glosso-pharyngo-laryngeal paralysis is sufficiently characteristic as a rule; pseudo-bulbar paralysis, being of cortical instead of medullary origin, has not the wasting of the tongue that is prominent in the latter.

The salivation that results from *gastric* or *hepatic reflexes* is almost physiological, though sometimes it reaches a pathological degree in certain cases of :—

Dilatation of the stomach	Gastric carcinoma
Gastric ulceration	Biliousness
Duodenal ulcer	Hepatic disorder
Acute dyspepsia	Pancreatitis.
Acute gastritis	

Mere slovenliness and lack of proper cerebral control are responsible for the slobbering and salivation of :—

Idiots	Dements
Imbeciles	and other mental cases.

Finally, there is sometimes a very remarkable degree of salivation that can be attributed to nothing but functional disorder—*ptyalorrhœa*. It can scarcely be called hysterical, because it may occur in men as well as in women, generally in later life rather than at a time when hysteria is commonest. The condition is a sort of salivary neurosis, which may come on suddenly and without obvious cause, or as the result of some worry, shock, or mental emotion. It may possibly be a functional affection of the 5th nerve analogous to the far more distressing tic douloureux. It is sometimes a very prominent symptom amongst the neuroses that are apt to accompany pregnancy. It can only be diagnosed when a careful examination has served to exclude any likelihood of organic disease, when the history is suggestive, and when the excessive salivation ceases after a time almost as suddenly as it began. In many such cases, notwithstanding the diagnosis being "functional," it will be found that there is a high systolic blood-pressure, with other signs of arteriosclerosis, suggesting that there are errors in the circulation which may involve the vasomotor and other brain centres, and thus produce the symptom.

Herbert French.

PULSATING TUMOURS.—(See SWELLING, PULSATILE.)

PULSATION, UNDUE ABDOMINAL AORTIC.—Excessive pulsation of the abdominal aorta may occur in cases of aortic regurgitation, when all the arteries throughout the body may pulsate with undue violence. Apart from aortic regurgitation, however, it is nearly always an entirely functional disorder of the aorta. It occurs much more frequently in women than in men, the patients generally being unmarried or childless, between 20 and 40 years of age. They complain of pain in the abdomen, especially in the epigastrium; a feeling of discomfort and distress; a sensation of pulsation and throbbing over the abdominal aorta; nausea, retching, sickness, and constipation; they are usually thin, anæmic, extremely nervous, often hysterical, and sometimes decidedly hypochondriacal. There may be nothing else the matter with them at all, or they may be suffering from some other complaint of which much nervousness is a feature, exophthalmic goitre for example. The condition is not infrequently associated with movable kidney and enteroptosis; in many patients the symptoms may suggest some organic disease, such as gastric ulcer, appendicitis, or ovaritis, without any of these being present.

On palpation of the abdomen the pulsation may be found to be forcible; but the normal cylindrical outline of the aorta can generally be felt to be quite free from any saccular bulging or fusiform dilatation; there is no thrill over it; on applying a stethoscope lightly to the pulsating region, no murmur will be audible; but firm pressure of the stethoscope, sufficient to compress the aorta slightly, will bring out a systolic bruit. The heart, lungs, and urine are usually normal. The knee-jerks are apt to be much exaggerated, though the plantar reflexes remain flexor, and there is no ankle-clonus. The chief importance of the condition clinically is that it is apt to be mistaken for an aneurysm of the abdominal aorta. Abdominal aneurysm is so extremely rare in women, however, that it should never be diagnosed unless the pulsation can be made out to be definitely expansile, or unless, in addition to pulsation, a definite tumour can be felt attached to the aorta.

Herbert French.

PULSE, UNDULY RAPID.—(See TACHYCARDIA.)

PULSE, UNDULY SLOW.—(See BRADYCARDIA.)

PULSES, UNEQUAL.—Inequality of the pulses may be a perfectly natural phenomenon; one frequently finds that the radial arteries of the two sides are not of the same calibre, owing to variable degrees of collateral circulation by

an enlarged comes *nervi mediani*. Inequality of the pulses is a much more important sign when known to have developed in a patient whose pulses were formerly normal. In such a case the cause is probably one of the following :—

Thoracic aneurysm	Embolism
Mediastinal new growth	Atheroma.
Accessory cervical rib	

Of these, by far the most common in the present connection is *thoracic aneurysm*, and even this is distinctly rare, for it is only in a small minority of aneurysm cases that the pulses are unequal. It is true that when very careful simultaneous records are made from the two radial pulses, slight differences in size and definite differences in time can be detected, the one being delayed behind the other; but in clinical medicine such minute methods of investigation are seldom applicable, and it is only in a very small proportion even of these cases that the diagnosis cannot be arrived at in other ways.

Definite inequality of the pulses, or definite delay of one behind the other, as gauged by simultaneous palpation of the two radial pulses, is distinctly uncommon, but when it does occur it is highly suggestive of thoracic aneurysm: if the latter involves the origin of the innominate artery, the right pulse will be smaller than the left; whereas if the aneurysm affects that part of the arch from which the left subclavian artery is derived, the left radial pulse will be smaller than and delayed behind the right. Similar delay or inequality might be produced by *new growth* compressing either the innominate artery on the right side or the subclavian artery on either side; but this is rare.

An *accessory cervical rib* might stenose the subclavian artery, but the condition is generally bilateral, so that it rarely produces inequality of the radial pulses; its symptoms are more likely to be those of interference with the lower part of the brachial plexus, with consequent pain, paræsthesia or paresis corresponding with the nerves distributed upon the ulnar aspect of the arms and hands.

Embolism of one or other radial artery will rather obliterate it altogether than cause it to be less in size than that of the other side. It will almost always be due to fungating endocarditis, of which there will be other evidence in the form of cardiac bruits, pyrexia, progressive anæmia, enlargement of the spleen, hæmorrhages, and evidence of multiple emboli.

Atheroma of the brachial or subclavian artery on one side might cause the corresponding radial pulse to be less than that on the other; but this very rarely happens, and in such a case it would be more probable that atheroma of the aorta with an aneurysmal dilatation would be diagnosed than atheroma restricted to the vessels in the upper arm, unless the *x-rays* exhibited no trace of aneurysmal opacity in the thorax.

Herbert French.

PUPIL, ABNORMALITIES OF THE.—Abnormalities of the pupil may be classified into:—I. *Irregularities in shape*; II. *Irregularities in size*.

I. Irregularities in Shape.—The normal pupil is circular or slightly oval. Its outline may become irregular owing to an adhesion between the iris and the lens, the result of *old iritis*. These adhesions are most evident when the pupil is dilated. A similar irregularity sometimes occurs with the *persistence of a pupillary membrane*—a congenital affection. The adhesions due to this cause may be distinguished from inflammatory adhesions by the fact that they arise from the anterior surface of the iris at a slight distance from the pupil, and not from the posterior surface and the extreme edge.

The pupil may also become irregular in shape as the result of *injuries*, such as rupture of the sphincter, and tearing of the root of the iris from its ciliary

adhesion (iridodialysis); of dislocation of the lens; or of partial adherence to an old perforated corneal ulcer.

II. Irregularities in Movement and Size.—Before considering the irregularities in the movements and size of the pupil, it is desirable to remember that its normal size varies during life. In extreme infancy it is small. It becomes larger during young adult and middle life, and ultimately becomes small again in old age. It is also, as a general rule, small in hypermetropic, and large in myopic eyes.

There are also four normal pupillary reflexes; (i) The light reflex; (ii) The reflex to accommodation; (iii) The reflex to sensory stimulation; (iv) Psychic reflexes. The reflexes to light and to accommodation are both constrictive, the constriction in accommodation being more in the nature of an associated muscular action. The sensory and psychic reflexes are both dilatations, the dilatation being caused by either sudden sensory stimuli or some sudden emotion, such as fright or terror.

The pathological variations in the pupil are best classified after Uhthoff as follows:—

1. *Loss of the Pupillary Light Reflex*, either with or without constriction of the pupil, constitutes the Argyll Robertson pupil. The pupil is constricted in nearly all tabetic cases, and the affection is most commonly bilateral. It never occurs in healthy individuals, but has been observed most frequently in locomotor ataxia, to an extent varying according to different observers from 70 to 90 per cent of all the cases. The condition is usually permanent. It also occurs in general paralysis of the insane.

2. *Loss of Convergent Accommodation Reflex and Retention of the Light Reflex.*—This condition is extremely rare, but has been observed in syphilis, basal meningitis, myelitis, and tumour of the corpora quadrigemina.

3. *Loss of the Convergence Pupillary Reflex* may be unilateral or bilateral. It occurs, rarely, in locomotor ataxia, and after some cases of diphtheria and alcoholic intoxication.

4. *Loss of all Reflex Movements of the Pupil.*—In this condition there is paralysis of the sphincter of the pupil and of the ciliary muscle, the extrinsic muscles of the eye being unaffected. The site of the lesion must, doubtless, be nuclear, and it is most frequently unilateral, though occasionally bilateral. Syphilis is the most frequent cause. It may also occur after diphtheria, and injury, or in some intracranial diseases.

5. In the condition in which there is a lesion of the optic tract on one side, between the chiasma and the globe, there will be, as a result, a loss of direct light reflex in that eye, and of the consensual light reflex in the opposite eye (see HEMIANOPSIA).

6. *Loss of Sensory or Psychic Reflex* occurs in lesions of the dilatator pupillary tract, such as paralysis of the cervical sympathetic; in which condition it is associated with slight ptosis of the upper lid, enophthalmos, and diminished tension of the globe.

7. *Abnormal Constriction of a Pupil, with Retention of the Light and Convergent Reflexes*, may occur from abnormal stimuli of the sphincter, or paralysis of the dilatator pupillæ as the result of acute encephalitis, intracranial abscess or growth, in which the lesion irritates but does not destroy the centre for convergence. In all cases of brain disease the constriction is ultimately replaced by dilatation.

8. *Abnormal Dilatation of the Pupil, with Retention of the Light and Convergent Reflexes*, is met with in cases of stimulation of the cervical sympathetic. It may also be observed in certain mental states, such as epilepsy, acute mania, or catalepsy

9. *Inequality in the size of the Pupils* is observed frequently, and may have no pathological significance; but pronounced difference in the size of the pupils is nearly always symptomatic of some organic lesion. In cases where the abnormal pupil is the smaller, the condition is usually due to hyperæmia of the iris, such as occurs in iritis; paralysis of the cervical sympathetic; or the use of a myotic drug such as physostigmine. In cases where the abnormal pupil is the larger, the dilatation is usually due to stimulation of the sympathetic, the use of a mydriatic, paralysis of the fibres of the third nerve, or increased ocular tension, such as may occur in glaucoma.

In cases of inequality of the pupils one may suspect tabes, general paralysis of the insane, a unilateral lesion of the third nerve or cervical sympathetic, trigeminal neuralgia, carotid or aortic aneurysm, a unilateral intracranial lesion, or glaucoma.

10. Irregularities in the shape of the pupils other than those mentioned above may occur in tabes and various cases of insanity. There is no marked or sharp irregularity, it only being noticed that the pupil is not circular owing to paralysis of certain fibres of the iris.

11. *Hippus*.—This term is applied to a condition in which, when both eyes are shaded, and then illuminated, the pupils will alternately dilate and contract. It is sometimes associated with nystagmus, and occurs also in disseminated sclerosis, and in some cases of brain tumour. It is observed most frequently when there is a central scotoma in the field of vision, with some injury to the macular or axial fibres of the optic nerve. It is also common in alcoholic subjects.

12. *Paradoxical Pupillary Reflex*: pupils dilating under the stimulus of light. This condition is extremely rare, and has only been observed in patients affected with grave lesions of the central nervous system, usually locomotor ataxy.

13. *Hemianopic Pupillary Reflex*: lesions of the brain situated in the optic tract above the corpora quadrigemina may give rise to partial loss of vision, but will not affect the pupil-reflex arc. For example, a lesion in the right occipital cortex may give rise to a left homonymous hemianopsia, but the pupil will react even when a light is thrown on the blind side of the retina (see HEMIANOPSIA). In cases, however, where the lesion is situated in the optic tract below the corpora quadrigemina, hemianopsia may also occur, but under these circumstances no pupillary reflex for light can be obtained on stimulus of the blind side of the retina, the pupil reacting to light when the opposite side of the retina is stimulated. This reaction is termed the hemiopic pupillary reflex, and is of great value in the localization of intracranial lesions.

Herbert L. Eason.

PURPURA signifies hæmorrhage into the skin, and, according to the size of the extravasation of blood, the lesions are spoken of as puncta or spots, vibices or lines, petechiæ or small patches, ecchymoses or bruises. The lesions cannot be obliterated by pressure with the finger, which distinguishes the effused blood from mere congestion. The diagnosis of the actual fact of purpura is seldom difficult; the persistence of the discoloration under pressure differentiates it from erythematous lesions, and the colour generally serves to distinguish it from pigmentation of the skin other than that due to hæmorrhage. In a case of doubt, the course which the lesions follow will serve to distinguish purpura, which changes and disappears, from capillary nævi or from pigmentation of the skin, which persist. It may be more difficult, however, to decide what is the nature of the purpura in any given case; the following is a list of its better recognized causes:—

CAUSES OF PURPURA.

1.—**Local Injuries :**

Flea-bites
Pediculosis
Leech-bite
Blows

Sprains
Rupture of a muscle
Rupture of a vein, especially a varicose vein.

2.—**Drugs and Poisons :**

Antipyrin
Iodoform
Iodide of Potassium
Sulphonal
Copaiba
Belladonna
Chloral
Chloral hydrate
Butyl-chloral hydrate
Veronal

Mercury
Arsenic
Quinine
Ergot
Salicylic acid
Potassium chlorate
Diphtheritic antitoxin
Ptomaine
Snake-bite poison.

3.—**Fevers :**

Typhus fever
Cerebrospinal fever
Small-pox
Pyæmia
Septicæmia
Malignant endocarditis
General tuberculosis
Dysentery
Cholera
Yellow fever

Weil's disease, or bilious typhoid
Plague
Remittent fever
Severe malarial fever
Blackwater fever
Measles
Diphtheria
Typhoid fever
Scarlet fever.

4.—**Jaundice from whatever cause (see JAUNDICE).**5.—**Bright's Disease.**6.—**Chronic Alcoholism :**

Cirrhosis of the liver

Peripheral neuritis.

7.—**The so-called Blood Diseases :**

Splénomédullary leukæmia
Lymphatic leukæmia
Hodgkin's disease
Lymphadenoma
Sarcomatosis
Splenic anæmia

Pseudo-leukæmia infantum
Scurvy
Barlow's disease
Hæmophilia
Chloroma.

8.—**Peliosis Rheumatica.**9.—**Henoch's Purpura.**10.—**Purpura Simplex .**

Morbus maculosus of Werlhof
Purpura hæmorrhagica
Purpura fulminans.

A number of the above conditions require but little discussion, for if they are but borne in mind, their diagnosis as the cause of purpura in any particular case will generally be easy.

Flea-bites are by far the commonest cause of purpura in the out-patient department of a hospital, and they may sometimes be so very numerous as to raise a misleading suspicion that the patient is suffering from some serious disease.

The relatively small hæmorrhagic foci, and their prevalence on the parts covered by the clothes rather than upon the hands, face, or exposed parts of the legs, serve to indicate the diagnosis, even in a severe case.

The commonest variety of *pediculosis* to produce purpura is *P. corporis* or *P. vestimentorum*; the circumstances of the case and the distribution of the purpura itself and of the marks of scratching, particularly in the regions where collars and other constrictions in the dress occur, would indicate the diagnosis.

The hæmorrhage around a *leech-bite* is so characteristic that, once seen, it cannot be mistaken for anything else.

Blows and *sprains*, if sufficiently severe, produce purpura even in the healthy, in whom the history gives the diagnosis; it is important to bear in mind, however, that there are some normal individuals who bruise with such ease that there may be no clear evidence of injury unless careful inquiry is made, when some trivial stumble or knock may be recalled to mind by the patient. Such easy bruising may of course occur in any of the blood diseases, but it is not uncommon in certain otherwise healthy women. A case of *epilepsy* may sometimes come under observation for multiple bruises simulating some other kind of purpura, but due to injuries produced during the attacks, which may themselves be unsuspected if they occur during the night.

Spontaneous *rupture of a muscle* leads to very extensive purpuric extravasation of blood, but the diagnosis is not difficult if the history is clear, and one can often feel the place where the muscle has given way unless it is too deep-seated to palpate, as in the case of the *plantaris longus*, which is apt to rupture during sudden efforts, such as may be made in playing tennis or the organ.

The *purpuric discoloration of the skin around varicose veins* in the legs, together with its resultant dark-brown pigmentation, is familiar to all.

As regards *drugs*, the list above indicates that there are many which may sometimes produce purpura; it may be said at once, however, that none do so at all commonly. Nevertheless the possibility should be borne in mind, and inquiry made as to the remedies the patient may have been taking. *Anti-diphtheritic serum* and *ptomaines* merit particular attention. The commonest eruption resulting from anti-diphtheritic serum, or from other forms of antitoxic horse-serum administered hypodermically, is *urticaria*; purpura is relatively rare; either form occurs as a rule about nine or ten days after the serum has been given, and is generally associated with lassitude, muscular and joint pains, anorexia, and more or less pyrexia, lasting from a few hours to two or three days. Ptomaine poisoning is often very difficult to recognize with certainty unless it occurs in epidemic form. It is due, however, in most cases to the products of the action of Gaertner's bacillus, and seeing that the blood-serum of patients affected by this bacterium develops agglutinating powers against it similar to Widal's reaction for typhoid fever, this serum test should not be omitted; if it proves positive the diagnosis is clear; a negative result, however, does not exclude ptomaine poisoning.

In the great majority of *acute fevers*, the occurrence of purpura is of prognostic rather than of diagnostic value; in diphtheria, for example, even a single well-defined purpuric spot is a sign of grave omen, but it does not assist at all in the diagnosis of the disease, which has to be recognized upon other grounds. The same applies to measles, scarlet fever, and so on; indeed, the only two fevers in the above list in which purpura is of essentially diagnostic value are *typhus* and *cerebrospinal fever*. The former of these is now very rare in Great Britain, but when it was common and typhoid fever began to be differentiated from it, the point upon which greatest stress was laid was that in true typhus or gaol fever there is always more or less purpura, whereas in typhoid fever all the red spots fade upon pressure. It happens occasionally, even yet, that typhus fever

develops in the poorest parts of cities, and this point is most useful in distinguishing it from typhoid. In the latter, if flea-bites are excluded, purpuric spots are exceedingly rare. *Cerebrospinal fever* presents many characters that are common to it and to other forms of acute meningitis; but if with these there is a purpuric eruption, it is at once differentiated from the others, though the absence of purpura does not exclude the disease. So characteristic is the purpura in some cases that the malady has earned the title of spotted fever, which used to occur in widespread epidemics, and still does in smaller ones from time to time. The diagnosis may be clinched by bacteriological examination of the cerebrospinal fluid obtained by lumbar puncture.

Small-pox may present cutaneous hæmorrhages of three different kinds; there may be hæmorrhage *into the pustules* in a late stage, when the diagnosis has already been made and when the prognosis is not thereby made worse; there may be hæmorrhage *between the pustules*, vesicles, or papules, the diagnosis having already been made, in which case the prognosis is not good; and there may be a hæmorrhagic eruption either all over the body or in the so-called bathing-drawers region in the *prodromal* stage of the disease, in which case the patient will almost certainly die before the true small-pox eruption develops, so that if there is not an epidemic at the time, the diagnosis may be exceedingly difficult.

Almost any condition in which there are pyogenic micro-organisms circulating in the blood-stream may be associated with extensive purpura, and this applies to *pyæmia* and *septicæmia* in general. The diagnosis will be confirmed best by obtaining cultivations from the blood, though there will very likely have been rigors, pyrexia, and other symptoms pointing to the nature of the case. *Malignant endocarditis* is only a variety of pyæmia or septicæmia. Seeing that it is very rare to get purpura in association with chronic valvular disease of the heart if both purpura rheumatica and infective endocarditis can be excluded, the occurrence of purpura in a heart case may be one of the main symptoms indicating that fungating endocarditis has supervened. So indefinite is the nomenclature in regard to this disease, that the terms malignant, ulcerative, fungating, infected, and infective endocarditis are used indiscriminately by different observers to denote the same condition. The disease may be further indicated by sudden changes in the bruits, by evidence of embolism, by progressive anæmia, by enlargement of the spleen, by irregular pyrexia, by retinal hæmorrhages, or by optic neuritis.

General tuberculosis is not a common cause of purpura, and yet in a few instances extensive purpura has been the first, and for the time being the only, symptom of an obscure illness which has ultimately turned out to be general tuberculosis. The patient has generally been a child, and the diagnosis has only been possible when the course of the case has been watched. The same may be said of *sarcomatosis* in certain cases, though this has been included under a different heading in the above list.

Jaundice is well worthy of being borne in mind as a cause of purpura, for although the occurrence of the latter symptom does not assist in differentiating one kind of jaundice from another, one might be misled into diagnosing something more serious than is necessary if one did not bear in mind that any kind of jaundice may produce purpura. Moreover, some of these patients may seem to have been grossly ill-treated if one were to judge only by the degree of bruising that may result from ordinary palpation; the danger of fatal oozing after operation is always to be remembered when surgical measures are thought of in a jaundiced subject. Spontaneous hæmorrhage into the skin is less common here than is hæmorrhage from what otherwise would be trivial causes.

Bright's disease, particularly the chronic varieties of the complaint, is capable of producing hæmorrhage anywhere in the body. Purpura is not a very common

form of such hæmorrhage, but when it does occur it may be extensive. The diagnosis is discussed under ALBUMINURIA (*q.v.*).

Chronic alcoholism, especially if it has already led to either cirrhosis of the liver or to peripheral neuritis, is occasionally a cause of considerable purpura, though the latter is generally confined to the legs, particularly to the parts below the knees. In many instances the diagnosis is easy, even if the history is not given with perfect honesty; but considerable difficulty sometimes arises in the case of ladies who have contracted the habit of secret drinking, their relatives and friends being entirely unaware of it.

Any of the so-called *blood diseases* may present purpura as a prominent symptom, and in some cases, particularly in *lymphatic leukæmia* in children, extensive purpura may be the first symptom that anything is wrong. More often, however, the disease has already given rise to anæmia or to enlargement of the spleen or lymphatic glands, or to some other prominent hæmorrhage, and the diagnosis has already been made by the time the purpura supervenes. (See ANÆMIA; SPLEEN, ENLARGEMENT OF THE; and LYMPHATIC GLAND ENLARGEMENT.) Broadly speaking, the method of diagnosis should be to have the blood examined in the first instance; if there is a very great increase in the number of leucocytes per cubic millimetre, the diagnosis is some form of leukæmia; if there is no such leucocytosis, and if there is enlargement of the lymphatic glands, the diagnosis is lymphadenoma or Hodgkin's disease; if the spleen is much enlarged but the lymphatic glands are normal, splenic anæmia suggests itself in an adult, or pseudo-leukæmia infantum in a child.

Scurvy in an adult is relatively rare, but is sometimes met with in those who have been obliged to live upon a diet containing no fresh vegetables for reasons of poverty; for instance, a man may try to live for a month or more on plain bread, in which case typical scurvy may develop in him, with the spongy heaping up of the gums both inside and outside the teeth, and with the knotty hæmorrhagic swellings in the muscles of the calves, as well as purpura. Children who are fed upon patent foods without a sufficiency of fresh cow's milk, or vegetable food, or fresh meat, not infrequently develop a milder form of scurvy, with marked tenderness of the periosteum of the long bones, pasty pallor, mouth bleeding from spongy gums, and possibly purpura; this is *infantile scurvy* or *Barlow's disease*, which should not be confused, as it is apt to be, with rickets.

Hæmophilia is generally indicated at once by the history of persistent oozing from slight cuts and scratches, and also by the fact that other members of the family, especially males, have suffered in a similar way.

Chloroma is a very rare disease, in some ways related to sarcomatosis, and in others to lymphatic leukæmia; it produces swellings in connection with the bones, especially of the head, together with enlargement of the lymphatic, lachrymal and salivary glands; it develops in early life, proves slowly fatal, and the diagnosis is confirmed by the green colour of the new-formed tissue—"green cancer." The blood changes are negative.

Peliosis rheumatica, or *purpura rheumatica*, or *Schönlein's disease*, was formerly regarded as being related to acute rheumatism; but it is exceedingly rare for a patient affected by it to present unmistakable signs of valvular heart disease, although there may be a local systolic bruit at the impulse. The reason why it is thought to be related to acute rheumatism is, that in addition to the extensive purpura, which comes out in successive crops and may affect any part of the body, though it is commoner upon the lower limbs than elsewhere, there are considerable pain, redness, and swelling of many joints, which may become affected successively; the temperature rises during an attack to 103° F. or 104° F., the throat generally being sore at the same time. It is not impossible that the purpura is due to the absorption of microbes or their toxins from the

acute tonsillitis ; but be this as it may, the diagnosis is not difficult when the purpura, the joint pains, and the pyrexia are present together. The disease is little influenced by sodium salicylate ; it may be associated with more or less erythema as well as purpura ; the malady affects young persons, especially between the ages of ten and thirty ; it is not confined to either sex, but is commoner in males than females.

Henoch's purpura is chiefly met with in children (*Fig. 111*, p. 382), and the same patient may suffer from recurrent attacks, which usually cease at or before puberty. In addition to the hæmorrhages beneath the skin, there is generally some tendency to joint pains not unlike those of *peliosis rheumatica*, but in addition to this the child is seized with more or less severe acute abdominal symptoms, varying from simple vomiting and stomach-ache to severe prostration with agonizing cramp-like attacks of colic, some of which may be followed by the passage of blood and mucus per rectum to such an extent as to simulate acute intussusception ; the abdominal attacks are probably the result of sub-mucous intestinal hæmorrhages. There is every degree of the affection, from mild to very severe, but the association of the purpura with the abdominal attacks in childhood suggests the diagnosis at once, especially if there has been a similar attack previously. The chief error to avoid is mistaking for Henoch's purpura that which is really an acute nephritis ; the urine should be examined periodically for albumin and renal tube-casts, even if there is no œdema, though the occurrence of blood alone would not be sufficient to indicate acute nephritis, seeing that hæmorrhage from the kidney may be due to Henoch's purpura itself.

It is only when every precaution has been taken to exclude all the above causes of purpura that one can be satisfied with any of the remaining three diagnoses, namely *purpura simplex*, *purpura hæmorrhagica* (*morbus maculosus* of Werlhof), or *purpura fulminans*. These differ from each other only in degree ; broadly speaking, *purpura simplex* signifies hæmorrhage into the skin only ; *purpura hæmorrhagica* has, in addition, hæmorrhages from the mucous membranes, particularly of the mouth, nose, and bowel, less commonly of the urinary passages ; whilst *purpura fulminans* is the term used to denote a condition in which a person may seem perfectly healthy to-day, may be seized with acute purpura and be dead before to-morrow, without developing any other symptoms to indicate the nature of the complaint. These kinds of purpura have sometimes been spoken of as idiopathic, but they must have some underlying cause, if only it can be found. It is better probably to label them cases of purpura of which the exact cause is not yet known, than to be content with such a term as *purpura simplex*, and it is probable that if bacteriological examinations were made, a bacterial cause would be discovered, particularly in connection with the tonsils, the gums in states of septic gingivitis or pyorrhœa alveolaris, the uterus, the bowel, or the circulating blood itself. *Herbert French.*

PUS IN THE CHEST.—(See CHEST, PUS IN.)

PUS IN THE STOOLS in sufficient amount to be recognizable by the naked eye, indicates the rupture of an abscess into the intestinal tract. The symptom is a rare one, however, for even when a large appendicular abscess perforates into the cæcum, the pus either becomes indistinguishable when mixed with the fæces, or unrecognizable on account of digestion and decomposition. The less the pus is mixed with other intestinal contents, the nearer to the anus has the site of rupture been ; but the diagnosis of the source of the abscess needs to be determined upon other grounds, particularly the history, and upon the results of general physical examination, including that of the rectum and vagina. Abscesses which are most apt to cause a discharge of pus with the stools are of

the appendicular, cholecystic, perinephric, psoas, pelvic, perigastric, or other local peritoneal types, and pyosalpinx.

Microscopical quantities of pus in the stools may be due to any of the causes already mentioned; but they may also be derived, not from lesions outside the intestines, but from affections of the mucous membrane itself: acute or chronic colitis, with or without ulceration; dysentery; cholera; dengue; mucous or mucomembranous colitis; tuberculous, typhoidal, malignant, or venereal ulceration of the bowel. The pus corpuscles may be recognizable as such under the microscope; but it is difficult to determine when the leucocytes derived from the intestinal catarrh are merely leucocytes in excess, and when their numbers become sufficient to merit the term actual pus. Examination with the sigmoidoscope is sometimes invaluable when the diagnosis has not been indicated clearly by other methods.

Herbert French.

PUSTULES.—The pustule, one of the primary cutaneous lesions, is an epidermic elevation, either unilocular or multilocular, containing a purulent liquid, and differing from a vesicle or a bulla only in the character of its contents. Always a product of inflammation, it may originate as a pustule or may develop from a papule, but much more often it is a transformed vesicle; if the metamorphosis is imperfect, the lesion is styled a papulo-pustule or a vesico-pustule. Frequently the transformation from a papule or a vesicle is so swift, that the true origin of the lesion may escape notice; but in such cases it is usual to find papules or vesicles intermingled with the pustules. The pustular cavity may be situated in the epidermis, in the derma, or in a follicle; a purulent accumulation *beneath* the derma is either an abscess or a gumma. *Epidermic* pustules may be superficial, as in impetigo, or deep, as in the condition known as *ecthyma*, which I regard as but a severe form of impetigo. *Dermic* pustules, e.g., in miliary abscess of new-born children, are seldom met with, while *follicular* pustules, such as those of sycosis, are of frequent occurrence, the pyogenic cocci effecting entrance into the follicle when this is not the original site of the suppuration. In *colour*, pustules are usually yellowish or greyish, with a red areola; but when the contents are mixed with blood, the yellow may be tinged with red or brown. If a pustule is punctured or ruptured, the liquid is seen to be more or less turbid and yellowish; under the microscope it is found to consist largely of leucocytes and serum as well as cocci. Pustules vary greatly in size: they may be as small as a pin-point, as in some of the pustules of eczema, or as large as a split pea, as in severe impetigo. The small ones may remain of inconsiderable dimensions, or may become large by excentric extension. The prevalent *shape* is roundish or convex, as in furuncle and acne; but it may be acuminate, as is frequent in sycosis and eczema, or flat and irregular, as in impetigo and syphilis, while in rare instances, as sometimes in scabies, it may be oblong, with a tendency to the linear form. In variola and the varioliform syphilide, the pustules may be flattened or concave, either because the fluid may not fully distend the cleft in which it lies, or from flaccidity of the sac, due to commencing absorption. Pustules may develop slowly, as sometimes occurs in impetigo and in the pustular syphiloderm; but as a rule they run a rapid course, and terminate either by rupture—much more often accidental than spontaneous—or by desiccation. In either case, a yellow, brown, or blackish crust, more or less thick and irregular, is formed; but if the termination is by desiccation, the crust has a less pronounced coloration, and is friable instead of firm.

A cutaneous affection in which the pustule plays a leading part is *impetigo*, in both its principal forms—the impetigo contagiosa of Tilbury Fox, otherwise impetigo vulgaris, and the follicular impetigo of Bockhart, the one due primarily to the streptococcus and secondarily to the staphylococcus, the other solely to the

staphylococcus. In *impetigo vulgaris*, usually following slight febrile disturbance, small erythematous spots appear, on which form vesicles containing a turbid fluid that quickly becomes purulent. When the pustules break, as they soon do, they discharge a fluid that quickly dries up into scabs that are at first yellowish, and afterwards green. Dotted about among the scabs are pustules, which may coalesce so as to form, on rupture, crusts of considerable size. The eruption may be limited to a few discrete lesions, or may extend over large areas of the body. In parts where the pustules are exposed to friction, as on the limbs, they are generally ruptured at an early stage, and a flat irregular scab, surrounded by an areola, forms over them—the condition known as *ecthyma*. Sometimes the distribution is annular (*impetigo circinata* or *gyrata*). In the condition known as *impetigo bullosa* the lesions are much larger, and are not always transformed into true pustules. With impetiginous eruptions, though not with these alone, *cutaneous diphtheria* is sometimes associated, especially in children. The most typical form of this affection has the appearance of an impetiginous eczema, associated with conjunctivitis, and occasionally with otorrhœa and rhinitis. No diphtheritic membrane may be present, and if cutaneous diphtheria is suspected, the Klebs-Löffler bacillus should be sought for bacteriologically.

The differences between *impetigo vulgaris* and *follicular impetigo* are well marked. The latter is pustular from the beginning, and always situated around a hair-follicle. It starts as a round pustule, often pierced by a long or coarse hair, and it may be quite small, or as large as a pea; the pus collects under the horny layer, which it distends and raises. The eruption, usually multiple, has no sites of election, but appears wherever a breach in the horny layer affords entrance to the pyogenic organism. The pustules are more resistant than those of *impetigo contagiosa*, and are less quick to break. When they rupture, yellow crusts, smaller and thinner than those of *impetigo vulgaris*, are formed. The pustules of follicular *impetigo* can hardly be mistaken for those of any other affection. The other form of *impetigo*, however, has in rare cases to be diagnosed from pemphigus. In the latter the lesions start, not as small vesicles but as bullæ, and the fluid they contain is only sometimes inoculable. Usually, too, there is marked systemic disturbance. But it is with *pustular eczema* that *impetigo vulgaris* is most likely to be confused, especially when the pustules of the latter condition have run together into a patch. In eczema, however, the pustules are smaller, there are severe itching and burning, there is an inflammatory areola around the crusts, which is seldom the case in *impetigo vulgaris*, and other definitely eczematous lesions will usually be found if carefully sought for, including infiltration and thickening of the integument.

Like follicular *impetigo*, *sycosis vulgaris* is a staphylococcic infection. The lesions begin as papules, or as nodules which form round the hairs—usually of the face, and especially of the chin, but sometimes attacking also the eyebrows, eyelashes, and the axillary and pubic regions—and presently develop into pustules, each of them pierced by a hair. As the result of suppuration, the hairs are loosened, and if one is pulled out, a drop or two of pus usually exudes. In severe cases, the pustules may be so closely packed together as to form infiltrations, which may assume a fungating character. The chief diagnostic features of the affection are its inflammatory character, its origin in the hair-follicles, and its limitation to the hairy parts, usually as I have said, of the face. The differential diagnosis from *tinea sycosis* has been given under FUNGOUS AFFECTIONS OF THE SKIN. Eczema is not limited to the hairy parts, and if the follicles are involved it is only secondarily, nor, as a rule, is the inflammation so severe as in *sycosis vulgaris*. Of *sycosis vulgaris* again, intense itching is not a feature. Sometimes, when the *sycosis* is widely diffused, the crusts may have to be removed to clear

up the diagnosis ; when this is done, the follicular implication will soon be perceived. Tertiary syphilitic ulceration is not restricted to the follicles, and behind it there lies a history of earlier specific lesions, as well as of the primary infection, unless this should have escaped notice. If there is ever any doubt as between sycosis vulgaris and acne vulgaris, the presence of the latter on non-hairy parts should of itself suffice to decide the question.

The pustules of *acne vulgaris* can scarcely, indeed, be confounded with those of any other affection, except with the lesions of small-pox (see below) and those of bromide and iodide eruptions. In these drug eruptions, however, comedones are absent, the lesions occur on any part of the body, and are generally a brighter red, while the fluid they contain is rather thinner. Drug eruptions, again, occur at any time of life, whereas *acne vulgaris* is essentially a disease of puberty. Pustular syphilides may attack any part of the body, and are generally grouped, which is never the case with the pustules of acne.

A *furuncle* is so characteristic that the only lesion from which it can ever require to be differentiated is a *carbuncle*. The pathological process is the same in both ; but while in furuncle there is but one point of suppuration and opening, in carbuncle there are several. The only condition from which a carbuncle has in turn to be diagnosed, except a furuncle and malignant pustule (see below), is diffuse cellulitis, in which there is no circumscribed outline.

In *malignant pustule* (anthrax), following itching and burning at the site of inoculation, a livid red papule usually appears, on which a bulla or pustule quickly forms and breaks, drying up into a black gangrenous eschar. This is fringed with tiny vesicles or pustules, and surrounded by a broad areola of solid oedematous infiltration, the skin over which is tense and violaceous. There are constitutional symptoms, with septic fever. The diagnosis rests mainly upon the presence of a gangrenous patch surrounded by infiltration in a patient whose occupation exposes him to infection with the anthrax bacillus, especially from cattle, hides, or wool. The organism may be detected without difficulty under the microscope. It is only at the outset that the lesion can be mistaken for a carbuncle. The primary lesion of syphilis can be excluded by its indolence, and by the absence of gangrene and of febrile symptoms.

In *glanders*, the cutaneous lesions begin as red spots, which pass through the papular and vesicular or bullous stage into pustules that give rise to widespread ulceration. The condition, with its severe constitutional disturbance and, except in some chronic cases, the peculiar discharge from the nostrils, is usually easy of recognition ; and in exceptional cases in which the diagnosis is in doubt, recourse should be had to mallein, or the bacillus—*B. mallei*—may be sought for with the aid of the microscope.

In *scrofulodermia* (tuberculides), usually an affection of childhood and adolescence, pustular lesions take the form which has been styled by Dühring the large flat pustular, and the small pustular scrofuloderm. The former begins as one or more superficial indurations which, becoming pustular, extend peripherally and form a flat, yellowish, crusted pustule of considerable size, surrounded by a violaceous areola. Neighbouring pustules may coalesce. When the crust is removed, a granular scrofulous ulcer is seen. The small pustular scrofuloderm is usually a papulo-pustule rather than a fully-developed pustule, the pus being frequently limited to the central part of the summit, while the outer part of the lesion remains hard. The crusting is sometimes a slow process, which may occupy several weeks, and when the crust drops off it leaves indelible scars not unlike those of variola. The only diseases with which scrofulodermia generally can be confused, are lupus and syphilis. The absence of "apple-jelly" nodules and of infiltration will distinguish it from lupus, though the two conditions may coexist. The syphilitic ulcer is met with in adults, and is usually a much more

active process than scrofuloderma, nor has the lesion the undermined border which is characteristic of the latter affection. Concomitant syphilitic signs will usually be present, just as in scrofuloderma there will generally be other tubercular symptoms.

In *syphilis*, the pustule is a much less frequent lesion than the papule, and is generally found in association with a cachectic state of health. It appears in two different forms, the acuminate and the flat pustular syphilide, and in both the lesion may be either small or large. The *small acuminate* or miliary syphilide, not usually much larger than a pinhead, in most instances begins as a papule, and papules will generally be found intermingled with the pustules. When the crusts into which the pustules dry are detached, there may be some scarring, or the lesions may leave no trace except stains, which presently disappear.

The diagnosis of these small acuminate pustules seldom presents any difficulty; but it is not so with the *large acuminate* pustules, the acneiform syphilides, which may be mistaken not only for acne, but also for variola and iodide eruptions. Appearing on a base which may at first be pink, and afterwards copper, they may be pustular from the beginning, or may start as vesicles or as papules; they are more or less generalized, about the size of a pea, disseminated, or grouped irregularly, and while they are predominantly acuminate, some of them may be rounded. Some of the pustules may be dimpled, and occasionally the majority of them display this character. When the crusts fall off, brownish stains are seen, and there may be slight scarring, which, however, is seldom permanent. The grouping which is characteristic of these pustular syphilides, and the drying-up of the pus into scales, are important points in differentiating them from the lesions of acne, which, further, instead of being generalized, seldom affect parts other than the face, the back of the neck, the chest, and the back between the shoulders. The comedones of acne are another distinguishing feature, the eruption is of a more sluggish and chronic character, and there is no cachexia. The diagnosis as between pustular syphilides and variola is given below. The pustules met with in iodic eruptions are seldom either generalized or profuse.

Small flat pustular syphilides ("impetiginous syphilides") may begin as such, or may develop from macules or papules. They are discrete; but in such regions as the face and scalp may run together. The eruption is of a generalized character, with a preference for the genitals, the scalp, and the face. The crusts into which the pustules quickly dry are frequently adherent; beneath them there is superficial ulceration; occasionally they are surrounded by an areola of the characteristic raw-ham colour. When the eruption is extensive, the patient is often anæmic and cachectic. The affections from which these syphilides have to be differentiated are pustular eczema and impetigo. The ulceration which underlies the crusts in the syphilides is not found in either of those conditions, nor is itching present as in eczema. In impetigo, the pustules most frequently affect the face and hands, and are superficial; and the eruption is mild in character and of shorter duration.

The *large flat pustular syphilides* ("ecthymatous syphilides") differ little from the small ones except in size, and the only lesions with which they are likely to be confused are those of severe impetigo vulgaris. The diagnosis from that condition must rest upon the slow development, the greater number of the pustules, the coppery areola and base, the accompanying cachexia, and the pigmented scars. But it should be remembered—and this applies not to pustular syphilides only, but to syphilis generally—that in most cases a sure diagnosis of syphilis can only be made when all the factors of the case are taken into account: the history, character, course and termination of the lesions, and their reaction to mercury or arsenic and the iodides. The distinctive characters of secondary lesions generally are their symmetry, their coppery colour, the

positions in which they occur, their polymorphism, and the absence of itching, together with enlarged glands, sore throat or tongue. In doubtful cases, the whole cutaneous surface should be examined for characteristic marks or lesions. If the diagnosis is still uncertain, the Wassermann test should be applied.

Of all diseases of which the pustule is one of the manifestations, *small-pox* is that which presents the greatest difficulty in diagnosis. The lesion, occasionally preceded by a roseolar rash not unlike that of scarlatina, begins as a mere fleck, of pin-head size, flush with the surface and impalpable. In the course of a few hours it swells up into a pink papule, which can be felt embedded in the skin like a small shot. In a few days, the papule undergoes vacuolation, at the same time getting bigger, and becoming grey and translucent. So the papule passes into the vesicle, which is loculated, so that if it is punctured the contained fluid is not entirely discharged. As a rule, the smaller vesicles are hemispherical, the larger flat-topped, and occasionally the crown is indented. After about twenty-four hours the contents become turbid and the covering dull and whitish, and so the pustular stage is entered upon. While the lesion is undergoing this transition, the grey translucent centre is encircled at the periphery of the crown by a white or yellow ring. By the sixth day from its birth, the lesion has become yellow throughout and the crown dome-shaped, and so the pustule attains maturity, and if of full size measures about three-eighths of an inch across. Even in unmodified small-pox, however, the lesions often fail to reach those dimensions. As the pustule develops, the erythematous zone, the areola, which encircled the papule and was biggest and brightest in the vesicular stage, begins to wane, and has disappeared by the time the pustule reaches maturity. This occurs about the ninth day. As the pustules dry up or burst, scabs are formed, which on separation leave dark stains, scars and "pits," the number and depth of the pits usually being determined by the severity of the disease. In mild attacks the pustules remain discrete, in severe cases they run together (confluent small-pox, *Fig. 160*, p. 606). In bad cases, hæmorrhage takes place into the skin and the interior of the pustules. The mucous membranes of the air-passages may be invaded, the extent to which they are involved being determined by their susceptibility rather than by the severity of the attack. In modified small-pox the eruption may resemble that of the unmodified disease, as here described, the difference being that the lesions are less abundant and are seldom confluent.

It has been usual in the diagnosis of small-pox to lay the chief stress upon the solidity and hardness of the papule, the umbilication of the vesicle, and the loculation of its cavity; but in his masterly monograph ("The Diagnosis of Small-pox") to which I owe the following description, Ricketts has shown that the distribution of the lesions is of more diagnostic value than their character, as also it is more easily observed. The parts most liable to the eruption are the face and hands, exposed as these are to constant stimulation from wind and weather and other causes; and of the two, the face, as the more exposed part, is more liable than the hands. Next to the hands in susceptibility come the upper limbs, then the trunk, then the lower limbs; the order being determined by the amount of friction with the clothes which these parts undergo. As to the trunk, the rash is thicker behind than in front, and thickest on the shoulders, where there is most friction. The incidence is smallest on the great flexures of the body, because these are the most sheltered parts, while the extensor surfaces of the limbs, and especially the elbow, receive a disproportionate share of the rash. The neck, sheltered by the head and the shoulders, fares better than either of those parts; the back of it suffers more than the front. On the flank, protected as it is by the arm, the rash is less profuse than on the adjoining parts of the chest-wall, either in front or behind. On the foot, the distribution is marked by great inconstancy. Usually the back of the foot

receives more attention than the sole ; between the toes, and the folds beneath the toes, enjoy comparative immunity ; and the parts for which the eruption shows most preference are the instep, especially the tendinous ridges and the

Fig. 160.—Small-pox. Stereoscopic views showing both the discrete and confluent varieties.
Photo by Dr. D. S. Davies, M.O.H., Bristol.

bony eminences, the tendo Achillis, the balls of the toes, the toe-pads, and the heels. When the malleoli present few lesions, as not seldom happens, it is because a well-fitting boot has been worn, and so these prominences have been protected from friction. The absence of uniformity of distribution in the case

of the foot is explained by differences in the conformation of the foot, in the foot-gear which is worn, and in the degree to which the patient is accustomed to walk. In the hand, the palm, and especially the hollow of it, suffers little, and the brunt of the attack is borne by the extensor surface; the rash is thickest on the back of the wrist and hand, and over the heads of the metacarpals. To these usual characters the distribution offers exceptions, some of them difficult of explanation; but they are neither so numerous nor so considerable as materially to lessen its diagnostic importance. Its significance consists mainly in the eruption being neither localized nor elliptic, but generalized; in its being symmetrical and graded—graded, too, evenly in homogeneous areas; and in its preference for surfaces exposed to friction.

The diagnosis of small-pox from chicken-pox—the disease with which it is most often confused—and from vaccinia, has been set out under VESICLES. The eruptions of measles and of German measles differ from that of small-pox in that, instead of being papular, they are macular, and that they never pass into a vesicular or a pustular stage. In German measles, further, there is enlargement of the posterior cervical glands, which is never the case in small-pox at an early stage. In scarlatina, the “strawberry tongue” is a sign which is quite different from the condition of the tongue in small-pox. The rose-red lenticular spots which make up the rash of enteric fever are neither so hard nor so prominent as the papules of small-pox, and they appear chiefly on the trunk, and elect the abdomen and chest rather than the back; the arms and legs, and especially the face, almost always escape. The purpuric spots sometimes seen in enteric may be misinterpreted as the signs of severe small-pox; but the absence of pronounced systemic disturbance and severe pain, and of an erythematous rash, should obviate the confusion.

If the pink, slightly elevated macules of simple purpura are mistaken for the eruption of small-pox, the error is soon corrected by the deeper colour which the macules take on; nor, even though the macules may become papules, have the lesions the characteristic hardness of variolous papules. Another point of difference between simple purpura and small-pox is, that in the former affection the face and trunk are seldom attacked, the sites of election being the limbs. In erythema multiforme, although the rash makes its chief attack upon the limbs, it may be widely diffused and may even invade the face. In such cases, however, the diffusion will usually be less general than that of the variolous eruption, nor is the order of incidence the same. With the involution which the erythematous lesions undergo, the resemblance to small-pox ceases. Even in cases of acute febrile erythema, in which the whole cutaneous surface is covered by a profuse eruption, the distribution is quite different from that of the small-pox eruption.

Confusion between small-pox and syphilis is much more likely to arise when the syphilide is pustular than when it is vesicular or papular. The erroneous diagnosis may be assisted by the fever and aching symptoms which may precede pustular syphilides, and by the fact that the lesions may begin as papules. In syphilis, however, the constitutional symptoms are less severe, the eruption runs a more indolent course, and appears in successive crops, whilst the vesicles which form on the summits of the papules have an indurated base. Sometimes, too, the syphilitic eruption is indifferent in distribution, and often it comprises various types of lesions, even when it is not distinctly polymorphic, whereas in small-pox the departure from homogeneity is much more limited.

Occasionally, impetigo vulgaris is mistaken for mild modified small-pox (*Fig. 161*, p. 608), but attention to the points which mark off the former affection from pustular eczema (see above) should prevent the mistake. Further differentiating features as between impetigo vulgaris and small-pox are, that in impetigo there

is no fever, and that the lesions begin as vesicles or bullæ and dry up into flat, yellowish crusts. In those cases of sudden and acute eczema which may mimic small-pox, guidance is to be found in the small size and superficiality of the

Fig. 161.—Stereoscopic view of a case of septic dermatitis wrongly diagnosed as small-pox.
From photo by Dr. D. S. Davies, M.O.H., Bristol.

eczematous lesions, and the œdema and infiltration of the underlying skin. In scabies, again, the vesicles are superficial, burrows will generally be found, and the heterogeneity of the secondary lesions will aid the diagnosis. In all these

affections, the distribution is quite different from that of small-pox, the incidence being partial or patchy. Thus, in impetigo, the lesions are frequently confined to the face and extremities, and if the trunk is invaded, it is the front more than the back, the lower part more than the upper. Acute eczema is seldom widely diffused. In scabies, except in children, the face escapes, and the commonest sites are the hands and fingers, buttocks, and feet.

In Ricketts' experience, no affection, except chicken-pox, is so frequently confused with small-pox as *acne vulgaris*, in spite of its chronic, afebrile character, and the absence of subjective symptoms. If, however, the rash is limited to the upper part of the body and a few characteristic *acne* lesions such as comedones are found, small-pox may be excluded.

I have seen *copaiba* eruption mistaken for small-pox. The absence of constitutional symptoms such as pain in the lumbar region and fever, the mixed character of the lesions, and the history are the chief points in the diagnosis.

It is seldom that bromide or iodide eruptions are mistaken for the rash of small-pox. In doubtful cases, attention must be paid to the larger size of the pustules, as compared with those of small-pox, and to the symmetrical or patchy distribution.

Malcolm Morris.

PYREXIA, PROLONGED.—A pyrexia may, for the purposes of this article, be considered to be prolonged if its duration is more than ten days. In the majority of cases, no doubt, there are signs and symptoms, or facts in the history, which enable the practitioner to make a diagnosis before this time; but sufficiently often difficulties arise from the absence of the distinctive characters of any one of the diseases commonly accompanied by such pyrexia. In most cases such a prolonged pyrexia is the result of one of the *infectious diseases*, and it is by a careful consideration of the more probable among these that one may often arrive at a definite opinion.

The *general infections* most likely to give rise to a long-lasting fever are :—

Typhus fever	Septicæmia from deep-seated foci of
Typhoid fever	disease, such as:—Empyema, Cere-
Paratyphoid fever	bral abscess, Pylephlebitis, or other
Malta fever	form of suppuration
Influenza	Malaria
Tuberculosis	Syphilis
Malignant endocarditis	Bacilluria
	Bronchopneumonia.

A high temperature of very long duration occurs often in connection with *diseases of the blood and blood-forming organs*, such as :—

Addison's anæmia	Leukæmia	Hodgkin's disease.
------------------	----------	--------------------

It also occurs much more often than has been commonly supposed in *sarcoma* and *carcinoma* of different organs, and has been observed in *cirrhosis of the liver*. There are two other forms of pyrexia which should be borne in mind, namely, a *prolonged pyrexia occurring in children*, often very difficult to explain; and so-called *neurotic pyrexias*.

Modern research has a tendency to rely upon its own methods alone, and to ignore the older clinical differences. But this involves a separate investigation for each disease as it comes to be considered; and thus it may happen that one patient may have to undergo, in addition to a thorough bedside examination of all his organs, a lumbar puncture, and the removal of blood for the Widal test, or for the cultivation of organisms; and these may have to be repeated. A full knowledge of the history of the illness, of exposure to infection, and of the clinical changes as far as they are manifested, is desirable in order that the

researches of the bacteriologist may be directed as early as possible into the right path.

Typhus.—On the score of prolonged pyrexia little need be said of this fever. The eruption is generally distinctive, and shows itself before the fever has attained any duration; but it is capable of being confounded with typhoid fever, and even with malignant endocarditis. The distinction from typhoid fever is given elsewhere; and a confusion with malignant endocarditis is only possible if the latter should produce a very uniformly distributed petechial eruption over the skin, while the cardiac murmur is of high intensity; or if a person already the subject of cardiac murmur should contract typhus, and have an ill-defined eruption. In either case, if the pyrexia were prolonged beyond the twelfth or fourteenth day, typhus would be unlikely.

Influenza.—In the majority of cases of influenza, uncomplicated by definite visceral changes such as pneumonia or gastro-enteritis, the fever is of short duration, and does not come within the scope of this article. But it is often as long as a week or ten days, and sometimes three weeks or more. The longer period, accompanied as the fever is by few distinctive signs, is sufficient to lead to a confusion with typhoid fever, tuberculosis, or malignant endocarditis, either of which may proceed for two or three weeks, and the last two for many more weeks, without distinctive clinical signs. The constant presence of influenza amongst us, and the great variety in the characters it assumes, make it very difficult to exclude it until positive signs of another complaint have manifested themselves. Equally difficult, however, is it to prove the existence of the disease, since the organism, Pfeiffer's bacillus, is not easily found in the blood; and in the prolonged cases, the rather striking peculiarities of the intense acute attacks, such as severe pain in the head and back of the eye, and in the lumbar region, may be absent.

The diagnosis can often be made positively only *viâ exclusionis*, when the bacteriological tests of typhoid fever and tuberculosis have failed, and if there is an entire absence of rose spots, diarrhœa, or enlarged spleen on the one hand, or of pulmonary symptoms on the other. All the more must we bear in mind the possibility that an apparent attack of recovered influenza may only be the pyrexial equivalent of the earliest tuberculous infection, and if at any time in the course of the illness sputum is available, it should certainly be examined for tubercle bacilli.

Typhoid Fever.—This should be comparatively easy to diagnose in the present day. A fever commencing with frontal headache, perhaps with diarrhœa, generally compelling the patient to lie up in bed by the end of the first week, and showing within the first ten days, rose spots on the abdomen and a slight enlargement of the spleen, while at that time the temperature is 101° F. or 102° F. in the morning, and 103° F. or more in the evening, and the pulse is relatively slow, namely from 80 to 100 in the minute, should be typhoid fever. The Widal reaction, that is, the agglutination of typhoid bacilli by the patient's blood serum, becomes positive about the tenth or twelfth day. All these signs may fail for a time: spots may be absent, the bowels may be persistently constipated, enlargement of the spleen may be difficult to prove, the Widal test may and often does fail. Examinations of the fæces for Eberth's bacillus are not easy; but cultivation of the bacillus from the blood taken from the patient's vein may yield the bacillus, and this at an earlier date than the Widal reaction can be obtained.

Apart from such cultivation, the appearance of rose spots from the sixth to the tenth day, with additions to their number every day for five or six days, forms perhaps the most conclusive evidence of typhoid fever; and the diagnosis based on these grounds should not be upset by one or two failures to get a positive reaction with the Widal test.

This test may require to be made with two or more strains of Eberth's bacillus, and failing them, paratyphoid bacilli should be used. A positive Widal reaction in a case otherwise unlike typhoid fever must be accepted with caution. If a case is devoid of spots, and gives no Widal reaction, the probability of its being typhoid fever might be asserted from its mode of onset, a characteristic chart of temperature (*Fig. 162*), with high readings morning and evening in the middle of the second week, and ending in twenty to twenty-five days after wide oscillations, and finally a pulse always under 100. On the other hand, a pulse of more than 100 does not exclude typhoid, as it is common enough in the severe adynamic forms.

Typhoid fever may be confounded with many acute diseases ; as a prolonged

Fig. 162.—Temperature chart of a case of typhoid fever

pyrexia it is especially pulmonary tuberculosis, malignant endocarditis, a long-lasting influenza, septicæmic processes, and occasionally tuberculous meningitis which will give difficulty.

Paratyphoid Fever.—Of this it need only be said that it presents the features of a benign typhoid fever, in which all the distinctive characters are less marked. Like typhoid, it may be confounded with a mild long influenza, or with early tuberculosis. Its recognition depends ultimately upon the agglutination of paratyphoid bacilli by the patient's blood serum.

Malta Fever.—This is one of the most prolonged of the fevers due to one recognized micro-organism ; for in the undulant form of the disease successive exacerbations of pyrexia may carry on the illness into the fifteenth or sixteenth

week (Fig. 163). It closely resembles typhoid fever, and is proved to be due to infection with *Micrococcus melitensis*, conveyed, almost invariably, in goat's milk. In British practice its occurrence is unlikely, except in one who has been in the parts of the world where it is rife,—namely, the Mediterranean coast and islands.

It differs from typhoid fever in the absence of spots, and of characteristic diarrhoea, but as these often fail in typhoid fever, the distinction is not always available. However, the diagnosis can generally be made by the Widal test, since the blood serum will agglutinate the *Micrococcus melitensis* as early as the fifth day of the disease.

Tuberculosis.—The onset of general miliary tuberculosis, or of miliary tuberculosis of the lung, has often for its only symptom a moderate pyrexia, with accompanying physical weakness and anorexia. Such a condition may continue for weeks without any other sign; the breathing need not be quickened, and there may be an entire absence of abnormal signs in the lungs. The morning temperature is frequently near the normal, while the evening temperature

Fig. 163.—Temperature chart of a case of Malta fever of undulant type.

alone is high: and it does not as a rule increase to a maximum and subsequently fall, so as to form the curve which is characteristic of typhoid, but continues nearly at the same level for long periods. In the absence of sputum, the detection of tubercle bacilli is not available. Tuberculin tests may, however, be tried, and will probably give positive results. Of these the most suitable is the cutaneous tuberculin test of von Pirquet. Tuberculous infection in other localities may equally, when not accompanied by striking local signs, and only presenting the pyrexia, be taken for typhoid fever: for instance, tuberculous disease of the kidney, or pyelitis, and especially tuberculous meningitis. Headache and fever occur both in this and in typhoid, and may be for a time the only facts in the case; until in the one case spots or loose motions assert themselves, or, in the other, optic neuritis, convulsions, paralysis, or retracted abdomen point to a cerebral localization.

Infective or Malignant Endocarditis.—This may be mentioned next because for days or weeks the only prominent feature may be a continuous pyrexia with evening rises to 101° F., falling in the morning to 99° or 98.4° F. (Fig. 164). In most cases a cardiac murmur is present, and then one may, after a certain lapse

of time, such as fourteen days, and excluding the possibility of typhoid fever, often make a diagnosis with confidence. This is confirmed by the occurrence of enlarged spleen, by rigors, by the appearance of petechial spots and small hæmorrhages under the skin, by the cessation of pulse in one or other of the accessible arteries, such as the radial, posterior tibial, or dorsalis pedis, by

Fig. 164.—Temperature chart of a case of malignant endocarditis.

optic neuritis or retinal hæmorrhages, and by anæmia. An attempt should be made to obtain an organism from the blood by cultivation, but it is not always successful. In the early stages the difficulty is not uncommonly increased by the fact that no murmur can be heard, in spite of the fact that

Fig. 165.—Temperature chart of a case of pyæmia, secondary to otitis media and lateral sinus thrombosis. There was a rigor almost daily.

endocardial changes are present. The course of some of these cases of infective endocarditis, which may be called chronic, is remarkably prolonged, sometimes for six, eight or twelve months, with little variations in the accompanying conditions. Long before that, of course, typhoid fever and tuberculosis would have been excluded; and after eight or ten weeks the co-existence of cardiac

not present to a marked degree in most cases; a little feverishness there may be, but it scarcely requires special mention. Only occasionally there is a really prolonged pyrexia, with decided evening elevations of temperature. The diagnosis is rarely in question, because the fever only accompanies the rash and sore throat; and the origin in a local infection is generally well known. The same help may be with us in the fever attending gumma-formation; but if the gumma is deep-seated, or in a viscus such as the liver, even though it should be painful, and recognized by palpation as an abnormal enlargement or thickening, some hesitation may be felt as to the diagnosis, unless it is remembered that such pyrexia may be present. Moreover, a pyrexia of this kind has occurred in connection with the lesions of the inherited disease. Syphilitic pyrexia is frequently of decided character, with evening elevations to 103° F. or more, and morning falls nearly to normal, until stopped, as it may be at once, by the administration of potassium iodide. In both these cases the Wassermann reaction is available to make certain the nature of the infection.

Bronchopneumonia.—This may be mentioned because it has sometimes a duration of many weeks, and during the whole time an oscillating temperature is present. The local signs are, however, sufficient to explain the presence of fever, and the difficulty lies only in the fact that a general pulmonary tuberculosis may resemble almost exactly the more curable bronchopneumonia of pneumococcal or streptococcal origin.

Malaria.—Important as is this disease, its diagnosis may be dealt with briefly here. The non-malignant quartan and tertian fevers produce isolated pyrexias of short duration which do not come within the scope of this paper. It is only the malignant fevers, which do not arise in this country, and are little likely to be seen in other than regions known to be malarious, which cause prolonged continuous pyrexia. The diagnosis is based upon a consideration of the symptoms, upon the discovery of the parasite, and upon the results of treatment with quinine. The symptoms, chill, fever and sweating, have less value in a continuous pyrexia than in the simple tertian and quartan fevers, and in a quotidian fever the resemblance to septic poisoning is well recognized. An enlarged spleen is present in malaria, but also commonly in typhoid fever. Most reliance is to be placed upon a microscopical examination of blood-films coloured with Romanowsky's or Leishman's stain; for in cases of pernicious malaria, it is rarely that the organisms (*Plate XII, Fig. E*) fail to be discovered by this means. Absence of leucocytosis and an increase of the large mononuclears to 15 per cent in a differential count of the leucocytes in the blood, are also in favour of malaria, at least in the first two weeks; after which the results may be very similar in typhoid fever. The third test is the administration of quinine, which, given in sufficient quantity, will stop malaria; and on the other hand, if the fever continues in spite of it, malaria is excluded. An adequate dose for this purpose is 3 or 4 gr. every three hours, day and night for two or three days.

Bacilluria.—This is usually due to infection of the urinary passages with *Bacillus coli communis*. The symptoms may be slight or they may be those of cystitis or pyelitis in a marked degree. With these there is a more or less continuous pyrexia. The diagnosis consists in the recognition of the *Bacillus coli* in the urine by microscopical examination. The urine is acid, with an unpleasant odour, clear when passed, but cloudy and turbid on standing; and the sediment contains pus cells, bladder epithelium, and perhaps renal cells, and hyaline and granular casts. An amount of albumin, usually not more than 0.1 per cent, may be present. The bacilli are best detected by centrifuging the urine, staining the deposit with methylene blue, and examining with an oil-immersion lens. The disorder is common in infants, and in adults it is most frequent in women in connection with pregnancy. The symptoms, especially in

infants, may be few, or none at all other than the pyrexia, which is variable in degree, generally irregular from day to day, may be accompanied by chills and sweating, and may last several weeks. In some cases, however, there are frequency of micturition, pain, perhaps paroxysmal, in the kidney or bladder, and gastro-intestinal symptoms. Hence in an obscure fever in infants, the urine should be examined carefully.

Other organisms sometimes infecting the urine are *Bacillus lactis aërogenes*, the typhoid bacillus, and *Bacillus proteus vulgaris*.

Anæmia.—The several forms of pernicious, idiopathic, or Addisonian anæmia are frequently accompanied by a moderate degree of pyrexia, which may persist

Fig. 167.—Characteristic temperature chart of a case of pernicious anæmia.

for many weeks (Fig. 167). Such an anæmia might be the manifestation of tuberculosis, of infective endocarditis, or of malignant growths; but an examination of the blood with the discovery of poikilocytosis, of a colour-index above unity, the lemon-yellow tint of the skin in some cases, and the history, will generally determine the diagnosis, though the differentiation of the particular form of anæmia may still remain to be considered (see ANÆMIA).

Hodgkin's Disease.—In some, but by no means all, cases of this disease, a very remarkable form of pyrexia occurs. It consists of alternating periods of pyrexia and apyrexia, each of eight, ten, or twelve days' duration, lasting in all for

six, nine, or twelve months. During the pyrexial period the temperature, beginning near the normal, becomes day by day higher and higher, till on the fourth or fifth evening it reaches 102° F. or 103° F., its highest point; it gradually declines during the next four or five days to the normal; and then for three or four days it becomes increasingly subnormal, till a minimum is reached, and from this point there is a gradual return to the normal, when a second pyrexial curve begins (*Fig. 168*). If the cervical, axillary, or inguinal lymph-glands, apart from or in company with the spleen, are enlarged, and the condition of the blood is normal, or of the simple chlorotic type, the diagnosis of Hodgkin's disease is

Fig. 168.—Temperature chart of a case of Hodgkin's disease.

safely made. If such a temperature is observed without any enlargement of the spleen or of the external glands, a lymphadenomatous enlargement of the internal glands, bronchial or mediastinal, should be suspected, and endeavours should be made to demonstrate them by palpation, percussion, or *x*-rays. Leucocytosis should be absent; but its occurrence in a late stage of the pyrexia would not militate against the diagnosis.

Leukæmia.—Pyrexia is a common occurrence in the different forms of leukæmia. As a rule the great size of the spleen in one group of cases leads to an easy diagnosis, and in another group the glands are manifestly enlarged, though

Fig. 169.—Temperature chart of a case of sarcoma of the neck and mediastinum.

acute cases occur in which these changes do not appear early; in all these forms an examination of the blood will show the excessive number of leucocytes, of one or other variety, a sufficient explanation of the occurrence of pyrexia.

New Growths.—The belief that new growths are not as a rule accompanied by pyrexia is well founded; but many exceptions have been recorded, both in regard to sarcoma and to carcinoma. A case of sarcoma of the neck and mediastinum was accompanied for the four months preceding death by a pyrexia resembling in its variations from week to week that which is so characteristic of Hodgkin's disease (*Fig. 169*), and carcinoma has now frequently been known

to be accompanied for weeks or months by fever, especially where there are secondary deposits in the liver. For obvious reasons the diagnosis is not generally difficult; that is, the tumour is in evidence. A point of importance is that the presence of pyrexia does not help to distinguish between syphilis and cancer.

Cirrhosis of the Liver.—The diagnostic relations of pyrexia in cirrhosis of the liver are on the same footing. It occurs in some cases and is apparently due to cirrhosis; whether because it is an inflammatory process, or because the cirrhosis is due to a toxæmia which may raise the temperature, does not seem to be determined. The fact is of interest when we consider that ascites due to hepatic cirrhosis has often been mistaken for tuberculous peritonitis, and, perhaps less often, tuberculous peritonitis for cirrhosis. The absence of pyrexia might possibly be held to exclude tuberculous peritonitis, but its presence would leave the diagnosis open, since it might be due to either.

Neurotic Pyrexia.—This term may be applied to two classes of case: in one the mercury is found at extraordinarily high levels at irregular intervals, often at different levels in different parts of the body, and falling again rapidly to the normal. This may be repeated many days, but hardly constitutes prolonged pyrexia. In the second variety the patient has a genuine pyrexia, lasting two, three, or more weeks, irregular in the elevations which the temperature may reach on successive days, but on the whole resembling the pyrexia of sepsis. These cases are more often females, and the fever may be associated with symptoms referable to the pelvic organs, or may persist after the entire subsidence of such symptoms, so that skilled obstetric physicians have been unable to find any active local lesion. The neurotic origin of such cases may be open to doubt, but it is supported by the variability of the pyrexia, and by its occasional rapid cessation without adequate explanation, and without any local change. The diagnosis can only be made as a rule *viâ exclusionis*, and must always be considered provisional as long as there is any probability of an adequate cause being found.

The Unexplained Pyrexia of Children.—This form of pyrexia is in a somewhat similar position to the above. All students of disease in children are familiar with the fact that in patients under nine or ten years of age a mild pyrexia may occur, lasting two, three, or four months, for which no explanation can be found. Since it arises in quite young subjects, a neurotic origin is not so readily suggested, nor so likely, as in the adult female, and yet it is possible that some cases are of this nature. Tuberculosis should be considered carefully, but is often safely and rightly excluded. Gastro-intestinal disturbance, such as constipation; the unsuitable nature of the food; and acute intoxication from the alimentary canal, are other possible explanations of some cases. Since the prognosis is good, it is satisfactory to be able to recognize the clinical condition, even though the causation is obscure; but the diagnosis can only be established after careful exclusion of typhoid fever, tuberculosis, and local inflammatory conditions such as otitis, bacilluria, and other definite lesions or infections.

Frederick Taylor.

PYREXIA WITHOUT OBVIOUS CAUSE.—It is barely fifty years since the clinical thermometer came into regular use, yet now its report is the most commonly ascertained factor in diagnosis and prognosis, though possibly not the most reliable.

A great deal of time and effort has been spent in attempts to ascertain the precise mechanism by which the human body maintains in health an average temperature (practically constant) of 98.4° F., and also in determining the exact factors that lead in disease, and also even in health, to a departure from that temperature.

From these studies, associated with, and controlled by, clinical observations,

there have been established a number of general principles and facts which must be grasped before we can form a just estimate of the value of the reading of the thermometer in diagnosis. We must briefly state the more important of these without discussion.

1. *Sources of the Actual Production of Heat in Health* in order of importance : (a) Muscles at work ; (b) Glands at work ; (c) All minor tissues in which katabolic changes are proceeding.

2. *Provisions for the Escape of Heat*.—(a) Temperature changes in the air, especially that expired ; (b) Escape by the skin, radiation and evaporation of sweat ; (c) Escape by urine and fæces ; (d) Warming of food and anabolic tissue changes.

3. *Mechanisms for Regulating the Distribution of Heat generated Locally*.—(a) A main centre for regulating the distribution of the blood, situated in the medulla ; (b) Subsidiary centres for the same purpose situated in the cord and (?) elsewhere ; (c) The physical properties of the blood, lymph, and tissue juices as regards heat capacity and their circulatory movements.

These three belong to the province of pure experimental physiology ; we have, then, the further observations shared by physiology and clinical medicine :

4. That the temperature in perfect health can be considerably raised (at least to 102° F.—Hill) by strenuous physical exertion ; such elevations very rapidly disappear, possibly with small oscillations.

5. That in exhaustion from violent effort or exposure (generally both, as in shipwrecks and similar accidents) the temperature can be, and is, very dangerously depressed, this being possibly the sole cause of death.

6. That in every form of microbic invasion of the body, the temperature may be altered, either by the poisonous products of the microbes, or by the activities of the microbes themselves, or by the effects of either of these activities upon the mechanism for regulating the distribution of heat, probably by all these methods and, perhaps, others.

Lastly, as purely clinical observations we have learnt :—

7. That in order that variations in temperature may kill, or indeed of themselves be of very serious import, they need to be very extreme (say 6 or 7 degrees above or below normal) or else very prolonged, the necessary duration varying, of course, with the degree of departure from the normal.

8. That in the wards of a hospital where the temperatures are taken and charted at regular intervals, it is scarcely possible to find a chart of chronic disease which does not show some oscillations in temperature, the causes of which are obscure or overlooked.

From these general propositions we may pass to the practical value of thermometric observations in diagnosis. We may again generalize, and say, that standing alone as a primary and isolated observation, the fact of a disturbance in temperature is of little use ; but when this observation is controlled by other factors in diagnosis, and we have made a complete diagnosis of a given disease, we are then in the position of knowing by experience approximately the course of the temperature for that disease, and we shall get many useful hints from the thermometer as to complications or the severity of the attack : a point to which we shall presently refer. Hence, it is useful in our present discussion to divide all patients into two main groups : (1) *Those who are well enough to visit their doctor*, and (2) *Those who are too ill to do so*.

1. **Patients who are well enough to visit their doctor**.—Unless some special complaint or physical sign soon leads to satisfactory diagnosis, let it be an accepted rule to take the temperature ; by doing so we shall have the primary, but possibly merely negative, satisfaction of not having omitted this element in

diagnosis, and not infrequently we shall have the very positive satisfaction of having discovered, early, a disease which we might otherwise have overlooked until something or some one else had drawn attention to it, greatly to our discomfiture and loss of credit. The three most typical illustrations of this position are perhaps *typhoid*, *phthisis*, and a condition which in our haste we label "*Influenza*."

A headache lasting four or five days, and associated with some degree of pyrexia, is, even standing alone, so suspicious of the first, that the patient must be ordered to bed to be watched. A nasty dry cough, with general anæmia, weakness, tiredness, and malaise, makes us very suspicious of the second, especially if there is also the slightest alteration in the breath sounds anywhere. The third is the recently developed refuge of the diagnostically destitute; it leads to much mortification when suppurating gums or tonsils, gonococcal discharges, decomposing urine, or other critical points are discovered later: a position which may be avoided by examining all easily accessible orifices, even in the consulting-room; and if the mouth, throat, and nose all seem healthy, by labelling the trouble fever of uncertain origin, and ordering the patient to bed. In fact, *if on examining the patient in the consulting-room no cause for the pyrexia is apparent*, I would lay down as a golden rule—*Remove the patient at once from Group (1) and place him in Group (2) for further critical examination of his or her person, blood, and excreta.*

2. **Patients who request their doctor to visit them.**—It must be admitted that in this group also, pyrexia by itself is not a very strong diagnostic point, for *ex hypothesi* the other symptoms are of considerable severity and importance, and therefore point pretty strongly in some diagnostic direction. Our residuum from Group (1), with a certain proportion of individuals originally in Group (2), will, however, together make up a by no means negligible number of patients, in whom the cause of pyrexia is obscure to an ordinary examination, and we must lay down rules of procedure.

Here it is the first rule to systematically examine every orifice of the body for a possible source of trouble; gums, ears, nose, throat must be more carefully inspected, and vagina, rectum, and urethra must now be examined critically; should all these prove healthy, the fingers and toes must be overhauled for overlooked sores; and the bones near joints investigated for a possible osteomyelitis.

The Blood.—It is by now almost certain that some clue will have been obtained, but should none have appeared (in some cases even with a complete diagnosis), we must now proceed to have the blood examined by the best available scientific methods; we may by this means prove that the blood itself is at fault, or that it contains some microbes, thus:—

1. *Leucocytosis*.—Suggests leucocythæmia perhaps, in which disease outbreaks of pyrexia are not uncommon; or some obscure focus of suppuration; or perhaps it proves that an obvious focus requires the surgeon's assistance; or per contra, it provides a slight argument against typhoid or tubercle, and in favour of gross parasitic worms.

2. *Poikilocytosis*.—Suggests a severe anæmia, which, like leucocythæmia, is known to have pyrexial periods.

3. *Widal's Test*.—This may clump motile typhoid bacilli, practically proving the presence of typhoid.

4. *Cultivation* of it may prove to demonstration a microbic invasion, and the name and nature of the invader, and possibly suggest the point of invasion.

5. *The microparasites* (malarial or other) may actually be recognized in the blood under the microscope.

The Urine may be found to be thick or decomposed, and thus give a clue to tubercle of the genito-urinary tract, to calculous trouble, or to *B. coli communis* invasion.

The Fæces may yield information : melæna, fatty stools, gall-stones, or even eggs of parasites may be found, thus clearing up the cause of an obscure pyrexia.

Calmette's Reaction may be tried for latent tubercle, but the dropping of tuberculin into an eye is not without its own risks, and in my opinion had better be avoided, especially as by the time tubercle has caused pyrexia it has probably so far advanced as to be discoverable by careful physical examination of the chest. Moreover, the test is alleged to be so delicate as to discover obsolete tubercle, which is not the cause of the pyrexia, and so may lead one astray.

When physical examination, clinical methods of investigating secretions and excretions, and bacteriological aids have thus all been exhausted, there will still remain a few rare cases in which the cause of the pyrexia is undiscoverable. These are chiefly abdominal : thus gall-stones and their complications, pyelophlebitis, ovarian abscess, and deep-seated phlebitis have all presented instances to the writer ; but he knows of no rules by which such cases can be discovered ; time or an autopsy, can alone clear them up.

Apart, however, from such obscurities, there still remain some interesting and useful observations to be made on certain clinical thermometric measurements.

PYREXIA OR SUBNORMAL TEMPERATURES IN CHILDREN.

In children we know that the heat-regulating, like other nervous mechanisms, takes time to develop proper and complete connections with, and control over, subordinate centres of regulation, whether these be foci of production or surfaces of loss ; hence we are not surprised, still less alarmed, at temperatures above normal in children, which in adults may have a very different significance. It is rather the reverse with those below normal, because we know that the growing child requires very large supplies of heat to carry on the anabolic functions of growth and development.

It is scarcely an exaggeration to say that every acute illness (reckoning by time only) or symptom complex in a child is associated with a departure from the normal temperature, and the importance of ascertaining the cause and degree of this departure can hardly be exaggerated from a therapeutical, if not from a diagnostic, point of view.

Subnormal Temperature.—Suppose we find a child in this condition, the immediate diagnosis is great exhaustion ; such temperatures are generally found in marasmic children who have been starved, or its equivalent, i.e., badly fed, or exposed ; the indications are hot food, stimulants, and warmth. Subnormal temperatures are also found in summer diarrhœa, or sometimes in conditions associated with intense pain ; also, at an interval after convulsions (not immediately), and in many other conditions, the differential diagnosis of which will generally be obvious.

Pyrexia, on the other hand, as we have said, owns an infinity of causes, of which we can only glance at a few which may give rise to trouble in diagnosis.

1. *Excitement.*—In children's wards, visiting day almost invariably causes a plentiful crop of high temperatures, even as much as 103° F., and the private practitioner has to remember this when a loving aunt or an injudicious visitor of any sort has come in contact with his little patient at home. A bad night may easily send the temperature up to any height.

2. *Febricula.*—This is merely a Latin name for the fact of pyrexia, but before using the term let every system be carefully examined for signs of disease. It may be that there is absolutely nothing else wrong, and cause No. 1 may be at work alone. The following is a useful and ordinary average clinical rule : for

each 1° F. the temperature rises we may expect the pulse to increase in frequency 10 beats (or in children 15) per minute, and the respirations 2 to 3 per minute, and if this ratio is maintained it is fairly safe to say that heart and lungs are neither of them specially threatened, and hence, *if there be nothing else to attract attention*, it is safe to say that the child is certainly feverish, and we must nurse and watch it. I have known a delicate boy of 9 or 10 thus to have a temperature of 102·5° to 103·5° for three or four days at a time for no reason that I could ever detect; he ate well, slept well, and felt well; and this aspect of affairs should be remembered.

On the other hand, such temporary attacks of pyrexia may be aroused by the presence of some micro-organisms which have hitherto escaped detection, but *quâ* the pyrexia in itself nothing more can be said. Deep-seated tubercle, perhaps, in internal lymphatic glands, may be suspected, but it will often be exceedingly difficult to settle the diagnosis.

3. *Convulsions*.—These must be remembered as a possible cause of a temperature of even 103° F. if the thermometer be used at once.

4. *Specific Zymotic Diseases*.—On discovering a child with fever, suspicion will naturally be aroused that one of these troubles is at hand. The only thing to be said here is: Do not attempt to give a diagnosis on the thermometer alone; the temperature is raised long before a diagnosis is possible. It is well to note that a temperature of 102° F. only, or less, is a point in favour of diphtheria against a tonsillitis of other causation, which frequently has a pyrexia of 104° F. or 105° F. Slight pyrexia, with headache and vomiting, makes us suspect tuberculous meningitis, whereas a temperature of 103° F. or 104° F. with similar associations renders pneumonia probable.

IN CHILDREN AND ADULTS.

Here we may draw attention to some of those cases in which the fever of known average departs from its usual course.

1. *Empyema*.—Suggested by the crisis of a pneumonia, followed in a few days by intermittent or remittent fever.

2. *Endocarditis*.—Suggested in rheumatism by a temperature of 100° F. to 100·5° F. or 101° F. following the initial fall from the administration of salicylates; though the absence of such pyrexia does not exclude the existence either of endocarditis or of pericarditis.

3. *Hyperpyrexia*.—Met with in rheumatism, typhoid, and other septic conditions; its onset is easy to detect in the latter conditions; in the former, restlessness with *less* complaint of pain may cause suspicion. The diagnosis must be confirmed by a frequency of registration proportionate to the severity of the initial observation; two-hourly, hourly, or even quarter-hourly observations may be necessary, that treatment may be controlled.

In addition to such obvious causes, it must be remembered that in cerebral diseases and injuries of almost any kind, the temperature may rise to most unusual heights; one over 104° F. almost certainly heralds a fatal event; the same is sometimes found in uræmia.

4. Attention may be drawn to the fact that *malaria* is not quite extinct in England, and a regular succession of pyrexial attacks at the same time of day suggests this cause.

5. *Sudden Drops in Temperature*.—These are met with in many diseases at times, e.g. typhoid, and the patient must be carefully examined for other suggestive factors—blanching, severe abdominal pain, etc., indicative of hæmorrhage, perforation, or other complication. Do not forget that the crisis in pneumonia is a great deal more of a crisis for the patient than it is for his microbes, and be ready with the appropriate stimulants.

6. *Pyrexia and Malignant Disease*.—When the nature of a swelling in the liver or elsewhere is being critically considered, it is well to bear in mind that the discovery of a temperature hovering about 101° F., or even higher, does not militate at all strongly against a malignant growth, for these frequently give rise to pyrexia, and so, too, but more rarely, may cirrhosis of the liver.

7. In the differential diagnosis of *cerebral abscess* from *tumour* it must not be overlooked that a subnormal temperature, contrary to the usual rule of suppuration, suggests an abscess rather than tumour.

8. It is well to bear in mind that *after an operation*, a few degrees of pyrexia, even for forty-eight hours, are not a conclusive proof of infection of the wound.

9. When the source of a continued pyrexia is being sought for, the heart must be carefully examined every day, or even more frequently, for *infective endocarditis* is a by no means infrequent result of gonococcal and other microbic invasions, which may be most difficult to detect.

Fred. J. Smith.

PYROSIS.—(See HEARTBURN.)

PYURIA.—Pus appears in the urine in all suppurative conditions affecting the urinary tract, and occasionally from the rupture of an extra-urinary abscess into the urinary apparatus. It may be present in large or in microscopic quantities; when in bulk it forms a thick, greyish, tenacious sediment, which must be distinguished from phosphates and from urates; urates are of a pinkish colour, and will be cleared by heating the specimen; phosphates will be dissolved by the addition of acid, whereas pus will remain unaltered by either test.

In alkaline urine, the pus cells tend to run together into a dense viscid deposit, leaving the upper layers of the urine slightly turbid. Urine containing pus will always contain at least some albumin and frequently epithelial cells from some part of the urinary tract. If the specimen containing pus be gently shaken with ozonic ether, a slight effervescence will be produced, or if mixed with liquor potassæ, a rosy precipitation occurs.

Microscopical Characters of Pus Cells in Urine.—The pus cell when present in acid urine is multinuclear, rounded, and about twice the size of a red blood-disc. The contents are granular, but the addition of acid clears the cell and makes the nucleus stand out more distinctly. It may be said, as a general rule, that a small amount of pus in an acid urine is derived from some form of pyelitis, whilst a larger amount of pus in alkaline urine is of vesical origin. There are, however, exceptions to this rule, as for instance, when a pocket of pus is discharged from a pyonephrotic kidney, although usually the pus from a kidney does not show the same viscosity as the pus in the urine of a case of chronic cystitis when alkaline fermentation has taken place in the bladder.

The following is a classified list of the causes of pyuria:—

(A). **From Diseases of the Urinary Organs.**

- | | | |
|---------------|--------------------------------------|--------------------------|
| 1. Renal : | Pyelitis | Pyonephrosis |
| | Pyelonephritis | Tuberculosis |
| | Renal abscess | Calculus. |
| 2. Ureteric : | Calculus. | |
| 3. Vesical : | Cystitis | |
| | Tuberculosis, acute or chronic | |
| | Calculus | |
| | Ulcer—Simple | Epitheliomatous |
| | Tumour—Sloughing papilloma | Villus-covered carcinoma |
| | Bilharzia hæmatobia. | |
| 4. Urethral : | Urethritis—Gonorrhœal, Septic, Gouty | |
| | Stricture. | |

(B). From Diseases outside the Urinary Organs.

Leucorrhœa.

Balanitis with phimosis.

From the extension of inflammatory processes to the bladder, or the rupture into the bladder or urethra of an abscess such as :—

Prostatic abscess

Appendicular abscess

Iliac or pelvic abscess

Psoas abscess

Pyosalpinx

Carcinoma of the pelvic organs—uterus or rectum

Carcinoma of the cæcum, sigmoid or pelvic colon

Ulceration of the small intestine—tuberculous or dysenteric.

It is impossible to determine the lesion producing pus in the urine simply by the examination of the latter. Due consideration must be given to the history and the other symptoms of any case, and particular care be taken not to lay too much emphasis upon any symptom which may point to a vesical lesion when in reality the trouble is in the kidney. This is perhaps most likely to occur in a hæmatogenous infection of the kidney by micro-organisms, in which increased frequency of micturition is a marked symptom, whilst the bladder remains quite free from disease. Occasionally, after pus has been present continuously in the urine for some time, it may disappear entirely, the change being accompanied by increase of pain in the side, by an elevation of temperature, or enlargement of the kidney in a case of pyonephrosis, when the obstruction to the flow of urine from that side has become temporarily complete. Very little help is derived from the character of epithelial cells accompanying pus in the urine. The shapes of the cells of the renal pelvis, ureter, and deeper layers of the bladder are so much alike, that it is usually impossible to differentiate them.

Some assistance in the determination of the origin of the pus in the urine may be gained by instrumental examination :

By Catheter.—If a catheter be passed and the bladder washed out with clear solution of boracic acid, it will be found that the medium is soon rendered clear if the pyuria is of renal origin, but that it is much more difficult to obtain a perfectly clear medium if the bladder is the seat of the suppurative lesion. If the medium is quickly cleared, but yet, after some ten minutes' retention in the bladder is again found to be turbid, the pus is almost certainly descending from the kidney.

The Cystoscope.—Much more certain evidence is gained, however, by a careful cystoscopic examination. By this means it can be determined in the great majority of cases if the bladder is infected or if any ulceration is present. In a few cases the bladder may be so affected that only a small dilatation is allowed, or bleeding is so easily produced that cystoscopy is rendered futile; in these cases there will be little need for an inspection of the bladder. If the bladder be found to be normal, evidence of a suppurative lesion in the kidney may be obtained from the appearance of the ureteric orifices or by the variations in the character of the urinary efflux from them. Instead of the normal forcible flow of clear urine from each orifice, mixing with the medium in the bladder in a characteristic swirl, urine containing pus in any quantity may be seen emitted, appearing in the field as a small smoky puff from the orifice (*Plate V, Fig. B*); pieces of muco-pus may be seen to pass from the orifice, or the turbid urine may be seen to leave the orifice in a gentle trickle instead of a jet if the renal-secreting function is impaired or if renal dilatation is present.

Apart from the alterations in the urinary efflux from an orifice, the actual appearance of the orifice may show changes which indicate renal disease. Thus,

in pyelitis, the margins of the orifice are slightly œdematous and congested, and appear to pout into the bladder (*Plate V, Fig. C*); the mucous membrane of the bladder, immediately below and internal to the orifice, is frequently congested or granular from the effect of the altered urinary flow upon it. If the renal pelvis and ureter are dilated, the orifice is usually elongated and patulous, whilst in tubercle or in diseases in which the ureter is thickened, the whole ureteric orifice is drawn upwards and outwards from its normal situation (*Plate V, Fig. D*), and is seen at the apex of a conical retracted area in the bladder base.

A. The following are the chief DISEASES OF THE URINARY ORGANS in which pyuria may be present:—

1. **Renal Disease.** *Diseases of inflammatory origin.*

Pyelitis and pyelonephritis may arise as an ascending infection from the lower urinary tract, especially when there is some obstruction to the normal passage of urine. Thus, it is common in cases of prostatic enlargement and stricture. When cystitis is present, it is usually bilateral, although one kidney may show much more advanced disease than the other. Any growth or lesion in the bladder which is accompanied by suppurative infection, and which involves the ureteric orifice, such as vesical epithelioma, or the direct involvement of one or both ureters in the spread of uterine cancer, may set up pyelitis in the kidney, the infection ascending either by the ureter or by the peri-ureteric lymphatics.

In this group of cases the primary cause of the disease has usually advanced to a sufficiently late stage to be obvious, and the symptoms of suppurative ascending infection of the renal pelvis or renal tissues are usually overshadowed by the symptoms of the disease causing the obstruction. Aching in the loin, rigors or raised temperature, tenderness on deep palpation in the renal area, or actual renal enlargement, are usually indicative of renal infection. The urine is often increased in quantity, of low specific gravity, and the daily excretion of solids is lessened; the skin is dry and harsh and the tongue glazed.

Pyelitis and pyelonephritis may also arise as an infection of the kidney apart from any other disease in the genito-urinary organs. Infection is conveyed to the kidney by the blood-stream (hæmatogenous form), and is not uncommon in acute fevers, or with mild forms of suppuration in other parts of the body, or in association with pregnancy. In the less acute forms a pyelitis may result, as in typhoid fever, but in most cases the hæmatogenous infection produces first a suppurative process in the renal parenchyma, from which infection spreads to the calyces and pelvis. This form of disease has been shown by recent work to be due most frequently to the colon bacillus in association with affections of the intestinal canal, less frequently to the staphylococcus, streptococcus, pneumococcus, or typhoid bacillus. The renal pyelitis which ensues when a calculus has ulcerated into the renal pelvis is truly a hæmatogenous infection.

Acute hæmatogenous infection of the renal pelvis without involvement of the renal parenchyma usually begins with slight rigors, tenderness in the loin, and increased frequency of micturition. The urine is faintly turbid and opalescent, does not settle to a pronounced sediment, but remains of a sheeny appearance. It contains numerous bacteria, a little pus, and a little albumin. When the infection first attacks the renal parenchyma as well as the pelvis, the symptoms are much more severe, and the patient may become rapidly uræmic. In the less acute cases, small foci of suppuration occur, which coalesce to form an abscess, with the general symptoms of suppuration. Renal abscess may also result from injury when an effusion of blood in the renal tissues becomes infected by pyogenic micro-organisms, or by the breaking down of a renal infarct.

Pyonephrosis—or dilatation of the pelvis and calyces of the kidney with pus or with pus and urine—is caused when suppuration has occurred in a kidney which is at the same time subjected to some form of obstruction to the normal passage

of urine. Pyonephrosis is most commonly caused by renal calculus or tuberculosis, but is by no means uncommon with a chronic cystitis, complicating urinary obstruction from an enlarged prostate or stricture. Carcinomatous ulceration affecting a ureteric orifice, either primary in the bladder or by direct extension of uterine cancer, is also a comparatively common cause of pyonephrosis. In contradistinction to suppurative pyelonephritis, the symptoms of pyonephrosis are less severe; at first they are those of the obstructive lesion causing the disease, to which are added the general symptoms of suppuration. Pyonephrosis causes a renal tumour of variable size, whilst in the same patient distinct intermittence in size may be observed, a decrease being associated with the discharge of a larger amount of pus in the urine.

The urine in suppurative disease of the kidney and its pelvis requires careful examination. It may be normal with a localized cortical renal abscess or with closed pyonephrosis; in all other lesions it contains pus and micro-organisms. If the pus-cells are found in the form of casts of the renal tubules, infection of the renal parenchyma is present, whilst in this latter the albumin in the urine is in excess of that due to the pus present. Polyuria, with a diminution of the total solids of the urine in a daily examination, is commonly present in inflammatory lesions of the renal tissue.

Renal Tuberculosis.—The miliary form of tuberculosis occurs in children as part of a general dissemination of tubercle, and causes no urinary symptoms. The kidney is, however, attacked not infrequently by primary tuberculous infection, when it is unilateral and begins as a deposit in the form of small tuberculous nodules. These enlarge and coalesce to form a larger caseating area, which eventually opens into the renal pelvis by direct ulceration of a calyx to discharge its contents by the urine, when the lining membrane of the renal pelvis and ureter become infected with tubercle and thickened by submucous infiltration. At first, before ulceration into the renal pelvis has occurred, the symptoms of the disease are very slight; there may be aching pain in the loin and slight albuminuria, but as soon as the renal pelvis is involved, more marked symptoms occur—including persistent pyuria, lumbar aching, increased frequency of micturition, and polyuria. The urine is pale, of low specific gravity, and of opalescent turbidity; by careful examination after centrifuging, the tubercle bacillus is usually found. A small amount of blood is generally present. The increased frequency of micturition occurs before any descending vesical infection has occurred, and this symptom, accompanied by pyuria, has frequently given rise to a diagnosis of vesical disease. The occurrence in a young adult patient of persistent pyuria which is not due to gonorrhœa, injury, or stone, should always be looked upon with grave suspicion, and a careful search made for the tubercle bacillus; should this not be found by the microscope, inoculation experiments into guinea-pigs should be conducted. A careful examination of the bladder should also be made by the cystoscope, when vesical tuberculosis may be rendered apparent (*Plate V, Fig. E*), or the characteristic changes in the ureteric orifice may show the presence of renal infection (*Plate V, Fig. D*). By digital examination per rectum, the lower end of the ureter may be felt to be thickened and rigid in renal tuberculosis.

Renal tuberculosis is often confounded with *renal stone*, and the colic which is usually associated with stone may be present in tuberculosis if a piece of caseous debris be passed down the ureter. A skiagraphic shadow of a calculus shows well-defined margins (*Fig. 97, p. 309*), whereas a tuberculous focus in the kidney may give rise to a faint, blurred, indistinct shadow in the renal area. The presence of tubercle bacilli will, however, determine the existence of tuberculosis, whilst tuberculous lesions elsewhere in the body, most frequently in the testes, prostate, or vesiculæ seminales, may also serve to confirm the diagnosis.

The symptoms of renal calculus vary with the position of the stone and the changes that have taken place in the kidney in consequence of its presence. It may be situated in the renal parenchyma, and cause no symptoms beyond lumbar aching; or in the renal pelvis, when, if movable, it may cause acute renal colic, due either to the attempted passage of the stone by the pelvic outlet or to the increased intrarenal pressure from blockage of the ureter. So long as the kidney remains aseptic the urine contains only a trace of blood in microscopic amount; but if it becomes infected with micro-organisms, pyelitis, pyelonephritis, or pyonephrosis may result, with their attendant symptoms. Thus, pus only occurs in the urine in a case of renal stone when infection of the kidney has occurred.

2. **Ureteric Calculus.**—A small renal calculus may become impacted during its passage along the ureter, and may cause some difficulty in diagnosis. The usual situations of the obstructed calculus are in the upper few inches of the ureter, at the pelvic brim, or at the vesical end of the tube; in most cases the previous history of renal colic and symptoms of renal stone will be sufficient to indicate its partial ureteric descent. A calculus may, however, be present in the upper end of the ureter or at the pelvic brim, and give very few symptoms beyond a fixed pain in the course of the ureter; in the latter situation it has frequently been mistaken for ovarian pain or for chronic appendicitis. If the stone blocks the ureter completely, the kidney of the same side—in the absence of septic infection—becomes functionless and atrophies; but if the calculus only partially occludes the lumen of the tube, renal distention will occur, with resulting uro- or pyonephrosis. If, however, the calculus becomes impacted in the vesical segment of the ureter, a train of symptoms occurs simulating vesical stone or vesical tuberculosis; namely, increased frequency of micturition, penile pain following micturition, and often a small amount of blood and pus in the urine, in addition to the aching pain in the loin. A ureteric calculus impacted in this situation may often be felt in the ureter upon a rectal or vaginal examination; it may be demonstrated by the x-rays; whilst the changes seen around the ureteric orifice, and the absence of a vesical lesion on cystoscopic examination, will confirm the diagnosis.

3. **Vesical Diseases.**—Pyuria may occur in any lesion of the bladder which is associated with inflammatory changes. The fact that urine is retained in the bladder renders the latter much more liable to septic infection, so that cystitis is common with urethral stricture or prostatic obstruction. Any ulceration of the bladder, tuberculous or malignant, is also accompanied by inflammatory changes, when pus will be present in the urine.

Cystitis may be acute or chronic, and the essential factor of either form is the infection of the bladder by some micro-organism; any agent which produces either congestion of the bladder or retention of urine, acts as a predisposing cause of cystitis.

With *acute cystitis* the mucous membrane of the bladder becomes oedematous and highly congested, and epithelial desquamation and formation of pus rapidly follow. Hæmorrhage may occur from the congested mucosa, or small abscesses develop in it and rupture into the bladder, to leave small areas of ulceration. In severe cases, patches of the mucous membrane may become gangrenous. The symptoms of acute cystitis are usually distinctive; frequent and painful micturition, elevation of temperature, pain in the perineum and suprapubic area, with the presence of pus and blood in the urine, which is commonly of an acid reaction. Usually, some distinct cause for the onset of acute cystitis is apparent, such as some form of acute urethritis or of previous instrumentation, and there is little difficulty in the diagnosis. The same symptoms are, however, produced by an acute inflammation of the prostate which, in nearly all cases, is preceded by acute urethritis; the presence of swelling of the gland,

and acute pain on rectal palpation, will determine the presence of prostatic inflammation.

Chronic cystitis may succeed acute. The symptoms are less marked, but increased frequency of micturition is always present. The urine is alkaline, contains pus and mucus, and the disease is commonly associated with some form of urinary obstruction, or with retention or incontinence due to some nervous disease, such as locomotor ataxy or transverse myelitis. The possibility of retroversion of a gravid uterus should not be overlooked. The association of pyuria and increased frequency of micturition, which is present in chronic cystitis, must be distinguished carefully from that due to pyelitis or pyelonephritis, for it has been shown that increased frequency of micturition may be present without any vesical infection. In renal pyelitis, the urine is usually acid in reaction, pale in colour, and shows a general turbidity, with little inclination towards a deposit at the bottom of a specimen. The urine of chronic cystitis is alkaline, and rapidly deposits a greyish sediment of pus. In pyelitis and pyelonephritis, the urine contains more albumin than the pus would account for, and on microscopic examination renal or pus casts are frequently found, whereas in cystitis the albumin is less, and vesical cellular elements are present without casts, unless the kidneys are affected also.

Further evidence may be obtained by the use of the *cystoscope*. In cystitis the bladder wall is found to be trabeculated and the mucous membrane thickened; it has lost the normal iridescent appearance, and the vessels of the mucous membrane are obscured. With pyelitis, the bladder wall is normal, but the ureteric orifice of the affected side shows the thickened or pouting lips and slightly raised area of thickened mucous membrane, whilst the urine flowing from the orifice may be seen to be turbid or to contain small particles of muco-pus.

Chronic cystitis may be simulated by an inflammation of the posterior urethra. In such a case, there is almost always a history of urethral infection, and the diagnosis can be made by urethral irrigation. The patient is directed to retain his urine for some three hours, and after irrigating the anterior urethra as far as the compressor muscle with sterile water or boric acid lotion, the urine is passed into two glasses. With posterior urethritis the urine contained in the first specimen will contain shreds of muco-pus, whilst that of the second specimen is clear; whereas, with cystitis, the second specimen will be as turbid as, or even more turbid than, the first.

Tuberculous cystitis occurs usually in young adults. The characteristic symptoms are increased frequency of micturition during both day and night, pyuria, with pricking pain in the glans penis at the end of micturition, and the appearance of a few drops of blood in the last drops of urine. The same symptoms are often present with vesical calculus and with vesical epithelioma, when ulceration has taken place. *Vesical calculus* is usually present in older patients, and during the early part of the illness, before cystitis has set in, the calculus only gives rise to desire to micturate during movement, and to penile pain. When cystitis supervenes, the frequency of micturition will be marked during both day and night. *Vesical epithelioma* also occurs in older patients, and when ulcerated may cause hæmaturia; frequently the diagnosis may be made by the palpation per rectum of an indurated area in the bladder base, or of some enlarged glands in the pelvic lymphatic space. Tuberculous cystitis in the early stages, when the disease is characterized by the deposition of greyish tubercles in the submucous coat of the bladder, may give rise to increased frequency of micturition without other symptoms, but in the progressive advance of the disease the tubercles enlarge, coalesce and ulcerate on the surface, by which time pus and blood will be present in the urine, and tubercle bacilli should

be found. It may be taken as a general rule that in any patient of young adult life with increased frequency of micturition and pyuria, a careful search should be made for tubercle bacilli in the urine, and for other tuberculous lesions, especially in the testes, prostate, or vesiculæ seminales.

Tuberculous cystitis is less often a primary disease than secondary to other lesions in the genito-urinary apparatus—most commonly to tuberculous disease of one kidney, when, after the primary focus has ruptured into the renal pelvis, the lining membranes of the latter, of the ureter and of the bladder become successively affected. The diagnosis between primary renal and primary vesical tuberculosis is very often difficult, for it has been shown that when the renal focus has ulcerated into the pelvis, and descending infection has commenced, the symptoms of the two affections are very similar. Thus, with renal disease, persistent pyuria, increased frequency of micturition, and penile pain at the termination of urination, may be present before the bladder shows any sign of disease; blood is usually present in small quantity in the urine, but its amount is not so definitely greater in the urine passed at the end of micturition as is the case in vesical disease. In renal tuberculosis there may be tenderness in the loin, the kidney is usually enlarged, and the lower end of the ureter can be felt distinctly thickened upon rectal or vaginal examination. The two conditions can usually be diagnosed by a careful cystoscopic examination. In vesical tuberculosis the deposition of submucous tubercles, together with the shallow ulceration in the bladder mucous membrane, may be seen (*Plate V, Fig. E*), whilst in renal tuberculosis, changes may be seen in the ureteric orifice of the affected side (*Plate V, Fig. D*). At first the orifice becomes thickened, œdematous, and slightly patulous; but later it is rigid and patent, or drawn up by the shortening of the ureter to occupy a position above and outside the normal situation in the trigonal area of the bladder, or drawn up to the apex of a conical retraction of the bladder base. When tuberculous cystitis is secondary to lesions in the testes, prostate, or vesicles, the disease commonly begins in the epididymis of one side, and spreads to the vesicle or prostate, whence a focus may directly ulcerate into the bladder. The patient will first notice increased frequency of micturition and vesical pain, followed by an attack of hæmaturia when actual ulceration into the bladder base occurs; the formation of a tuberculous ulcer in the bladder leads to pyuria and the other symptoms mentioned above. This sequence is by no means uncommon; the history of testicular disease and the evidence obtained by rectal examination will serve to indicate the nature of the condition.

Vesical calculus may give rise to pyuria when it is accompanied by cystitis, but may be present a long time before any inflammatory infection occurs. When cystitis is present, the urine shows no features which will distinguish it from that of patients suffering from some other form of cystitis, except that there may be a constant presence of crystals, or an increased amount of blood after exercise. The constant symptoms of vesical calculus are vesical irritability during the day time, penile pain after micturition, and hæmaturia, especially after any exercise. If the presence of a calculus is suspected in the bladder, an examination by the *x*-rays (*Fig. 98, p. 312*), a sound, or the cystoscope, will reveal it. Röntgen rays will detect even a uric-acid stone; the cystoscope may detect a stone that is in a diverticulum, partially encysted or lying in the pouch behind an enlarged prostate, where it may easily be overlooked in searching the interior of the bladder with a sound.

Ulceration of the urinary bladder, apart from tuberculosis and epithelioma, occurs as a simple ulcer, consecutive to chronic cystitis, or as the result of injury. A single non-tuberculous ulcer, similar to gastric ulcer, has been described as occurring in young adults in the neighbourhood of the ureteric

orifices, causing hæmaturia and painful frequent micturition. Later, the surface of the ulcer becomes encrusted with phosphatic material, when the urine contains muco-pus, and often small flakes of phosphatic débris from the surface of the ulcer. This single ulcer is rare, and can only be diagnosed by the use of the cystoscope. Ulceration may also occur in the bladder as a result of severe cystitis, when necrosis has occurred in the mucous membrane. This condition is occasionally present in a case of obstinate cystitis, giving rise to painful and frequent micturition, and may be diagnosed by means of the cystoscope. Both the simple and the consecutive ulcer must be differentiated from tuberculous ulceration of the bladder; in the latter, hæmorrhage is usually slight, and occurs at the termination of micturition; tubercle bacilli may be found in the urine, or other deposits of tubercle found in the epididymis, prostate, or seminal vesicles. The cystoscopic appearance of tuberculous disease, and its more generalized distribution in the vesical wall, will afford the strongest evidence in the diagnosis.

Malignant ulceration of the bladder occurs in two distinct forms: (a) The infiltrating epithelioma; (b) The villus-covered carcinoma.

(a). *The infiltrating variety* occurs as an ulcer, with raised edges and uneven necrotic surface, placed usually at the basal portion of the bladder. It is usually met with in men over fifty years of age, causing increased frequency in micturition, pain at the glans penis following micturition, with blood and pus in the urine. The bladder-wall in the vicinity of the ulcer is densely infiltrated, and frequently can be felt on digital examination by the rectum, whilst at the same time the lymphatic glands in the pelvic space may be felt to be enlarged.

(b). *The villus-covered carcinoma* of the bladder is not uncommon, and gives rise to irregular profuse hæmorrhages. The tumour is attached to the bladder by a broad pedicle, or may be entirely sessile and covered by blunted villi, presenting a coarsely mammillated surface. It occurs in elderly patients, and the tumours are frequently multiple. The surface is often necrotic, giving rise to pyuria. The diagnosis is not difficult, the frequently recurring hæmorrhages in the urine, associated with increased frequency of micturition, pain, and pyuria in an elderly patient, being fairly distinctive. Not uncommonly there is unilateral renal aching from the interference, by the position of the growth, with the flow of urine from one ureteric orifice, so that renal disease may be suspected; but in all cases a careful cystoscopic examination will show the nature of the disease. Difficulty may be experienced in obtaining a satisfactorily clear medium for a cystoscopic view, but in most cases this can be accomplished by gentle manipulations, or by the use of a styptic such as adrenalin 1-1000, or silver nitrate 1-1000. Difficulty may be found in distinguishing cystoscopically between a benign papilloma and villus-covered pedunculated carcinoma; but the broad attachment of the latter to the bladder, the stunted villi covering it, and the multiplicity of the tumours, will be signs of malignant disease (*Plate VI, Fig. F*). In rare instances a *benign papilloma* may begin to slough on the surface, or may be accompanied by cystitis, when pyuria will be present. A cystoscopic examination will reveal the diagnosis. Microscopical examination of the urinary deposit may show distinctive fragments of new growth.

Bilharzia hæmatobia may cause pus in the urine in advanced cases. When the small nodules in the submucous tissues (*Plate VI, Fig. K*) of the bladder ulcerate, small fungating masses are found in the bladder. The typical ova in the urine (*Fig. 13, p. 93*), in addition to pus and blood, will be found on microscopical examination of the urinary sediment.

4. **Urethral Causes.**—Any condition which sets up a purulent urethritis will cause pyuria. If the urethritis is recent or profuse, the local condition will be

enough to indicate the diagnosis, but it must be remembered that cystitis may complicate a case of urethritis by direct backward infection. If, in addition to urethral discharge, there is increased desire to urinate, suprapubic pain, or hæmaturia, acute cystitis is probably present. The anterior urethra should be irrigated well with sterile water or boric acid lotion, and the patient then directed to pass urine into two glasses. If the first portion passed contains pus and the second is clear, infection is present in the posterior urethra and not in the bladder, but if both specimens are turbid with pus, cystitis is present.

The onset of acute prostatitis complicating urethritis gives rise to increased desire to micturate, and perineal and suprapubic pain, in addition to pyuria, or may cause retention of urine. Digital examination of the prostate, per rectum, will show the prostate to be acutely inflamed, enlarged, and very painful.

A small amount of pus may be present in the urine in cases of chronic urethritis which is not sufficient to cause any visible discharge from the meatus. The anterior urethra should be irrigated well, and the urine again passed into two separate glasses, when, if the first washings from the urethra contain pus, there is infection in the anterior urethra; if the first specimen of urine contains pus but the second is clear, there is infection in the posterior urethra; whilst if both contain pus, cystitis is present. In any case of urethral discharge, a bacteriological examination should be made for the organism causing the infection, for it is far from uncommon to find that an apparent gonorrhœal urethritis is in reality due to staphylococcal infection.

Pyuria is commonly present in cases of stricture of the urethra, from the co-existing urethritis or cystitis.

B. PYURIA CAUSED BY DISEASE OUTSIDE THE URINARY ORGANS.—Pus may be present in the urine, apart from any disease in the urinary apparatus, either by accidental contamination of the urine, or by the direct spread of inflammatory or carcinomatous processes from neighbouring organs to the urethra, the bladder, or more rarely the ureter. In the male, the accumulation of pus behind a *phimosis* may account for pyuria, or in the female a *leucorrhœal discharge* may contaminate the urine. In the latter case the vulva should be cleansed well with an antiseptic, and a catheter passed to obtain a specimen for examination.

The spread of inflammatory processes, or the actual rupture of an abscess into any part of the urinary tract, will cause pyuria, and may create considerable difficulty in diagnosis. If symptoms pointing to urinary trouble, such as markedly increased frequency of micturition or slight hæmaturia, be followed by the sudden appearance of a quantity of pus in the urine, there is strong probability of the *rupture of an extra-urinary abscess* into the bladder or urethra, provided that the sudden emptying of a renal abscess or a pyonephrosis can be eliminated. Frequently the history of any case will give some indication of the primary trouble, of which the most frequent are prostatic abscess, appendical abscess, pyosalpinx, psoas, iliac, or pelvic abscess.

Prostatic abscess is most frequently a sequela of an acute urethritis which has infected the posterior urethra and caused an acute prostatitis. It may be due to a gonorrhœal or to a septic venereal infection, or may result from septic instrumentation in the urethra. An acute prostatitis is very prone to result in the formation of an abscess which may rupture into the urethra, bladder, or rectum, unless appropriate surgical measures be undertaken. The onset of acute prostatitis is marked by increasing desire to micturate, pain in the perineum and hypogastric areas, and raised temperature, whilst, per rectum, the prostate is felt to be uniformly enlarged and very tender. If an abscess result, there may be rigors and increased difficulty in micturition, even retention of urine, whilst a

soft area may be felt in the prostate from the rectal aspect. A prostatic abscess may occur more rarely in connection with a *prostatic calculus*; it may open into the urethra or bladder, or may be present in advanced *genito-urinary tuberculosis*, when a prostatic focus may caseate and ulcerate into the trigonal area of the bladder, a condition which is usually accompanied by a sharp attack of hæmaturia. A tuberculous focus in the prostate is commonly a comparatively late feature in the disease, and the presence of nodules in the epididymis or seminal vesicles, or the previous knowledge of vesical tuberculosis, will assist very largely in the diagnosis.

Pyuria in Inflammation of the Vermiform Appendix.—In the usual position of the appendix the bladder is commonly not affected; but if the appendix passes downwards across the pelvic brim, it is not uncommon to find that, should it become inflamed, the patient complains of frequent and painful micturition. The appendix may be adherent to the bladder, when the latter will show on cystoscopic examination a localized area of acute congestion on the right lateral wall, and both pus and blood may be present in the urine; further, a small abscess may be formed in the adhesions between the appendix and the bladder, ulcerating into the latter and giving rise to pyuria. Two such cases have come under the care of the writer, when the association of frequently recurring attacks of pain low down in the right side of the pelvis, with increased frequency of micturition and pyuria, had given rise to the suspicion of ureteral calculus. In each case a cystoscopic examination showed a normal ureter, and a small ulcer in the right lateral wall of the bladder, surrounded by an area of acute cystitis. The diagnosis of these cases is by no means easy; in the first place the situation of the pain is lower in the pelvis than is usual with appendicitis, whilst the association with urinary symptoms rather points to vesical disease; but the character of the onset of the trouble, with elevation of temperature and pulse-rate, and right-sided abdominal rigidity, will point to an acute intra-abdominal lesion. In other cases, again, an abscess resulting from appendicular suppuration may track down into the pelvis and, if unopened, may rupture into the bladder. In these cases, there will be the usual history of acute appendicitis, followed by a tumour in the right iliac fossa or pelvic space, with a continuance of pyrexia, or even rigors, which subside on the appearance of a large quantity of pus in the urine.

A *pyosalpinx* may rupture into the bladder or cause cystitis from the direct spread of the inflammatory process to the bladder. There will usually be a history of leucorrhœa, with constant aching or dragging pains in the lumbo-sacral region, aggravated at intervals with more severe attacks of pain and malaise. The periods may be profuse and associated with more pain than usual, and on vaginal examination a distinct fullness or tumour may be felt in one or both fornices.

Psoas or iliac abscess may rupture into the bladder, and a psoas abscess has been known to open into a ureter; but the swelling in the iliac fossa or inguinal region, together with signs of spinal caries, will point to the condition.

Carcinoma of the neighbouring organs in the pelvis frequently attacks the bladder by the direct spread of the growth. This is most common in carcinoma of the uterine cervix and of the rectum, but may result from cancer of the pelvic colon, sigmoid, or cæcum. In any case, the spread of the disease to the bladder occurs late in the disease, so that symptoms of the initial trouble are sufficiently manifest to point to the diagnosis. The implication of the bladder is first shown by an increased desire to pass urine, and by pain during the act; later, when the growth has actually infiltrated the vesical mucous membrane, ulceration into the bladder occurs, with the passage of pus and blood in the urine. If the growth has extended from the uterus or vagina, there may be a leakage of urine

into the latter; or if from the rectum or colon, some fæces or flatus may be passed per urethram.

Tuberculous or dysenteric ulcers of the small intestine have in some instances become adherent to the bladder wall, and caused cystitis by direct spread, or have even perforated into the bladder.

RAINBOW VISION.—(See VISION, DEFECTS OF.)

RASHES.—(See ERYTHEMA; PUSTULES; VESICLES, ETC.)

REACTION OF DEGENERATION.—In testing muscles and nerves electrically, two different kinds of current are employed, namely: *faradic*, in which there is a very rapid alternate making and breaking of the current, and the *galvanic*, in which the current flows continuously until it is voluntarily interrupted by the operator. The faradic current continuously excites the nerve and muscle all the time it flows; the galvanic current only excites when it is made and when it is broken; not whilst it is flowing. In the case of the faradic current there is no difference between the poles, each being alternately an anode and a kathode many times a minute; in the galvanic current, on the other hand, the pole connected to the zinc of the battery is known as the kathode, and it is by this pole that the current leaves the body, whilst the other pole is known as the anode, and by it the current enters the body. When testing muscles or nerves, it is usual to have one pole in contact with an indifferent part, such as the spine, and the other over the motor point of the muscle or nerve to be tested. Broadly speaking, the best spot for stimulating a nerve is the place where it is most superficial, and for a muscle, over the site of entry of its motor nerve. It is important to have the skin well wetted, in order to minimize its resistance to electrical conduction; and the strengths of current required to produce contractions should be measured by a galvanometer, without which the relative excitabilities of the nerves and muscles of the two sides of the body cannot be compared.

Under normal conditions, both faradic and galvanic currents produce brisk contractions of a muscle when applied either to it or to its nerve; and with galvanism it is found that a weaker current will suffice to evoke a contraction on making the circuit when the kathode is on the muscle or nerve than when the anode is similarly employed. This is usually summarized by the formula $K.C.C. > A.C.C.$, which means "the kathodal closure contraction is more easily obtained than is the anodal closure contraction." When the nerve is degenerated, however, there is a change in these electrical reactions, and when there is complete reaction of degeneration—often written and spoken of as R.D.—stimulation of the nerve itself evokes no muscular contractions whether the faradic or the galvanic current is employed, stimulation of the muscle evokes no contraction when the faradic current is used, whilst with galvanism the muscle can still be made to contract, though its method of response differs from the normal in the following respects:—

1. It may sometimes be evoked by a strength of current less than the healthy minimum.

2. The twitch of the contraction is slow and sluggish, instead of brisk and quick.

3. It may be evoked at least as readily when the pole upon the muscle is the anode as when it is the kathode; this is expressed by the formulæ $A.C.C. = K.C.C.$, or $A.C.C. > K.C.C.$, which mean that the anodal closure contraction is obtained from quite as small a current as is the kathodal closure contraction, or even from a smaller current than the minimum required for the kathodal closure contraction.

In this connection, however, two distinct considerations require to be clearly understood. In the first place, if a given nerve were cut across with a knife, there would be no immediate R.D.; it takes a week or more for the process of nerve degeneration to reach the stage that produces R.D.; it then depends upon what happens to the nerve how long the R.D. persists; if regeneration occurs, it takes from twelve weeks onwards to complete itself, and R.D. will be found all that time; if the nerve does not regenerate, then R.D. may persist for two or three years or more, provided that the muscle fibres are kept, by massage and electrical treatment, from becoming mere strands of fibrous tissue. Should the latter change ensue, there will be no more electrical response in the fibrous tissue that used to be muscle than there would be in any other fibrous tissue.

In the second place, it happens, as often as not, that when some fibres in a nerve trunk degenerate, others do not, and the same applies to the corresponding muscle fibres. It follows that there will then be a mixed reaction, the normal fibres giving a normal response, the degenerated fibres giving R.D.; the greater the proportion of degenerated fibres, the nearer will the reactions obtained approach to complete R.D., and vice versa. The result is spoken of as *partial R.D.*; some excitability both of the nerves and of the muscles to faradism remains, but it is less than normal; the nerve responds to galvanism, but not so readily as does the muscle when the latter is stimulated directly; the response of the muscle will be less brisk than normal, and yet K.C.C. may still be more easily obtained than A.C.C. It is by no means easy to be sure of the interpretation of a partial R.D., but partial is commoner than complete R.D.

The chief use of R.D. is in distinguishing cases of muscular atrophy that are due to organic changes in the lower neurone from other cases of atrophy, especially when the latter is due to general wasting from cachexia, or to arthritis, or disuse, or a primary muscular dystrophy. When R.D. is present there is a lesion in the lower neurone, either in the anterior cornual cells, in the anterior nerve roots, or in the peripheral motor nerve fibres. The differential diagnosis of the various affections of these parts is discussed under ATROPHY, MUSCULAR.

It remains to add that there are a few maladies in which the electrical reactions are peculiar, though they do not present R.D. In tetany, for instance, Erb has shown that A.C.C. is often greater than K.C.C., although in other respects the reactions are normal. In Thomsen's disease there is variability in the polar responses, but excitability to faradism remains. In some cases of Raynaud's disease, and in angio-neurotic oedema and allied vasomotor neuroses, there may be variations from the normal galvanic reactions. In myasthenia gravis (*Figs. 83, 84, p. 261*) it is characteristic that, whereas the affected muscles respond readily to the first few faradic stimuli, "the contractions rapidly diminish in size and cease after a few minutes, notwithstanding the continuance of stimulation. After a period of rest this myasthenic reaction is obtainable again, and so on. This type of electrical response corresponds precisely to the rapid fatigue of the voluntary muscle movements, and the diagnosis is not difficult, though the disease is rare.

Herbert French.

RECTUM, ABNORMALITIES FELT PER.

Method of Examination.—The patient should be placed in a good light and on a couch of convenient height. With male subjects the position recommended is the knee-elbow, and with females the right lateral with the knees flexed and the right arm drawn behind the back. The examination should be made with the left hand, leaving the right free for manipulations. Most diseases of the rectum are situated within two inches of the anus. It is advisable, therefore, that to begin with, the finger should be inserted as far as the first joint only,

and the lower inch of the bowel examined thoroughly. The examination must not be concluded until the finger has been passed up as high as possible and the whole of the rectum within reach explored, as well as the coccyx, sacrum, ischio-rectal fossæ, and adjoining viscera. The rectal speculum and the sigmoidoscope may also be needed to complete the examination.

If any abnormality be felt, the first thing to ascertain is (1) *Whether it lies free in the lumen or is attached to the wall of the rectum*; (2) *Whether it is some abnormality of an adjoining structure or viscus that can be felt through the rectum.*

I.—ABNORMALITIES LYING FREE IN THE LUMEN OR ATTACHED TO THE WALL OF THE RECTUM.

A. Foreign Bodies.—Though fæces can hardly be considered as foreign to the rectum, yet a hard, scybalous mass, enterolith, or hair-ball may amount to an abnormality.

True foreign bodies include those that have been introduced through the anus, and those that have been swallowed. Examples of the first class are seldom met with, and then are generally in persons of weak intellect. Thieves sometimes employ the rectum as a hiding-place for stolen goods. The majority of foreign bodies felt per rectum have been swallowed, and consist of fishbones, pins, needles, and splinters of wood. Their importance lies in the fact that they may cause a rectal or ischio-rectal abscess, and in treating such a case their discovery and removal is essential for a complete cure.

B. Swellings of the Rectum projecting into the Lumen.

1. *Internal Hæmorrhoids* are rarely palpable to the finger unless chronically inflamed, thrombosed, or gangrenous. If palpable, they will be felt immediately inside the anus, and can easily be hooked out with the finger and made to protrude through the anal orifice for inspection. The existence of piles having been diagnosed, an effort should be made to see if there is any causative condition, such as a carcinoma in the bowel above.

2. *Abscess* (submucous) gives rise to a more or less elongated, smooth, elastic swelling in the rectal wall. It is intensely tender, the slightest pressure causing great pain. The mucous membrane may feel hot, and pit on pressure. If the abscess has burst or bursts during examination, the finger on withdrawal will be covered with pus. An abscess that has already emptied itself feels like a small pea or bean in the submucous tissue.

3. *Polypus* is a term used to designate, without reference to its histological characteristics, any benign tumour that is pedunculated. Almost all innocent tumours in this position, even if sessile at the beginning, become pedunculated owing to the downward pressure of the fæces. The passage of blood and mucus, combined with the absence of piles and carcinoma, should lead one to suspect the presence of a polypus. It may not be easy to feel, because its consistency is much the same as that of the mucous membrane, and further, its peduncle may allow such free movement that it may easily be mistaken for a small mass of fæces. The best way of fixing these growths is to sweep the finger round and round the whole circumference of the rectum up to the highest point attainable. The growth is then arrested by the pedicle, and the finger can be hooked round it, so that the growth is drawn down and, if possible, made to protrude through the anus. If the polypus is large, a rectal speculum may be of service. It is to be remembered that polypi are often multiple.

4. *Ulcers*, unless malignant or chronically inflamed, can rarely be felt with the finger; they must be exposed to view with the speculum. They may be tuberculous, gummatous, traumatic, or due to ulcerative colitis or dysentery.

5. *Carcinoma* occurs usually in people over forty. Its commonest site is within the four terminal inches of the bowel. The exploring finger feels a swelling in the wall of the rectum, and unfortunately, because patients do not present themselves early for examination, the swelling will be large. The great characteristic is that it is hard, fixed, irregular, and nodular. The extent of the growth varies, of course, with the stage of the disease: it may involve only a small part of the circumference of the bowel, or may extend right round so as to occlude the lumen and cause a stricture. The growth is usually disintegrated on the surface, forming a malignant ulcer; this surface is friable and bleeds easily. There is nearly always a belt of normal mucosa between the internal sphincter and the neoplasm.

Not only the lateral but the upper limit of the growth is to be ascertained by inserting the finger to its extreme limit, care being taken not to split the mass. Another point to be gauged by a rectal examination, is the degree of infiltration as measured by the fixity of the tumour to the neighbouring structures, e.g., sacrum and coccyx. Following the rectal examination, the abdomen is to be palpated for evidence of infection of the inguinal, pelvic, and lumbar glands, and the existence of secondary deposits in the liver.

The clinical symptoms of carcinoma of the rectum are very suggestive. The patient generally complains of diarrhœa, the bowels being open five to twenty times a day, and this may have followed on a period of constipation. Notwithstanding the apparent diarrhœa, the total amount of fœces passed is very small, and no sense of satisfaction is obtained by the patient after stool. The action of the bowels may be so rapid as to merit the description "explosive diarrhœa." Hæmorrhage from the bowel is a common symptom, and in the later stages there is a discharge of mucus. Pain is complained of—a dull aching pain in the rectum and at the bottom of the back, which is not made much worse by the passage of a motion, quite unlike the sharp temporary excruciating pain associated with an anal fissure or ulcer. Emaciation is rapid, and a history of wasting and diarrhœa in a middle-aged patient should always lead to a careful examination of the rectum, and if nothing is to be felt with the finger, a sigmoidoscope should be used. A carcinoma is likely to be overlooked from carelessness and from not making an examination. Mistakes may, however, arise between carcinoma and an adenomatous polypus or ulceration, either traumatic or tuberculous, around which much long-standing inflammation has caused thickening. The facts that a carcinoma is hard, the surface often excavated, and the edges nodular and everted, are generally sufficient. If real doubt exists, a piece of the ulcer may be removed for microscopic report.

6. *Intussusception*.—Occasionally a piece of intussuscepted bowel may come down so far as to be felt per rectum. This condition is associated with the passage of blood and mucus, and therefore might be mistaken for a disease of the rectum proper. The fact that intussusception occurs nearly always in children, especially at the age of nine months or thereabouts, and causes intestinal obstruction, should make such a mistake easily avoidable.

C. **Stricture** due to a carcinoma is dealt with above, but a few remarks remain to be made about fibrous stricture. This may be present at the anal orifice, at the level of the upper border of the internal sphincter, or three to four inches up the rectum. It may be annular or tubular. The finger meets with a firm cord-like constriction, which perhaps will not allow the entrance of more than its tip; there will be no bleeding unless the finger is forced through the stenosis and the mucous membrane torn.

D. **Fistulæ**, either recto-vaginal or recto-vesical, whether congenital or acquired, may be felt with the finger. The passing of urine or fœces by abnormal passages indicates the complaint.

E. Malformations of the Rectum.—Some children are born without an anus, or without the lower portion of the rectum, or the finger introduced may be stopped by a membrane separating the upper from the lower portion of the bowel. The diagnosis is obvious. The usual types of abnormalities are shown on the accompanying diagrams, *Figs. 170–173*, reproduced from the *Medical Annual*, 1910: the figures are a summary by Dr. A. Keith of a series of 54 cases in male, and 52 cases in female, children.

Fig. 170.—Sagittal section of the pelvis of a male child, showing the rectum opening into the prostatic part of the urethra. A Bladder; B rectum; C recto-vesical pouch; D uterus masculinus; E intraclacal anus; F prostate; G proctodæum; H external and internal sphincters; I Cowper's gland.

Fig. 171.—Illustrating the degrees of imperfection in the male. The rectum is shaded; the various degrees make up a series between the proctodæum and base of the prostate.

Fig. 172.—Sagittal section of the pelvis of a female infant, showing the rectum opening into the navicular fossa of the vulva. A Bladder; B rectum; C recto-uterine fold; D symphysis pubis; E vulva-anus; F cervix; G proctodæum (rarely present if the rectum opens into the vulva); H urethra; I clitoris; K hymen.

Fig. 173.—Illustrating the common varieties of malformation in the female; the various degrees make up a series between the proctodæum and the recto-uterine fold.

II.—ABNORMALITIES OF SOME NEIGHBOURING STRUCTURE OR VISCUS FELT THROUGH THE RECTUM.

It does not lie within the scope of this article to give the differential diagnosis of all the morbid conditions that can be felt through the rectum; it suffices to take the structures within reach of the finger, and indicate the varying conditions in which a diagnosis may be aided by a rectal examination.

On the Anterior Wall the structures that can normally be felt are the prostate in the male, and the uterus in the female.

Prostate.—Any enlargement is easily felt. An *adenoma* is the commonest form. This is soft, elastic, and has a groove in the middle line. A *carcinoma* or *sarcoma* is hard and fixed, and the outlines are blurred. A *prostatic abscess* causes a marked painful protrusion into the rectum.

The Vesiculæ Seminales are not palpable normally. The fact that they can be felt is almost sufficient to declare them diseased. They are most commonly affected in connection with tuberculosis of the testes or from present or past gonococcal vesiculitis.

The Bladder is not felt if healthy. If greatly distended it may form a tense resistance in the anterior wall of the rectum. Rarely, a large stone or a malignant growth of the floor may be felt.

The Uterus is easily palpable. Any enlargement or retroversion can be recognized; the pressure of a foetal head may occlude the rectum.

The Vagina cannot be felt unless it is occupied by a foreign body such as a pessary, or is the seat of a growth.

The Ovaries, if enlarged by cystic disease or by new growth, may come within reach of the finger; *pyosalpinx* is often a bilateral affection in which the inflammatory masses can be felt per rectum in Douglas's pouch; they can be detected more readily by vaginal examination, however, when this route is permissible.

Through the Posterior Wall the only structures that can be recognized are the coccyx and sacrum.

The Coccyx may be found bent in and pressing on the rectum. In coccydynia any movement of the coccyx may cause great pain.

The Sacrum may be the seat of either a growth or an abscess, which will cause a bulging into the posterior wall.

On the two Lateral Surfaces no structures are normally recognized. The ischio-rectal fossæ are common sites for *abscesses*, and these can be felt as tense swellings pushing in the wall. Rarely an *aneurysm* of the internal iliac artery or a *stone in the lowest portion of the ureter* may be felt.

If anything is felt with the tip of the finger through the upper portion of the rectum, it will usually be something distending Douglas's pouch. This may be blood coming from a ruptured or leaking *ectopic gestation*, or, more likely, a localized *abscess*, either parametric or arising from a septic Fallopian tube or the vermiform appendix. In some cases, an abscess in this position may exert such pressure on the rectum as to cause intestinal obstruction. Some surgeons state that they are able to detect the appendix if it is hanging over the brim of the pelvis, but to do this the finger must be long and the senses very acute.

Sometimes, when there is doubt as to whether symptoms arising in connection with a more distant organ, e.g., the stomach or the gall-bladder, are due to malignant disease or not, rectal examination affords valuable evidence of malignancy even when there are no pelvic symptoms at all. When secondary deposits have arisen, they develop not infrequently in the pelvic peritoneum,

presumably as the result of gravitation of malignant particles into Douglas's pouch. These latent secondary deposits can sometimes be felt very definitely as a firm band or shelf—the "rectal shelf"—if the observer's index finger is a fairly long one.

George E. Gask.

RECTUM, BLOOD PER.—(See BLOOD PER ANUM; and MELÆNA.)

REDUPLICATION OF HEART SOUND.—It very seldom happens that the diagnosis in a particular case is influenced to any marked degree by the presence or absence of reduplication of either heart sound; nevertheless, the reduplication is sometimes so definite that it attracts special attention and needs interpretation. It has to be distinguished from other triple sounds, particularly from the canter-rhythm that occurs most commonly with acute pericarditis, and less often with dilatation of the heart from fatty change, especially in pernicious anæmia and other conditions of oligochromæmia; and from the beginning of a mid-diastolic bruit at the impulse in a case of acute rheumatic endocarditis of the mitral valves. One can lay down no rules as to how these various sounds are to be distinguished; it can only be done by having heard them in other cases; sometimes, indeed, opinions differ as to whether the sounds heard in a given patient are due to a bruit or to a reduplication.

Reduplication of the first sound is rare, and to all intents and purposes it never occurs except at or near the impulse; it indicates some abnormality, but does not specify exactly what that abnormality may be. If there is no bruit, the commonest cause is great hypertrophy of the left ventricle from granular kidney or arteriosclerosis, indicated by the big heart, high blood-pressure, urinary and retinal changes.

Reduplication of the second sound is common, especially in the pulmonary area (second left intercostal space close to the sternum). It generally indicates great relative increase in the intrapulmonary blood-pressure, so that the pulmonary valves close a fraction sooner than the aortic; the reduplication may alternate with simple accentuation (see p. 1), the commonest cause being mitral disease, especially mitral stenosis. Similar reduplication of the second sound may be heard at the impulse also in these cases, though more often the second sound here is weak or inaudible. The commonest cause for reduplication of the second sound at the impulse is great relative increase in the systemic blood-pressure—especially in cases of arteriosclerosis or granular kidney. The second sound in the aortic area (second right intercostal space close to the sternum) is generally very loud and at the same time ringing, or even reduplicated also if the pulmonary second sound is of its ordinary loudness. There are no other really important causes of reduplication of either of the heart sounds.

Herbert French.

REFLEX, PLANTAR.—(See BABINSKI'S SIGN.)

REFLEX, PUPILLARY.—(See PUPIL, ABNORMALITIES OF THE.)

REGURGITATION OF FOOD THROUGH THE NOSE.—This occurrence may be but a temporary accident, the result of an unsuccessful attempt to stave off a sneeze, a cough, or a burst of laughter when the mouth is full of food or fluid. It may also result from an explosive return of gas from the stomach or œsophagus, particularly after drinking gassy fluid such as soda-water, champagne, ginger-beer, cider, or beer. In such cases the diagnosis is generally obvious.

Repeated regurgitation of food through the nose results from two main groups of causes, namely:—

A. Structural Imperfections of the Palate :—

- (a) Congenital: cleft palate
- (b) Acquired perforation: (i.) traumatic, (ii.) syphilitic, (iii.) malignant, (iv.) tuberculous.

B. Paresis or Paralysis of the Soft Palate or of the Pharynx :—

- | | |
|------------------------------------|---|
| (a) Post-diphtheritic | (e) The result of pseudo-bulbar paralysis |
| (b) Post-operative | (f) Cases of undetermined cause. |
| (c) Syphilitic | |
| (d) The result of bulbar paralysis | |

Simple inspection of the roof of the mouth is generally sufficient to decide whether the cause belongs to group *A* or to group *B*. The median and symmetrical imperfection of a congenital cleft palate is obvious, and there is the history of the trouble dating from birth. There may be a harelip or other congenital abnormality at the same time. When an ulcerative process is still in progress, there may for a time be some doubt as to whether it is syphilitic, malignant, or tuberculous. The history may help, or the healing of the ulcer under the influence of mercury or iodide of potassium may indicate its syphilitic nature. If it is important to arrive at the correct diagnosis as early as possible, a small portion of the pathological tissue may be excised and examined microscopically, or some assistance may be derived from the application of Wassermann's serum test, or by direct examination of scrapings from the ulcer for the *Spirochæta pallida* or for tubercle bacilli. Tuberculous ulceration of the palate is very rare, and is generally associated either with lupus or with definite phthisis. A new growth of the palate may be either epithelioma, endothelioma, or sarcoma, the distinction between these depending mainly on the microscope.

Diphtheria.—If there is no structural defect of the palate, the regurgitation of food through the nose being due to paralysis, by far the most likely cause, when this is the chief symptom, is previous diphtheria. The existence of the latter may have been recognized at the time, but quite often the diphtherial attack has been so slight as either to have caused no definite illness at the time, or else to have been regarded as simple sore throat. The palate alone may be paralyzed, giving rise to a nasal alteration in the character of the voice, as well as to the regurgitation; or there may be paresis of the ciliary muscles and the eyes as well, causing difficulty in reading; less commonly, there is further evidence of peripheral neuritis affecting the limbs and heart. The trouble may not come on for three or four weeks after the diphtherial attack and therefore it may no longer be possible to detect Klebs-Löffler bacilli in swabbings from the tonsils or fauces; but in every such case it is important to look for them, both directly and by means of cultures. Probably not a few cases ascribed to "influenza," or to undetermined causes, are really post-diphtheritic. The paresis recovers in time, sometimes quickly, but often not until three months or more have elapsed.

Post-operative Cases.—The history in these cases will point to the diagnosis; the accident is rare, and as a rule the effects are temporary; it may happen during the removal of tonsils and adenoids.

Syphilitic Paralysis of the Palate is not common, and it hardly ever occurs by itself. It is a general rule that luetic affections of cranial nerves are multiple and often asymmetrical; thus there may be strabismus, or a laryngeal paresis, in addition to that of the palate; or there may be a history or other evidence of syphilis.

Bulbar or pseudo-bulbar Paralysis.—When this affects the palate and causes regurgitation of food through the nose, there have generally been other symptoms

for some time. The malady is slowly progressive, and starts with paresis of the lips and tongue; swallowing is difficult, not so much because of the regurgitation as because the tongue is unable to thrust the bolus back between the fauces. The constant dribbling of saliva from the angles of the mouth is characteristic of some cases. The title labio-glosso-pharyngo-laryngeal paralysis indicates the usual sequence of events. Bulbar paralysis may be associated with progressive muscular atrophy, and it may be distinguished from pseudo-bulbar paralysis by the atrophy of the tongue, which occurs in the former but not in the latter. Bulbar paralysis is due to a lesion in the medulla oblongata, whereas pseudo-bulbar paralysis has very similar symptoms due to bilateral cortical softening. In either case the patients are generally elderly.

Undetermined Causes.—As regards such cases, it may be repeated that the majority are doubtless post-diphtheritic, so that it is important to take swabbings from the throat of all such patients, in order to examine culturally for the Klebs-Löffler bacillus.

Herbert French.

RETENTION OF URINE.—(See MICTURITION, ABNORMALITIES OF.)

RETRACTION OF THE ABDOMEN.—(See RIGIDITY OF THE ABDOMEN.)

RETRACTION OF THE GUMS is occasionally a symptom which troubles patients very much, but in itself it seldom indicates more than a local affection. In a mild degree it may be due to excessive use of a hard tooth-brush; in the absence of this cause it suggests that there is a local infective process, especially tartar, caries of the teeth, or pyorrhœa alveolaris. These conditions are discussed under the heading of BLEEDING GUMS, though very often retraction may be present, even in an extreme degree, without actual bleeding.

Herbert French.

RETRACTION OF THE HEAD.—Retraction of the head may be a marked symptom in the following conditions:—

- | | | |
|------------------|------|--|
| Acute meningitis | (i.) | Suppurative |
| " | " | (ii.) Tuberculous (basal) |
| " | " | (iii.) Meningococcal (posterior basal) |
| " | " | (iv.) Meningococcal (epidemic cerebrospinal) |

Cerebellar or other subtentorial tumour or abscess

Superior longitudinal sinus thrombosis

Acute encephalitis

Bronchopneumonia with partial asphyxia

Laryngeal obstruction, especially diphtheria in children

Strychnine poisoning

Tetanus

Hydrophobia

Catalepsy

Spasmodic torticollis

Paramyoclonus multiplex

Hysteria and hystero-epilepsy.

In arriving at a diagnosis in any given case, the probability is that *strychnine poisoning*, *tetanus*, and *hydrophobia* will either suggest themselves at once on account of other circumstances in the case, or else will not need to be discussed at all. *Hysteria* can only be diagnosed when all other possibilities have been excluded, and probably not until the case has been anxiously watched for a time; there may be other functional symptoms in the case; the patient is generally a young adult, more often female than male. *Catalepsy* and *hystero-epilepsy* will be suggested by the mental symptoms, or obvious insanity.

These things being excluded, the first thought that marked and maintained retraction of the head arouses is that the patient has some serious intracranial lesion, probably *meningitis*. Before coming to this conclusion, however, it is important not to forget that extreme dyspnoea in children sometimes produces considerable head retraction, so that the physical signs in the lungs and heart should be noted carefully, *bronchopneumonia* and *capillary bronchitis* being kept specially in mind, and any signs of *laryngeal obstruction* looked for, especially stridor and spasmodic up-and-down movements of the thyroid cartilage, with sucking in of the thorax above and below the clavicles, along the attachments of the diaphragm, and in the intercostal spaces. *Diphtheria*, *foreign body in the larynx*, and *retropharyngeal abscess* have all been mistaken for meningitis.

If there is no evidence of sufficient throat or lung trouble to account for the symptom, an intracranial lesion is probable; and by far the most likely, especially in a child, is acute meningitis, either tuberculous or posterior basal. Symptoms common to all the intracranial affections are headache, vomiting, and giddiness; pyrexia, generalized convulsions, coma, incontinence of urine and faeces, retraction of the head, and optic neuritis; or even local symptoms, especially twitchings, convulsions, or paralysis of individual limbs or parts of limbs, according as one part of the brain or another is more irritated or softened than the rest. If there is an obvious source of sepsis in connection with the cranium, such as otitis media, mastoid abscess, facial erysipelas, a septic scalp wound, boils, pediculi with sores, suppuration in the orbit, nose, antrum of Highmore, frontal, ethmoidal, or sphenoidal air-cells, or nasopharynx, the probability is that any acute meningitic symptoms are due to staphylococcal or streptococcal *suppurative meningitis*; *pneumococcal meningitis* may occur without local sepsis, either alone or as part of a general pneumococcal septicæmia; suppurative meningitis due to the *Bacillus diphtheriæ*, the typhoid bacillus, or the *Bacillus coli communis* may occur, but it is decidedly uncommon and clinically indistinguishable from other forms of suppurative meningitis, in all of which marked pyrexia and a fatal ending in two or three days are the rule. *Tuberculous meningitis* is much commoner in childhood than it is at any other age; it is always part of a general tuberculosis, and it is very rare in adult life. At first there may be no pyrexia, though this depends on the caseous glands and tuberculous lesions in the lungs and elsewhere more than upon the meningitis. At first, the diagnosis is apt to be uncertain, but as the days go by the serious nature of the complaint generally becomes obvious; the effortless vomiting, the irregular pyrexia, severe headache, optic neuritis, retracted head, possibly choroidal tubercles (*Plate VIII, Fig. W*) or evidence of tuberculous foci elsewhere, serve to clinch the diagnosis. The chief difficulty, after the stage of retraction has been reached, is to decide between tuberculous meningitis on the one hand and *meningococcal (posterior basal) meningitis* on the other. The duration of the disease is often of assistance in this respect—suppurative meningitis kills in two or three days, tuberculous meningitis in two or three weeks, whilst posterior basal meningitis ends in recovery in a variable percentage of cases, even after continuing for two or three months. The tendency to head retraction is greatest with the posterior basal, least with the suppurative forms. Optic neuritis barely has time to develop in suppurative meningitis, but it is present more often than not in both basal and posterior basal meningitis. The way in which the heels touch the occiput in some cases of the latter may by itself decide the diagnosis. Another point in favour of meningococcal meningitis, is the occurrence of periodic spike-like rises of the temperature chart—pyrexial “crises” lasting twenty-four hours or less, and superposed upon what is otherwise a chart of but moderate type. When doubt remains as to the

fact of meningitis or as to its nature, microscopical and bacteriological examinations of the cerebrospinal fluid obtained by lumbar puncture will often serve to establish the diagnosis.

The Cerebrospinal Fluid.—Normal cerebrospinal fluid is clear like water, alkaline in reaction, of specific gravity 1·004 to 1·007; it should drip out at the rate of 60 drops per minute; it contains no albumin, a trace of globulin, and a substance which reduces Fehling's solution. In cases of acute meningitis it is opalescent, turbid or obviously purulent, yellowish or even brown; its specific gravity is raised, it comes away at a greater rate than 60 drops per minute, and it contains excess of globulin, together with albumin and nucleo-proteid. Its alkalinity and its reducing power remain as in health. Microscopically, the normal fluid is practically free from cells, whilst in all forms of acute meningitis there are many polymorphonuclear cells, and in tuberculous cases, many lymphocytes also; bacteriologically, tubercle bacilli are the least easy to find. The Gram-negative meningococci (*Diplococci intracellulares meningitidis Weichselbaumii*) (Plate XII, Fig. N) are characterized by their occurrence within the leucocytes in pairs, like gonococci, but without the reniform shape of the latter. The organisms of suppurative meningitis may be discovered on direct staining, but more often cultural methods are required.

Where posterior basal meningitis ends and *epidemic cerebrospinal meningitis* begins, it is difficult to say; they are both meningococcal, and probably they are only different types of the same malady, connected together by sporadic cases in which posterior basal meningitis is associated with more or less severe spinal symptoms. The way in which the least touch or movement causes the patient to cry out with pain sometimes indicates how inflamed the coverings of the posterior nerve-roots are, besides which, the erythematous, vesicular or purpuric skin eruptions that may accompany it often suggest the diagnosis. There is no difficulty during an epidemic; it is the sporadic case that may be missed. The clinching point in the diagnosis is bacteriological investigation after lumbar puncture, assisted perhaps by the beneficial effects of the specific antimeningococcal serum.

Superior longitudinal sinus thrombosis and *acute polio-encephalitis* are both nearly always diagnosed as acute meningitis in the first instance. It is when a case that has simulated acute and severe meningitis, with coma and apparently impending death, gets rapidly better after a few days and ends in speedy recovery, with or without some impairment of local or general brain functions, in a child or young person, that one changes one's diagnosis of meningitis to polio-encephalitis, though even then it remains one of opinion chiefly. Almost the same applies to superior longitudinal sinus thrombosis; though, if acute cerebral symptoms in a previously healthy child end in a gradual and but partial recovery, accompanied by permanent spastic paralysis of the legs, without much affection of the arms, it is very possible that the lesion has been thrombosis of the superior longitudinal sinus, with softening of the leg areas of cortex on either side of it.

Cerebellar or other *subtentorial tumours* or *abscesses* generally cause a much more gradual onset of symptoms than do any of the other conditions named. Head retraction is not present until the later stages. The diagnosis of tumour will rest on the slow increase in the signs of raised intracranial pressure, with nystagmus, optic neuritis going on to optic atrophy, and a tendency to fall always in one definite direction—forwards or backwards if the tumour is in the vermis, to the right or to the left according as it is in the right or left hemisphere. There is often marked ataxy, with exaggeration of the tendon reflexes, particularly on the same side as the tumour. If nystagmus is well marked, this serves as a point of some value in distinguishing a cerebellar from a cerebral tumour. Abscess is distinguished from tumour chiefly by the existence of some obvious

cause for intracranial abscess, especially otitis media on the one hand, bronchiectasis upon the other. Cerebellar abscess may give rise to no pyrexia and no leucocytosis; but whether the temperature is raised or not, the pulse-rate is often absolutely slowed.

Herbert French.

RIGIDITY OF THE ABDOMEN is a sign not to be regarded lightly, and one to find the true significance of which may call for the greatest care and skill. The patient should be examined lying on the back with the whole of the abdomen and lower thorax exposed. The observer, seated on a level with the patient, should watch the abdomen for a minute or so and see whether it moves or not with respiration, and whether one part moves more than another.

It should be remembered that some patients, whether from modesty or timidity, hold their abdomens intensely rigid in a wholly unnecessary way, a tendency which may create a false impression. This can be avoided by engaging them in conversation for a minute or two, by asking them to take a few deep breaths, or by making them draw their knees up and keep their mouths open, when the normal abdominal walls will generally relax.

There are varying degrees of rigidity. The whole abdomen may be rigid, the upper or lower part only, or one side, as in the presence of a localized appendicular abscess. Again, one part or one rectus muscle may be put, as it is termed, "on guard," whenever the patient thinks a tender spot is about to be touched. The rigidity over an inflamed gall-bladder is an instance of this.

The commonest cause of rigidity is *septic infection of the peritoneum*, which may follow external wounds, abdominal operations, childbirth, abortion, endometritis, parametritis, extension of inflammation from or perforation of the appendix, ulcer of the stomach, duodenum, or bowels, perforation of the gall-bladder, suppurating Fallopian tube, or abscess of the liver, spleen or kidney. It is a safe rule to believe there is peritonitis until the contrary is proved. As in the case of other disease, diagnosis must not be based on one clinical sign, and the patient must be examined for the other signs of peritonitis.

The history of the onset is important. In perforative cases, the beginning is marked by intense abdominal pain. This may be general and continuous, or by being referred to the stomach or appendix region give an indication of the seat of the mischief. The position taken up is on the back, sometimes with the knees drawn up to relieve abdominal tension, and the patient generally lies still, for any movement causes increase of pain. In colic, on the contrary, whether intestinal, biliary, or renal, the patient rolls about during the spasms.

It is painful to use the diaphragm: therefore, respiration is superficial and costal in type. The abdomen gradually becomes distended, tense, and tympanic; the liver dullness which was previously present may disappear, and, in some forms of peritonitis, fluid may accumulate in the abdomen and be detected by the signs of shifting dullness in the flanks. The pulse is small and rapid, 100 to 150, and has the tendency to quicken. A friction rub may be heard over the liver or the spleen when the patient breathes. Borborygmi will generally be absent. Vomiting is an early, prominent, and almost constant feature. The contents of the stomach are ejected first, then bile-stained fluid, and later green or brownish fluid with a slight faecal odour. The vomiting is often of a peculiar "pumping" character. The bowels may be loose at first, and then constipation follows, but is not complete, as in intestinal obstruction. Micturition is frequent; occasionally there is retention when the pelvic peritoneum is acutely inflamed. When the disease is well developed, the appearance of the patient is very characteristic, exhibiting the "Hippocratic facies." In this, as in other diseases, successful treatment

demands early diagnosis, and it is to be hoped that this will be made long before the clinical picture is complete.

Leucocytosis as a Diagnostic Sign.—In suppurative peritonitis this is marked early, and is almost invariably present (15,000 to 30,000 per c.mm.). In very severe cases, in which the patient is rapidly poisoned by the quantity and virulence of the toxins, and is not reacting, it may be absent. Here, however, the other signs of peritonitis will be well marked.

It does not necessarily follow, because the whole abdomen is rigid, that the peritonitis is general. For instance, in cases of perforative appendicitis it has been shown by operation that pus was only to be found around the cæcum, and yet there was general rigidity. Without operating, it is often impossible to tell. The best way of finding out whether there is pus in the abdomen, and the method to be employed at once if there is any doubt, is to open the abdomen and see.

OTHER CONDITIONS ASSOCIATED WITH ABDOMINAL RIGIDITY WHICH MAY BE MISTAKEN FOR PERITONITIS.

Pneumonia or Diaphragmatic Pleurisy.—In the early stages here, before the onset of dullness in the lungs and other physical signs in the chest, the most prominent features may be abdominal pain and rigidity. Laparotomy has often been performed on the mistaken diagnosis of peritonitis. If, however, the examination is thorough, signs pointing to implication of the lungs will usually be found. Rapidity of respiration, working of the nares, and blueness of the lips should receive particular attention. Examination of the blood will often reveal a high leucocytosis (30,000 to 40,000); in suppurative peritonitis the numbers are rarely so high.

Colic.—The suddenness of the onset of pain, its intense character and the abdominal rigidity, may render this condition extremely difficult to differentiate from peritonitis due to perforation of some viscus. Collapse may be marked, and the effect on the pulse is considerable; vomiting is common also. The temperature is slightly raised but rarely exceeds 100° F., and the pulse, though it may be rapid, does not tend to quicken progressively. The pain is spasmodic, not continuous as in peritonitis, and is generally relieved in a few hours. Biliary and renal colic are fairly characteristic, but that due to lead, the crises of tabes dorsalis, or gastro-intestinal disturbances may easily be mistaken. The gums are to be examined for a blue line, the knee-jerks and pupils tested, and a blood-count made. In uncomplicated colic there is no leucocytosis. In cases of extreme difficulty the abdomen may have to be opened. The persistence of borborygmi is in favour of colic rather than of general peritonitis.

Intestinal Obstruction.—The vomiting and constipation here present may lead one to think of peritonitis, and indeed the two conditions may be present at the same time, as in the case of an ulcerating carcinoma of the bowel. Usually the rigidity is not well marked, and the constipation, which is not absolute in peritonitis, is here complete.

Injuries of the Abdomen.—

1. Contusion of the abdominal wall, with laceration of muscle: Particularly in patients who have been run over across the abdomen, rigidity is a marked feature, and there must always be a doubt at first whether any of the viscera have been torn and are bleeding, or whether the escape of their contents is setting up peritonitis. In the case of mere contusion, if the patient is put to bed and kept warm, collapse will soon disappear, the abdomen will become less rigid, and the pulse-rate will fall.

2. Contusion of the abdominal wall with injury of viscera: The signs here will be more marked, and instead of tending to diminish rapidly will become

worse. If there is internal bleeding, the mucous surfaces will be pale, the skin cold and clammy, and the pulse small and frequent. If the contents of a viscus have escaped, the signs of peritonitis will develop rapidly. In all cases of doubt an exploratory laparotomy should not be delayed.

Ruptured Tubal Gestation.—This may simulate general peritonitis. The abdominal rigidity here is not well marked, and the signs of bleeding are. A moderate degree of leucocytosis is present (10,000 to 15,000), but the number of red cells is much diminished. If the patient is a woman of the child-bearing age, is known to be a week or more overdue as to monthly period, and has begun to lose blood per vaginam synchronously with the onset of acute abdominal pain and pallor, the diagnosis will suggest itself at once.

Acute Hæmorrhagic Pancreatitis is usually diagnosed as intestinal obstruction or acute perforative peritonitis. The attack sets in with intense pain, usually in the upper and left part of the abdomen. Vomiting, constipation, and tympanitic distention are present. The condition is so rare, and the signs are so unreliable, that an exploratory laparotomy should be made, and the nature of the case becomes obvious directly the characteristic opaque yellow patches of fat-necrosis are seen in the omentum.

Rupture of an Abdominal Aneurysm, Dissecting Aortic Aneurysm, Embolism of the Superior Mesenteric Artery, may simulate peritonitis, and so also may *Acute Thrombosis of the Inferior Vena Cava*; but all these conditions are rare, and they will be very difficult of diagnosis unless the existence of some cause for them, such as aortic aneurysm or fungating endocarditis, is already known.

Acute Suppurative Nephritis sometimes gives abdominal rigidity, and is associated with fever and vomiting. There is always marked tenderness in the loin on the affected side, and the urine will contain albumin, pus, blood, casts, and bacteria. The milder types of the infection (see BACTERIURIA) may be mistaken for acute appendicitis, or for general peritonitis, unless the centrifugized deposit from the urine is examined microscopically for pus.

George E. Gask.

RIGORS, or CHILLS, are common at the onset of the most various acute febrile disorders, and may occur at regular or irregular intervals in the course of many of the more severe of them. The chief sign of a rigor is shivering, the chief symptom a feeling of cold and general wretchedness. At its beginning, the patient looks chilly, pinched, and blue, and sits or lies huddled up, complaining of the cold; his arteries are contracted, the pulse is rapid, small, and of raised tension; the extremities are chilled superficially, but the internal temperature is raised above the normal. Very soon the sensation of cold induces involuntary shivering to correct it; the patient shakes all over, sometimes so violently that the chair or bed is thrown into noisy vibration; his teeth chatter, and even the muscles of the face twitch involuntarily. This shivering lasts for a few minutes, or even for an hour, gradually dying away as the patient feels himself to be warmed up. Thus the initial stage of the fever passes into the second stage or fastigium, in which the complaint is of sweating, thirst, and undue heat, and the body temperature rises still further. In children, general convulsions, with partial or complete loss of consciousness, may occur at the onset of an acute infection, under conditions that would give rise to a rigor in adults. In adults, convulsions are not known to take the place of rigors. Cases may arise, however, particularly when only an imperfect history can be obtained, in which it may be hard to say whether a patient has had a rigor, or an epileptiform, hysterical, or epileptic fit. Should the patient have lost consciousness during the shivering, or have fallen down, bitten his tongue, or passed his water during the attack, or should he give a history of similar attacks on previous occasions, the diagnosis of epilepsy would be more than

probable. Epileptiform fits that unskilled observers might confuse with rigors, may occur in uræmic or eclamptic patients; the history of the case, and the discovery of albumin in the patient's water, together with other evidences of acute or chronic renal disease, should make the diagnosis clear. Fits indistinguishable from rigors to the untrained eye may occur in hysteria; in these, however, the shivering patient would be red in the face, or at least would not present the slightly livid and shrunken facial appearance characteristic of a rigor, the temperature would not be raised, and the signs or a history of other hysterical phenomena should be obtainable.

For their further consideration it is convenient to classify rigors according as they are single or multiple.

1. **Single Rigors.**—The occurrence of a *single rigor* at the outset of an acute infectious disorder is extremely common, and may be taken as evidence of the severity of the infection to some extent; in lobar pneumonia this initial rigor is often particularly long and severe. No exhaustive list of the disorders that may be thus ushered in can be given; but it may be generally stated that an initial rigor is common in:—

Lobar pneumonia	Erysipelas
Small-pox	Cerebrospinal fever
Influenza	Acute poliomyelitis
Severe feverish colds	—————
Septicæmia	Malaria
Pyæmia	Yellow fever
Pneumonic tuberculosis	Weil's disease
Typhus	—————
Relapsing fever	After catheterization.

It is less often seen in:—

Scarlet fever	Sapræmia
Measles	Glanders
Diphtheria	Sick headache
Tonsillitis	Acute gastro-intestinal disorders
Rheumatic fever	Nephritis
Tetanus	Cholelithiasis
Miliary tuberculosis	Renal calculus.

And is comparatively rare in:—

Enteric fever	Cholera
German measles	Plague
Mumps	Dysentery
Gout	Malta fever
Anthrax	Beri-beri.
Hydrophobia	

The diagnosis of all these different morbid conditions must naturally be made from the history of exposure to infection, and from the subsequent signs and symptoms. It is clear that the occurrence or non-occurrence of an initial rigor will rarely be of much practical assistance in determining the nature of the disorder from which any given patient is suffering.

A rigor after catheterization is not rare, whether the kidneys be sound or no, and in some cases is due to septic infection of the urethra or bladder by the instrumentation. In others, however, it ensues when no infection has taken place, and is not followed by any evidences of urinary sepsis; in these instances the rigor must be referred vaguely to nervous shock, and need not give rise to alarm.

2. **A Second Rigor** coming on in the course of any of these disorders, or a rigor occurring unexpectedly for the first time when the disease is well established or declining, is often evidence of the spread of the infection, or of the occurrence of some complication. For example, a second rigor occurring in the course of *lobar pneumonia* may coincide with the appearance of signs indicating the spread of the disease to the second and previously sound lung; a second rigor happening after the crisis may indicate the establishment of an empyema. In *enteric fever* a second rigor may be due to such complications as perforation of the intestine, acute peritonitis, pleurisy, pneumonia, middle-ear disease, periostitis, and so forth. But it must be remembered that there is an abnormal type of enteric fever in which rigors occur for no apparent reason, followed by heavy sweats; and that rigors may be observed in cases with constipation, or during defervescence, or in enteric patients who have been treated with antipyretic drugs.

3. **Recurring Rigors.**—The occurrence of a *series of rigors* often gives information of more definite value, for it is seen in but a comparatively limited number of local or general infections, most of which have some characteristic or localizing signs. In themselves, these rigors are no more than evidence of the severity of the infections in which they are seen, and of the extent to which bacterial or other toxins have been absorbed into the blood and have upset the thermotactic centres. The following are the chief disorders characterized by a series of rigors:

Malaria—tertian, quartan, æstivo-autumnal or malignant tertian, and mixed types

Relapsing fever

Acute leukæmia

Acute blood-infections, including:—

Portal pyæmia

Pyæmia

Septico-pyæmia

Septicæmia

} Special forms of which may be known as puerperal fever, malignant endocarditis, acute infective osteomyelitis, suppurative pyelphlebitis, etc.

Acute inflammations, such as:—

Pyelitis

Pyelonephritis

Cystitis

Cholecystitis

Empyema

Infective sinus thrombosis.

Abscess formation:—

Hepatic (tropical abscess)

Appendicular

Subphrenic

Perinephric

Prostatic

Cerebral.

Pulmonary tuberculosis; bronchiectasis.

Enteric fever; influenza.

Erysipelas.

It is neither possible nor desirable to detail the diagnosis of all these disorders; but it may be pointed out that a very thorough physical examination of any patient presenting multiple rigors should be made; the condition is always of serious import, and may be due to septic absorption from some deep-seated abscess that produces only the scantiest of physical signs, but calls out urgently for surgical treatment. When no abnormal physical signs can be found, bacterial cultures should be made from the circulating blood, care being taken to draw off a sufficient quantity of blood—5 to 10 c.cm.—and to repeat the cultivation several times before it is decided that the blood-stream is sterile.

In *malaria* the rigors tend to recur at regular intervals of forty-eight or seventy-two hours in the benign tertian and quartan infections, at shorter

intervals if the infection is mixed. In the æstivo-autumnal form, the rigors and also the course of the fever, are much less regular. In all cases of malaria the parasite can be found in the circulating blood, and the patient, if not in extremis, is cured by quinine: there is no leucocytosis, but a relative increase in large lymphocytes occurs.

In *relapsing fever* the onset is acute, with a rigor or a series of rigors. A fortnight later, when the patient has been convalescing for a week or ten days, relapse and a second rigor or series of rigors occurs. A second relapse may be noted at the end of the third week, and in a very few cases a third relapse. To all intents and purposes relapsing fever has died out of the United Kingdom, but it is met with in Egypt, India, and other countries. It occurs in epidemics, and Obermeier's spirochæte (*Plate XII, Fig. I*) can be found in the patient's blood while he is feverish.

Multiple rigors occur exceptionally in the course of *acute blood-diseases*, such as acute leukæmia, pernicious anæmia, or Hodgkin's disease. Severe and progressive anæmia, wasting, fever, heavy sweats, and hæmorrhage from the mucous membranes, are likely to occur in these cases, with characteristic changes in the microscopical appearances presented by the blood.

Multiple rigors are without doubt commonest in the various forms of *acute blood-infections*, given the presence of bacteria of the proper degree of virulence in the blood-stream. Special forms of these infections have received particular names. Thus *puerperal fever* occurs after delivery, and is due to bacterial infection of the uterus and its spread thence to the blood; the patient will probably have a sanious or offensive vaginal discharge as well as the evidences of septicæmia or pyæmia. In *malignant endocarditis*, attention is mainly directed to the condition of the heart, the presence of valvular murmurs, the detachment of emboli from the inflammatory vegetations on the heart-valves and their lodgment in various peripheral arterioles. In *acute infective osteomyelitis* the first complaint arises from the acute inflammation occurring in the marrow of one of the bones. *Portal pyæmia* or suppurative pylephlebitis, is seen in patients with various acute inflammatory intra-abdominal lesions, and is due to the spread of bacterial infection to the portal vein. The commonest precursor is mild appendicitis. The blood in the portal vein clots, the clot is infected with microbes, softens, and breaks up, to be dispersed throughout the liver in the form of infective emboli. Multiple hepatic abscesses result, with pain, swelling, and tenderness in the hepatic region; jaundice is present in less than half the cases, with more or less coloured stools, vomiting and diarrhœa are frequent, and there is hectic fever. *Pyæmia* (*Fig. 165, p. 613*) is characterized by the formation of metastatic abscesses in any of the tissues or organs of the body, oftenest in the lungs, in consequence of the lodgment there of multiple infected emboli. Before the days of antiseptic or aseptic surgery, pyæmia was the common outcome of serious surgical operations or severe wounds. Nowadays it is comparatively infrequent, and when it does occur is secondary to a severe infected wound, to ulcerations of the mucous surfaces, or to deeply-seated abscesses that are not amenable to surgical treatment. Occasionally it seems to be idiopathic, or due to some infective lesion that escapes discovery. Pyæmia oftenest begins suddenly; the main symptoms are hectic fever, rigors, leucocytosis, diarrhœa and vomiting, heavy sweats, prostration, and the formation of secondary abscesses due to the arrest of septic emboli. When the lungs become the seat of multiple abscesses, the breathing becomes rapid, and signs of bronchitis, pleurisy, or pulmonary consolidation appear. Abscesses in the more superficial tissues or joints make their presence known by the local evidences of pain, swelling, redness, and heat; in the deeper parts or organs, by pain and disturbance of function. The development of secondary subcutaneous abscesses is common in the less

acute cases; abscess-formation in the heart, and suppurative pericarditis, are prone to occur when the primary lesion is a periostitis or an acute necrosis of bone. Pyæmia may be distinguished from enteric fever only with great difficulty, if evidences of abscess-formation or some source of primary infection are not forthcoming, especially as the typhoid state is common in the later stages of both diseases; the occurrence of multiple rigors is rare in enteric fever, common in pyæmia, and Widal's reaction should be of assistance here. From malaria, pyæmia is distinguished by not reacting to quinine; malarial parasites will not be found in the circulating blood. Pain and inflammation in the joints after childbirth or a miscarriage may be diagnosed as rheumatism when the condition is really one of pyæmia or puerperal fever.

The precise diagnosis between pyæmia and septicæmia is often impossible, and is, indeed, of academic rather than clinical interest. The necessity for it is in part avoided by the use of the term *septicopyæmia*, the evidences of which are much the same as those of pyæmia: all three conditions may arise from identical causes, and bacteria (streptococci, staphylococci, gonococci, pneumococci, *B. coli communis*, *B. typhosus*, *B. influenzae*, *B. pyocyaneus*, etc.), may be cultivated from the circulating blood in any of them. Multiple rigors are far commoner in pyæmia—where several may occur daily—than they are in septicæmia. *Septicæmia*, the disease due to the growth of microbes in the blood without the formation of metastatic abscesses, originates in lesions very similar to those that underlie pyæmia, or results from infected but apparently trifling cuts or injuries, or even from neglected chronic suppuration about the teeth. Its main symptoms are fever, debility, anæmia; in severe cases rigors occur, and the patient may fall into the typhoid state. The bacteria causing it can be cultivated from the circulating blood; septic rashes are often seen in both pyæmia and septicæmia, but they are not seen in enteric fever. It should be noted that, at the best, a deal of looseness attaches to the meaning of the term septicæmia; for in lobar pneumonia, enteric fever, Malta fever, and many other acute febrile disorders, the specific microbes can habitually be cultivated from the circulating blood. Technically speaking, therefore, these are all instances of septicæmia. Two new terms have recently come into vogue in this connection, namely, *bacillæmia* and *bacteriæmia*.

Multiple rigors occur in a number of *acute inflammatory infections* localized in various parts or organs of the body, provided that the inflammation is sufficiently extensive and the infecting micro-organism of a sufficiently virulent type. It is often impossible to say how far such rigors are evidence of the absorption of toxins, and how far they indicate that living bacteria have gained access to the blood-stream. Situated in the genito-urinary tract, these inflammations are often associated with a history of gonorrhœa, renal calculus, or gout, and produce characteristic pathological changes (hæmaturia, pyuria, albuminuria) in the urine, or difficulties in micturition. If the gall-bladder or bile-ducts are the seat of the inflammation, jaundice and pain in the hepatic region will probably be observed with the fever and rigors, and a history of gall-stone colic may be given; Charcot's hepatic intermittent fever is due to chronic cholangitis, with intermittent biliary obstruction due to a ball-valve stone often lying in the ampulla of Vater. The occurrence of rigors in a child convalescing from pneumonia, measles, scarlet fever, or pleurisy, may lead to the discovery of an unsuspected empyema. *Infective sinus thrombosis* characteristically occurs in patients with chronic or intermittent otorrhœa, and indicates that the bacterial infection has spread from the ear to one of the cranial venous sinuses. Its symptoms are general—those of septicæmia or pyæmia, often with an initial rigor and vomiting followed by high fever, more rigors (*Fig. 165*, p. 613), and sweating—and local. The local symptoms are very severe pain

about the ear, excruciating headache, and venous congestion of the optic disc, with others that vary with the site of the thrombosis. If the sigmoid sinus is thrombosed, œdema and tenderness over the mastoid appear, and should the clotting spread downwards a thrombus may be felt in the internal jugular vein. Thrombosis of the cavernous sinus is accompanied by squint, exophthalmos, and œdema of the orbits and eyelids. Thrombosis of the superior longitudinal sinus may set up œdema of the scalp near the sagittal suture. The diagnosis must be made from cerebral or cerebellar abscess, in which repeated vomiting is likely to occur, and the localizing signs and symptoms will suggest brain-disease; and from meningitis, in which rigors are rare. In other patients, some acute inflammatory disorder may result in definite *abscess formation*, when rigors may develop from toxic or septic absorption; here again, the virulence of the particular microbe causing the inflammation will be the chief factor in determining whether rigors occur or not. In many cases the rigors will really be due to a secondary and probably terminal septicæmia or pyæmia.

Tropical abscess of the liver, usually single, occurs in patients who have been abroad and have had dysentery, whether amœbic or bacterial. The early symptoms of liver abscess are often obscure, malaise, fever, sweating, rigors, and gastro-intestinal disturbances occurring, or a pleural effusion secondary to spread of infection through the diaphragm, while nothing particularly suggests implication of the liver. As a rule, complaint of dull pain in the right hypochondrium, axilla, or shoulder will be made; if the abscess is at all large, absolute increase in the size of the liver-dullness will be found, particularly in an upward direction and to the right, the liver will be somewhat tender, and the patient will prefer to lie on the right side. Slight jaundice is frequently observed. The diagnosis from infective cholangitis must be made, where jaundice is more marked and often intermittent, and enlargement of the gall-bladder can be made out. The diagnosis of the other forms of abscess mentioned in the list given above must be made on general lines, and will not be further considered here.

Multiple rigors may occur from septic absorption in various diseases of the lungs, the most important of which are *bronchiectasis*, and advanced *pulmonary tuberculosis*, with secondary pyogenic infection of the bronchi or tuberculous cavities. In either case the sputum will be abundant, and will probably contain fragments of elastic tissue; it is sure to be offensive in bronchiectasis.

High or irregular fever with recurring rigors has been recorded in a few unusual cases of *enteric fever* (Fig. 162, p. 611) and of *influenza* without any complication, and in erysipelas (Fig. 166, p. 614).

A. J. Jex-Blake.

RINGWORM.—(See FUNGUS AFFECTIONS OF THE SKIN.)

RISUS SARDONICUS.—The term risus sardonicus is used to denote the fixed unmirthful grin that results from spasm of the muscles of both sides of the face. The angles of the mouth are drawn outwards and the eyelids are raised by tonic contraction of the same muscles that produce the facial expression of smiling, but the spasm is maintained in a way that at once excludes natural smiling. The chief causes of the condition are tetanus, strychnine poisoning, malingering, hysteria, catalepsy.

Catalepsy.—The differential diagnosis is not, as a rule, difficult. A cataleptic case is chronic; the facies is by no means always that of smiling, but if it should be, then the smile is a fixed one; the chief characteristic of the condition is the maintenance for hours at a stretch of some attitude that would rapidly fatigue an ordinary person; the history and the associated mental symptoms of melancholia or dementia would point to the diagnosis, and tetanus and strychnine poisoning would be excluded by the absence of tetanic spasms.

Hysteria sometimes takes a form that may for a while raise doubts as to strychnine having been taken, but, as a rule, the multiformity of the contortions points to the correct diagnosis. The features may be kept fixed for a time, but sooner or later they become twisted into all sorts of shapes, and the tonic and clonic spasms of the body and limbs are not in any way regular, as they are apt to be in strychnine poisoning and tetanus. The patient is likely to be a woman, and there may be a history of previous hysteria. During a quiescent interval it may be found possible to stroke or touch the patient without bringing on a convulsion, whereas in strychnine poisoning and in tetanus the slightest touch is apt to evoke a violent and generalized spasm, even opisthotonos.

Malingering may take the form of imitated convulsions, during which the features may be kept fixed in one position or another, sometimes in that of smiling. The fixed voluntary contractions cannot be long maintained, however, on account of fatigue, so that although there may be some doubt at first, this generally disappears soon. The patient is generally a man who has something to gain by malingering: a night's lodging in a hospital, for instance.

Strychnine Poisoning and **Tetanus** are the two chief causes of typical risus sardonius. The main point to rely on in distinguishing the two is the history, if it is obtainable—the injection of an overdose of strychnine hypodermically, or the taking of a rat-paste, on the one hand, or the occurrence of some small but penetrating wound by a rusty nail or earth-soiled knife or stick during the fortnight preceding the symptoms, on the other. The absence of any known wound, however, does not exclude tetanus. If lock-jaw and stiffness of the neck are prominent features, tetanus is more probable than strychnine poisoning, and vice versa. In strychnine cases, the patient will either die quickly, or the symptoms will rapidly subside, whereas in tetanus they may persist unabated for several days. In a few instances the diagnosis may only be settled by the discovery of strychnine in the gastric contents, or of tetanus bacilli (*Plate XII, Fig. T*) in anaërobic cultivations from the infected wound.

It only remains to add that a few cases of *facial sclerodermia* may simulate risus sardonius, though more often there are complete smoothness of the features and lack of expression. There are no spasmodic contractions, the condition comes on gradually, is permanent, and the diagnosis becomes obvious at once when the hard smooth skin is palpated, for one cannot pick it up between one's fingers.

Herbert French.

RUMINATION.—(See MERYCISM.)

RUPIA.—(See SCABS.)

SALIVATION, UNDUE.—(See PTYALISM.)

SAND, INTESTINAL.—This is seen in the motions, especially when they are fluid, of some sufferers from membranous colitis. It is like the finest sea-sand; its colour varies owing to varying degrees of imbibition of fæcal pigment. Usually it is red, looking something like fine uric acid, and it varies from this to a pale dirty yellow. It is seen best showing up against the white of the bed-pan in which it lies. Analysis shows that it consists of from 30 to 70 per cent of organic matter, doubtless all derived from the fæces. The inorganic matter is invariably nearly all calcium phosphate, with traces of calcium oxalate, magnesium, iron, and perhaps silica. The amount of sand passed in a day may be four teaspoonfuls, but usually it is much less. Many patients pass it for years, but not always constantly even then; it may be passed daily for weeks, and then for weeks none is passed. It is far commoner in those who have membranous colitis than in other patients, but it has been

PLATE IX.

INTESTINAL SAND

1. Microscopical appearance of true intestinal sand.
2. Microscopical appearance of false intestinal sand, following the ingestion of pears.

*By Permission from THE FÆCES IN CHILDREN
AND ADULTS, P. J. Cammidge.*

seen with malignant disease of the large intestine; it always indicates some organic disease of the colon. It must be distinguished from false intestinal sand, which looks very like it and may be found in the motions of those who have eaten largely of pears. This is entirely vegetable, and can be distinguished easily from true intestinal sand by microscopical examination (*Plate IX*).

W. Hale White.

SCABS.—The scab, or crust, one of the secondary cutaneous lesions, is a more or less irregular, dried-up mass of exudation on the surface of the skin. It may be produced by the desiccation of serum, pus, or blood, or of a mixture of these fluids, and commingling with these substances there may be epithelial débris, or fat, or fungous elements. Scabs form on matured vesicles, bullæ and pustules, on ulcerations, erosions, and on every kind of excoriation, pathological or traumatic. If the exudation is thin, as sometimes in eczema, they are soft and friable, and soon eliminated; if it is thick, they may be tougher and more adherent, and successive layers may be formed, as in the rupial crusts of syphilis. Scabs composed largely of fungous elements are more or less friable, and these, like those resulting from the seborrhœic process, may partake of the character of scales as well as of scabs. Such formations, however, as for example the "crusts" of favus, are in the nature of scales rather than of scabs, and are noticed elsewhere. (See SCALY ERUPTIONS; and FUNGOUS AFFECTIONS OF THE SKIN.)

Scabs vary greatly, not only in consistence, thickness, and adhesiveness, but also in colour and in form; and by attention to these differences the diagnosis of the affections in which they occur may be assisted. Some guidance may also be obtained from the condition of the surface from which the scab has been removed; it may be dry when the scab has been long adherent, as in some cases of impetigo, excoriated as in eczema, or ulcerated as in rupia. But the clinician will be guided much more by the primary than by any secondary lesion; and for the decisive diagnostic features of the diseases about to be mentioned, the reader is referred to the articles MACULES; VESICLES; BULLÆ; PAPULES; NODULES; and PUSTULES.

In *irritative herpes* the vesicles on the skin shrivel up and form yellowish-brown crusts, which after a few days become detached, as a rule leaving no scar, but only a brownish stain, which slowly fades away. In *herpes zoster* most of the vesicles which do not abort, reach the same termination; but others, instead of drying up, may burst and discharge a fluid, which then forms yellowish or brownish crusts. In *zoster* a scar is sometimes produced. In *erythema multiforme* there is often considerable scabbing, as is mentioned under VESICLES. In *eczema* the lesions may dry up either into scales (see under SCALY ERUPTIONS) or into crusts. Crustation is usually the third stage in the evolution of the disease, the discharge from the vesicles drying into greyish-yellow scabs of varying thickness, which become detached and are succeeded by others until the "weeping" ceases. When the lips are attacked, they may become so stiffened under layers of crusts superimposed one upon another that the patient can hardly move his lips without fissuring the skin. In the male, the "bathing-drawers" area may be so covered with crusts that the patient cannot walk or sit down without breaking them. In the same region in the female the inflammation and crustation may be even more severe, and the scabs may be marked by much foulness. One of the characteristic features of what is called *papular eczema* is the appearance of a tiny dome of blood-crust on the papules, due to scratching. In *seborrhœic eczema* there may either be scaling, or the squames may be massed into fatty crusts (see SCALY ERUPTIONS). The scabs in *eczema rubrum* are extremely thin, like goldbeater's skin; when they are torn off, a red, wet, raw, tender surface is laid bare. The crusts of *scabies* may be distinguished

from those of eczema by their being isolated and distributed irregularly, instead of being grouped, and by the multiformity of the lesions with which they are mixed—vesicles, bullæ, pustules, hæmorrhagic scabs, etc. In most itching diseases there will be found blood-scabs, resulting from the scratching to which the patient is provoked.

In *cheiropompholyx* the bullæ into which the little sago-grain vesicles run, dry up into crusts, the removal of which reveals a surface that is red and exquisitely tender. The appearance and sensitiveness of the underlying skin, together with the limitation to the hands and feet, and often to the hands alone, will help the diagnosis. The crusts of *syconis vulgaris* also have a limited distribution; they may be confined to the upper lip, and in any case they do not extend beyond the hairy parts of the face. They are brown or yellow in colour, thin, and distinctly adherent.

In *impetigo contagiosa* (Tilbury Fox) the scabs which are formed from the dried-up fluid discharged by the pustules on rupture are yellowish; in uncleanly persons they are brown, or even black. A characteristic feature is that they have around them no hyperæmic halo, but look as if they might have been stuck on artificially. In the severe form of the disease styled ecthyma, however, the flat irregular scab formed from the ruptured vesicles is surrounded by a more or less pronounced areola. At first loosely attached, the scabs in impetigo contagiosa afterwards become so firmly adherent that their removal requires some force and gives rise to a little bleeding. In this affection there is what may be called a secondary scab, formed by the drying-up of the thick, purulent discharge—honey-like in consistence and appearance—from the surface left raw by the removal of the earlier crusts. The reddish stain that appears when the lesion heals is not permanent. In *pemphigus vulgaris* the crusts into which the bullæ shrink are brownish-yellow; and when they fall off spontaneously, the surface beneath is not raw, as in impetigo, but is found to be covered with newly-formed epidermis, at first purple, but afterwards turning brown, and gradually becoming normal in colour. When the area covered by the scabs is extensive, there is an unpleasant sense of tension, and if they are removed prematurely, excoriation may be caused. In the more serious affection known as *pemphigus foliaceus*, the crusts are yellowish, and as the disease proceeds, large scales are formed. In *pemphigus vegetans* the foul-smelling secretion from the patches of affected skin forms a thin crust, which can easily be stripped off, when a papillary excrescence, partly covered with a thin stratum of epidermis, is revealed. The process usually ends in gangrene and death. The excrescences are distinguishable from the condylomata of syphilis by always being surrounded by a zone of bullæ, while condylomata have an infiltrated border.

In *nerve leprosy* the bullæ, which have the same characters as those of pemphigus vulgaris, form, on rupture, a large crust, the removal of which exposes a grey surface consisting of altered rete, the epidermis being cast off by suppuration. In this way a succession of yellow scabs or crusts may be formed and fall off, leaving at last a granulating surface, which ultimately is converted into a white scar. If the bullæ abort, they are followed by a parchment-like scale instead of a crust, and this in turn gives place to a hyperæsthetic ulcer. The scabs of nerve leprosy have some resemblance to the *rupial crusts* of secondary syphilis, but there is little danger of confusion between the two. The rupial crusts, greenish or blackish, consist of several successive layers, each one smaller than the one immediately below it, so that a pyramidal structure is formed, somewhat resembling the shell of a limpet. This very characteristic crust, which can scarcely be mistaken for that of any other condition, and is distinguishable from the psoriasis rupioides of M'Call Anderson by the base being ulcerated, usually is formed from pustules, but may follow also on the drying up

of bullæ. The scabs in *secondary yaws* form upon the yellow heads of large papules, and beneath them are found reddish raspberry-like granulations which secrete a little pus, and after a time become pale or even white. Healing usually takes place beneath the scabs, which fall off about the end of the second month from the onset of the secondary rash. The raspberry-like granulations, the characteristic lesion of yaws, will obviate confusion between these crusts and those of any other affection. The crusts of *lupus vulgaris* are greenish-black, like rupial crusts, but they do not consist of layers superimposed upon each other, and dotted around the ragged edge will be seen the "apple-jelly" nodules which are the "note" of lupus.

In *small-pox* the formation of scabs on the pustules begins in the centre and causes a secondary "umbilication"; it is generally attended by intense itching. In from three to four weeks from their appearance the crusts fall off, leaving a reddened surface, made uneven by scars or "pits." The true nature of the disease will have been discovered, even in doubtful cases, before the crust stage is reached. (For the differential diagnosis, see under PUSTULES.) In the diagnosis of *ulcers*, as in that of small-pox, the crust is of little importance. These are dealt with under *ULCERATION OF THE FACE* and *ULCERATION OF THE FOOT*.

Malcolm Morris.

SCALY ERUPTIONS.—The squame, or scale, one of the secondary cutaneous lesions, is a dry, and as a rule laminated, exfoliation of the epidermis. Disregarding the slight, imperceptible desquamation which is a purely physiological process, scales may be said to result either from inflammation, as in psoriasis and pityriasis rubra pilaris; from an abnormal dryness of the skin, as in dry seborrhœa and keratosis pilaris; or from an earlier acute hyperæmia, as in scarlatina and other erythematous eruptions. The process may consist in an over-multiplication of the epidermic cells or in interference with the normal horny transformation. In colour, scales are ordinarily white or grey, either dull and lustreless, as in seborrhœa, or silvery, as in psoriasis; but they are sometimes a dirty yellow, as in some dry syphilides, or even reddish-brown, as in oily seborrhœa. They may be large and thin, as in pityriasis rubra, or small and branny, as in tinea versicolor; even in the same affection (e.g., pityriasis rubra) they may vary greatly in size in different regions. They may consist of a single layer, as in squamous eczema, or of several adherent strata, as in psoriasis. In quantity they may be inconsiderable, as in tinea versicolor, or most profuse, as in psoriasis and pityriasis rubra. Usually they are dry and friable, but if mixed with an oily secretion, as in seborrhœa, or with a serous or seropurulent discharge, as in eczema, they may partake of the nature of both scales and crusts.

A brief description of the scales met with in various affections may be given here; but except in a few diseases of which they form a highly characteristic manifestation, such as seborrhœa, psoriasis, and pityriasis rubra, they have little diagnostic value, and, as I have said elsewhere of scabs, diagnosis must usually rest upon primary rather than upon secondary lesions.

Sometimes there is scale-formation in eruptions due to the internal administration of such *drugs* as quinine or belladonna, or to the external application of carbolic acid, iodine, etc.; but it has no significance in diagnosis. In *keratosis pilaris* (xeroderma) and other forms of *ichthyosis*, there is always more or less desquamation of the dry and roughened and sometimes warty skin: but here also it is without diagnostic import. Of the scales of scarlet fever, measles, German measles, and other *infectious fevers*, again, nothing need be said, for the diagnosis ought to have been settled before they appear. Nor need I speak of the scaliness of tinea tonsurans, tinea versicolor, and other *fungous affections*,

for the differential diagnosis of these diseases has been given under FUNGOUS DISEASES. The scales of papular syphilides, again, have been described under PAPULES, and the diagnosis of the lesions, both primary and secondary, from those of psoriasis will be found in that article. In the unusual instances of *urticaria* in which desquamation is present, it is so slight as to be negligible. In most forms of *erythema*, scales occur; but here again they have little significance for the diagnostician, and it will be sufficient to say that in *erythema simplex* the desquamation is slight, and that in *erythema scarlatiniforme* it is more considerable. In *lupus erythematosus* the central scar-like depression of the primary eruptive lesions may be covered either with thin, papery, greyish scales, or with a firmly adherent scab. In parts furnished with sebaceous glands, the skin will usually be covered with small adherent scales of sebum, which at the margin of the patch plug the dilated orifices of the glands, so that numerous comedones are formed. From other forms of *erythema*, as also from ringworm, *lupus erythematosus* may be distinguished by the slowness and persistence of the process. The lesion itself, atrophic in the centre, with a well-defined red border, and studded with plugs, can scarcely be mistaken when it appears on its site of election, the face. When, however, it occurs on the hands, it may mimic chilblains so closely that only the lapse of time can make the diagnosis certain, *lupus erythematosus* being much more obdurate to treatment, and not disappearing in the summer. For the diagnosis between *lupus erythematosus* and psoriasis, see below; for that between *lupus erythematosus* and *lupus vulgaris*, see under NODULES.

We now come to affections in which scales play a more important part. In *seborrhœa sicca*, there is an excess of the solid fatty constituents of the sebum, and the excreted material takes the form of scaly but usually somewhat greasy masses. In *seborrhœa oleosa* there is an abnormal predominance of the oily part of the sebaceous secretion, which dries into yellowish or reddish-brown cakes of greasy scales, often with a hyperæmic base and a fringe of papules about the edge. In the face, oily *seborrhœa* is more often met with than the dry form; but *seborrhœa* generally, though it may occur on the trunk and limbs, almost invariably begins on the scalp. When not limited to the scalp, as usually it is, it spreads downwards to the face, round the neck, the chest, the centre of the back, and the limbs. In the light of this preference for the scalp, and the downward extension when the affection is not confined to that part, a typical case of *seborrhœa* is unmistakable. In cases of *seborrhœa* which resemble psoriasis, guidance may be found in the scales, which in the latter affection are silvery, and harder. The respective starting-points of the eruptions, however, furnish a safer indication, psoriasis almost always appearing first on the elbows and knees and spreading upwards.

In typical *eczema*, scaling forms the final stage of the pathological process. After the initial *erythema* comes the exudation, then the crustation (see SCABS), next the dry stage, and lastly the desquamation, the epidermis being shed in scales that become progressively thinner and smaller until only a brownish stain is left to mark the site. All the stages, as need hardly be said, are often present at once in a given case. Scaling is frequently a noticeable feature when there is a predominance of erythematous lesions, as it is also in *eczema folliculorum*. But it is in *seborrhœic eczema* that this phenomenon is most prominent, the latent catarrh with which the affection begins being followed by the agglutination of epidermic scales which are thrown off in the form of large lamellæ. In some cases the scales may increase in quantity, in others, as is mentioned under SCABS, they may become massed into fatty crusts among the hairs. The differential diagnosis of *eczema* has been set out in the articles on the primary lesions. The secondary lesions in this affection may indeed

be rather a hindrance than a help in determining its true nature, and in doubtful cases the first thing to do is to remove both scales and crusts in order that the underlying lesion may be carefully examined. As between eczema and psoriasis, however, just as between eczema and seborrhœa, the scales afford guidance in the diagnosis. While in psoriasis the lower layers of scales are whitish or silvery and hard, in eczema they are yellowish, dull and friable.

In this affection, *psoriasis*, the scale has distinct diagnostic value. It enters, indeed, into the definition of the disease as an affection of the skin, characterized by flat, dry patches of varying extent, covered with whitish, silver-grey, or asbestos-like scales. The scaliness may vary from a thin film to a dense, heaped-up mass. If the scales are removed, a smooth, shining hyperæmic surface is seen, studded with spots that show various gradations of colour, from a deep to a bright red, the bright-red points being the tops of inflamed papillæ. The eruption appears as papules of pin-head size, at first red, but becoming white as the scales form. Spreading centrifugally, the papules form patches, generally roundish or oval when small, and becoming more irregular as they grow larger. They may remain stationary for a long time, and slowly disappear, or, continuing to spread, may become confluent. While the disease is active the individual patch is encircled by a narrow zone of redness, but when it is not spreading this fades away. Sooner or later involution takes place, and the redness which the lesions leave behind them soon disappears, though in protracted cases a brown stain may persist, and in rare instances there may be superficial atrophy. In distribution, psoriasis is almost invariably symmetrical. Like small-pox, it shows a marked predilection for surfaces that are exposed to friction. Almost always it starts on the tips of the elbows and the fronts of the knees. After the extensor aspects of the limbs, its favourite site is the hairy scalp, and then the trunk, especially over the lumbar region. In typical cases the clinical picture—the patches with sharply defined border, covered with hard, shiny scales; the hyperæmic surface beneath, dotted with red points; the distribution as just described; the unimpaired health, the natural complexion, the proneness to attack blue-eyed fair-haired persons, and the absence of exudation—scarcely admit of misinterpretation. In all these particulars, except the unimpaired health, psoriasis differs from eczema, as well as in the less intense and less constant itching by which it is attended. On the scalp, while psoriasis usually occurs in patches and ends abruptly at or only just beyond the margin of the hair, seborrhœic eczema almost invariably extends over the whole surface, and often involves the face and the neck. Almost always, too, psoriasis spreads upwards from its sites of election, seborrhœic eczema downwards from the head. In very chronic forms of eczema, in which there may be no history of “weeping,” the diagnosis from psoriasis may be difficult. In all doubtful instances, gentle scratching on the affected surface will bring out the silvery scales, if the case is one of psoriasis.

In the papular stage of *lichen planus*, that affection may in some cases be mistaken for psoriasis. In lichen planus, however, the eruption shows a preference for the flexor aspects of the wrists and knees; it consists of shining-smooth papules, while scales are absent; the ground-tint, so to speak, is bluish red or violet; and the patches are formed by the aggregation of a number of papules instead of by centrifugal extension. In doubtful cases the whole body must be searched for the typical lesions of either disease.

Lupus erythematosus differs from psoriasis in that, in the former condition, the scales are not abundant, the edge of the patch is more elevated, the cheeks are usually attacked, as they are not in psoriasis, and there are the distinctive plugs in the orifices of the sebaceous ducts, as described earlier

in this article. Scarring, too, may be found in the patch, and there may be atrophy of the ears.

As between psoriasis and *papular syphilides*, the diagnosis is given under PAPULES. The heaped-up crusts of the condition which has been styled psoriasis rupioides can be distinguished from the rupial lesions of syphilis by the base being ulcerated in the latter disease; but syphilis mimics everything, and cases sometimes occur in which it can only be distinguished even from so distinctive an affection as psoriasis by attention to the history, and by the discovery of other lesions, the presence of cachexia, the influence of iodides and mercury, or by the Wassermann serum test.

In *pityriasis rubra* the whole cutaneous surface is always inflamed and reddened, without infiltration or thickening, but accompanied by profuse desquamation (*Plate X*), branny on the head, shed in larger flakes from the trunk, and from the hands and feet in huge scales. Pityriasis rubra may occur as an independent disease—an extremely rare event—or may follow in the wake of erythema multiforme, eczema, psoriasis, lichen planus, dermatitis herpetiformis, and certain drug eruptions. Its most frequent precursor is psoriasis. The constant and profuse desquamation, the papery scales and sheets in which the epidermis is shed, are important diagnostic signs; others are the vivid redness of the eruption, the rapidity with which it is diffused, its universality, the serious impairment of health—sometimes issuing in death—which it produces, and the frequent absence of itching. From eczema it is distinguished by the absence of exudation and of crusts; from psoriasis by its rapid spread and universal diffusion; from pemphigus foliaceus by the absence of loose bullæ and of foul-smelling discharge, the less severe general symptoms, and the greater amenability to treatment; from lichen ruber planus by the absence of papules, as well as by its rapid extension and involvement of the whole area of the body.

The essential lesions of *pityriasis rosea* are patches or circles, very slightly raised and thinly covered with small scales. The eruption usually first shows itself on the abdomen, though it may begin on the chest, the face, or the arms. It spreads less rapidly than pityriasis rubra, but in two or three weeks the trunk, the face, and the limbs may be covered, and though occasionally it is universal, it seldom extends below the elbow or the knee. The diagnosis is seldom in doubt, the characteristic "herald patch" with which the rash begins, the pale-red tint, the slight elevation of the patches, the mingling of maculate and circinate lesions, the slight degree of scaliness, and the spontaneous involution, forming a distinctive *ensemble*. The differences it presents from pityriasis rubra have been indicated. From psoriasis it is differentiated by its less inflammatory character, the more rapid onset, the slight scaliness, its neglect of the situations most vulnerable to psoriatic attack, and the absence of hyperæmic spots on the surface beneath the scales. From seborrhœa corporis, by the dryness of the scales, its much less chronic character, the lesions disappearing spontaneously in a few weeks. From tinea circinata, by the large number and wide distribution of the lesions, and the absence of the fungus which is the cause of cutaneous ringworm. From the maculo-papular syphilide, by the absence of infiltration, the lighter colour, the fact that the palms of the hands are usually spared, and the lack of concomitant syphilitic signs.

Pityriasis rubra pilaris may appear in the form of scaly patches, resembling psoriasis, on the palms and soles, or as a dry eruption, covered with eczematous-looking crusts; but the papule which soon appears is a more characteristic lesion, and the diagnosis of the condition from psoriasis and other affections will be found under PAPULES.

PITYRIASIS RUBRA

*From "Diseases of the Skin,"
by kind permission of Sir Malcolm Morris, K.C.V.O.*

SENSATION, SOME ABNORMALITIES OF.—The abnormalities of sensation which we meet with in disease are as numerous as they are important for the purpose of diagnosis. Under PAIN IN THE FACE; PAIN IN THE UPPER EXTREMITY; and PAIN IN THE LOWER EXTREMITY, the question of subjective

Fig. 174.—THE DISTRIBUTION OF SENSORY NERVES IN THE SKIN.

pain in relationship to diagnosis has been discussed, and in the second of these articles some reference will be found to another subjective abnormality of sensation, to which the term "acroparæsthesia" is applied.

In the present paper we shall have to deal first of all with the common forms of sensory loss, and their significance in clinical work. Wherever sensory loss occurs, it should afford some assistance in forming a conclusion as to the site of disease, even if it does not indicate clearly anything with regard to its nature. In order that the sensory loss may give the necessary information as to the site of disease, it is absolutely necessary that the physician should ascertain both the limit and the nature of the loss. He will be able to judge from the shape and locality of the anæsthetic area, whether it conforms to a lesion of a peripheral nerve, a spinal root, or some part of the central nervous system. An analysis of the sensory loss—that is to say, an examination directed to show whether the loss is uniform to all forms of sensory stimuli, or whether it is limited to one or two forms only—will provide additional information for the purpose of diagnosing the situation of the lesion.

In order to utilize the information provided by the shape and size of the area of anæsthesia, it is necessary to know what are the areas on the surface of the body which correspond to the distribution of peripheral nerves on the one hand,

Fig. 175.—Peripheral neuritis. "Glove and stocking anæsthesia." Cotton-wool and pin-prick sensibility impaired or lost over the dotted areas. This is associated with hyperalgesia of the underlying muscles.

and of spinal segments or spinal roots on the other. The accompanying diagrams (Fig. 174 and Plate XI) supply this information to some extent, but in order that it may be used to the best advantage, it is necessary to say a few words about various forms of sensory loss due to lesions in different parts of the nervous system.

Before entering upon this part of the subject, we may interpose an explanation of the way in which we propose to use the terms anæsthesia, analgesia, and thermo-anæsthesia.

Anæsthesia will be used to denote impairment or loss of the cutaneous sensibility to cotton-wool touch, and it is important to remember that parts which

are hairless should be chosen when an accurate examination is being made.

Analgesia refers to impairment or loss of pain-sense, the adjective "superficial" being applied when the surface pain produced by the prick of a pin is interfered with, and the adjective "deep" when the pain usually associated with pinching or squeezing the muscles and deeper tissues is no longer appreciated.

Thermo-anæsthesia indicates loss of appreciation of heat and cold; but as we shall see later, the inability to distinguish between things which are warm and cool is not always associated with equal loss of sensibility in distinguishing between objects which are ice-cold and really hot.

Disturbances of Sensation in Peripheral Nerve Lesions.—It was shown by Head and Rivers that the afferent mechanism of the peripheral nervous system consists of the following three sub-systems:—

1. *Deep Sensibility.*—This conveys impulses excited by pressure and by all

movements of joints, tendons, and muscles. Painful impulses derived from excessive pressure are also carried by this sub-system. By its means a healthy person is not only able to recognize movements of joints, but also the locality of the stimulus and the direction of the movement. The fibres which conduct these sensory impulses run mainly with the muscular nerves, and are not destroyed by division of the sensory nerves to the skin.

2. *Protopathic Sensibility*.—This sub-system responds to painful cutaneous stimuli (pin-pricks) and to the more extreme degrees of heat and cold. The appreciation of these stimuli is vague and inexact as to the locality of the spot stimulated.

3. *Epicritic Sensibility*.—To this sub-system is due the power of perceiving and locating light touches (cotton-wool), of discriminating between two points applied simultaneously to the surface, and of recognizing the finer grades of temperature called cool and warm.

It has been shown that when a *peripheral cutaneous nerve* is divided the area of epicritic loss is greater than that of protopathic loss; in other words, there is more overlapping of protopathic sensibility than of epicritic sensibility between neighbouring nerve distributions. Thus, if the *ulnar nerve* is divided near the wrist, there is complete loss to touch, superficial pain, heat, and cold, over an area including the little finger and part of the inner edge of the palm of the hand. This is the area of epicritic and protopathic loss. But epicritic loss extends over a wide area which includes half the ring finger and more of the hand. In this area of epicritic loss pain can be recognized but cannot be localized exactly, while light touch is not appreciated, and the discrimination between cool and warm is absent.

Fig. 176.—Division of ulnar nerve at the wrist. The dark area represents loss of epicritic and protopathic sensibility. The line indicates the limits of epicritic loss. (After Head and Sherren.)

A consideration of the above points shows how important it is to define accurately the exact nature of any sensory loss, and to be careful that the appreciation of pressure is not mistaken for the appreciation of light touch. If tactile sensibility is tested by means of the observer's finger or by the head of a pin, the results will be vitiated, because pressure sensibility is at once brought into action.

Another diagnostic point of importance depends on the fact that protopathic sensibility returns some months before epicritic sensibility in the process of regeneration after the division of a peripheral nerve. During the stage of protopathic repair there is often a considerable degree of hyperalgesia in the affected area; that is to say, the pain produced by a pin-prick or a scratch is out of all proportion to the nature of the stimulus.

So far we have dealt with the disturbance of sensibility produced by the disease or injury of a single nerve. In the disease known as *peripheral neuritis* the sensory disturbances are very characteristic, and consist of pain, tingling, tenderness, and cutaneous anæsthesia. Spontaneous pain in the limbs is often complained of, but more important is the intense suffering produced by movements, and especially by handling the limbs or by squeezing the muscles. At the same time cotton-wool touch is often unperceived on the peripheral parts of the limbs, particularly in what are known as the glove and stocking areas. This combination of deep hyperalgesia and cutaneous anæsthesia constitutes

an important differential sign between some cases of peripheral neuritis and cases of tabes dorsalis, in which superficial and deep analgesia are nearly always associated.

Disturbances of Sensation in Lesions of the Cord.—Head and Thompson have shown that the impulses of the three peripheral sub-systems—deep epicritic, and protopathic—combine in new groups soon after they enter the spinal cord. Some impulses cross to the opposite side immediately, others cross after running a short course on the same side, and others ascend to the upper extremity of the cord entirely on the side of their entry. This rearrangement may be summarized briefly thus:—

1. Impulses of pain, whether excited by cutaneous stimuli or by excessive pressure, run together in the spinal cord, and cross, probably soon, to the opposite side.

2. Impulses of temperature of all degrees cross to the opposite side and are closely associated, but not intermingled, with those of pain; the impulses of heat are also separated from those of cold.

3. Impulses excited by light touch and by pressure, and those which subserve their localization, accompany each other, cross to the opposite side, probably less rapidly than those of pain and temperature, and ascend in a path which is distinct from that of the latter.

4. Impulses subserving the senses of passive position and movement are associated with those of tactile discrimination (compass points) in their ascent of the cord on the same side as their entry. These impulses pass up the posterior columns.

The accompanying diagram represents this rearrangement of impulses and their course in the spinal cord:—

Fig. 177.—Diagram illustrating the course of the sensory impulses passing from the peripheral nerves into the spinal cord. (From the author's article in *Osler's Modern Medicine*, vol. vii.)

The chief points of practical importance in clinical work to be deduced from the above considerations are as follows: In the first place, analgesia resulting from a cord lesion always includes deep as well as superficial pain, and so differs from the analgesia produced by a peripheral nerve lesion in which, as we have

PLATE XI.

DIAGRAM SHOWING THE RADICULAR SENSORY AREAS OF THE HUMAN BODY

Copyright.

By Dr. E. Farquhar Buzzard.

This diagram has been compiled by the writer from a study of similar diagrams published by others, and modified in accordance with his own experience.

Although the various areas depicted in the diagram are essentially Root Areas, the information they supply can be used clinically for the purpose of localizing both radicular and intramedullary lesions. It must be remembered, however, that the deductions in the one case are different from those in the other. If, for instance, the character of the sensory change in one of these areas is of the peripheral type, a radicular lesion of the corresponding segmental level may be diagnosed; if, on the other hand, the sensory loss is of the central type in a particular skin area, the spinal lesion must be sought at a level several segments higher than that which corresponds to the sensory area.

For practical purposes it is important to remember that the uppermost level of sensory change (not the upper level of total analgesia) should be compared with the nearest corresponding line on this diagram. If employed with an intelligent appreciation of these points the diagram is of much clinical importance, but it should not be exploited blindly as a mechanical calculator. Individual variations alone are sufficient to demand a considerable margin of error.

seen, superficial analgesia may be associated with deep hyperalgesia. In the second place, a lesion of the spinal cord may abolish the appreciation of thermal stimuli, but, if it does so, the discrimination between all degrees of heat and cold will be lost. This again differs from the effect of some peripheral lesions. In the third place, a lesion of the posterior columns may produce loss of the sense of passive position and movement without any loss of tactile, painful, or thermal stimuli, a combination which does not obtain as the result of a lesion limited to the peripheral nervous system.

In all diseases or injuries of the spinal cord, the degree of sensory loss depends, of course, upon the severity of the lesion. On the other hand, the distribution of the sensory loss is of the greatest importance for the diagnosis of the level of the lesion. The distribution must be mapped out carefully, and then compared with the accompanying diagram (*Plate XI*), which shows the sensory areas corresponding to the different spinal segments.

In a case of *myelitis*, for instance, it may be found that sensation is perfect above the level of the umbilicus, and impaired on the trunk and legs below that level (*Fig. 179*). We shall be justified in concluding that the highest point of the disease corresponds to the 9th dorsal segment of the cord. Take another example: *fracture dislocation of the vertebrae* is common in the cervical region, and may crush the spinal cord at the level of the 7th cervical segment. The resulting sensory loss is represented in the accompanying chart (*Fig. 180*).

Fig. 178.—Comminuted fracture of the sacrum, with injury to the 3rd, 4th, and 5th sacral roots. Complete loss of sensibility to touch, superficial pain, heat and cold.

Fig. 179.—Dorsal myelitis affecting the cord as high as the 9th dorsal segment. The shaded parts are insensitive to touch, deep and superficial pain, and all degrees of temperature.

Fig. 180.—Fracture-dislocation of the cervical spine. The shaded area represents the loss of sensibility to touch, pain, heat and cold.

In testing the sensibility of the skin, it is always advisable to work from the anæsthetic area towards the normal, and to note not only complete anæsthesia, but all modifications of sensation. For instance, bordering on the region of complete anæsthesia there may be an area in which the patient is able to appreciate a touch or a pin-prick, but in which he describes the sensation produced as differing from the natural sensation elicited by these stimuli. Such modifications should be taken into account in diagnosing the level of the lesion.

As a result of disease or injury of one side of the spinal cord, a symptom-complex called *Brown-Séquard paralysis* is met with. This includes loss of sensibility in parts of the body on the opposite side to that of the lesion, and at

a lower level. The sensory loss is often of a dissociative type, that is to say, tactile sensibility is preserved while painful and thermal sensibility is lost. *Fig. 181* illustrates the sensory loss in a case of this kind.

Syringomyelia and *hæmatomyelia* are other conditions in which dissociative anæsthesia is common (*Fig. 182*). In the former disease thermo-anæsthesia and analgesia are usually found first in the upper extremities and thorax, and they tend to spread all over the body. In rare instances they commence in the lower extremities or on the face. Their distribution is nearly always asymmetrical. The borders of the cutaneous loss are not sharp but shaded off, and correspond to the limits of spinal-root areas. On the other hand, charts sometimes show regions of dissociative anæsthesia which correspond laterally to one or more root areas, but do not cover their longitudinal extent.

For instance, the sensory loss in

Fig. 181.—Brown-Séquard paralysis due to an intra-medullary one-sided lesion of the lower thoracic cord. The shaded area was insensitive to deep and superficial pain and to all degrees of temperature, but sensitive to touch. The sense of passive movement and position and tactile discrimination were disturbed in the right foot. There was spastic paralysis of the right leg only. (*After Head and Thompson.*)

one hand may be limited above by a line encircling the forearm so as to give it the appearance of a glove distribution. Similarly, on the face a central area, including the nose, mouth, and eyes, may preserve its sensibility intact, while the surrounding regions are completely insensitive to painful and thermal stimuli. Thermo-anæsthesia and analgesia are sometimes, but not always, co-extensive. Tactile loss also occurs, but usually supervenes in the later stages of the disease. Subjective sensations may form the initial evidence of the disease, and may be thermal, painful, or tactile. Lancinating pains and cramps are described. More curious are the subjective sensations of drenching sweat in a part which is dry, or of cold in a part which is quite normal in temperature.

In *tabes dorsalis* the disturbances of sensation are numerous and characteristic. Lightning and dull boring pains, tingling, numbness, girdle sensations, and various painful crises are among the subjective abnormalities. Impairment or loss of deep and superficial pain sensibility in various parts of the body is one of the earliest and most important physical signs for the purpose of diagnosis.

The cutaneous analgesia is generally found on the legs, and often also in the root areas on the arms and thorax corresponding to the C 8 to D 5 segments (see Fig. 183). Deep analgesia is nearly always present in the calf muscles. Superficial nerves such as the ulnar may often be found insensitive to rolling or pinching. Delayed sensibility is another phenomenon very characteristic of some cases of *tabes dorsalis*. Hyperæsthesia may be present, especially in bands around the abdomen, when gastric or intestinal crises form part of the clinical picture. Intolerance of hot or cold water on any part of the skin is described not uncommonly by patients suffering from severe forms of the disease. *Allocheiria*, or reference of a sensory stimulus to the opposite side of the body, has also been observed.

The sense of position and movement is nearly always disturbed in locomotor ataxy, and this results in varying degrees of inco-ordination and in the production of Romberg's sign. Astereognosis, or the inability to gauge approximately the

Fig. 182. — Syringomyelia. The shaded parts show the areas of dissociative anæsthesia, i.e., of thermo-anæsthesia and analgesia. This was associated with atrophic palsy of the upper extremities.

size and shape of objects placed in the patient's hand, is another common sensory defect.

In *disseminated sclerosis*, sensory troubles do not as a rule constitute so prominent a feature as do the motor disabilities, but subjective and objective changes are by no means uncommon. Numbness of one limb lasting a few weeks or months, girdle sensations, and even pains of a neuralgic type, are sometimes complained of. I have known transient hemianæsthesia to be an initial symptom in one case, and astereognosis with loss of sense of position on one side, to be the earliest signs of disease in two or three cases. From the diagnostic standpoint these are important facts, because it is very tempting to assume, erroneously, that such sensory phenomena, occurring alone without any reflex or motor signs of organic disease, are hysterical in origin. They

Fig. 183. — Early *tabes dorsalis*. The dotted areas represent a characteristic distribution of sensory disturbance. The loss is chiefly to painful stimuli, and the superficial analgesia is almost always associated with deep analgesia.

are doubtless due to patches of disease in the neighbourhood of the internal capsule.

This brings us to the consideration of the **Abnormalities of Sensation resulting from disease of the Higher Parts of the Nervous System.**

Hemianæsthesia is a common result of the various vascular accidents responsible for *apoplexy* and hemiplegia. It may be present with or without any motor paralysis and with or without hemianopia; sometimes all three phenomena are associated in the case of severe lesions of the internal capsule and optic radiations. In most cases of apoplexy hemianæsthesia is slight and transient. Tactile and pain sensibility may be impaired, usually more so on the limbs than on the trunk, and more especially in the distal portions of the arm and leg. Even when touches are perceived, they are localized badly by the patient. In *lesions of the optic thalamus* the opposite side of the body may be the site of a curious sensory disturbance which consists in part of a lowered

Fig. 184.—Thrombosis of left posterior inferior cerebellar artery. The dotted areas show the regions of dissociative anæsthesia, i.e., loss of sensibility to pain and temperature of all degrees.

sensibility to painful stimuli and in part of a great exaggeration of the disagreeable effects produced by such stimuli when they are perceived. For instance, the patient may fail to recognize a light pin-prick so well on the affected as on the sound side, but a scratch may produce an intensely painful sensation referred to a very wide area and not localized to the spot stimulated. In such cases the patient often complains also of paroxysms of severe pain in the affected limbs.

The *hemianæsthesia of hysteria* is usually far more complete to all forms of stimulation than any hemianæsthesia due to organic disease of the brain. The hysterical patient is found to have lost taste, smell, and sometimes even hearing, on the anæsthetic side. The visual defect, instead of being hemianopic as in the organic cases, is generally a marked contraction of the visual

fields, sometimes amounting to blindness, especially in the eye corresponding to the other sensory defects.

Lesions of the brain-stem may also be responsible for extensive loss of sensation. For instance, thrombosis of the posterior inferior cerebellar artery gives rise to a localized softening on one side of the medulla, which produces thermo-anæsthesia and analgesia on the same side of the face, and on the trunk and limbs of the opposite side. This sensory disturbance is sometimes complicated by homolateral cerebellar ataxy and cranial nerve palsies.

So far we have dealt chiefly with the various forms of lowered sensibility, and have given little attention to perversions of sensation, such as are indicated by the terms *hyperæsthesia* and *paræsthesia*.

Hyperæsthesia is observed in cases of tabes dorsalis and peripheral nerve lesions as described above, but it is also met with in other conditions of organic as well as functional disease. It is found, for instance, in root areas in cases of

vertebral and intravertebral disease. In *spinal caries* and in *tumours of the spinal meninges*, a zone of hyperæsthesia may be detected just above the area of anæsthesia produced by the compression of the cord, or it may precede the appearance of compression signs. The increased sensibility is probably caused by pressure on, or irritation of, the posterior root fibres. A similar phenomenon is a frequent accompaniment and sequel of an attack of *herpes zoster*. The shape and situation of such hyperæsthetic zones afford a clue to the site of the lesion. Hyperæsthesia as well as paræsthesia are among the earliest signs of *subacute combined degeneration of the cord*, and are referred by the patient to peripheral parts of his four extremities. They may precede by many weeks or months the appearance of ataxic or spastic paraplegia and definite areas of sensory loss. Similar symptoms are also complained of in not a few cases of pernicious anæmia and other severe blood diseases, probably on account of scattered degenerations in the nervous system as the result of the ANÆMIA (*q.v.*).

Neurasthenic and hysterical states are responsible for hyperæsthetic areas which have no relation to central or peripheral innervation. In neurasthenia, especially the traumatic variety, the patches are usually found on and around the spine and over the scalp. In hysterical conditions similar patches may be detected in the mammary and ovarian regions.

Hyperæsthesia in connection with *visceral disease* has been referred to in other articles, such as those on PAIN IN THE FACE; PAIN IN THE UPPER EXTREMITY; etc.

SHIVERING FITS.—(See RIGORS.)

SHORTNESS OF BREATH.—(See BREATH, SHORTNESS OF.)

SKIN ERUPTIONS.—(See MACULES; PAPULES; ETC.)

SKODAIC RESONANCE.—When there is a basal and unilateral pleuritic effusion of medium degree, it may often be noted that the pitch of the percussion note over the upper part of the thorax in front is higher on that side of the chest on which the effusion is than on the other. It is not a question either of impairment of resonance or of hyper-resonance, but merely of pitch. This higher pitch of the percussion note over the upper lobe, when the lower lobe is compressed by an effusion, is named "Skodaic resonance," after the observer who first drew attention to it. Its importance is mainly twofold: in the first place it does not indicate disease of that part of the lung which affords the sign—for instance, the fact that, in a case of right-sided effusion, the right upper lobe gives a higher-pitched percussion note than does the left cannot be taken as evidence that there is a lesion, perhaps tuberculous, at the right apex; in the second place, it is erroneous to suppose that this is only obtained in cases of effusion; its occurrence cannot be taken as proof that dullness at the base is due to fluid there. It is true that *pleural effusion* gives it not only in most marked degree, but also most commonly; nevertheless it may also be observed in some cases of *basal pneumonia* without effusion, or as the result of compression of a lower lobe by such causes as *subdiaphragmatic* or *hepatic abscess*, *hepatic masses* such as *carcinoma*, *gumma* or *hydatid cyst*, *great enlargements of the spleen* such as occur in *splenomedullary leukæmia*, a *big heart*, a *pericardial effusion*, or a *mediastinal* or *pulmonary new growth*.

The cause of Skodaic resonance has never been quite decided, and many theories have been propounded about it; clinically, the most serviceable view is that anything that lessens the degree to which the upper lobe is stretched, yet without actually compressing it, may produce a rise in the pitch of its percussion note. Bilateral compression of the bases of the lungs

by such lesions as ascites, presumably causes bilateral Skodaic resonance, but this is difficult to determine, because the latter is only recognizable when there is a difference of pitch between the two sides of the upper part of the chest in front.

Skodaic resonance over an upper lobe when there is some lesion affecting the lower lobe on the same side, should not be confused with the tympanic note that may sometimes be heard over the other parts of the thorax. Stomach tympany is normally heard external to and below the precordial region over an area known as Traube's space, which is bounded above by the precordial dullness, behind by the splenic dullness, and below by the rib margin. When the stomach is dilated, there may be an abnormal extent of this gastric tympany in the thorax. When the transverse colon is distended with gas, or when it is pushed upwards by something intra-abdominal, it may produce abnormal areas of thoracic tympany, particularly in the lower sternal region or on either side of this.

Such conditions can scarcely be mistaken for Skodaic resonance, for the latter concerns the upper part of an upper lobe in front, and is not a definite tympany, but rather a moderate rise in the pitch of the ordinary percussion note, not as a rule obvious till the two sides are contrasted.

Herbert French.

SLEEPLESSNESS.—(See INSOMNIA.)

SMELL, ABNORMALITIES OF.—Abnormalities of the sense of smell fall into three main categories, namely :—(1) *Too great sensitiveness to smells which actually exist* ; (2) *Deficient sensitiveness to smells which actually exist* ; (3) *Subjective sensations of smells which do not exist*.

1. Too great sensitiveness to existing smells is sometimes a nuisance to the individual, but is very seldom a sign of disease. There are very great differences in the powers of perception of different sensations in different persons, and just as some can appreciate very slight differences in sounds more than others, so can some detect smells which are undiscernible by others. This is natural idiosyncrasy.

2. Deficient sensitiveness to actual smells is often but the obverse of the above, and no sign of disease, although it may be a detriment to the individual, especially in certain commercial pursuits in which the varying qualities of products are judged partly by smell. When the power of smell, having been normal, becomes deficient or totally absent, the change may affect one nostril only, or both. The condition may be transient or persistent. The commonest cause of transient anosmia is *acute nasal catarrh*, whether the result of an ordinary cold, or of other affections such as *hay fever* (*coryza e feno*), oncoming measles, or the effects of drugs such as *iodide of potassium* or *arsenic*.

Persistent anosmia may be due to :—

(a). *Inability to get air freely, or at all, through the nostril*, as the result of :—

Adenoids	Hypertrophic rhinitis
Polypi	Syphilis
Dislocation of the nasal septum	Necrosis of bones in the nares
Nasal septal spur	Occlusion of anterior or posterior nares.

(b). *Alteration in the olfactory mucous membrane*, so that it no longer transmits impulses to the endings of the olfactory nerve, although the airway is free :—

Atrophic rhinitis

Paralysis of the fifth nerve, leading to undue dryness of the mucosa.

(c). *Abnormalities of the olfactory nerves.*

Congenital absence

Hydrocephalus

Olfactory neuritis, either the result of overstimulation locally by strong noxious vapours, ammonia, or snuff; or part of a general peripheral neuritis

Post-influenzal changes.

(d). *Cranial lesions*, especially hæmorrhage, thrombosis, embolism, softening injury, or tumour of the uncinate gyrus, which is the centre for smell.(e). *General nerve diseases*, especially :—

General paralysis of the insane

Locomotor ataxy.

(f). *Hysteria.*

There is little need to discuss the above table in detail, for each heading speaks for itself. When a case is being investigated, the history is very important; it is next necessary to examine the nose carefully through a speculum, and to test the air-way through each nostril; if there is any local lesion, it will generally become obvious at once, and only after local affections have been excluded should conditions in groups *c*, *d*, *e*, and *f* be discussed. Anosmia will seldom if ever be a prominent symptom, except in connection with local affections of the nose; when due to any other cause, there will nearly always be some other symptoms which will attract attention more than the anosmia itself.

3. Subjective sensations of smells which do not exist externally may be due to :—

(a). Offensive or purulent inflammations of the nose or of the air-cells communicating with it, especially empyema of the antrum of Highmore, or of a frontal sinus.

(b). Local thickening of the meninges, tumour of the brain, or interference with the vascular supply, causing irritation of the hippocampal region.

(c). An aura preceding an epileptic seizure.

(d). Hysteria.

(e). Insanity.

In arriving at a diagnosis, it is chiefly important to exclude purulent affections discharging into the nose; if it is possible to state with certainty that the abnormal sensations have no such organic basis, it is not difficult as a rule to decide between the other causes. It is a curious fact that subjective abnormalities of smell are apt to be associated with delusional insanity concerning the genital organs, in which the prognosis is not free from acute dangers.

Herbert French.

SNORING may be a very troublesome symptom in some patients, particularly to those who have to sleep in the same room with them; but it is often less an indication of disease than merely a bad habit. Most snorers sleep with their mouths open, and breathe partly through the nose and partly through the mouth; but it is possible for snoring to occur with the mouth completely shut, and nothing the matter with the nasal passages. The tendency is increased, however, by any obstruction of the nasal airway, so that particular examination should be made for such lesions as undue smallness of the nares or a tendency for the soft parts of the nostrils to collapse on inspiration, deflected septum, hypertrophic rhinitis, polypi, adenoids, acute or chronic nasal catarrh, inflammation of the accessory sinuses or of the pharyngeal tonsils, or even a fibrosarcoma or other neoplasm of the nasopharynx.

Herbert French.

SORE THROAT may be due to one or other of many different causes :—

1. Affections of the Tonsils :—

Quinsy.

Acute Tonsillitis.

(a). With reddening and swelling only :

Acute inflammation due to various micro-organisms, especially to streptococci ; staphylococci ; pneumococci ; diphtheria bacilli ; Hofmann's bacilli ; Vincent's spirilla and fusiform bacilli ; spirochaeta (treponema) pallida ; micrococci catarrhales ; bacilli influenzæ ; tubercle bacilli. The sore throats of scarlet fever, German measles, and measles are probably not due to specific micro-organisms, but to streptococci, or others of the bacteria just enumerated.

(b). With redness, swelling, and exudation :

Follicular tonsillitis due to streptococci, etc., as above.

Diphtheria

Vincent's angina

Syphilis.

(c). With ulceration :

Phlegmonous tonsillitis due to streptococci, etc., as above.

Syphilis

Vincent's angina.

Chronic Affections of the Tonsils :—

Recurrent inflammation often associated with adenoids, or tonsillar hypertrophy, especially in children

Primary or secondary syphilis

Vincent's angina

Squamous-celled carcinoma

Sarcoma

Gumma

Tubercle.

2. Inflammation of the Soft Palate, Uvula, and Fauces :—

Catarrh, occurring either by itself or associated with any of the varieties of tonsillitis enumerated above

Gumma

Squamous-celled carcinoma

Tubercle.

3. Affections of the Pharynx :—

Acute catarrhal pharyngitis due to any of the micro-organisms mentioned under the heading of acute tonsillitis

Chronic granular pharyngitis due to smoking in excess ; or to over-use, as in clergyman's, costermonger's, or stockbroker's sore throat

Squamous-celled carcinoma of the pharynx

Post-pharyngeal abscess

Varicella

Variola.

4. Laryngeal Conditions, especially :—

Acute catarrhal laryngitis due to any of the organisms mentioned above

Tuberculous laryngitis

Syphilitic laryngitis

Carcinoma laryngis

Acute perichondritis of the arytenoid cartilages.

5. **Sore Throats the result of the Swallowing or Inhalation of Irritants :—**

Corrosives, such as alkalies or strong acids
Ammonia vapour
Hot steam.

6. **Mumps.**7. **Acute and Subacute Adenitis** of the lymphatic glands in the neck.

Notwithstanding the length of the above list the differential diagnosis of a sore throat in practice is not difficult as a rule. Inquiry into the history and inspection of the parts locally in a good light will generally serve to give one a very shrewd notion of the nature of the complaint. The chief point in practice is to determine as soon as possible whether the Klebs-Löffler bacilli of diphtheria are present or not, for it has been established that there is no kind of sore throat which can be recognized clinically as non-diphtheritic. It is important that swabbings should be taken from the inflamed parts and examined by a bacteriologist both directly in films stained by Neisser's method, and by means of cultures. Similar bacteriological investigations will serve to determine which of the organisms mentioned above is responsible for an acute or follicular or ulcerative sore throat other than diphtheritic, it being borne in mind, however, that the organism should be found in fairly pure cultures if it is to be regarded as causative and not merely as a secondary or even casual infection.

1. **Affections of the Tonsils.**

Quinsy is practically always an asymmetrical affection, one tonsil being very much more bulged than the other ; the surface is reddened, generally without follicular suppuration, and the diagnosis is ultimately confirmed by the bursting of the abscess.

The presence of Klebs-Löffler bacilli in association with a sore throat may be regarded as conclusive proof that the lesion is *diphtheria*, even though there may be no typical diphtheritic exudate. Diphtheria having been excluded, the diagnosis of one of the other varieties of acute tonsillitis is rendered possible. The frequency with which *acute rheumatism* is associated with recurrent tonsillitis, especially in young people between the ages of five and twenty, should always be borne in mind ; the patient may or may not have suffered from other effects of acute rheumatism, such as joint pains, endocarditis (evidenced by the bruits), pericarditis, pleurisy, erythema nodosum, chorea ; or a history of such rheumatic affections may be obtained in other members of the same family. The tonsillitis is benefited by sodium salicylate, but by no means to the same extent as are the joint pains, so that the effect of treatment is not by itself conclusive evidence of the nature of the complaint.

When acute rheumatism gives rise simultaneously to generalized erythema and to tonsillitis, there will be very considerable difficulty in excluding *scarlet fever*, especially if there has been considerable nausea or actual vomiting ; in some such cases the diagnosis will be one of opinion only ; that which was regarded at first as acute rheumatic tonsillitis and erythema may prove to have been scarlatina after all, should the patient presently develop acute nephritis ; the occurrence of extensive peeling of the skin is not conclusive evidence of scarlatinal erythema and sore throat. If the patient is known to have had scarlet fever formerly, the rheumatic nature of the case is more likely.

Follicular tonsillitis is not a final diagnosis, for it may be due to various different micro-organisms, and there is no doubt that the diphtheria bacillus may produce that which to inspection presents multiple foci of pus in the different tonsillar crypts formerly regarded as characteristic of follicular as distinct from diphtheritic tonsillitis. The only conclusive proof that a comparatively simple follicular tonsillitis is not diphtheritic is bacteriological examination. If clinical

points alone have to be relied on, one would say that the higher the temperature, the greater the constitutional disturbances, and the more sudden the onset, the more likely is it not to be diphtheria.

Vincent's angina has been differentiated bacteriologically, cases of this kind having formerly been regarded either as diphtheria or as follicular tonsillitis. The characteristic micro-organisms present are elongated fusiform bacilli symbiotic with spirilla (*Plate XII, Fig. M*). The disease is, as a rule, more resistant to treatment than are other forms of acute sore throat, so that what has originally been a tonsillitis with exudation presently becomes an ulceration associated with remarkable fœtor of the breath, but without that tendency to fatal termination presented by most other varieties of acute ulcerative or phlegmonous sore throat. The disease cannot be recognized without the aid of the bacteriologist.

Syphilis may cause acute soreness of the throat in its secondary stages, and unless that possibility is borne in mind, one may diagnose as acute simple or acute follicular tonsillitis that which is really syphilitic. There is more or less pyrexia at the same time, and in most cases there will be tenderness of the scalp and of the bones, together with the well-known roseolous eruption upon the skin and the "snail-track" ulcers upon the pharynx. The diagnosis may be more difficult in women than in men, for in the latter the remains of the chancre may still be obvious. Wassermann's serum test may materially assist in the diagnosis of doubtful cases.

Chronic affections of the tonsils in children are nearly always the result of recurrent acute attacks of non-diphtheritic tonsillitis, generally in association with adenoids, both affections arising from the habit of mouth breathing. Inspection of the bulging hypertrophied tonsils, with or without digital examination of the posterior nasal fossæ, will indicate the diagnosis. In an older person, simple hypertrophy from a recurrent tonsillitis becomes progressively less common. Chronic tonsillitis in a young adult may be diphtheritic, syphilitic, or due to Vincent's angina, the diagnosis between these being arrived at in the way described above. It may be mentioned that in very rare instances an actual chancre appears upon one tonsil, giving rise, unless secondary symptoms are present, to much difficulty in diagnosis until the case has been watched. *Malignant disease of the tonsils*, whether *squamous-celled carcinoma*, or *sarcoma*, is fortunately not very common; when it does develop, its comparatively non-acute course and its unilateral distribution with progressive ulceration of the central parts and overgrowth of the edges of the neoplasm will point to the diagnosis. A *gumma* of the tonsil is very rare, and it might at first simulate squamous-celled carcinoma: in case of doubt a small portion of the suspicious mass might be excised, and examined microscopically; or if operative measures were not to be adopted at once, potassium iodide might be administered, and the lesion would be shown to be gummatous if it were thereby relieved or cured. *Tuberculous ulceration* of the tonsils is quite uncommon, practically never primary, but secondary to extension from the lungs, and nearly always preceded by both phthisis and tuberculosis of the larynx. The diagnosis will be indicated by the discovery of tubercle bacilli in the sputum, though it should not be forgotten that carcinoma or gumma might affect the tonsils in a person who had phthisis.

2. Inflammation of the Soft Palate, Uvula, and Fauces.

This may be seen in many cases of common cold; in association with acute rheumatism; in persons who have recently returned to town from a holiday in the country; in patients who have been subjected to the influence of motor-car dust stirred up from the roads after the latter have been dry for about three days—a longer period of dryness seems to lead to relative disinfection of the dust, whilst rain keeps the dust from rising, so that either continuance of fine

weather or a return to wet leads to a disappearance of the sore throats; or in those who are subjected to the influence of relatively concentrated microbes, as in the air of old-fashioned hospital wards, of ill-ventilated much-inhabited rooms, of sewers, and the like. Often a rim of acute reddening is to be seen all along the edge of the anterior pillars of the fauces, and affecting much of the uvula and of the soft palate, producing, as a rule, but little pyrexia, though much discomfort in swallowing, and a raspy feeling on the back of the mouth on first waking in the morning. This inflammation of the palate and fauces may or may not be associated with tonsillitis, pharyngitis, or laryngitis; it is clearly microbial; and doubtless more than one of the varieties of bacteria mentioned above may produce the lesion. The diagnosis of the fact of inflammation is obvious on inspection; that of the nature of the micro-organism requires skilled bacteriological assistance.

Gumma, squamous-celled carcinoma, and tuberculous affections of the fauces, soft palate, and uvula are relatively uncommon; they are differentiated in the same way as has been described in connection with tonsillitis.

3. Affections of the Pharynx.

Acute pharyngitis may occur by itself, or in association with acute tonsillitis or acute laryngitis, and in either case it may be due to any of the micro-organisms mentioned above. The differential diagnosis of the micro-organisms is carried out in the bacteriological laboratory. The fact of acute pharyngitis is determined by careful inspection of the structures at the back of the mouth.

Chronic pharyngitis is generally the result of excessive smoking, or of the undue use of the voice, in which latter case it may be associated with hoarseness or ready tiring of the voice, as in those who have to declaim loud and long—clergymen, stockbrokers, costermongers, public orators, and others. The history will generally point to the nature of such a case, though it is necessary to examine the sputum and the lungs for evidence of tuberculosis, and also to look for signs of either syphilis or new growth, in order to exclude these possible alternatives.

Post-pharyngeal abscess is rather a cause of acute dyspnoea than of soreness of the throat; it is almost confined to infancy; after three or four years of age the disease becomes almost unknown. It might be simulated by spinal caries, in which, long before there is soreness of the throat, there is severe pain in the cervical region of the spine, especially on movement.

Chicken-pox and *small-pox* may each produce its characteristic eruption in the mouth, pharynx, and œsophagus, and thus give rise to sore throat; but the latter symptom will never be present by itself, and the presence of the cutaneous papules, vesicles, or pustules, will indicate the diagnosis, especially if there have been other similar cases in the neighbourhood.

4. Laryngeal Conditions.

Acute laryngitis may be due to the same micro-organisms as acute tonsillitis; soreness of the throat is generally less complained of than is huskiness, or weakness or loss of voice. The nature of the inflammation is determined bacteriologically in most cases. One variety of acute non-diphtheritic laryngitis that merits special mention is that due to pyogenic cocci—pneumococci, streptococci, staphylococci—which in a few cases, in addition to producing acute superficial inflammation, also lead to rapid and extreme œdema of the larynx, with death from asphyxia unless tracheotomy be speedily performed. These cases have been spoken of as *acute suffocative œdema* of the larynx.

Tuberculous, syphilitic, and carcinomatous lesions of the larynx are less acute, though they may have relatively acute exacerbations or may become secondarily infected with pyogenic cocci; their diagnosis depends partly upon laryngoscopic inspection—tuberculosis and syphilis being bilateral, whilst new growth is

generally unilateral; upon examination of the sputum for tubercle bacilli, and of the lungs for apical physical signs of phthisis; upon the beneficial influence of potassium iodide and mercury; upon Wassermann's syphilitic serum test; upon microscopic examination of small excised portions; or upon the course of the disease.

5. **Sore Throats the Result of the Swallowing or Inhalation of Irritants and Corrosives**, are diagnosed as a rule by the history; inquiry into the circumstances of the case will generally suffice to indicate that some irritant has been taken, or there may be direct evidence of it in the form of eschars on the lips or the buccal mucosa; there may be vomiting and hæmatemesis; analysis of the gastric contents may indicate the nature of the poison taken; ammonia may be detected by the smell.

6, 7. **Mumps and Acute Adenitis of the Cervical Lymphatic Glands** may each produce marked soreness of the throat in addition to dysphagia, stiffness, discomfort, and pain. Mumps is not difficult to diagnose unless its possibility is forgotten, in which case it might be mistaken for acute œdema of the neck or other similar lesions. The way in which the swelling is located in the salivary glands, starting on one side and spreading to both, is often pathognomonic. Cervical adenitis might simulate mumps, but careful palpation will generally enable one to determine that the swelling is not in the salivary but in the lymphatic glands, and it will only remain to decide what has been the source of the infection. This will probably have been from some inflammatory, ulcerative, or malignant focus in connection with the shoulders, neck, head, face, lips, cheeks, gums, teeth, tongue, fauces, uvula, palate, tonsils, pharynx, or nares; the differential diagnosis will be based upon inspection and palpation of the parts, together with bacteriological examination.

It only remains to add that *scarlet fever* is at the present time so atypical that acute cervical adenitis may really be of scarlatinal origin without any scarlatini-form rash having been observed upon the skin. One would naturally look for evidence of desquamation, sore throat, bald tongue, albuminuria, nephritis, perhaps otitis media; but there is no doubt that some cases of acute cervical adenitis are really scarlatinal, without there having been any other sign of this disease except pyrexia and sore throat. A few such cases prove rapidly fatal, and they have recently been recorded as examples of acute and fatal sore throat corresponding with one form of the *angina maligna* of the eighteenth century.

Herbert French.

SORES, PENILE.—Sores on the penis may be present on the thin mucous covering of the glans or prepuce, or on the cutaneous surface of the body of the penis; they are more common in the former situation.

Ulceration in the neighbourhood of the glans, penis may be due to:—

- | | |
|------------------------|----------------------------|
| 1. Balanitis | 5. Epithelioma |
| 2. Herpes progenitalis | 6. Gummatous ulceration |
| 3. Soft sore | 7. Tuberculous ulceration. |
| 4. Chancre | |

1. **Balanitis.**—If inflammatory processes have been allowed to continue beneath the prepuce, ulceration and excoriation of the mucous membrane covering the glans penis or lining the prepuce, will occur. The surface of the glans will be seen to be denuded of epithelium, and the process will be accompanied by a stinking, purulent discharge. Multiple shallow ulcers are formed, rapidly coalescing and causing considerable discomfort. The prepuce often becomes swollen and œdematous, preventing retraction, so that a condition of phimosis occurs. In this condition care must be exercised in the diagnosis of a simple balanitis from one accompanying acute gonorrhœal urethritis or an

underlying syphilitic or soft chancre. With an acute urethritis, there will be a history of infection, pain along the course of the urethra during micturition, and other symptoms, such as chordee; further, the intracellular gonococcus may be identified in a stained smear of the discharge (*Plate XII, Fig. R*).

If a chancre exist under the swollen phimosed prepuce, there is often a tender spot about the corona or at the frænum. With a soft sore, consecutive sores may appear about the orifice of the prepuce, whilst the inguinal glands are much more likely to be inflamed or to suppurate than in a simple balanitis. A syphilitic chancre obscured by a phimosis can usually be felt distinctly under the skin, and causes a comparatively small amount of discharge, whilst the inguinal glands become enlarged but do not suppurate. The history of the date of infection, and the subsequent appearance of secondary symptoms, will materially help in the diagnosis.

A form of balanitis which is frequently very obstinate to treatment may occur in patients the subject of gout or diabetes mellitus.

2. **Herpes Progenitalis.**—Herpes may attack the genital organs as part of a herpes zoster in which the cutaneous eruption depends upon some lesion of the central nervous system, or as a local affection, the so-called catarrhal herpes. The disease begins as a patch of erythema on the inner surface of the prepuce or on the glans penis, followed by the appearance of vesicles and pustules; the latter become rubbed by the clothes, and form small ulcers. Herpes of the genital organs tends to recur, so that a previous history of a similar attack is often forthcoming. If it arise during the vesicular stage, no difficulty will be met with in the diagnosis; but if suppuration has followed, it must be diagnosed from a venereal sore. Soft chancres are usually deeper, with marked edges; their base is sloughing, and they are usually accompanied by a bubo, which is exceptional with herpes. A syphilitic chancre is usually single, indurated and raised, and is accompanied by the typical, multiple, discrete, amygdaloid glands in the inguinal region. It should be remembered that syphilis may become inoculated upon a herpetic patch, or that herpes may appear in an area previously inoculated with the syphilitic virus.

3. **Soft Sores or Chancroids** of the penis occur almost invariably from infection during sexual connection. The incubation period is short, a vesicle occurs in two days, and this rapidly breaks down to form a rounded or oval ulcer with sharply defined edges, and a yellowish sloughing base. The ulcers appear usually on the mucous surface of the glans, frænum, or corona, and are most often multiple, direct inoculation occurring from an ulcer to the contiguous part. They may cause rapid destruction of tissue, perforating the frænum or spreading over the surface of the glans.

The soft sore must be differentiated from others occurring on the glans, and above all from a syphilitic chancre. At the same time it must be remembered that besides the infection with chancroid, a simultaneous infection with syphilis may have taken place, so that a soft sore may ultimately become indurated and assume the character of a primary syphilitic lesion. The chancroids are multiple, are accompanied by a good deal of thin, purulent discharge, and by a painful swelling of the inguinal glands, usually of one side, which have a marked tendency to suppurate. On the other hand, a syphilitic chancre is single, is raised and indurated, has little discharge, and is accompanied by enlarged, but firm and indolent, glands in both inguinal regions; the incubation period of a syphilitic chancre is from twenty-one to twenty-five days.

The multiple ulcerations caused by herpes are more superficial, and rarely cause a bubo.

4. **Chancre**—the initial lesion of syphilis—generally appears on the penis, and is most common in the neighbourhood of the frænum or coronary sulcus. A

chancre appears about twenty-one days after infection, as a reddened patch, which becomes raised above the surface of the mucous membrane, with distinctly indurated margins. The central part breaks down into an ulcer, discharging a thin, purulent fluid, and at the same time the inguinal glands of both sides become palpable, slightly enlarged, but discrete, and with no tendency to suppurate. The chancre increases but slowly in size, or may occasionally become smaller without any treatment, and after a further lapse of from four to six weeks the typical secondary symptoms make their appearance; namely, a roseolar rash on the chest, abdomen, face, and thighs, general adenitis, and a mucous patch about the faucial pillars and tonsils.

The diagnosis of the primary lesion of syphilis frequently presents no difficulties, the indurated character of the sore, the date of its appearance after infection, and the presence of firm, indurated glands in the inguinal region, being distinctive. In other cases the character of the sore is by no means distinctive, and it is necessary to differentiate it from other lesions of the penis. If the sore be syphilitic, the secondary manifestations of the disease will follow, provided that the doubtful ulcer is not treated as a chancre. Thus, in any case in which syphilis is suspected, but not wholly certain, it is advisable to withhold any specific treatment for syphilis until such time as secondary symptoms appear, so that a patient may not be condemned to the lengthy process of treatment for syphilis until the diagnosis is absolutely certain. Wassermann's serum reaction may also be tried, and the *Spirochæta pallida* looked for in scrapings from the affected parts.

A chancre may be simulated by an inflamed soft sore, especially if the latter has undergone cauterization. Soft sores are, however, frequently multiple, appear within a few days of infection, and are accompanied by a painful enlargement of the inguinal lymphatic glands, which are particularly prone to suppurate. It must not be forgotten that a double infection may have occurred, so that a soft sore may show little inclination to heal or, becoming indurated, may present the features of a chancre after about three weeks, and later, the symptoms of constitutional syphilis.

Epithelioma of the penis in the early stage may be confused with syphilitic chancre. In epithelioma there is no history of infection; it occurs only in elderly patients, and there is frequently a greater destruction of tissue than in syphilis. The inguinal glands are not enlarged until the sore has been present for some weeks, and there are no secondary lesions such as the faucial ulceration and cutaneous rash. If any doubt exists, a small piece may be removed from the edge of the ulcer for microscopical examination.

Perhaps the greatest difficulty in the diagnosis of a chancre is experienced when the latter is hidden beneath an inflamed and phimosed prepuce. There is a purulent and foul discharge from beneath the prepuce, which may be œdematous and swollen; the inguinal glands are enlarged from the associated sepsis, either with a simple balanitis or from subpreputial ulceration. If a chancre is present, it can frequently be felt as an indurated area under the prepuce, whilst if it has been present for some time, the secondary lesions of syphilis may be present. If any doubt exists in an elderly patient whether an indurated subpreputial area be an early epithelioma or a syphilitic sore, the prepuce should be split up along the dorsal aspect under anæsthesia, the ulceration inspected, and a small piece submitted to microscopical examination if necessary, without loss of time.

5. **Epithelioma** (squamous-celled carcinoma) is the most common form of malignant growth of the penis. It arises most frequently from the inner aspect of the prepuce, or from the mucous membrane of the glans, as a small, raised ulcer, with friable, irregular edges. Epithelioma is rarely present before the

age of forty years, and frequently occurs on the site of previous ulceration or long-standing irritation. An epitheliomatous ulcer increases gradually in size, in spite of various forms of treatment, and with it is frequently associated glandular enlargement in the inguinal area. At first the glands may be enlarged from septic infection, but later from malignant infiltration.

An epitheliomatous ulcer may in some cases be confused with a chancre; but the friable, irregular edges of the former, the liability to bleed, and the gradual progressive increase in size in spite of treatment in an elderly patient, should give rise to grave suspicion of malignant disease. The microscopical examination of a small piece removed from the edge of the ulcer will give direct evidence of epithelioma.

6. **Gummatous Ulceration** of the penis occasionally occurs, resulting from the disintegration of a small gumma of the glans or prepuce, frequently in the position of an old scar. A gumma commences as a small, elevated nodule, which, if left untreated, softens and discharges its contents, leaving an ulcer bounded by thin edges and with a yellowish, sloughy base. A gummatous ulcer has been mistaken for a primary lesion of syphilis; but the absence of induration, the history of the onset and of a previous infection with syphilis, would be points against a chancre. A second infection with syphilis is by no means unknown, but it is very rare in comparison with a gummatous ulceration. Occasionally the base of a gummatous ulcer proliferates into a papillary tumour and has given rise to a suspicion of carcinoma; the diagnosis will be confirmed by the behaviour of the lesion under potassium iodide, when a tertiary syphilitic affection will rapidly clear up.

7. **Tuberculous or Lupoid Ulceration** of the penis is rare, and is usually associated with advanced tuberculous infiltration elsewhere. Tuberculous ulcers are usually shallow, with thin overhanging edges, painful and multiple. In rare instances the infection has resulted from the rite of infantile circumcision by the Jewish method.

R. H. Jocelyn Swan.

SORES, PERINEAL.—Ulceration may be present in the perineum as the result of:—

- | | |
|--|--------------------------|
| 1. Cutaneous inflammations and
traumatism | 3. Prostatic suppuration |
| 2. Urethral fistulæ or suppuration | 4. Syphilis |
| | 5. Epithelioma. |

1. **Cutaneous Inflammations and Traumatism.**—An ulcer in the perineum may result from *direct injury* to the area, or from *inflammatory infection of the sebaceous or hair follicles* of the cutaneous covering. An ulcer from these causes may be placed at the centre or to one side of the perineum, is movable on the deeper parts, and shows no tract into which a probe can be passed, indicating its derivation from other tissues. In women, ulceration of the perineal area may be associated with *gonorrhæal or septic vaginal discharge*.

2. **Urethral Suppuration or Fistulæ.**—During the progress of an acute urethritis, a glandular follicle frequently becomes infected. The suppurative process leading from this in the bulbous urethra may extend towards the perineum and open externally, leaving a small fistula which may or may not discharge urine during the act of micturition. In a similar manner, urinary fistulæ may result from the inflammatory processes behind a urethral stricture, and in an old-standing case it is not uncommon to find a urinary calculus in the dilated portion of the urethra behind the stricture. In the first instance, when the urethral suppuration is acute and an abscess bursts in the perineum, the diagnosis will be quite obvious, and the ordinary treatment for an abscess, in addition to that of the acute urethritis, will usually suffice to cure the condition.

If, however, the perineal wound discharges urine, it will be found that this

occurs as a rule only during the act of micturition; as there is no interference with the vesical sphincter. In nearly all cases, however, it will be found that there exists a stricture of the urethra, though not necessarily one of sufficient degree to cause any severe interference with micturition. An endoscopic examination will show the presence of a urethral stricture, whilst behind it can be seen frequently the sloughy granulations denoting the position of the internal or urethral opening of the fistula.

Occasionally it may be found that urine drains from a perineal fistula continuously, and not only during the act of micturition. In these cases there is constant soaking of the perineal skin, and frequently excoriation. That urine should leak constantly from the fistula denotes interference with the vesical sphincter, either by dilatation behind a tight urethral stricture, by the presence of a calculus in the prostatic or membranous urethra, or by actual division of the vesical sphincter following some operation, such as perineal prostatectomy or perineal lithotomy.

3. **Diseases of the Prostate.**—An abscess or tuberculous focus in the prostate may occasionally discharge in the perineum, and remain as a sinus.

An abscess in the prostate arises practically always from some infection in the posterior urethra, from venereal causes, or after septic instrumentation. It is accompanied by urethral discharge, or there is a history of a recent infection, whilst per rectum the prostate may be felt to be inflamed or scarred from the shrinkage of the abscess cavity.

That a tuberculous cavity in the prostate should open in the perineum implies that there is advanced tuberculous disease, so that little difficulty will be found in arriving at a diagnosis. A tuberculous prostate is very rarely a primary condition, but in most cases is secondary to disease in the testis or bladder, so that an examination of these organs will in nearly all cases give evidence of tuberculous disease and indicate the nature of the perineal fistula. Palpation of the prostate per rectum may reveal the rounded nodular deposit of tubercle in the gland.

4. **Syphilis** may cause ulceration on the perineum either as a chancre or by mucous tubercles. A chancre on the perineum is rare. It forms a small ulcer with slightly indurated borders, indolent in character, and accompanied by slight enlargement of the inguinal lymphatic glands. A chancre of the skin does not possess the usual features of a genital chancre, and is not usually diagnosed with certainty until the secondary lesions of syphilis become apparent; but an ulcer with raised, infiltrated edges, which shows no tendency to heal under aseptic precautions, should always give rise to a suspicion of syphilis. The *Spirochæta pallida* may be looked for, and Wassermann's serum test tried.

Condylomata may be present about the perineum in association with active syphilis. They may extend from the anal or vulval orifice, and form oval or rounded, flat-topped, sessile masses, covered by macerated, greyish epithelium, or they may be ulcerated on the surface. The accompanying signs of syphilis will indicate the diagnosis.

5. **Epitheliomatous Ulceration** of the perineum is practically only seen as a direct spread of a growth of the anus or vulval area, when the diagnosis presents no difficulty. An epithelioma may develop in the scar of some former cutaneous affection, in which case an ulceration may exist, showing the usual characteristics of a cutaneous epithelioma, namely, gradual progressive increase in size, raised, friable edges, and tendency to slight hæmorrhages. The inguinal glands may be enlarged early from inflammatory absorption, or later by infection with malignant disease. In case of doubt a fragment may be removed for microscopical examination.

R. H. Jocelyn Swan.

SORES, SCROTAL.—Ulceration of the scrotum occurs in association with:—

- | | |
|--|---|
| <ol style="list-style-type: none"> 1. New growth :
Epithelioma
Papilloma 2. Fistulæ. | <ol style="list-style-type: none"> 3. Testicular disease :
Inflammatory
Tuberculous
Syphilitic. 4. Suppurating cysts. 5. Syphilis. |
|--|---|

1. **Epithelioma of the Scrotum** is the most common form of ulceration met with in this region. Although commonly known as "chimney-sweep's cancer," scrotal epithelioma is by no means limited to this avocation, but it is certainly more common in men engaged in work in which they are exposed to much irritation from solid particles or from noxious fumes. Hence the disease is most commonly seen amongst chimney-sweeps, employees in gas-works, paraffin and chemical works, and coal-mines. The disease commonly begins as a small subcutaneous nodule, over which the skin is thinned and adherent; the nodule slowly enlarges, and the thinned covering gives way, to form an ulcer with thickened, irregular edges and with a tendency to bleed on slight injury. The ulcerated area extends both radially and into the tissues of the scrotum, later involving the testes. The inguinal lymphatic glands become enlarged soon after active ulceration commences, at first from inflammatory causes, but later from malignant infiltration.

In other cases a scrotal epithelioma begins in a *wart* or in a *papilloma*, which may have been present for some years with only slight increase in growth. These soft papillomata are not unusually the starting-point of malignant change, when they become more vascular, whilst the surface epithelium becomes thinned and easily excoriated. A small amount of foul discharge is present, often encrusted into a scab, which on removal leaves an ulcer with indurated, everted edges, with the gradual progress of a cutaneous epithelioma.

Thus a small ulcer on the scrotum, especially if indurated or readily caused to bleed, must be looked upon with extreme suspicion, and when it does not improve with ordinary antiseptic medication, should be widely removed without waiting for glandular enlargement.

Epithelioma may occur in the scrotal area as a localized recurrence after removal of a malignant growth of the penis or testicle. The knowledge of the previous condition for which operation has been performed, would cause any recurrent ulceration about the scar to be regarded with extreme suspicion of malignant disease.

2. **Fistulæ** may occur in the scrotum and cause ulceration. They are most common in association with tuberculous or syphilitic disease of the testes (see below), but occasionally they occur from urethral extravasation, or the burrowing from rectal suppuration. An abscess may form and open through the scrotal skin from a peri-urethral abscess accompanying an acute urethritis or formed by septic infection behind a urethral stricture. In either case a small amount of urine may leak through the opening during micturition, whilst the history of urethral discharge, or of difficulty in micturition and other symptoms of stricture, will point to the diagnosis.

3. **Testicular Disease.**—In some cases extension of disease in the testicle may involve the coverings of the scrotum, and may even perforate them to form a scrotal sore. This sequence occasionally occurs with: (1) A testicular abscess; (2) Tuberculosis of the testis; (3) Gumma of the testis.

A *testicular abscess* is somewhat uncommon, but may arise from direct extensions from the urethra *viâ* the vesiculæ seminales and vasa deferentia or by a

hæmatogenous infection during the course of a specific fever, such as scarlet fever, parotitis, or enterica. It may also follow chronic torsio testis. With urethral disease, the primary trouble may be due to gonorrhœa, or more frequently to a septic urethritis from the introduction of infected instruments, and is thus not infrequent in cases of prostatic enlargement in which the patient is passing his own catheter. In cases in which the infective process extends from the urethra, the epididymis is affected first, whilst in the metastatic cases the body of the testis usually shows the first sign of enlargement. These acute inflammations of the testis occasionally suppurate, when the scrotal tunics become inflamed and adherent, whilst softening occurs later, and unless surgically relieved, the abscess opens through the skin, leaving an ulcer, and a sinus discharging pus.

Tuberculosis of the testicle may occur as a primary disease or as a secondary deposit in association with tuberculosis elsewhere in the genito-urinary tract. Testicular tubercle almost always begins as a nodule in the epididymis, but in the later progress of the disease may extend into the testicle proper. If the tuberculous nodule progresses rather than undergoes cure, the scrotal skin becomes adherent, thinned, and finally perforated, leaving a shallow ulcer with thin, undermined edges, and discharging thin pus. Occasionally the necrotic tubules of the epididymis fungate through the opening in the scrotum, appearing as a greyish, sloughy projection from the cutaneous opening—the so-called “hernia testis.”

A *gumma of the testis* causes a swelling in the body of the testis rather than in the epididymis. A gumma which remains unrecognized or untreated may soften and ulcerate through the scrotal skin in a manner similar to tuberculous disease, leaving a clearly-defined ulcerated area with sharply-cut margins, and a wash-leather-like sloughy base. The gummatous granulation tissue may fungate through the scrotal aperture, forming a yellowish, necrotic mass.

The diagnosis of these three conditions may produce some difficulty in the earlier stages (see SWELLING, SCROTAL), but in the advanced stage now under consideration, when an open scrotal sore is present, the diagnosis is easier. The *opening of a testicular abscess* on the scrotum leaves a small sinus discharging pus and accompanied by a general enlargement of the organ. Preceding the rupture of the abscess there is acute pain in the testicle, with rise of temperature, rigors, and general signs of suppuration, which are much diminished as soon as the abscess is allowed to burst. There is often a urethral discharge, which, however, is often much lessened with the onset of the acute epididymitis, with distinct thickening of the cord and aching pain in the neighbourhood of the external abdominal ring, or in metastatic cases the abscess occurs during the progress of an acute fever. The general history is one of acute pain commencing in the testicle, with rapid and extremely tender swelling of the organ, followed by abscess-formation.

In *tuberculosis of the testis* the progress is much more gradual. A nodule may have been present in the epididymis for some time, gradually enlarging, but causing very little pain; in some cases a nodule may have been present for months without any apparent change, and then it may enlarge suddenly, involve the scrotal tunics, and discharge its contents. By the time the disease has reached this stage, it is probable that evidence of tuberculous trouble will be found in other organs, particularly the other testis, prostate, seminal vesicle, or bladder. The affected testicle usually presents several nodules in the epididymis, tender on pressure, whilst small nodules may also be felt in the vas deferens.

The opening remaining from the discharge of a *gummatous orchitis* is usually

a rounded ulcer with sharply-cut edges and yellowish base. The whole testis is enlarged, practically painless, and gives a sensation of weight in the organ. The cord is not thickened, and there is no evidence of disease in the other testicle, prostate, or seminal vesicles. There is probably a history of syphilis, and other tertiary syphilitic lesions may be present elsewhere, such as gummatous periostitis. Strong evidence of the syphilitic nature of the disease is often obtained by the result of treatment with large doses of potassium iodide, alone or in combination with mercury, when a gumma diminishes in size with marked rapidity. It should be remarked, however, that, as in two cases under the writer's care, testes which are subsequently removed and found to contain large gummata, may show no improvement before operation, even under large doses of iodides.

A *Hernial Protrusion of necrotic Testicular Tissue* may be present either with tuberculous disease or from a gumma. In tuberculosis the mass is greyish and necrotic, discharging thin pus, and there will be sufficient evidence of tuberculous disease in the underlying testis and other genital organs. A distinctive feature of the gummatous hernia testis is found in the appearance of the cutaneous opening; if the fungating mass be pushed aside, the opening in the scrotal skin will be seen to be cleanly cut and to encircle the protruding tissue tightly. The fungating hernia testis of tubercle or syphilis must also be diagnosed from other conditions producing a raised tumour on the scrotum. An epithelioma of the scrotum has raised borders, but the centre is excavated, and there is rarely any enlargement of the testis. A sloughing papilloma of the scrotum may more nearly reproduce the appearance, but the tumour and the skin are freely movable on the underlying testis, whilst in hernia testis the mass is easily seen to be connected with the testicle, and the tubular structure of the latter is often apparent on picking up a small fragment of the fungating tumour.

4. **Cysts of the Scrotum.**—As an exceptional occurrence, a sebaceous cyst may develop in the scrotal skin, suppurate, and leave an open sore. The areas remaining present raised borders, and are easily mistaken for an early epithelioma. An accurate history of the previous swelling in the skin is of little assistance in these cases, but the microscopical examination of a piece removed from the margin of the ulcer will readily exclude malignancy. A suppurating cyst in the scrotum is more uncommon than epithelioma.

5. **Syphilis of the Scrotum** may be present either as a primary chancre or as a mucous tubercle. A *primary chancre* in this situation is by no means easy to recognize unless other signs of syphilis are present; but the presence of a cutaneous sore which does not show much inclination to heal under non-mercurial antiseptic dressings should always give a suspicion of syphilis. There is often only slight induration of the ulcer compared with that of a penile chancre, but the edge is raised and of a rolled appearance. The inguinal lymphatic glands are enlarged and discrete, and some five to six weeks after the commencement of the ulcer the usual secondary symptoms of syphilis become manifest.

Mucous tubercles may be present on the scrotum, usually on the femoral aspect. They may extend directly from the anal area. No difficulty will be met with in the diagnosis, as other signs of syphilis are obvious.

R. H. Jocelyn Swan.

SPASMODIC CONTRACTIONS.—(See CONTRACTIONS.)

SPASMODIC DYSPNŒA.—(See DYSPNŒA.)

SPASTICITY.—(See GAIT, ABNORMALITIES OF.)

SPEECH, ABNORMALITIES OF.—Speech is a highly-specialized function of the human nervous system, by means of which we are able, more easily and more clearly than by any other means, to communicate our thoughts, desires, commands, etc., one to another. Abnormalities of speech are numerous, varying from complete mutism to slight defects in articulation, and dependent on disturbances, functional or organic, in some part of the complex mechanism which is responsible for the production of intelligible language.

This article is intended to expose the broad principles by which various abnormalities of speech can be detected and used for the purposes of diagnosis; it does not embrace a discussion of the controversial views which are held concerning their exact production.

The amount of investigation required for making a diagnosis in cases of speech abnormality must vary within wide limits. The greatest care is called for in the examination of cases of aphasia which result from disturbances in the function of the cerebral speech centres or their dependent paths of communication. On the other hand, the defective articulation of a patient suffering from cleft palate needs only a comparatively superficial examination in order to arrive at a correct diagnosis.

It will be convenient to consider the various abnormalities of speech under the following heads: (1) *Mental defects*; (2) *Aphasia*; (3) *Deaf mutism*; (4) *Dysarthria*; (5) *Functional disorders—stammering, lalling, idioglossia*.

1. **Mental Defects.**—The acquirement of the power of speech may be delayed in children who are mentally defective, and in some forms of idiocy may be suspended altogether. Before making a diagnosis of mental deficiency in a child who appears to be dilatory in talking, it is well to remember that the age at which speech is acquired is very variable, and that the delay may be considerable where no mental impairment is present. In such cases the diagnosis must depend on a consideration of other points in the child's development. Inquiry should be made as to whether he is clean in his habits, whether he is destructive, whether he plays with toys or with other children in a natural manner, and whether he displays abnormally bad temper or irritability. In some cases the delay in speaking may be due to a defect in hearing which has been unsuspected by the parents. This point is especially apt to arise in respect to children who have begun to talk at the normal age, and who have lost what little they had learned of the art in the sequel of some acute illness.

In adults, loss of speech may be due to many forms of mental deficiency of a temporary or permanent nature. A familiar example of temporary loss of speech may be the result of that degree of alcoholic intoxication to which the term "speechless" is vulgarly applied. Similarly, the intoxication of the higher mental faculties associated with organic poisons, such as those of pneumonia or typhoid fever, may be responsible for temporary loss of speech. Complete mutism due to disease of the higher intellectual centres of the brain is common enough in various forms of dementia, and is proved to be no aphasic defect by the sudden and complete restoration of speech which may take place after months or even years of silence.

The speechlessness of a melancholic patient or of one who is suffering from paralytic dementia is further differentiated from true aphasia by the fact that the latter is associated with attempts at communication, while the former is not. On the other hand, it must be remembered that general paralysis of the insane is a disease in which temporary aphasia is by no means uncommon, especially in connection with the transient hemiplegia following "congestive" attacks.

2. **Aphasia.**—A definition of aphasia is difficult to supply in a few words. The term is used to denote that loss of speech which does not depend on mental deficiency, nor upon paralysis of the motor mechanism of articulation. Such a

negative description requires, however, some modification, because aphasia is frequently associated with some impairment of intelligence resulting from disturbance of internal language. Internal language plays an important part in all intellectual processes, and any lesion of the cerebral centres connected with it must necessarily interfere with the higher mental activities. This is particularly the case in what is called sensory aphasia, that variety which depends upon a lesion of the auditory and visual word centres situated in the cortex near the posterior part of the left Sylvian fissure of the brain.

In right-handed persons the chief speech centres are placed in the left cerebral hemisphere (*Fig. 185*), and it is customary to consider them as being three in number. The posterior part of the first temporal convolution is regarded as the area in which the auditory memories of spoken words are stored and recalled. It plays an important part in the development of speech, because it is largely through the sense of hearing that the child first learns to associate objects with their names and expressions with their meaning. The cortex in the angular gyrus has a similar special function in regard to the storage of visual word memories, a function which bears the same relationship to written language as

Fig. 185.—Left cerebral hemisphere, with speech centres.

the auditory word centre has to spoken language. These two portions of the cortex constitute the sensory speech centres. A third important centre is called the motor, or, better, the higher kinæsthetic centre, and this is located in Broca's area, or the posterior part of the third frontal convolution. In this situation are stored the memories of afferent impulses excited by the motor activities employed in speech. Unless this centre is intact, the conversion of internal into external language is imperfect or impossible. In the opinion of some authorities, there is a similar kinæsthetic centre in the posterior part of the left second frontal convolution, which plays a part in connection with written language comparable to the part played by Broca's area in relation to spoken language.

With these physiological and anatomical data as a basis, we can proceed to consider the chief varieties of aphasia and the points in their differential diagnosis. Before doing so, it is well to sound a note of warning with regard to the complications which are constantly being met with by the clinician in attempting to analyze cases of aphasia. In the first place, a diagrammatic anatomical definition of the cerebral centres is liable to give a wrong impression.

These centres are more diffuse in their function than they appear to be on a map of the brain, and they are much more interdependent than their topography would suggest. Communicating nervous tracts bind them together in such a way that a destructive lesion of one must necessarily upset the function of another, and so modify profoundly the clinical picture of any particular case. In the second place, it must not be forgotten that aphasia is, in the majority of instances, the result of a vascular lesion, and that all the centres to which we have referred lie in the area supplied by one artery—the middle cerebral artery. Consequently it is only rational to expect that, even when the main brunt of a vascular disturbance falls on one of the special speech centres, the other centres may also suffer more or less, temporarily or permanently, from disturbances of nutrition. In any case of aphasia, therefore, we may have to be satisfied if we can arrive at a conclusion as to the site of the chief defect, without being able to define the exact limits of the loss or impairment of cerebral function. In the third place, due allowance must be made for the recognized fact that the right cerebral hemisphere may gradually acquire some degree of speech activity, especially in cases of aphasia occurring during the earlier years of life, and may tend to replace the loss caused by the defective action of the left hemisphere.

Word-deafness is the result of a lesion either of the auditory word centre in the temporal cortex, or of one which isolates that centre from the periphery: that is to say, of a sub-cortical lesion cutting off the centre from auditory impulses. In either case the patient who is word-deaf is unable to recognize the meaning of spoken language, although he may hear perfectly the sounds by which it is conveyed. In the course of examination it will be found that he fails to understand anything which is said to him, and that he does not obey simple commands so long as they are not accompanied by gestures suggestive of their meaning. If the visual word centre has not been affected at the same time, he will still be able to read and to understand what is written. In fact he will depend upon writing and reading for his means of communication with others. The amount of interference with spontaneous speech will depend upon whether the lesion is cortical or sub-cortical. In the latter case the integrity of the auditory word centre preserves internal speech, and so permits the patient to speak spontaneously with fluency and probably with accuracy, and his power of writing will be equally unimpaired. When the cortical centre is itself destroyed, internal language is thoroughly disorganized, and although a certain amount of spontaneous speech may be uttered, it is certain to be more or less unintelligible. According to the extent of the lesion, it will vary between a speech containing inaccuracies of minor importance, and one which is a jargon incapable of interpretation. Characteristic of this defect is the fact that the patient himself does not appreciate the mistakes he makes. His written language is likely to be more accurate and more intelligible than his spoken language, but it will probably not reach a very high standard. He may copy with accuracy, but is quite unable to write from dictation. Such are the usual chief attributes of word-deafness in its pure form. Clinically, word-deafness is usually accompanied by word-blindness, to a greater or less extent.

Word-blindness, or *Alexia*, is produced by a lesion of the left angular gyrus, and may or may not be accompanied by defective vision. As in the case of word-deafness, it may result from a cortical or from a sub-cortical lesion, and it is in association with the latter class of case that *HEMIANOPIA* (*q.v.*) is most commonly observed. In cortical word-blindness the patient is unable to read, although he sees the letters clearly and may even be able to copy them in the same way as a child copies letters when learning the alphabet. Writing conveys no meaning to his mind, although in the less severe cases the patient may still recognize familiar words, such as his name. There are, in fact, varying degrees

of word-blindness, some of which are difficult to understand and to analyze. The word-blind patient suffers in his spontaneous speech to a greater or less extent according to whether he uses his visual or his auditory memories chiefly in the process of internal language. Should he be a "visual" his spontaneous speech will suffer much more than if he is an "auditive." The terms "visual" and "auditive" are used to distinguish two classes of persons, the first depending more on their visual memories of words, and the second more on their auditory memories of words in the course of reviving them for the purposes of internal thought and speech. Spontaneous writing is likely to be completely lost, but writing from dictation may possibly be carried out with more or less accuracy.

In word-blindness due to a sub-cortical lesion, although hemianopia is almost certain to be present, spontaneous speech and spontaneous writing are perfectly preserved, although the power of reading and the power of copying hand-written sentences into printed capitals are entirely in abeyance.

When word-blindness and word-deafness coexist, the condition is called *sensory aphasia*, and is one to which some authorities believe that the term aphasia should be limited. It is, however, usual to describe a motor aphasia which may be dependent upon a cortical or sub-cortical lesion.

Cortical motor aphasia results from a destructive lesion of Broca's area, the part of the cortex which stores memories of the afferent impulses excited by speech, and in which such memories must be revived if spontaneous speech is to be carried out perfectly. This form of motor aphasia may be present without any paralysis, but it is usually accompanied by some disturbances of internal speech, and perhaps even by some defective understanding of spoken and written language, which, however, never amounts to true sensory aphasia.

Much more common is the *sub-cortical motor aphasia* which is due to a lesion cutting off Broca's cortical area from the motor mechanism connected with articulation. In this form of aphasia the intellectual processes and internal language may be perfectly intact, but in the majority of cases the inability to speak is associated with right hemiplegia in right-handed persons, or with left hemiplegia in left-handed individuals. The imperfect speech of the patient who is partly aphasic from a sub-cortical motor lesion may resemble to some extent that of the patient who is word-deaf; but the former is conscious of his mistakes and the latter is not. Sub-cortical motor aphasia may perhaps be better described as an articulatory rather than a speech defect: as an anarthria rather than an aphasia. All the attributes for speech are preserved, but its emission is impossible.

Agraphia results usually from a lesion of the visual word-centre, or perhaps in some cases from a lesion of the posterior part of the left second frontal convolution. In the former case the power of writing may be lost, although there is no paralysis of the arm or hand. In the latter case the agraphia is usually associated with right hemiplegia, and in order to test whether the power of communicating thoughts by written language is preserved, the patient must be asked to use the left hand for the purpose. There is some doubt as to whether pure motor agraphia occurs, and some doubt as to the lesion upon which it may depend. I have had experience of the clinical occurrence of pure motor agraphia without being able to correlate the phenomenon with its anatomical basis.

We have now considered the various forms of aphasia and have indicated their points of distinction. This will serve as a basis for diagnosing the site of the lesion responsible for the speech defect, but the nature of the lesion must be determined from other considerations. Vascular lesions, for instance, are usually acute in their onset, sudden in the case of *embolism*, less precipitate as a rule in cases of *hemorrhage* or *thrombosis*. In *cerebral tumour* or *abscess* the onset

of symptoms is more gradual, and local troubles such as that of aphasia are generally accompanied or preceded by the symptoms of increased intracranial pressure in the form of headache, vomiting, and optic neuritis. But aphasia is not always the result of a gross and permanent lesion. Transitory aphasia may be observed in the sequel of epileptiform convulsions, or may be in itself an *epileptic equivalent*—a form of *petit mal* in an epileptic subject. Temporary aphasia occurs also in connection with *migraine*, and I have known it to occur at intervals during a period of thirty or forty years in a woman who was perfectly healthy in every respect, and who showed no other symptoms suggestive of either epilepsy or migraine.

4. **Dysarthria**, or in its extreme form "*anarthria*," is the term used to describe defective articulation as opposed to defective speech. Articulation is carried on by certain muscles of the larynx, pharynx, palate, tongue, and lips which are innervated by the bulbar nuclei, and the latter are set into action by voluntary impulses coming from the motor cortex of both cerebral hemispheres via the pyramidal tracts. The articulatory movements, therefore, are bilaterally represented in the brain, and, like other bilaterally represented movements of the body, are not disorganized by unilateral lesions of the pyramidal system. Thus, in cases of hemiplegia without aphasia, there is little or no defect in articulation, and the examination of such a patient shows that both vocal cords, both sides of the palate, and the tongue, retain their power of voluntary movement almost, if not quite, to perfection.

Suprabulbar dysarthria is induced, however, in cases of *double hemiplegia*, when the fibres from both hemispheres to the bulbar nuclei are interfered with by destructive lesions. When a right-sided stroke is followed by a left-sided stroke, or when double hemiplegia results from a lesion in the pons, dysarthria results. In such cases the power of speech may be perfect, but the ability to articulate naturally and clearly is disturbed. The patient is not aphasic but dysarthric. Articulation is usually slow, spastic, and indistinct, if it is not altogether unintelligible. These cases are differentiated from cases of dysarthria due to lesions of the bulbar nuclei or of the cranial nerves, not only by the presence of other hemiplegic signs in the limbs and trunk, but by the fact that the tongue retains its shape, nutrition, and normal electrical reactions, and the palate its natural reflex. This condition of *pseudo-bulbar palsy*, as it is sometimes called, is further distinguished by facial starchiness or spasticity, and by the patient's inability to control the expression of his emotions.

Dysarthria of similar origin, but generally of less degree, may be observed in cases of *general paralysis of the insane*, in *cerebral diplegia*, and in *disseminated sclerosis*. In the latter disease the terms "*staccato*" or "*scanning*" are applied to describe the articulatory defect. Some cases of *Friedreich's ataxy* exhibit a form of articulation which is slow and jerky, not unlike that of disseminated sclerosis. Probably some degree of inco-ordination enters into the production of this peculiar utterance. In all these diseases the diagnosis of the condition depends upon the presence of other symptoms and physical signs, and can rarely be deduced from the articulation alone.

Dysarthria also arises from disease of the bulbar nuclei, or of the nerves arising from the latter which supply the muscles of the larynx, pharynx, tongue, and lips. In true *bulbar palsy*, which is a disease depending on a slowly progressive degeneration of these motor nuclei, articulatory defects are often among the earliest symptoms. The diagnosis of these cases is based on the fact that the symptoms begin insidiously and progress gradually, that the paresis affects the muscles of both sides more or less symmetrically, and that it is an atrophic form of paralysis. The atrophy is best seen in the tongue muscles, and is usually associated with a certain amount of fibrillation, and with diminution

of their electrical excitability. The palatal reflex is also impaired, and an examination of the vocal cords shows that they too are the seat of a progressive palsy. The dysarthria is always accompanied, sooner or later, by some degree of dysphagia, and also by some weakness and atrophy of the muscles of mastication. Atrophic palsy may also be observed in the small muscles of the hands, and there is a tendency to exaggeration of all the tendon reflexes in the limbs.

A similar clinical picture may develop in cases of gross disease of the bulb, due either to local softening or hæmorrhage, or in rarer cases to the gradual growth of a tumour in that region. Such cases can be differentiated from true bulbar palsy, partly by the more acute onset of symptoms in the case of the *vascular lesions*, and partly by the asymmetrical distribution of the muscular atrophy and paresis when a *tumour* forms the basis of the disease. *Gummatous meningitis* at the base of the brain may involve the cranial nerves close to their exit from the bulb, and so produce a dysarthria of a somewhat similar character. When tumours or meningitis are the cause of the dysarthria, symptoms of increased intracranial pressure are likely to be observed.

Another form of bulbar palsy is seen in cases of *myasthenia gravis*. In this condition there is little or no atrophy of the articulatory muscles, although some thinning of the tongue is sometimes observed. The distinguishing characteristics of this dysarthria are first of all its marked variability, and secondly the effect produced by fatigue. A myasthenic patient may begin a conversation, or may begin to read aloud from a book, without showing much difficulty in his utterance, but, as he progresses, his articulation becomes more and more defective and more difficult to understand. Usually the palate fails quickly, and a nasal quality is given to the voice. If he is asked to repeat the word "rub" many times, the terminal "b" becomes an "m," and he ends by saying "rum" instead of "rub." Most cases of *myasthenia gravis* exhibit similar fatigue phenomena in relation to other parts of the musculature (see *Fig. 83*, p. 261), and in particular show varying degrees of ocular palsy, which, like the dysarthria, is at one time more marked than at another, and which is much influenced by rest and exercise.

Some articulatory defect is produced in cases of bilateral peripheral palsy of the palate, which most often results from the effects of the *diphtheria poison*. The voice is nasal, and the pronunciation of certain consonants becomes impossible. "B" becomes "m," "d" becomes "n," and "k" sounds like "ng."

Bilateral facial palsy interferes with that part of articulation which depends upon the labial muscles, and so renders speech indistinct, although not unintelligible. Facial palsy of this kind is met with in some cases of peripheral neuritis and also in some cases of myopathy, especially that form to which the name Landouzy-Dejerine is applied.

Unilateral bulbar palsy may exist without much interference with articulation or phonation. There may be considerable palsy of one vocal cord due to a lesion of one recurrent laryngeal nerve, without a recognizable alteration in the character of the voice. A bilateral laryngeal palsy, when complete, leads to aphonia. Similarly, unilateral palsy of the palate or of one-half of the tongue may exist without articulatory defect, especially after the patient has become accustomed to the altered conditions.

5. Functional Disorders of Speech.—In cases of hysteria, a *functional aphonia* is by no means uncommon, and in many cases can only be distinguished from aphonia due to organic disease by an examination of the larynx. Hysterical aphonia may be complete; in other cases the voice is reduced to a whisper, and yet the patient is able to adduct the cords properly in coughing. This is often

a recurrent malady, and the suddenness of its onset, as well as the suddenness with which it is often cured, are peculiar characteristics.

Stammering is another type of functional dysarthria and presents a large variety of forms. There is little difficulty in their recognition, because in all cases when once the articulatory flow is established the utterance is perfectly normal. The difficulty generally arises either in commencing a word or a sentence, or in other cases the trouble is evoked only in connection with the production of certain consonants. Some of the cases depend on an initial spasm of the articulatory muscles, and others upon an inco-ordination between the action of the respiratory muscles and those which have to do with phonation and articulation. The complete absence of any physical signs of disease, and the history of the case, make the diagnosis easy. On the other hand, stammering is occasionally an early symptom of progressive degenerative conditions of the central nervous system, especially of general paralysis of the insane.

The term "*lalling*" is applied to a defective form of articulation chiefly met with in persons who are more or less mentally feeble. It is characterized by what appears to be an imperfect pronunciation of certain consonants. In more severe cases one consonant is consistently replaced by another, such as "r" by "w." These mistakes in pronunciation are common enough in normal children when learning to speak, but the endurance of the defect after the learning age is passed generally indicates some permanent mental deficiency. A temporary perversion of speech is occasionally seen in children before they learn the proper use of language. They may talk glibly and fluently in a language which they appear to understand themselves but which is unintelligible to their neighbours. In this condition, to which the term "*idioglossia*" is generally given, the prognosis may be regarded as favourable. E. Farquhar Buzzard.

SPLEEN, ENLARGEMENT OF THE.

The Physical Signs of Enlargement of the Spleen.—If the organ is only slightly or moderately enlarged, there is no alteration in the size or shape of the abdomen; if it is considerably or enormously enlarged, the abdomen may be much distended, and at a first glance this distention may appear to be uniform, as though due to ascites. Closer inspection may show that it is by no means uniform, there being distinct bulging of the left side, especially in the left hypochondrium, the left lumbar, and the left half of the umbilical regions. The inner border may be tilted forward in some cases, so that a distinct edge or ridge may be seen pushing the abdominal wall forward, this ridge running downwards and inwards from the left costal margin near the anterior axillary line towards the umbilicus; in a few cases a distinct notch can be seen in this edge or ridge. When the patient takes a deep breath, the prominence may be seen to move distinctly downwards, though occasionally the spleen may be so enormously enlarged that its lower end becomes impacted in the pelvis, when no downward movement is possible.

Palpation is the best means of detecting splenic enlargement. If the organ is but little enlarged, it may not be felt until the observer, standing upon the left-hand side of the recumbent patient, and supporting the lower left ribs posteriorly with his right hand, steadily but firmly presses the fingers of his left hand under the left costal margin just in front of the anterior axillary line; when the patient now takes a deep breath, a definite sense of increased resistance may reveal splenic enlargement when the organ is comparatively soft, as in many cases of typhoid fever for example, or a hard mass with a distinct edge may be felt in more obvious cases. When the enlargement is moderate or considerable, the splenic tumour will be felt coming down from beneath the left ribs close behind the abdominal wall; and unless there is a very large liver at the same time, or

some other cause preventing the viscus from following its natural direction as it enlarges, it tends to reach and ultimately cross the middle line at or just below the level of the umbilicus. It is generally smooth and firm, and the characteristic notch or notches can be felt in its anterior border. Except in those rare cases in which the whole spleen is dislocated, it will not be possible to insert a hand between it and the left costal margin, or to define its upper limit by palpation. The lower pole can be felt readily moving decidedly downwards on inspiration, unless the enlargement is very great. On bimanual palpation, the loin is flaccid and not filled out as it would be by a renal tumour, and the mass cannot be pushed back into the loin so as to be felt by the posterior hand as readily as it is by the hand on the anterior abdominal wall.

Percussion yields a dull note over the mass, the dullness being directly continuous with an increased area of dullness in the thorax extending upwards as high as the seventh rib in the mid-axillary line, the sixth rib in the nipple line, or even higher, and including the ordinary area of splenic impairment of resonance behind. Percussion of the left loin will generally elicit resonance here, indicating that the colon is not displaced as it would have been by a renal tumour; no intestines can be felt or percussed over the front of the spleen.

Auscultation seldom affords much evidence of value in these cases, but sometimes when the splenic enlargement is associated with local peritonitis, as in cases of infarction for example, a loud rub may be heard over the mass; and sometimes, especially if the enlargement is associated with venous engorgement, a well-marked continuous humming bruit may be heard.

Distinction between an Enlarged Spleen and other Tumours which may simulate it. An enlarged spleen has to be distinguished from other tumours which may arise in the left hypochondriac region, especially from:—(1) Kidney tumours or perinephric inflammation or abscess; (2) Suprarenal tumours; (3) Carcinoma of the splenic flexure of the colon; (4) Pancreatic tumours, especially cyst or carcinoma; (5) Malignant growth of the stomach; (6) Ovarian tumour; (7) Tuberculous peritonitis; (8) Faecal accumulation in the colon.

Distinction from a Renal Tumour.—It may be difficult to distinguish an enlarged spleen from a kidney in some cases. Both conditions may cause local prominence or bulging of the left side of the abdomen; in the case of splenic enlargement the bulging is more forward and inward, whereas in a kidney enlargement, the loin is more likely to be bulged. No distinct edge or notch can be seen or felt in the case of the majority of renal enlargements, a most important point, the significance of which cannot be over-estimated. Either tumour may move downwards when the patient takes a deep breath; but the spleen, being in closer contact with the under surface of the diaphragm, moves the more markedly of the two. A renal tumour, being more deeply situated in the abdomen, seldom approximates closely to the anterior abdominal wall unless the enlargement is very great, in which case the loin will be filled out and feel very firm and resistant on bimanual examination. A renal tumour generally slopes away as it approaches the ribs, so that it is less difficult to get one's hand between its upper pole and the costal margin than is the case with the undislocated spleen. The colon may be seen or felt over the anterior surface of a renal tumour, which is never the case with splenic enlargement; and percussion may yield a resonant note in front, or in typical cases a vertical band of colonic resonance down the centre of an otherwise dull mass, the loin posteriorly being dull; whereas with a splenic tumour the loin is generally resonant, and the anterior aspect of the mass quite dull. The presence of a local bruit or rub would make renal tumour unlikely. The occurrence of HÆMATURIA (*q.v.*), PYURIA (*q.v.*), or ALBUMINURIA (*q.v.*), would suggest renal enlargement, whilst the conditions of the blood might be such as to suggest splenic.

Notwithstanding all these points, to distinguish between splenic and renal masses is sometimes by no means easy; and it is only by paying careful attention to the history and to the patient's own sensations, as well as to the physical signs, and to the changes in the blood and urine, that a correct diagnosis can be made.

Malignant Disease of the Left Suprarenal Gland may cause a large mass which is sometimes particularly difficult to distinguish, either from a splenic or from a renal enlargement. Owing to the close proximity of the suprarenal capsule to the kidney, and the liability of the latter to become infiltrated by growth of the former, the physical signs of a suprarenal are practically the same as those of a renal tumour, except that it may be more difficult to pass the hand between the mass and the costal margin. Hæmaturia and other urinary changes may result from spread of the disease to the kidney; affection of one suprarenal gland alone does not produce Addison's disease, and it may be impossible to arrive at a correct diagnosis without laparotomy.

A peculiar affection of children deserves special mention: at a comparatively early age there may be an abnormal development of the pubic and axillary hair and of the genital organs (see *Figs. 125, 126*, pp. 453, 454), with premature puberty, associated with overgrowth of suprarenal rests in the kidney, the resultant tumour being spoken of as a hypernephroma.

Carcinoma of the Splenic Flexure of the colon is usually annular, giving rise to no definite tumour, but rather to symptoms of chronic, followed by acute, intestinal obstruction. Occasionally, however, the growth may be more voluminous, or it may have caused leakage and inflammatory matting from local perforation through or above the growth, with the result that a fairly large tumour may be felt in and below the left hypochondrium. This mass is generally resonant to percussion, has no well-defined edge or notch, and may vary somewhat in position from day to day: it will usually be associated with intestinal symptoms, especially constipation alternating with diarrhœa, and the passage of mucus, and occasionally blood, per rectum. Sometimes there are obvious secondary deposits in the liver or in the left supraclavicular glands.

Pancreatic Tumours are usually situated more in the median line of the abdomen than is a spleen, between the ensiform cartilage and the umbilicus; sometimes, however, a very large cyst, such as may nearly fill the abdominal cavity, may cause considerable difficulty in the diagnosis. One very important point is that no definite edge and no notch can be felt. The stomach generally lies in front of a pancreatic cyst; or, if the latter pushes its way forward so as to displace the stomach upwards and the transverse colon downwards, it may be possible to define its relationship to the stomach by inflating the latter with gas. A splenic tumour rarely extends to the right of the middle line unless the enlargement is great, and then it crosses at or below the umbilicus, whereas a pancreatic cyst reaches across to the right of the middle line above the navel. Pancreatic new growth has a similar position; but the outline of the mass, if any can be felt at all, is more nodular; there will generally be jaundice and a palpable gall-bladder, and the urine may yield Cammidge's pancreatic reaction.

Malignant Growth of the Stomach may be mistaken for enlargement of the spleen, and even suggest splenomedullary leukaemia; this is especially so with gastric sarcoma, which, though very much rarer than carcinoma, is more likely to involve the whole of the stomach and give rise to a very large tumour occupying chiefly the upper part of the left side of the abdomen. The following changes will serve to distinguish a gastric new growth from enlargement of the spleen: the mass is apt to shift its position during the course of an examination or from day to day; it does not present a well-defined edge with definite notch or notches; it may extend a considerable distance to the right of the middle line, although

its lower limit may not be below the level of the umbilicus; it is likely to be resonant in front, though the percussion note over it may be impaired; there may be anæmia and leucocytosis, but the blood-changes would not be characteristic of any positive blood disease; the taking of food may cause an increase in the gastric pain; vomiting will generally be a prominent symptom; the vomit may contain blood, obvious or occult; free hydrochloric acid may be deficient or absent; sarcinæ ventriculi may be found (*Fig. 92*, p. 267); and there may be secondary deposits, especially in the liver or in the left supra-clavicular glands.

Ovarian Tumours have been mistaken for enlargement of the spleen, and vice versa, the differential diagnosis being particularly difficult in cases in which the spleen has become dislocated, or is so large as to reach down as far as the uterus. The organ has sometimes been found so dislocated as to lie wholly within the pelvis. The differential diagnosis depends in most cases on the following points: an ovarian tumour rarely extends upwards to such an extent that its upper limit comes into actual contact with the left costal margin, so that the hand cannot be placed between it and the ribs; it does not move much downwards during deep inspiration; it extends upwards from the pelvis, whence it may be felt definitely to arise, the lower part of the abdomen being more prominent than the upper; it is usually more globular than a splenic tumour, and has no sharp, well-defined edge with notches in it, even when covered with projecting bosses of simple or malignant new growth; it usually extends more to the right of the middle line than an enlarged spleen; and it is more apt to transmit aortic pulsations; a vaginal examination may determine that the mass is attached to one or other of the broad ligaments, and that the cervix and the body of the uterus are drawn upwards; there will probably be no distinctive blood-changes, but very likely amenorrhœa.

Tuberculous Peritonitis may cause various abdominal tumours (see ASCITES), and sometimes gives rise to a mass occupying the left hypochondriac region, the result of matting together of the intestines, thickening of the omentum, or thickening and infiltration of the peritoneum attached to the abdominal wall here. The tumour does not generally extend close up under the ribs so that the hand may be placed between it and the costal margin, and although it may feel somewhat rounded, with a more or less well-defined edge, there is no definite notch to be felt; sometimes, however, when there are two, three, or more separate masses united together, a notch may be simulated to some extent. The mass itself may be dull, but there is generally resonance between it and the normal splenic dullness. ASCITES (*q.v.*) is often present, and there may be palpable lumps in other parts of the abdomen, or perhaps redness and œdema of the abdominal wall, or a purulent or faecal discharge from the umbilicus. There may be signs of tuberculosis elsewhere, for instance in joints, or lymphatic glands. Calmette's or von Pirquet's tuberculin reactions may be positive. The patient will generally be young, and have consumed unsterilized cow's milk. Pyrexia may be present or absent, either with tuberculous peritonitis or with splenic affections, so that its occurrence does not assist the diagnosis much, except perhaps, that if the chart exhibits marked evening pyrexia, with a sub-normal temperature in the morning, it is an additional argument in favour of tubercle in a young subject. The reverse type of pyrexia—morning rise and evening fall—has been spoken of as characteristic of tubercle, but it is seldom met with.

Fæcal Accumulation in the Splenic Flexure or adjacent parts of the transverse or descending colon may be mistaken for an enlargement of the spleen upon a first examination; but this source of error is usually removed when the patient is re-examined after an abundant action of the bowels has taken place. The

condition is found most frequently in women if the age is not great, or in elderly people of either sex. There is generally a history of severe obstipation, and possibly attacks of temporary obstruction. The mass is generally irregular, more or less cylindrical, and in thin persons it may be possible actually to alter its shape by manipulation with the hand. The best test of the condition, however, is the effect of copious enemata upon the mass.

Hæmatoma due to Leakage from an Abdominal Aneurysm is by no means always easily recognized, and it may be mistaken for an enlargement either of the spleen or of the kidney, unless the aneurysm itself can be felt pulsating; or unless there is a history of an acute exacerbation of intra-abdominal pain, accompanied by blanching due to the amount of blood lost from the leaking aneurysm.

CAUSES OF SPLENIC ENLARGEMENT.

Having concluded that the spleen is enlarged, the next step is to decide the cause of the enlargement. There are various ways in which the different causes may be classified, but from a diagnostic point of view the following is serviceable:—

I. Chronic Enlargement of the Spleen.

(a). *Very great enlargement:*

Splenomedullary leukæmia	Splenomegalic polycythæmia
Lymphatic leukæmia	Splenomegalic cirrhosis
Mixed leukæmia	Splenic anæmia
Chronic malaria	Pseudo-leukæmia infantum.
Kala-azar	

(b). *Moderate enlargement.*—All conditions mentioned in group (a) will at some stage exhibit a spleen that has not yet become enormous; and besides these, chronic and moderate enlargement of the spleen may be exhibited in cases of:—

Pernicious anæmia	Thrombosis of the portal vein
Rickets	Pressure on the portal vein by
Congenital syphilis	enlarged lymphatic glands or
Hodgkin's disease	by adjacent tumour of the gall-
Cirrhosis of the liver	bladder, liver, pancreas, stomach,
Lardaceous disease	etc.

II. Acute Enlargement of the Spleen, the enlargement as a rule being slight.

(a). *Acute infective fevers:*

Especially—

Typhoid fever	Malaria
Paratyphoid fever	Erysipelas
Relapsing fever	Septicæmia.

Less often in—

Pneumonia	Typhus fever
Diphtheria	Influenza
Scarlet fever	General tuberculosis
Small-pox	

(b). *Embolism*, especially in cases of fungating endocarditis.

(c). *Injury.*

(d). *Strangulation* by twisting of the pedicle.

It will be noted that no mention is made of abscess, gumma, carcinoma (whether primary or secondary), sarcoma (primary or secondary), or hydatid cyst of the spleen, for these are all so exceedingly rare that it is very unlikely

they will be met with. It will also be noted that no mention is made of backward pressure, whether due to chronic valvular disease of the heart with failing compensation, or to obstruction to the inferior vena cava above the hepatic veins, such as may result from thrombosis or from pressure upon the veins by mediastinal fibrosis or new growth. These conditions are purposely omitted, for it is quite exceptional for ordinary backward pressure to produce enlargement of the spleen. So true is this, that in a case of chronic valvular heart-disease with failing compensation, the existence of a definitely palpable spleen is evidence of there being more than mere mechanical heart-failure—probably superposed fungating endocarditis. The chief exceptions to this occur in childhood, where the spleen becomes more easily palpable than in adults, so that with heart-failure in a child enlargement of the spleen is less good evidence of fungating endocarditis than it is in a grown-up person.

I.—CHRONIC ENLARGEMENT OF THE SPLEEN.

(a). **Chronic and very great Enlargement of the Spleen.**—When the spleen is so large as to occupy half the abdomen or more, the diagnosis is generally very easy. The largest of all spleens are those due to *splénomédullary leukæmia*. The first step is to make a full examination of the blood, including particularly total and differential leucocyte counts. If there is an extreme degree of leucocytosis, up to anything between 50,000 and 1,500,000 per c.mm. for example, the diagnosis is almost certainly leukæmia, and if in the differential leucocyte count there are from 20 per cent to 50 per cent of myelocytes, it is of the splenomédullary type, whilst if the small lymphocytes amount to 90 per cent or more, the disease is of the *lymphatic* form, in which the lymphatic glands are almost certain to be enlarged as well as the spleen; in some cases of lymphatic leukæmia it may be scarcely enlarged at all, but in others it may be almost if not quite as large as in the splenomédullary type of the disease. For mixed leukæmia, see ANÆMIA. In the absence of any marked leucocytosis, or of characteristic differential leucocyte counts (see also ANÆMIA), the diagnosis of the nature of a very large spleen will depend in the first place upon whether there has or has not been residence in a *malarial* region—the fens districts of Great Britain, the tropics, or certain parts of Europe, particularly Italy. The *ague-cake* spleen of the fens is now very rare; it is more often found in chronic cases of tropical malaria, when the history may indicate its nature, and if the patient is having febrile attacks, the parasites (*Plate XII, Figs. A, B, C, D, E*) may be found in the blood. Recent investigations have shown that some, at least, of the enlarged spleens formerly attributed to malaria, are due to other infections. One of these has been clearly differentiated from the rest, namely *Kala-azar*, which occurs in India, particularly in Assam, in Africa, and in Sicily, and is diagnosed chiefly by the discovery of the Leishman-Donovan bodies in the fluid obtained by splenic puncture (*Plate XII, Fig. H*).

Splenomegalic polycythæmia is a rare affection of adults, characterized by more or less cyanosis and symptoms which might suggest a cardiac lesion, together with more or less enlargement of the spleen, and polycythæmia amounting perhaps to six, seven, or even ten million red corpuscles per c.mm. The diagnosis is arrived at when polycythæmia and enlargement of the spleen occur in the absence of any definite cause.

Splenomegalic cirrhosis is an affection of children and young adults, in whom there are likely to be more or less jaundice, anæmia, lack of development, and ultimately ascites, as well as considerable enlargement of the spleen. There is a tendency for this malady to affect more than one member of a family, and this sometimes gives the clue to the diagnosis. When death ultimately ensues, in addition to the great enlargement of the spleen, these cases exhibit more or

less fibrosis or cirrhosis of the liver, and sometimes the liver is indistinguishable from that of ordinary alcoholic cirrhosis. What relationship this malady has to ordinary alcoholic cirrhosis of the liver on the one hand, and to splenic anæmia or Banti's disease upon the other, is not clear; but owing to the enlargement of the spleen, it is differentiated as splenomegalic cirrhosis. Hæmorrhages, particularly hæmatemesis, are not infrequent in this as in other forms of cirrhosis of the liver. The blood-changes are merely those of a simple chlorotic anæmia. The diagnosis is afforded chiefly by the age of the patient, by the size of the spleen, and by the absence of any positive blood-changes, particularly if more than one member of the family is affected in the same way. The patient often lives for a number of years, and is able to work in spite of the complaint, until ascites supervenes. The fingers may be clubbed.

Splenic anæmia has been discussed under ANÆMIA (*q.v.*). The spleen is

Fig. 186.—Splenic anæmia: photograph showing the outline of the spleen. There was severe chlorotic anæmia without leucocytosis; the patient died, and at the autopsy there was no cirrhosis of the liver.

not as a rule very greatly enlarged, though sometimes it may be (*Fig. 186*). The blood-changes are simply those of progressive and severe anæmia of a chlorotic type; even though there may really be a disease meriting the distinctive term, "splenic anæmia," not a few cases diagnosed as such on account of the co-existence of splenic enlargement with simple anæmia, ultimately turn out to be cirrhosis of the liver. When that which is really cirrhosis of the liver is diagnosed in its early stages as splenic anæmia, the condition is termed Banti's disease.

Pseudo-leukæmia infantum (VON JAKSCH'S DISEASE) is, apart from true leukæmia, almost the only cause of very great enlargement of the spleen in young children (*Fig. 2*, p. 42). It is diagnosed by the severity of the anæmia, which is of the in-

determinate chlorotic type without great leucocytosis, but with all the changes that are to be expected in any severe anæmia (pp. 27, 28) developing in an infant of a year old or less, running a chronic course, but sometimes resulting in complete recovery.

(b). **Chronic Enlargement of the Spleen, the enlargement being of moderate size.**

It is clear that conditions which may sometimes produce great enlargement of the spleen must go through a phase in which the spleen is not yet enormous, and at this stage all those diseases that have just been discussed will come into the present group. The remarks already made need not be repeated here, however, for the diagnosis at the stage in which the spleen is yet only moderately big is arrived at in the way already described. A blood-count is essential in order to exclude or diagnose splenomedullary leukæmia or

lymphatic leukæmia; parasites may be discovered to account for malaria or kala-azar; and so on.

The spleen is palpable in a considerable proportion of cases of *pernicious anæmia*, but it is seldom greatly enlarged, and the diagnosis is arrived at by finding the blood-changes described under ANÆMIA. In none of the other diseases mentioned in the list above are the blood-changes themselves pathognomonic.

The spleen of a small child is very often just palpable without there being any disease at all; if it is more decidedly enlarged, the first suspicion will be that it is due to *rickets* or *congenital syphilis*. The bony changes, quadrate head, beaded ribs, large epiphyses, exaggerated curves of the long bones, particularly of the legs, delay in the closure of the fontanelles, and the pot-belly, will suggest rickets; it should be added, however, that owing to the eversion of the lower ribs along a line corresponding with the attachment of the diaphragm, and known as Harrison's sulcus, the spleen often becomes unduly palpable in rickety children without being necessarily enlarged. Congenital syphilis may be suggested by a knowledge of the family history, by the occurrence of snuffles, of specific skin eruptions, and so forth; but in many cases the diagnosis will be one of surmise only, unless it can be confirmed by the specific serum reaction of Wassermann. *Pseudo-leukæmia infantum* has already been discussed above; by some observers it has been regarded as in some way associated either with rickets, with congenital syphilis, or both; but the most recent view seems to be that it is due to some cause other than these, though its nature is not yet known.

Hodgkin's Disease, when it is typical, is associated with considerable and progressive LYMPHATIC GLAND ENLARGEMENT (*q.v.*), especially those of the neck, and later those of the axillæ and groins, thorax and abdomen, together with moderate but seldom very great enlargement of the spleen; without any anæmia to begin with, but later with a progressive and ultimately severe anæmia of the chlorotic type, with all the changes mentioned on pp. 27, 28; without leucocytosis, and with nothing characteristic about the differential leucocyte count, except that an occasional basophile cell or myelocyte may be seen. Hodgkin himself laid particular stress upon the changes in the spleen in this disease, but there can be little doubt that there are cases of a precisely similar nature in which there is much lymphatic glandular enlargement without enlargement of the spleen. An attempt is sometimes made to distinguish this type from that with splenic enlargement, by styling it lymphadenoma; but where lymphadenoma ends and Hodgkin's disease begins, and vice versa, is by no means settled. It would seem much more likely that there is every degree of acuteness and severity between extremes that are wide apart, those cases which have lymphatic glandular enlargement and a rapidly fatal ending without leucocytosis as their most prominent feature being styled lymphosarcoma; similar cases with the addition of enlargement of the spleen, but a fairly rapid fatal ending, being termed acute Hodgkin's disease; others again, with enlargement of the glands without enlargement of the spleen and with rather greater duration, being termed lymphadenoma; whilst precisely similar cases with enlargement of both spleen and glands, and a duration of anything between several months and several years, are termed ordinary Hodgkin's disease. One very important point to be realized about this disease is, that the blood-changes in it are not pathognomonic even when they are severe.

Cirrhosis of the Liver, by the time it has ended fatally, is nearly always associated with a spleen that is bigger than normal as judged by post-mortem weights. Clinically, however, this enlargement can be made out only in a small proportion of the cases, and even in these the enlargement is seldom

great. When, however, there is doubt as to the diagnosis, and cirrhosis of the liver seems to be a possible cause for other symptoms, such as HÆMATEMESIS (*q.v.*), ASCITES (*q.v.*), JAUNDICE (*q.v.*), the presence of chronic but not very great enlargement of the spleen, without affection of the lymphatic glands and without pathognomonic blood-changes, is an additional argument in favour of the diagnosis. Splenic enlargement is a very prominent and relatively early feature in a few cases, on the other hand, as in the splenomegalic cirrhosis of children and young adults; whilst in some older patients, long before the hepatic changes themselves attract attention, the case may come under observation for anæmia, with or without hæmorrhage such as purpura, epistaxis, hæmatemesis, or the passage of blood per rectum; and a considerable enlargement of the spleen may be found. The blood-changes may be merely chlorotic, and in the absence of other definite signs or symptoms, the diagnosis of splenic anæmia, that is to say of simple anæmia associated with an enlarged spleen, may be made; many such cases ultimately turn out to be examples of cirrhosis of the liver—Banti's disease.

Lardaceous Disease.—A lardaceous spleen is not always enlarged, but is frequently big enough to be palpable, and the liver is generally enlarged at the same time. Lardaceous disease of the spleen is met with in two forms: (1) the

DESCRIPTION OF PLATE XII.

A, Malaria, early ring form; *B*, Malaria, ordinary ring form; *C*, Malaria, mature tertian; *D*, Malaria, tertian, ready to sporulate; *E*, Malaria, crescentic; *F*, *Filaria* embryo; *G*, *Trypanosoma Gambiense*; *H*, Leishman-Donovan bodies, obtained by splenic puncture; *I*, *Spirochæta Obermeieri* of relapsing fever; *J*, *Spirochæta pallida* of syphilis; *K*, Tubercle bacilli and pus cells; *L*, Diphtheria bacilli; *M*, Vincent's angina, *Spirilla* and Fusiform bacilli; *N*, Meningococci within a leucocyte; *O*, Pneumococci and pus cells; *P*, Staphylococci and pus cells; *Q*, Streptococci and pus cells; *R*, Gonococci, in and outside of pus cells; *S*, Actinomyces; *T*, Tetanus bacilli.

(The magnification of *F* and *S* is much less than is that of the remainder; the relative magnifications are indicated by the relative sizes of the white corpuscles.)

sago spleen, in which the changes involve the Malpighian bodies mainly; and (2) the diffuse waxy spleen, in which the blood-vessels, sinuses, and trabeculae are universally affected. It is a condition which results from long-continued suppuration, discharging sinuses from empyema or spinal caries, purulent cavities in phthisis or bronchiectasis, or from tertiary syphilis. If considerable enlargement of the spleen is associated with any of these conditions, it is most probably due to lardaceous disease. There are generally diarrhoea on account of affection of the intestines; and polyuria and albuminuria owing to renal changes. The patient is weak, frail-looking, and bloodless. Blood-counts exclude leukæmia, and indicate more or less severe anæmia of the chlorotic type. The disease is very much less common than formerly, and for the most part it is diagnosed by reason of there being obvious cause for it, especially prolonged suppuration or tertiary syphilis.

Thrombosis of the Portal Vein as a cause for splenic enlargement can seldom be more than guessed at (see ASCITES).

Pressure on the Portal Vein by enlarged lymphatic glands or by adjacent tumours, will almost certainly be associated with obstruction to the bile-duct at the same time, so that there will be jaundice, and probably also ascites, in addition to any splenic enlargement; the latter in any case will not be more than slight or moderate.

II.—ACUTE ENLARGEMENT OF THE SPLEEN.

Acute Infectious Fevers.

Typhoid Fever is the best known febrile disease in which moderate enlargement of the spleen occurs. The organ is usually soft, so that in many cases only an increased sense of resistance can be determined on palpating close under the left ribs. The enlargement may be so slight that the organ may only be felt when the patient takes a deep breath, so as to push it down from under the ribs; or it may be so big that its lower border reaches down to the level of the umbilicus. If, in a case of obscure fever in which a continued pyrexia is associated (especially during the first ten days) with a relatively slow pulse-rate, the spleen is found to be enlarged, the diagnosis of typhoid fever is very likely, especially if there is a history of a gradual onset with a feeling of anorexia and lassitude, accompanied by headache and sometimes with attacks of epistaxis, a gradual rise of temperature which, if it has been observed from the first, is seen to go up about two degrees every night, with a fall of one degree the following morning, until step by step it reaches 103° F. or 104° F., or even higher; and perhaps no definite abnormal physical signs whatever except as regards the spleen, or a few rhonchi in the chest. The characteristic rash does not appear until the sixth day or later, when it comes out on the abdomen as a rule, sometimes also upon the chest and back, in the form of small, rosy-red, flattened papules which fade on pressure, come out in successive crops, and are seldom present to the extent of more than half-a-dozen or a dozen at a time. Widal's agglutinating serum reaction should ultimately be positive in a dilution of 1 in 200 in half an hour, but it is generally the second week before this test is positive. Earlier confirmation of the nature of the fever may be obtained by the blood-count, there being no leucocytosis—indeed, sometimes LEUCOPENIA (*q.v.*)—whilst, unlike many febrile illnesses, typhoid fever produces a relative increase, not in the polymorphonuclear cells, but in the small lymphocytes. Such blood-changes are in themselves almost pathognomonic, and they are obtainable before Widal's reaction is to be expected, though the latter is the ultimate test of the fever. When neither blood-count nor serum-test is possible, the diagnosis may not be cleared up until the third week or later, when sloughs from Peyer's patches can be discovered in the stools. The ratio of the pulse-rate and temperature is of very considerable value in the diagnosis, for in the majority of cases the pulse-rate is very low; for instance, with a temperature of 104° F., the pulse-rate may be only 85 or 90 per minute, when the physiological ratio for this temperature is 120. Pneumonia in its earlier stages may also produce a low pulse-ratio; but the respiration-ratio is here increased, which is not the case in typhoid fever. The following figures illustrate these points:—

			T.	P.	R.
Physiological ratio	..	..	104° F.	125	32
Typhoid fever	..	..	104° F.	.90	30
Pneumonia	..	..	104° F.	100	40

Paratyphoid Fever is closely related to typhoid fever, the clinical symptoms being very similar; the importance of distinguishing between the two lies chiefly in the carrying out of Widal's agglutinating serum reaction. It sometimes happens that in a case which, from a clinical point of view, is almost certainly typhoid fever, the serum will not cause clumping of Eberth's typhoid bacilli; and so far as the bacteriological test goes, the diagnosis might remain altogether obscure unless the serum were also tested against the *Bacillus paratyphosus A* and the *Bacillus paratyphosus B*. In a certain proportion of cases, clumping will be obtained with one or other of these, the diagnosis of paratyphoid fever being based upon bacteriological rather than upon clinical conditions. The spleen is enlarged in paratyphoid fever to about the same extent as in typhoid.

Relapsing Fever is associated with considerable enlargement of the spleen. The disease is contagious, but nowadays rare, developing only under conditions of filth and famine. It is characterized by an acute onset, with chills, pains in the back, and a sudden rise of temperature. The latter remains high for six or seven days, and then falls by crisis. For about a week the temperature remains normal, and then it rises again as before, several such remissions and relapses succeeding each other and being pathognomonic of the disease. The pulse is rapid, and there is profuse sweating. Enlargement of the spleen is detected early. It is most conclusively distinguished from other diseases by examination of blood-films in which the *Spirochaeta Obermeieri* (Plate XII, Fig. I), will be found.

Malaria.—Apart from the chronic enlargement of the spleen due to recurrent attacks of malaria, the spleen becomes enlarged and soft as the result of active hyperæmia during acute attacks. Even when no splenic enlargement can be detected in the intervals, during the paroxysms the viscus can usually be felt projecting below the costal margin, presenting a soft and indefinite lower border. When the patient has more or less chronic enlargement of the spleen as the result of preceding attacks, each acute febrile paroxysm is associated as a rule with an additional swelling which passes off after the attack. For the characters of the fever, see pp. 34, 35. The nature of the malady will be suggested by geographical considerations, or by the influence of quinine; but the only conclusive proof of its nature is the discovery in stained blood-films of the malaria parasites (Plate XII, Figs. A, B, C, D). There is often marked anæmia, especially in cases of recurrent malaria, the red corpuscles and hæmoglobin becoming reduced as in chlorosis; the leucocytes are also diminished, and the differential leucocyte count shows a relative increase in the large hyaline lymphocytes up to even 15 or 20 per cent.

Erysipelas is often associated with a moderate degree of enlargement of the spleen; but the fever, rigors (Fig. 166, p. 614), and slightly-raised red spreading infection of the skin are sufficiently characteristic to indicate the diagnosis.

Septicæmia may be less easy to diagnose unless there is some obvious source of sepsis in the first instance, such as infection of the uterus after childbirth, sepsis in connection with the general peritoneal cavity, joints, wounds, and so forth. The chief difficulty arises in those cases in which the source of the sepsis is not obvious, being due to absorption from such lesions as pyorrhœa alveolaris, whitlows, acne, or other comparatively small superficial affections; or to deep-seated suppuration, such as a hidden empyema, infective pyelephlebitis, infective cholangitis, pyosalpinx, and so forth. In some cases of chronic or subacute septicæmia, enlargement of the spleen may be considerable, and the diagnosis of infective endocarditis will very likely suggest itself. Whether or not the heart valves are affected in these cases, the ultimate diagnosis will depend upon discovery of infective organisms in cultures obtained by venesection.

Diphtheria, *Pneumonia*, *Scarlet Fever*, and *Small-pox* seldom give rise to any very prominent splenic enlargement, and the only importance of it is, that in the early stages of the malady, detection of a spleen that is just palpable may temporarily arouse a suspicion that the patient may be suffering from typhoid fever. The course of the disease, bacteriological examination by swabbings from the throat, the physical signs in the lungs, and characters of the sputum and the skin rash, will serve to point to the correct diagnosis in each case.

Typhus Fever is fortunately very rare now, although there are small outbreaks of it in the poorer parts of large cities from time to time; the spleen becomes soft and moderately enlarged, but less constantly so than in typhoid fever. The disease sets in more acutely than enteric, with chills, early prostration, and a high temperature which ends by less marked lysis than does

that of typhoid fever; and sometimes almost by crisis at the end of the second week. The rash differs from that of typhoid fever, in that it appears on the fifth day, and consists of petechiæ and of dark red groups of subcutaneous macules, in addition to rosy-red papules on the surface. Nervous symptoms become very marked, especially at the end of the first week, the so-called typhoid state being an expression used to denote, not the condition that occurs in typhoid fever, but that which develops in typhus. There may be severe vomiting, and retention of urine, important symptoms that are rare in typhoid fever. There should be no positive Widal's reaction, and no sloughs in the stools.

Influenza is a diagnosis which should never be made unless with very good cause, for many febrile illnesses in which the real cause escapes recognition receive the label influenza. It is easiest to diagnose correctly in times of severe epidemic, and then slight enlargement of the spleen may occur in a few cases. This in itself is not important if influenza can be diagnosed with certainty on other grounds; but until the nature of the fever becomes obvious, it is important in that it may suggest typhoid when none exists. The sudden onset, the extreme prostration, the high pulse-rate as well as temperature, the initial chill, the profuse sweating which comes on when the patient begins to improve, and the fall of the temperature after an illness lasting from twenty-four hours to three or four days or a week, would all point to influenza. It may, however, be impossible to distinguish influenza from typhoid fever until the course of the pyrexia has been watched. It is worthy of note that in influenza as well as typhoid, there is no leucocytosis.

General Tuberculosis may also simulate typhoid fever in certain cases, and enlargement of the spleen may result from the development of tubercles in it. When cerebral symptoms predominate, the diagnosis is relatively easy; the headache may be equally severe in both, but with tuberculous meningitis there is more vomiting and more retraction of the head, whilst it is probable that optic neuritis, and perhaps choroidal tubercles, can be detected. Widal's test will remain persistently negative; there will be no rosy rash, probably no leucocytosis, and no sloughs will be found in the stools. In some cases, however, general tuberculosis produces a clinical picture that may be very difficult to distinguish from typhoid fever. Lumbar puncture may decide the diagnosis.

Embolism.—Fungating endocarditis is nearly always associated with palpable enlargement of the spleen, and sometimes the organ attains a considerable size. As stated above, ordinary heart-disease with failure of compensation does not give rise to splenic enlargement that can be recognized clinically, except perhaps in children, notwithstanding the fact that one might have expected the backward pressure to cause the spleen to be big by being dilated with blood. Except in children, enlargement of the spleen in a heart case should always arouse serious suspicion of infective endocarditis. The enlargement may be due to embolism and infarction, in which case there may have been a history of acute pain low down on the left side of the chest, accompanied by a definite rub due to perisplenitis over the infarct. The splenic enlargement in some cases, however, is due less to actual infarction than to the general toxæmia; even when there has been an infarct it is not always easy to be sure of it. Fungating endocarditis sometimes develops without there being any bruit at all; the diagnosis is then exceedingly difficult unless the patient suffers from multiple emboli—cerebral, renal, intestinal, splenic, peripheral. Sometimes such an embolus may be followed by the development of an acute aneurysm—femoral, popliteal, cerebral, and so forth. A cerebral embolism of this kind has sometimes resulted in sudden transient coma and hemiplegia; the patient has seemed to be recovering; then in a day or two has relapsed into coma again, and died, the cause of the relapse and fatal ending being the development of an acute cerebral

aneurysm at the site of the embolus, rupture of this aneurysm, and death from the resultant hæmorrhage. Progressive anæmia of the chlorotic type, without much leucocytosis, is another feature of these cases. The diagnosis must always be difficult when there is no cardiac bruit; whilst, when there is a bruit, the difficulty is to determine whether the patient is suffering merely from mechanical heart-failure, or from fungating endocarditis superposed upon the chronic heart lesions (pp. 38, 39).

Thrombotic infarction may cause acute splenic enlargement in almost any of the blood diseases, particularly in lymphadenoma and leukæmia.

Neither *Injury* nor *Strangulation of the spleen by its becoming twisted upon its own hilum* is a very common event, and the latter is nearly always the result of injury. A blow in the splenic region may be such as to cause a rupture in the pulp of the spleen without bursting its capsule, and without obviously injuring the chest wall or the abdomen. The bleeding that occurs within the capsule of the spleen itself causes very great pain in the part and enlargement of the organ; the diagnosis can seldom be more than guessed at unless laparotomy is performed. Strangulation of the spleen seldom occurs if the organ is in its natural position; but when there has been previous dislocation, an abdominal injury, or sometimes a sudden spontaneous effort, has led to its becoming twisted on its own hilum, the symptoms being such as to suggest an acute intra-abdominal condition requiring immediate laparotomy, but seldom pointing to the actual diagnosis until the laparotomy has been performed.

Herbert French.

SPONGY GUMS.—(See BLEEDING GUMS.)

SPUTA vary enormously as to their amount, consistence, colour, and so forth; but by far the most important point about them in diagnosis is the determination of whether they contain tubercle bacilli or not. There is no particular variety of sputum which can be said to be characteristic of pulmonary tuberculosis to the naked eye, although much stress is generally laid upon the fact that phthisis with cavitation produces a nummular sputum—that is to say, sputum of which the individual portions expectorated tend, not to coalesce but to flatten out as separate round portions, if they are spat on to a flat, dry surface; if expectorated into antiseptic fluid, they remain as more or less globular, separate masses. As a matter of fact, however, ordinary bronchitis may produce sputum possessing a typical appearance of nummularity, and it is most unwise to rely on the naked-eye appearances of sputum for any diagnosis except that of lobar pneumonia, when it may be typically viscid and rusty. It is in almost all cases essential to make films of the sputum, and to stain these for tubercle bacilli by the Ziehl-Neelsen method with carbol-fuchsin.

The carbol-fuchsin solution is made up of 1 gr. of fuchsin, 10 c.c. of absolute alcohol, and 100 c.c. of 5 per cent solution of carbolic acid in distilled water. The slide is covered by the stain in a suitable receiver, and held over a small Bunsen burner or spirit flame until the fluid steams briskly but does not actually boil. After immersion in this for five minutes at least, and it does not much matter if for longer, the excess of stain is poured off, the film washed in water, the excess of the latter drained off, and the slide immersed in 25 per cent sulphuric acid for about half a minute; it is then transferred to water again, and recovers more or less of the red tint of the fuchsin; if too little of this has been discharged, the slide is returned to the sulphuric acid for another period, and so on; when well decolorized, only the thickest parts of the film retain obvious red; it is then counterstained by five minutes' immersion in carbol-methylene blue, the excess of this stain being washed off with water, the film dried in the air, and either mounted in Canada balsam or else examined directly through cedar-wood oil; the tubercle bacilli (*Plate XII, Fig. K*) show up as bright red rods in a blue field under the oil-immersion lens.

The presence of acid-fast bacilli in an ordinary sputum film is very nearly proof positive of tuberculosis of the lung, the only source of fallacy being the possibility of non-pathogenic acid-fast bacilli being derived from the mouth. It is very unlikely that this source of fallacy will persist from day to day, especially if care be taken to make the films from the interior of the sputum pellets. It should be remembered, of course, that the absence of tubercle bacilli, or rather their non-detection, is no proof of the absence of pulmonary phthisis, and if there is doubt, successive sputa should be tested in the same way. It should also be remembered that a lesion which may have been tuberculous originally, may in time lose its tuberculous character, the tubercle bacilli may die out, though the cavities produced by them still persist and become occupied by pyogenic organisms and their products. Many of the symptoms of phthisis itself are not due to tubercle bacilli directly, but rather to secondary infection by streptococci, staphylococci, pneumococci, and so forth; and the degree of this secondary infection may be gauged from the films at the same time as one looks for tubercle bacilli.

It is also important to realize that a person may expectorate sputum containing tubercle bacilli in abundance every day for months, and yet may have precisely as much lung tissue left by the end of that time as at the beginning; this is due to the fact that when cavities have been produced they are lined by granulation tissue, and it is possible for the discharge from the surface of these granulations to produce a continuous supply of sputum without the erosion of the lung tissue progressing. One sees a precisely similar state of affairs in cases of some skin ulcers, which may discharge abundantly and yet remain much the same size for months at a time. The best evidence of lung destruction is afforded by the discovery of elastic fibres (*Fig. 187*) in the sputum; if these are present there must be something which is eroding the lung tissue, and if tubercle bacilli are present at the same time, the two together indicate advancing phthisis. The elastic fibres may be obvious when ordinary sputum is examined fresh

Fig. 187.—Elastic fibres from sputum. The lower figure is less magnified than the upper, and shows alveolar arrangement of the fibres. (From French's *Medical Laboratory Methods*.)

after it has been pressed out between cover-slip and slide, but oftener they are more easily detected when a quantity of sputum has been boiled with strong caustic soda to destroy pus cells, mucus, and so forth, leaving the very resistant elastic fibres unaffected. Tubercle bacilli are also very resistant to the effect of strong alkali, and when they are suspected to be present but cannot be found without in some way concentrating them, it is a useful plan to boil the sputum with an equal amount of 5 per cent caustic potash, to dilute the result with water, to centrifugalize it well, and make films from the deposit. There are various other methods of obtaining concentrated bacilli from the sputum, but this is one of the simplest. It should be borne in mind that tubercle bacilli may be found even when the sputum is exceedingly small in amount and apparently insignificant and mucoid.

For sputa containing blood, see HÆMOPTYSIS.

Viscid, rusty Sputum is almost pathognomonic of pneumonia. As a rule the diagnosis of lobar pneumonia is fairly clear owing to the sudden onset of an acute pulmonary complaint associated with fine crepitations confined to one or more lobes, followed by dullness, with bronchial breathing, bronchophony, and

pectoriloquy without râles; these being succeeded by redux crepitations, with a diminution in the bronchophony, pectoriloquy, and bronchial breathing until normal voice and breath sounds are restored. The patient's temperature, after maintaining a high level such as 103° F. or 104° F. for from five to ten or more days—usually about seven—falls by crisis (*Fig. 188*). The respiration rate is very rapid—for example, 40 per minute—during the height of the fever, and the skin is flushed, dry, pungent before the crisis, moist from profuse perspiration after it. The diagnosis is much more difficult in some cases, however; there are not a few patients in whom the consolidation is deep-seated, so that it does not come to the surface at all, and lobar pneumonia has to be diagnosed when there are no abnormal physical signs to be detected in either side of the chest. In such cases the general symptoms may suggest the diagnosis, and the sticky, viscid sputum, the colour of which is generally that of iron rust—but which may be any of the colours that a bruise may have, from bright-red or brown to greenish-brown, greenish, yellowish, or even bluish-yellow—confirms it even when the lung signs remain normal. The viscosity of the sputum in these cases

Fig. 188.—Temperature chart of an ordinary case of lobar pneumonia, showing a crisis on the seventh day of the illness, and a slight post-critical rise on the following day.

is of as much importance as the colour. Films of it usually contain numbers of pneumococci (*Plate XII, Fig. O*); in exceptional instances pneumo-bacilli. When lobar pneumonia is due to the influenza bacillus, the sputum has not the viscid, rusty character as a rule, but is more like that of ordinary muco-purulent bronchitis. The presence of large numbers of pneumococci, however, or of any other micro-organism than the tubercle bacillus, is by itself no proof that this is the cause of the lung lesion, for even in the sputum of perfectly normal persons, pneumococci and other bacteria are frequently abundant. It is quite possible for a patient who is dying of general miliary tuberculosis of the lung to have no tubercle bacilli in the sputum, but an abundance of capsulated pneumococci which may readily, when they are discovered, lead to an erroneous diagnosis.

Influenza bacilli are exceedingly small; but it is important that they should be looked for, both directly and by cultural methods, in all cases thought to be influenzal, before this diagnosis is regarded as established: even when influenza bacilli are found, there is still the possibility that they may be an intercurrent infection in some other malady; but it is so tempting to think of influenza when no other obvious cause for a febrile illness can be discovered, that it should not be diagnosed until influenza bacilli have been shown to be present.

Abundance of Foul Sputum, especially when expectorated much at a time at comparatively long intervals, is sometimes by itself a striking symptom, and it suggests that the patient is suffering from one or other of the following :—

Bronchiectasis	An empyema ruptured into the
Phthisis with cavitation	lung
Fætid bronchitis	Gangrene of the lung.

It is sometimes very easy to distinguish between these ; with *fibroid lung and bronchiectasis* the patient is likely to have had symptoms periodically for a long while ; there will generally be marked CLUBBING OF THE FINGERS (*q.v.*) ; the abnormal physical signs are confined to one lung as a rule, and especially to the lower lobe, with displacement of the heart towards that side ; there will be deficiency of movement, resonance, and vesicular murmur in the affected lower lobe, together with either absence of voice sounds and of râles, or scattered foci of crackling râles, especially when the patient coughs, with bronchophony, pectoriloquy, and bronchial breathing. If, on the other hand, the abundant and foul sputum is associated with abnormal physical signs in both lungs, and if the upper lobes are obviously more affected than the lower, if the patient has a strong tuberculous family history, and if tubercle bacilli are either now present in the sputum, or are known to have been present formerly,—the diagnosis of *chronic phthisis with extensive cavitation and secondary infection* of the cavities with pyogenic organisms is obvious.

Fætid bronchitis is always a dangerous diagnosis to make, and the probability is that many cases so diagnosed have been examples either of deep-seated bronchiectasis, of phthisis with cavitation and secondary pyococcic infection, or of *empyema ruptured into the lung*. The latter is generally associated with hardly any abnormal physical signs, because if the original empyema had given rise to its ordinary physical signs, it would have been diagnosed and relieved by operation ; an empyema may develop either between the lobes, or between the pericardium and the lung, or between the diaphragm and the lung, in such a way as to leave normal lung tissue all round the surface next the chest wall, so that the usual evidence of pus in the chest is entirely wanting. Even if abnormal physical signs are produced when the pus is kept in an abnormal position in this way, the needle may have to pass through so much tissue before the empyema cavity is entered, that the pus cannot be located in either of these cases the empyema will, in the course of time, tend to ulcerate its way through the pleura and lead to the expectoration of large quantities of foul sputum at intervals as the empyema cavity re-fills. The diagnosis depends largely upon the exclusion of other causes of abundant foul expectoration, and perhaps upon the history of a preceding illness predisposing to empyema, for example, lobar pneumonia.

Gangrene of the lung may be simulated to some extent by bronchiectasis or by empyema rupturing into the lung ; but generally speaking nothing but gangrene will produce so much stench. Foul though the sputum in bad bronchiectasis may become, it seldom approaches the awful fætor of pulmonary gangrene. The history, moreover, is acute ; there may be some obvious cause for gangrene, particularly lobar pneumonia in a patient debilitated from some other cause, such as diabetes, or inhalation of foul particles after immersion in a dirty river, or as the result of disease of the mouth, throat, or œsophagus, or septic embolism of the lung from lateral sinus thrombosis, and so forth. If any doubt remains as to whether the lung tissue is being destroyed or not, elastic fibres can be sought for, their presence at once distinguishing between bronchiectasis or deep-seated empyema on the one hand and gangrene on the other.

When a large quantity of pus is expectorated through the lung in a person who, having been in the tropics and having possibly suffered from dysentery, has since had symptoms pointing to hepatic trouble, the possibility that an amœbic abscess of the liver may have opened its way through the diaphragm into the lung will immediately occur to one, especially if the expectorated pus is tinged the colour of anchovy sauce. It might be thought that the *Amœba coli* would be found in it; but this is not the case, for this protozoon is not present in the pus of a hepatic abscess, but only in the granulations of the abscess wall. The sputum in these cases is not foul as a rule.

The other abnormal features that may be exhibited by sputum are relatively uncommon, and are of diagnostic significance only in exceptional cases. The serous, mucoid, muco-purulent, or purulent sputum of the various stages of acute and chronic *bronchitis* may arouse a doubt as to whether the patient has not a tuberculous focus; repeated examination will fail to reveal either tubercle bacilli or elastic fibres, but it is to be remembered that a considerable minority of phthisical subjects seem not to expectorate the bacilli. *Black sputum* is common in those who live in smoky atmospheres, particularly in towns, colliery districts, and manufacturing centres. Other changes in colour may be due to hæmoptysis, pneumonia, or hepatic abscess, which are all discussed above; sometimes infection by the *Bacillus pyocyaneus* may produce greenish or bluish sputa which may alarm the patient, but which need not have any serious import.

Curschmann's spirals (p. 179) and *Charcot-Leyden crystals* (p. 117) have been discussed elsewhere.

Casts of the bronchial tubes are met with in very exceptional cases, and they are of two main types—namely, diphtheritic, and non-diphtheritic. The distinction depends on bacteriological examination; histologically they consist of ill-defined exudate containing cells irregularly embedded in it. Non-diphtheritic casts are due to plastic or fibrinous bronchitis, a very rare disease of which the sputum is the diagnostic point. Two other rare causes for the expectoration of casts of the bronchi are lobar pneumonia, and the inhalation of blood from some other part of the lung in a case of hæmoptysis, and its subsequent expectoration after it has clotted.

Now and again a cretaceous pellet or a small caseous mass may be found in the sputum of a patient who either has pulmonary phthisis, as evidenced by the abnormal apical physical signs, and by the detection of elastic fibres as well as tubercle bacilli in the sputum, or in children as the result of the ulceration of a caseous bronchial gland into the trachea or a main bronchus, and then expectoration of its caseous or cretaceous contents.

Another rarity which has occasionally been found in the sputum is a recognizable particle of new growth, the detection of which may be of material assistance in diagnosis.

Chemical analyses are relied on by some observers in distinguishing tuberculous from non-tuberculous sputum, it being stated that expectoration containing coagulable proteid is more likely to be the result of tuberculous infection than is sputum which does not coagulate with heat. This distinction, however, is not universally accepted, and microscopical examination for tubercle bacilli is certainly a more reliable test in the great majority of cases.

The rarer bacteria and moulds that may be detected in the sputum by special bacteriological methods generally require very special investigation, including cultural tests by skilled bacteriologists: one need not, therefore, enter into details here, though it may be well to enumerate certain micro-organisms which may be pathogenic in the lung in comparatively rare instances—*B. mallei*,

generally amongst workers in stables or otherwise in connection with horses; *Aspergillus flavus*, *A. niger*, *A. fumigatus*, generally amongst those who have to do with the artificial feeding of pigeons and other birds; *Actinomyces* or the ray fungus, in those who have had to do with barley in some way or another, or, as has recently been demonstrated, in those who are in the habit of holding cotton in their mouths, such as tailors and seamstresses. Besides these pathogenic micro-organisms, not a few others which are not actually pathogenic are to be recognized in the sputum when it has become secondarily infected in chronic cases. *Penicillium glaucum*, for instance, or *Oidium albicans*; yeast and other moulds; *Micrococcus tetragenus*; or *Oidium tropicale*, a micro-organism similar to but culturally different from *Oidium albicans*, which has recently been reported to be a cause of lung lesions both in Europeans and natives in Ceylon, the symptoms suggesting phthisis, but the latter being excluded by the persistent absence of tubercle bacilli from the sputum and by the absence of reaction to tuberculin.

Whooping-cough is sometimes difficult to distinguish from other colds and from bronchitis, and if the recent statements to the effect that it is due to a minute bacillus prove true, bacteriological examination of the sputum may be of use in diagnosing this condition in doubtful cases.

The lung fluke, *Paragonimus Westermani*, which causes hæmoptysis in Corea, Japan, and parts of China, is to be diagnosed by the discovery of its oval, capsulated eggs in the sputum.

Herbert French.

SQUINT.—(See STRABISMUS.)

STAMMERING.—(See SPEECH, ABNORMALITIES OF.)

STERILITY.—The differential diagnosis of the causes of sterility is often a matter of great difficulty, and although there are many well-defined conditions which give rise to it, we are bound to admit that there are numbers of cases in which no definite cause can be found. Further, we must not overlook the fact that the husband is responsible for a sterile marriage in one-fourth to one-third of the cases. This is a fact shown by many observers, and too often forgotten when investigating cases. Therefore, we must not consider a case to be complete unless the husband and his semen have been investigated. Many a woman has her married life made miserable, and is taken from doctor to doctor on account of sterility, when the husband really is to blame. The causes of sterility are shown in the table on the next page.

From a study of this table, it is clear that some of the causes of sterility are primary, whilst others are secondary. Thus absence of the uterus or infantile uterus means primary sterility, whilst hyperinvolution, carcinoma of the cervix, etc., may occur in women who have had children, and only secondarily become sterile on account of these lesions. Further, some of these causes are common, or may be remedied; others, on the other hand, are rare or absolutely incurable. Diagnosis is therefore of great importance, for it is far better to discover and remedy a defect early in married life, than to wait until the best years are soured and embittered by the longing for a child. Unfortunately, many patients, from various motives, put off the investigation too long.

Congenital Lesions.—Some of the congenital lesions are diagnosed easily, such as closure of the hymen, absence of the vagina, or closure of the cervix, whilst absence of the essential organs often requires an anæsthetic in order that a bimanual examination may be made satisfactorily. The infantile uterus and small adult type are very difficult to differentiate; but it may be remembered that in the former the body forms only one-third of the total length of the organ, whilst in the latter it forms two-thirds, both types of uterus being small in the

antero-posterior and lateral dimensions, and only slightly shortened in the vertical. Of all the congenital lesions, the "*cochleate*" uterus of Pozzi is the commonest cause of sterility, and is the most hopeful as regards treatment. The uterus is felt to be unusually curved anteriorly, has a long conical cervix, and a small external os. In such an externally malformed uterus as this, it is possible that the internal structure is abnormal; the endometrium, perhaps, is unduly thin and fibrous, the muscle layers badly developed. The hypothetical *change in the endometrium* may be the essential cause of sterility: hence curettage for its complete removal forms an essential part of the treatment. The peculiar shape and curvature have long been considered a possible cause, preventing the entrance of spermatozoa into the cavity. *Pseudo-hermaphroditism* usually shows itself by shortness of the vagina, elongation of the clitoris, and the presence of glandular masses in the groins, which are almost always testes, proving that the subjects of it are really undeveloped males.

LESIONS OF THE GENERATIVE ORGANS.		GENERAL CONDITIONS.
<i>Congenital Lesions—</i>	<i>Acquired Lesions—</i>	Old age
Absence of uterus, tubes, ovaries	Dyspareunia	Obesity
Closure of hymen, vagina, cervix	Vaginismus	Anæmia
Pseudo-hermaphroditism	Salpingo-oöphoritis	Nutritional disturbances
Infantile uterus	Uterine fibroids	Incompatibility
Small adult type of uterus	Endometritis	Absence of sexual feeling.
"Cochleate" uterus	Cervical catarrh	
Displacements	Polypi	
Hypothetical changes in endometrium.	Carcinoma of cervix	
	Carcinoma of fundus	
	Ovarian tumours	
	Acquired atresia of vagina	
	" " cervix	
	Genital fistulæ	
	Hyperinvolution	
	Frequent astringent douches	
	Deficient ovarian activity.	
	<i>In the male.</i>	
	Azoöspemia	
	Oligospermia	
	Necrospemia.	

Acquired Lesions.—The differential diagnosis of the acquired lesions can only be made by complete examination of the patient by inspection, bimanual examination, and the use of the microscope to elucidate doubtful growths. *Dyspareunia* as a cause is dealt with in the article under this head. *Hyperinvolution* requires just a word to itself, as it is an interesting and easily diagnosed condition. It occurs always after a labour, and strictly means a continuance and progressive increase of the normal lactation atrophy of the uterus. The uterus is felt to be very small bimanually, and the sound may pass only $1\frac{1}{2}$ inches in a marked case. It is always associated with incurable amenorrhœa.

Deficient ovarian activity, whereby the Graafian follicles do not ripen or rupture, is not to be diagnosed by any of the ordinary methods we can employ, and it is doubtful whether a microscopic examination of the ovaries themselves would

reveal the true condition. It is supposed to be associated with scanty menstruation or amenorrhœa for which no other definite cause can be found. Absence of ovarian activity must be the true cause in the general conditions, which are outwardly shown by *obesity*, *anæmia*, and *disturbances of nutrition*; and it is a fact that some women have not conceived as long as they remain too fat, whilst loss of weight has in some cases been followed by conception. *Incompatibility* between husband and wife sexually is an ill-defined condition, which, however, is fully believed to be a cause of sterility. It is almost incapable of proof, for in the case of a sterile widow who remarries and conceives for the first time, we have no proof that the former husband was capable of procreation. *Absence of sexual feeling* or the sexual orgasm, too, is not always a cause of sterility, for conception has occurred in women who are absolutely devoid of these feelings. On the other hand, most authors quote the case of a woman who conceived as a result of the only coitus at which an orgasm was experienced. The influence of *age* on child-bearing must never be forgotten, the liability to conceive falling rapidly every year over thirty.

Sterility of the Male.—Finally, the examination of the husband and his seminal fluid should never be omitted unless there is some quite well-defined cause to be found in the wife. Assuming that the penis and testes are present, and that erections render the sexual act possible, the seminal fluid must be examined carefully.

The fluid should be collected in a condom by means of a normal coitus, and should be examined within twelve hours. It must be spread on a slide and examined with a high power of the microscope. There may be no spermatozoa present at all, the condition known as *azoospermia*, in which case the husband is incapable of procreation. There may be but few spermatozoa, and those exhibiting only feeble powers of movement: *oligospermia*. There may be plenty of spermatozoa present, but quite devoid of motility: *necrospermia*. It is unnecessary in this article to enter into the causes of these conditions. They are usually incurable, and consequently further investigation is unnecessary.

Thos. G. Stevens.

STERTOR is really another word for snoring; but it is commonly restricted to the heavy, snoring sound accompanying inspiration, produced not in the nose but by vibrations of the soft palate, generally when the patient is in a state of profound unconsciousness. It differs from stridor in that the latter is produced in the larynx. If, as is generally the case, the patient is comatose, the presence or absence of stertor helps little in the diagnosis, which is discussed under the heading **COMA**. Sometimes, however, without being comatose, the patient may have stertor during sleep, when he is suffering from any of the following:—

Adenoids

Hypertrophied tonsils

Quinsy

Paralysis of the soft palate

Post-pharyngeal abscess.

The stertor in these cases is closely akin to snoring. The differential diagnosis generally becomes manifest when the interior of the mouth and pharynx are examined. Possibly the condition most likely to be overlooked is post-pharyngeal abscess, but this should not be mistaken for anything else if a digital examination of the back of the mouth is made; moreover, except when due to tuberculous caries of the cervical vertebræ, it is commonest in infants and quite small children, becoming rarer with each year of life.

Herbert French.

STIFF NECK.—This occurs in a number of diseases entirely different in character, and its significance may be either grave or trivial. It is rarely that stiffness is the only symptom, but it may be the first thing complained of, or it may be a complication arising in the course of a disease.

It is not right to assume that the trouble is trivial, or vaguely to designate it as "rheumatic," without a thorough investigation. It is necessary first to inquire into the history of the duration of the illness, when it may become obvious that it follows, say, an injury, or has arisen during the course of some disease and is not primary. Next examine the patient with the head and shoulders bared, and see whether there is any swelling or abnormality present, also the extent of possible movement, and whether or not it is the movement that causes pain; and if possible locate the seat of the pain. Many further investigations may be necessary, e.g., examination of the throat for tonsillitis, the ear for suppurative otitis media, etc., according to the circumstances of the case.

Exposure to Cold or Sleeping in a Cramped Position may give rise to a transient stiff neck, which is associated with no other symptoms. There is generally a distinct history of the patient waking up in the morning with a stiff neck, and the diagnosis is made by exclusion. It is well not to confound these with cases of rheumatoid arthritis.

Inflammation of the Lymphatic Glands and the cellular tissues of the neck. Any inflammatory focus in the neck may cause stiffness, whether it be a boil or carbuncle, or an enlarged gland arising from a carious tooth, an inflamed tonsil, pediculosis capitis, or other similar cause. There is no spasm or rigidity of the muscles here, the neck can be moved quite well; but it hurts to do so, and therefore it is held stiffly. The diagnosis is made easy, for the signs of inflammation will be obvious.

Torticollis or *Wry-neck* is due to contraction of the sternomastoid muscle on one side, usually the result of an injury to the muscle caused by pulling on the aftercoming head in breech presentations. The muscle stands out as a tight band in the neck, and its contraction leads to a characteristic deformity. The head is pulled down towards the affected side, and the face and chin are tilted towards the opposite shoulder. The movements of the head are necessarily restricted owing to the shortening of the one muscle, and in long-standing cases this leads to a marked asymmetry of the face. The consequences are not limited to the head and neck, for the spine shares in the general obliquity, and shows marked lateral curvature in old cases.

Spasmodic Torticollis is an unusual form due to spasms of the sternomastoid and other muscles of the neck. The spasms are intermittent, coming on suddenly with great pain, the affected muscles relaxing after a variable time.

Cervical Caries.—The greatest care must be taken not to confound muscular rigidity with tuberculous disease of the cervical vertebræ. In the latter, pain and rigidity are among the earliest signs; the pain is increased by the least movement, and the child—for it is generally a child that is affected—takes the greatest precaution to avoid any movement, even holding the head between the two hands. The position of the head varies; it is most often held very stiff and straight, the natural backward curve of the neck being lost. In the late stages there may be an angular or lateral curve. The distaste for movement is very well brought out when the patient is asked to look round—the eyes only are moved, or the whole body is rotated. Bearing the possibility of this condition in mind, there is not much difficulty in diagnosis, but in doubtful cases a skiagram should be taken.

Infective Arthritis of the Cervical Vertebræ.—Following infective diseases such as scarlet fever, diphtheria and tonsillitis, especially in children, there may ensue a very chronic form of suppurative arthritis affecting one or several of the cervical vertebræ, and going on sometimes to complete bony ankylosis.

Spondylitis Deformans causes fixation of the neck, though the movements of nodding 'yes' and 'no' remain; the nature of the case is at once indicated, however, by the fixation of the other regions of the spinal column also.

Injuries to the Neck.—A stiff neck may arise from some slight injury, such as a blow or a sudden twist. This will be clear from the history.

Severe injuries involving fracture or dislocation are almost always fatal: if not immediately, then in a few days. A rare injury that may not be fatal is unilateral dislocation of one of the cervical vertebræ. This may result from a fall on to the head. From the start, there are great pain and stiffness in the neck, the head being fixed immovably and turned to the opposite side to that of the displacement.

Burns.—A self-evident cause of stiffness is the cicatricial contraction following a burn on the neck.

Stiffness and retraction of the head are important indications of *meningitis*, but they are by no means constant; when present they are generally accompanied by other well-marked signs of *meningitis*.

Stiffness of the neck is one of the earliest signs of *tetanus*; it is rarely the only one, however. The trouble soon spreads to the jaw, causing trismus. The patient looks very ill, and there is almost always some wound which is sufficient to indicate the cause of the illness.

Geo. E. Gask.

STRABISMUS.—Squints may be classified, according to their *direction*, into convergent, divergent, or attitudinal; according to their *cause*, into paralytic and non-paralytic (concomitant).

The diagnosis between paralytic and non-paralytic strabismus is, as a rule, easy. In a paralytic strabismus the convergence or divergence of the two eyes is not constant in amount in all directions, as the farther the eyes are moved over in the direction of the action of the paralyzed muscle the greater will be the deviation from parallelism. In a concomitant squint the eyes always bear the same relative position to each other in whatever direction they are turned.

The diagnosis of the cause of a paralytic strabismus, which is associated with **DIPLOPIA**, is discussed under that heading (*q.v.*). The causes of concomitant strabismus are usually—*Error of refraction*; *Failure of binocular vision*; *Defective vision in one eye*; or the association of one or more of these conditions. The cause cannot be determined accurately without a careful examination of the ocular refraction under a mydriatic. In general terms it may be stated that convergent squints are, as a rule, due to hypermetropia, and divergent squints to myopia.

Herbert L. Eason.

STRANGURY.—(See MICTURITION, ABNORMALITIES OF.)

STRIDOR is a term used to denote a harsh, vibrating noise produced as the air passes in or out of a partially obstructed larynx or trachea. It may be due to many different causes, which may be classified as follows:—

1. **Partial Obstruction Inside the Larynx or Trachea:—**

- Mucus or muco-pus
- Foreign body
- Caseous gland rupturing into trachea.

2. **Affections of the Wall of the Larynx or Trachea:—**

- Diphtheria
- Acute œdema due to—
 - Bright's disease
 - Potassium iodide
 - Acute streptococcal laryngitis
 - Acute pneumococcal laryngitis
 - Acute staphylococcal laryngitis

Secondary infection in cases of tuberculous ulceration		
"	"	" syphilitic ulceration
"	"	" malignant ulceration
"	"	" traumatic ulceration
"	"	" post-typhoidal ulceration

Stenosis after tracheotomy or cut throat

Epithelioma of the vocal cords

Fibroma of the vocal cords

Epithelioma of the trachea

Syphilitic stenosis.

3. Swellings Outside Compressing the Larynx or Trachea :—

Enlargement of the thyroid gland

Enlargement of the thymus gland

Thoracic aneurysm

Mediastinal new growth

Post-pharyngeal abscess

Epithelioma of the œsophagus invading the trachea

Malignant glands in the neck

Epitheliomatous glands in the neck.

4. Bilateral Abductor Paralysis of the Vocal Cords, generally due to syphilitic degeneration of the vagal-nuclear nerve cells.

Distinction is sometimes drawn between inspiratory and expiratory stridor, and stridor which is both inspiratory and expiratory; but in practice such a distinction is not helpful. The main value of stridor as a symptom is that it indicates stenosis of the main air-passages by one or other of the above causes, except in those rare cases in which it is functional: *hysterical stridor* ceases during sleep, is nearly always confined to the female sex, as a rule between the ages of fifteen and thirty, and is often associated with other functional nervous symptoms, such as globus hystericus and functional aphonia. Stridor should never be diagnosed as functional, however, until every possible organic cause has been excluded. The differential diagnosis of the causes of obstruction to the main air-passages will be found discussed on page 464.

Herbert French.

STUPOR.—(See COMA.)

STUTTERING.—(See SPEECH, ABNORMALITIES OF.)

SUCCUSSION SOUNDS.—Succussion sounds may be heard when a part that contains any considerable bulk of both fluid and gas is shaken, whilst the ear or the stethoscope is applied over the part. Sometimes the sounds are so loud that they can be heard at a considerable distance from the patient. A very good example of succussion sound is often afforded by the normal stomach after a quantity of fluid has just been swallowed. It is a mistake to suppose that gastric succussion sounds are evidence of abnormality; they merely prove that the viscus contains fluid and gas at the same time; the gas may be due to fermentation, but it is often nothing but air that has been swallowed during drinking. The chief value of gastric succussion sounds is that, according to the position in the abdomen at which they can be heard, they afford some clue as to the position, and perhaps as to the size, of the stomach. They should not be heard lower than the umbilicus; if they are, the stomach is either displaced downwards, or dilated, or both.

Another variety of succussion sounds may sometimes be heard in the chest, especially in cases of hydropneumothorax; when the patient deliberately oscillates his trunk to and fro, and then stops, the fluid and air can be heard

making noises like those produced when a partly-filled barrel is moved about. Sometimes the fluid splashes up on to the collapsed lung and then drips off again into the pool at the bottom of the pleural cavity, each drop echoing in the cavity and producing a metallic clink like a *bruit d'airain* or coin sound. Similar succussion sounds may be produced by a pyopneumothorax or a hæmopneumothorax, the difference between these being decided, as a rule, by exploratory needling.

Succussion sounds other than those due to the stomach, or to gas and fluid in the pleural cavity, are uncommon, but the following is a list of the chief possible causes :—

1. Causes of Succussion Sounds in the Thorax :—

- (a) Hydropneumothorax
- (b) Pyopneumothorax
- (c) Hæmopneumothorax
- (d) Diaphragmatic hernia
- (e) Subdiaphragmatic abscess communicating with stomach or duodenum, and so containing air and pus ; or else infected with the *Bacillus coli communis*, and containing gas and pus
- (f) Hydropneumopericardium
- (g) Pyopneumopericardium
- (h) A huge phthisical cavity beneath a thin chest wall.

2. Causes of Succussion Sounds in the Abdomen :—

- (a) The normal stomach
- (b) Dilatation of the stomach
- (c) Enormous dilatation of the cæcum
- (d) Enormous dilatation of the sigmoid colon
- (e) Enormous dilatation of some other part of the colon
- (f) Pneumoperitoneum, due to : (i) Perforated gastric ulcer ; (ii) Perforated duodenal ulcer ; (iii) Perforated typhoid ulcer of the intestine ; (iv) Perforated tuberculous ulcer of the intestine ; (v) Perforated malignant ulcer of the colon ; (vi) Production of gas by the *Bacillus coli communis*, either in a local abscess (e.g., appendicular or subdiaphragmatic) or in the general peritoneum
- (g) Subdiaphragmatic abscess communicating with the interior of stomach
- (h) Air and urine in the bladder (see PNEUMATURIA)
- (i) Infection of an ovarian cyst or other collection of fluid by a gas-producing micro-organism.

1. Succussion Sounds in the Chest. — The diagnosis is not as a rule difficult. It is very rare indeed for a *phthisical cavity* to give succussion sounds ; but should it do so, the phenomenon would be apical rather than basal, and thus distinguishable from most cases of hydro- or pyo-pneumothorax. It is possible for the latter to be apical, however, if old adhesions prevent the parietal and visceral layers of pleura from separating in the lower part of the chest, and then, if tubercle bacilli were found in the sputum, it would become a matter of opinion as to whether the sounds were produced in the pleural cavity or in a huge vomica. *Hydro- and pyo-pericardium* are very rare, and they are at once distinguished by the extraordinary churning sounds made by the heart beating within the mixture of air and fluid. Survival is improbable. The cause is generally either an epithelioma of the œsophagus opening the pericardium from behind, a foreign body, such as a tooth-plate, ulcerating through from the œsophagus, or else the opening of an air-containing subdiaphragmatic abscess through the diaphragm into the pericardium, or infection of the pericardial sac by a gas-producing organism such as the *Bacillus coli communis*.

It may be important to know that a *subdiaphragmatic abscess* containing air, owing to communication with a hole in a gastric or duodenal ulcer, sometimes pushes the diaphragm up so high that the condition may be mistaken for hydro- or pyo-pneumothorax when it is really subdiaphragmatic; it may be possible to distinguish the two by knowing that the trouble began with gastric ulceration; on the other hand, it may be impossible to tell which it is until an operation is performed and the position of the diaphragm ascertained. When the trouble is subdiaphragmatic, the tendency is to displace the heart upwards rather than towards the opposite side of the chest, whereas the contrary is true of pneumothorax. The *x*-rays may be of use in deciding whether the diaphragm is above or below the gas-containing cavity.

Diaphragmatic hernia is very rare; it may be congenital, or it may be the result of severe injury to the abdomen and chest. In neither case are the patient's prospects of survival good. The exact diagnosis may not be arrived at without operation or post-mortem examination; if the stomach is herniated into the thorax, however, the effects of eating and drinking upon the physical signs may point to the diagnosis, or the *x*-rays may be used to demonstrate the gastric shadow after the administration of large doses of bismuth oxycarbonate by the mouth. In most cases of *hydropneumothorax* there is little difficulty as to the diagnosis of the condition itself; it may be less easy to decide what the hydro-pneumothorax is due to. The onset has generally been sudden, with acute pain in the affected side of the chest, cyanosis, and dyspnoea, and by far the commonest cause is phthisis. The sputum should be examined carefully for tubercle bacilli. In some instances an injury may have been the immediate cause, but injury will very seldom produce hydropneumothorax unless there was already a tuberculous or other lesion in the lung at the time of the accident. Hydropneumothorax may result temporarily after paracentesis thoracis.

If there has been bleeding at the same time, *hæmopneumothorax* may be found. Either a hydro- or a hæmo-pneumothorax may become infected with pyogenic organisms and converted into a *pyopneumothorax*, in which case the patient will be more gravely ill, with pyrexia, cachexia, and perhaps rigors. The diagnosis will be confirmed by needling the chest. Pyopneumothorax is apt to escape detection, however, because it arises when the patient is too ill to be shaken—in cases of gangrene of the lung for instance, resulting perhaps from lobar pneumonia, obstruction of a bronchus by a foreign body or a new growth, or the breaking down of an infective bronchopneumonia or pulmonary infarct. Generally speaking, indeed, one may say that the existence of well-marked succussion sounds in the pleural cavity of a patient who has sufficient vigour to shake his own body to and fro indicates hydropneumothorax of phthisical origin.

2. Succussion Sounds in the Abdomen.—The first point in the differential diagnosis of succussion sounds in the abdomen is to decide whether the sounds are *gastric* or not. Generally this is obvious; if there is doubt, the effect of putting more gas or more fluid into the stomach by taking a seidlitz powder in two halves, or by drinking a quantity of water, will usually so change the character and distribution of the sounds if they are gastric, that little doubt will remain; or the *x*-rays and bismuth method of demarcating the stomach may be employed. As has been mentioned, the existence of gastric succussion is no proof of gastrectasis; if, however, the succussion sounds are audible over a larger area than the normal stomach should occupy, they afford valuable evidence of *gastrectasis*, and the next step will be to determine the cause of the latter. Dilatation of the stomach has three main causes, namely, atony, non-malignant pyloric obstruction, especially by a healed simple ulcer, and malignant pyloric obstruction by primary gastric carcinoma.

The presence of visible peristaltic waves, or the occurrence of vomiting, will exclude simple atony, which can never be diagnosed with certainty until it is known that there is no pyloric obstruction. The latter will be indicated by the periodicity of the vomiting; by the abundance of the fluid vomited being greater than the amount taken at the last meal; by the presence in it of particles of food eaten a day or more previously—ham, for instance, vomited on Tuesday when last partaken of on Sunday;—by the visible peristaltic waves corresponding with the stomach; and by the presence of *sarcinæ* in the vomit (see *Fig. 92*, p. 267).

There may also be evidence of delay in the absorption of substances that are not dissolved until they reach the pancreatic juice in the duodenum, tested for instance by giving methylene blue in keratin-coated capsules, and observing when the urine first begins to be blue. Keratin is not dissolved by gastric juice, but is by pancreatic; if there is no evidence of pancreatic disease, delay of more than one to two hours in the first sign of blueness of the urine, after giving the capsules, indicates marked delay in their transit from stomach to duodenum.

It is often a matter of extreme difficulty to decide whether pyloric stenosis is simple or malignant, though upon the whole the shorter the history, the older the patient, and the more definite the pyloric thickening or lump the more likely is the lesion to be carcinomatous. The latter may occur in quite young subjects, however, even between 20 and 30; and a long history does not exclude carcinoma, since some cases of simple ulcer ultimately become malignant. Even when laparotomy is performed for the relief of the condition, its nature may not be obvious; sometimes, indeed, post-mortem examination has failed to decide whether the stenosed pylorus was carcinomatous or not, until microscopical examinations have been made. It has been stated that if the gastric juice after a test meal contains a normal amount of HCl, the diagnosis is unlikely to be carcinoma, and vice versa; but even this general rule has many exceptions.

The diagnosis of pyloric stenosis due to other causes than healed ulcer or a carcinoma is seldom possible without a laparotomy; occasionally such out-of-the-way things as a calcified retroperitoneal cyst adherent to the pylorus and thought to have been a carcinoma pylori may be found.

If there are well-marked abdominal succussion sounds that can definitely be shown not to be gastric, there are generally other well-marked signs and symptoms which materially assist the diagnosis.

Succussion sounds in the general peritoneal cavity are excessively rare, for even though this cavity should contain both gas and fluid, for instance after perforation of a typhoid ulcer, the coils of bowel prevent the sounds from being readily produced. The list of causes given above indicates the conditions that may be present. It would clearly be next to impossible to diagnose most of them unless the previous state of the patient was accurately known, or unless exploratory laparotomy was resorted to. It is important to remember that the *Bacillus coli communis* produces gas, so that intra-abdominal abscesses, appendicular and otherwise, are not infrequently resonant. The occurrence, however, of marked non-gastric succussion sounds in the abdomen of a patient who is not acutely ill will generally arouse a suspicion that there is distention with gas and fluid of some part of the large bowel, especially the cæcum or the sigmoid colon. This distention will generally be the result either of chronic constipation (see p. 140) or of some cause of intestinal stenosis.

In some cases that were formerly described as idiopathic dilatation of the colon, but which are now regarded as chronic volvulus of the sigmoid colon, the result of persistent constipation, the sigmoid dilatation may be so extreme that this part of the intestine bulges up as far as the diaphragm (Hirschsprung's disease, see *Fig. 40*, p. 148, and *Fig. 122*, p. 432); the occurrence of succussion

sounds in such a dilated colon might readily lead to the erroneous diagnosis of gastrectasis; the pear-shaped outline of the dilated viscus, and the fact that it is known to have come upwards from the pelvis, may indicate the true nature of the case, but sometimes the fact that succussion sounds are colonic and not gastric, can only be determined by giving large doses of bismuth by the mouth and then outlining the stomach by the dark shadow cast by the bismuth under the x -rays.

Herbert French.

SUPPRESSION OF URINE.—(See ANURIA.)

SWEATING, ABNORMALITIES OF.—The functional disorders of the sweat-glands, *sudamen (miliaria)* and *hidrocystoma*, are dealt with from the diagnostic point of view in the article on VESICLES. The other abnormalities require but the briefest notice in a work on diagnosis, for it is hardly possible to confuse them with each other or with any other conditions. In *hyperidrosis* the secretion of sweat is excessive, either over the whole skin or in some particular region, e.g., the palms and soles, and especially covered parts furnished with large sweat-glands, such as the axillæ and genital regions. Occasionally hyperidrosis is limited to the area of distribution of a particular nerve—the fifth, for example. In some cases a peculiar pink tint of the inner side of the palm and the ball of the little finger and thumb has been noticed. In rare instances hyperidrosis in delicate children is associated with *granulosis rubra nasi*, a condition in which the skin of the nose becomes intensely red, and is dotted over with minute deep-red specks and papules, the papules gradually developing into pustules which soon dry up. The cells around the sweat-ducts are infiltrated, and both ducts and coils, and also the blood-vessels and the lymphatic spaces of the corium, are dilated. This complication is distinguishable from rosacea by the age of the patient and the absence of telangiectases and of change in the sebaceous glands; from eczema, by the absence of vesiculation and weeping, and its obduracy to local treatment; from lupus erythematosus, by the absence of scales; and from lupus vulgaris, by the absence of apple-jelly nodules. The night sweats of *phthisis*, and those associated with *rickets* and with *infantile scurvy* (Barlow's disease), are not, as a rule, difficult to attribute to their cause.

In *anidrosis* the secretion may be merely diminished or totally suppressed, and either the whole skin, or only some particular area, may be affected. The abnormality is rarely idiopathic, but is usually associated with ichthyosis, psoriasis, eczema, sclerodermia, with disordered innervation, belladonna poisoning, or with malnutrition. Apart from the dryness there is no symptom except a sense of fullness and tension on exposure to heat.

Bromidrosis, or foul-smelling sweat, sometimes associated with hyperidrosis, may occur in connection with such general affections as acute rheumatism, uræmia, and scurvy, or following a serious illness like pneumonia, or may be idiopathic. Occasionally generalized, it is much more frequently limited to particular parts, such as the feet, the axillæ, and the perineum. The foul smell is due to the growth of the *Bacillus fetidus* upon the sweat after exudation.

In *chromidrosis* both sweat and sebum may be coloured, generally some shade of blue, but occasionally red, green, yellow, violet, and even black. The pigmentation is usually localized, the most frequent situations being the eyelids, cheeks, forehead, and side of the nose; but occasionally the whole of the face and large parts of the trunk and limbs, and especially the axillæ and groins, are affected. The condition is probably a neurosis, but it may be due to the ingestion of copper (green sweat), or of iron (blue sweat), or to the action of cocci or the *Bacillus pyocyaneus* upon the sweat after secretion. The chief point in diagnosis is the exclusion of imposture.

Hæmatidrosis, or bloody sweat, generally limited to particular parts, the face, hands, feet, navel, etc., may be a form of so-called vicarious menstruation, or an expression of emotional stress in highly-strung persons. *Uridrosis*, in which urinary constituents are present in the sweat in abnormal quantity, is not an idiopathic affection, but an accompaniment of such grave conditions as cholera and uræmia. It is quite unmistakable; the sweat has a urinous odour, and white crystals will be seen on the skin.

Malcolm Morris.

SWELLING, ABDOMINAL.—This may be acute or chronic, general or local, and caused by abdominal accumulations that are mainly either gaseous, fluid, or solid. The *position*, *physical consistency*, and *duration* of abdominal swellings are their three outstanding clinical features, and it is on these that their classification for purposes of diagnosis should be based.

CLASSIFICATION.

I.—Swellings in the Abdominal Wall itself:—

Solid deposits

Surgical emphysema

II.—General Internal Abdominal Swellings:—

A. *Mainly gaseous*—Meteorism (*q.v.*)

B. *Mainly fluid*—

Ascites (*q.v.*)

Large cystic tumours

Abnormal distention of hollow viscera

C. *Mainly solid*—

Obesity (*q.v.*)

Constipation (*q.v.*)

Inflammatory deposits

New growths

Hydatid disease

III.—Local Internal Abdominal Swellings:—

A. *Due to general causes*—

Encysted ascites

Tuberculous peritonitis

Hydatid disease

Subphrenic abscess

Phantom tumours

Enteroptosis

B. *The Regional Diagnosis of Local Abdominal Swellings.*

I.—SWELLINGS IN THE ABDOMINAL WALL ITSELF.

Swellings that are situated in the abdominal wall itself can be recognized by their superficial position; by the fact that they adhere to the skin, muscles, or fascia of the abdominal wall; or by the discovery that they do not follow the movements of the viscera immediately underlying the wall of the abdomen, and therefore must be superficial to them. But it may be impossible to distinguish between a fatty tumour in the deeper part of the wall, for example, and a fatty omental mass that has become adherent to the parietal peritoneum, and so has practically incorporated itself with the abdominal wall.

Inflammatory swelling of the wall may occur by infection from without or, less often, from within. Thus a liver abscess may cause extensive redness and swelling in the right hypochondriac region; infiltration of the abdominal wall is often met with in operations for appendicular abscess. In acute cases of *Hodgkin's disease* and *lymphosarcoma*, tumours suggesting a subacute inflammatory process may occur in the abdominal wall; but they are really localized lymphadenomatous or sarcomatous deposits, not due to infection, and are associated with glandular enlargements in other parts of the body and with anæmia. *Inflammatory swelling about the umbilicus* is not rare in newly-born infants, and is due to the entrance of infection by way of the cord; in stout

uncleanly adults the umbilical fossa may be the seat of intertrigo, which becomes painful, swells, and suppurates, in consequence of infection from without. But a far more serious umbilical inflammation may occur in patients, usually children, with *tuberculous peritonitis*; a tuberculous mass in connection with the round ligament may break down, perforate at the umbilicus, set up a chronic discharge there, and ultimately a fæcal umbilical fistula may be established. In rare cases a *subdiaphragmatic* or *perigastric abscess* may cause inflammatory thickening of the round ligament and umbilicus.

Œdema of the abdominal wall may be either local or general (see *ŒDEMA*).

Tumours of the abdominal wall, excluding those due to inflammation, are rare except in certain situations. *Lipomata* and *fibro-lipomata* may occur in any part of it, and in the inguinal or femoral rings closely imitate omental hernias. *Herniæ* are commoner, particularly at the umbilicus and in the groins, and there is little likelihood that a definite hernial protrusion in any part of the abdominal wall will be overlooked; but minute hernias into the abdominal wall, such as may occur along the linea alba, especially above the umbilicus, at the femoral or inguinal rings, or along the lineæ semilunares, may suffice to produce complete intestinal obstruction and yet be small enough to demand very careful palpation for their discovery.

In *malignant disease* of the stomach, pylorus, or region of the portal fissure generally, small secondary nodules may appear quite early at the umbilicus or in the round ligament just above it; and this may occur before the primary tumour has given rise to any definite signs or symptoms.

In certain cases of extensive *surgical emphysema* the fascial planes of the abdominal wall are invaded and dissected out by gas, which imparts to them a highly characteristic feathery, crepitant, and crackling feeling on palpation. The gas may have entered from wounds in the neck, thorax, or trachea, or it may have been generated by gas-producing microbes in any abscess or focus of inflammation in the trunk or viscera, and have made its way thence into the abdominal wall.

II.—GENERAL INTERNAL ABDOMINAL SWELLINGS.

A. Mainly Gaseous.—*Distention of the intestines with gas* is an event familiar to all; its diagnosis is discussed under *METEORISM* (*q.v.*). In this condition the whole of the abdomen, or in special cases some part of it only, is distended, and on percussion gives a highly resonant or tympanitic note. It often happens that the outlines of the gas-distended viscera can be seen on the abdominal wall, particularly when it is looked at in an oblique illumination. The increased size of the inflated intestine is apt to produce displacement of the other viscera; the dome of the diaphragm is pushed up into the chest, carrying the heart with it and shifting the apex-beat upwards; the liver is similarly pushed up, and in addition it is often caused to rotate round a transverse axis, its lower anterior edge ascending and its lower posterior edge descending, with the result that the area of liver-dullness in front is much reduced, or even lost altogether. But it is only a little reduced in the mid-axillary line, so long as the gas remains in the intestine; and if the liver-dullness in the mid-axillary line disappears, the diagnosis of free gas in the peritoneal cavity is to be made.

B. Mainly Fluid.—The diagnosis of the various causes producing accumulations of fluid in the peritoneal cavity is given under the heading *ASCITES* (*q.v.*). Whatever its cause, ascites is usually not difficult to diagnose when the amount of fluid present is as much as three pints or more; smaller quantities produce no very definite physical signs. Ascitic fluid, when free, always tends to gravitate into the most dependent parts of the abdominal cavity, causing localized bulging, dullness on percussion, and transmitting a characteristic

fluid thrill when percussed and palpated at the same time. When present in moderate amount, it occupies the flanks while the patient lies on his back; the intestines are floated upwards, and produce a tympanitic or resonant area about and above the umbilicus. When present in large amount—three or four gallons—it may make the whole of the abdomen dull on percussion, probably because the mesentery is not long enough to allow the gas-containing intestine to reach the anterior abdominal wall and make it resonant.

It may be impossible to diagnose ascites in an adult when less than about three pints are present; the fluid appears to spread itself about the abdomen and pelvis, and to occupy the interstices between the viscera, without producing any unmistakable signs of its presence. Such small amounts of fluid may be detected if the patient is placed in the knee-elbow position, when the most dependent part of the abdomen will become dull on percussion; they may also be diagnosed in women by vaginal examination, when the weight and resistance of the fluid can be felt in Douglas's pouch. It is said that they can be diagnosed in males by pressing a finger upwards and outwards in the inguinal canal, and percussing the abdominal wall above it, the patient standing upright, when a fluid thrill will be communicated to the finger. If a moderate amount is present—one or two gallons—and the abdominal wall is markedly oedematous, the diagnosis of ascites may again be impossible, while it may be difficult also if the abdominal wall is very fat. If peritoneal adhesions are present, the ascitic fluid may become encysted or loculated, and be difficult of diagnosis because it simulates other cystic or semi-solid growths occurring in the abdomen.

There are but few abdominal swellings that simulate ascites. Unusually large and mobile cysts of the ovary, mesentery, omentum, peritoneum, or liver do so most often, and in a few cases large soft retroperitoneal lipomata (which may occur even in emaciated patients) have been taken for ascites. The distinguishing characteristic of ascitic fluid is the readiness with which it changes its position in accordance with changes in the patient's posture and in obedience to gravity. Ovarian and other cystic growths in the abdomen hardly ever exhibit such complete mobility, and tend rather to swing over mainly to the one or the other side of the abdomen about some more or less fixed point—the pedicle of the cyst—as the patient turns from one side to the other on the couch. An *ovarian cyst* should arise out of the pelvis, and it is usually possible to demonstrate its connection with the uterine adnexa. But every gynaecologist must have met with cases of simple ascites operated upon for ovarian or parovarian cyst, and with cases of cyst treated by paracentesis, in the belief that the condition was one of ascites. In instances that are fortunately rare, the mistake has been made of regarding some viscus abnormally distended with fluid as ascitic fluid, and of treating it, as such, by paracentesis. This has most often happened to the *bladder* (Fig. 191, p. 730), which should always be emptied (either naturally or by the catheter) before the abdomen is tapped; to a greatly *dilated stomach* full of fluid (Fig. 190, p. 728); to the *intestines* when distended with fluid fæces in enteritis or chronic obstruction; to the *gall-bladder* in cholelithiasis; to the *uterus* in pregnancy alone, or in pregnancy combined with hydramnios.

The effusion of blood into the peritoneal cavity, or *hæmoperitoneum*, occurring after a fall or after the abdomen has been crushed or has received a blow, may cause a slight movable dullness in the flanks exactly like that of ascites; but the patient will be blanched and anæmic from loss of blood, with rapid small pulse and sighing respiration, and there will be a history of the recent accident. The blood comes from some ruptured viscus, often the liver or spleen, and the diagnosis is not usually difficult. The accumulation of pus in the peritoneal cavity, or *pyoperitoneum*, is a part of acute peritonitis of local origin, and may also occur in pneumococcic or tuberculous peritonitis; it is associated with

many other signs and symptoms—pain, fever, vomiting, constipation, wasting, and others—that are foreign to ascites. In rare instances the abdomen may become distended with bile, *choleperitonæum* resulting; usually the bile is infected and sets up acute peritonitis, but if it is sterile the symptoms are slight, jaundice is absent, and the signs point only to ascites.

C. Mainly Solid.—In OBESITY (*q.v.*) the abdomen may swell either in consequence of the deposit of fat in the abdominal wall itself, or as the result of fatty deposits behind the peritoneum generally, in the mesentery, in the omentum and appendices epiploicæ. In very fat patients it is rarely possible to diagnose the exact nature of an intra-abdominal mass by the usual methods of palpation and percussion, and without having recourse to exploratory laparotomy, because the abdominal walls are so thick. The frequency with which inconveniently large fatty accumulations occur in the abdomens of such persons must not be forgotten when the diagnosis of some vaguely-felt tumour within the abdomen has to be considered.

In the severer and more chronic cases of CONSTIPATION (*q.v.*), abdominal distention may result from the accumulation of fæces in the large intestine, particularly when dilatation of the colon, whether idiopathic or secondary, is present. The scybala can usually be felt quite distinctly, perhaps soft and plastic in the region of the ascending colon, usually hard and nodular in the descending sigmoid and colon. *Idiopathic dilatation of the colon* seems to be congenital, and is associated with much hypertrophy of the colon (*Fig. 122, p. 432*); it is known as *Hirschsprung's disease*. The child, obstinately constipated at all times, has periodical dyspeptic attacks, in which the distended abdomen becomes even larger; the bowels may not be open for many days or even several weeks together, while many pounds of scybala accumulate in the colon and sigmoid, which come to occupy the whole of the front of the abdomen. Forcible colonic peristalsis is usually visible on the surface of the abdomen. Malnutrition and chronic impairment of health result, and the patients usually die young, with emaciation or symptoms of intestinal obstruction. Yet no obstruction is found to exist post mortem; possibly there is a congenital abnormal kinking causing intermittent obstruction at the point where the sigmoid joins the rectum. The diagnosis is easy if the dilatation and hypertrophy of the colon are once seen. In older patients a very similar *dilatation and hypertrophy of the colon* may come on as the result of chronic obstruction about the lower end of the large intestine. (See VOMITING.) As much as 47 lb. weight of fæces may accumulate in the intestines of such patients as these.

In rare cases of chronic peritonitis, particularly when it is tuberculous, semi-solid *inflammatory masses* may bring about a general swelling of the abdomen; the diagnosis is discussed below. General swelling of the abdomen may occur in *malignant disease* of the peritoneum, the so-called malignant peritonitis, due in part to the growth of numerous secondary malignant nodules, in part to a concomitant ascites. The symptoms are often vague at first—loss of weight, strength, appetite, with indefinite abdominal disorders. The abdomen enlarges, and if there is not much ascites the secondary deposits can be felt obscurely through the abdominal wall. Occasionally they can be palpated in the abdominal wall itself near the umbilicus, or in the round ligament above it, or the urachus below. As the case progresses, emaciation becomes marked, the skin loses its elasticity and often develops a diffuse brownish pigmentation; bedsores are not rare. The primary growth may be in any of the thoracic, abdominal, or pelvic organs, or in the mamma or testis. If any primary growth can be made out, the diagnosis will not be difficult, especially if glandular enlargements are found in the groins or axillæ, if the ascitic fluid is hæmorrhagic, and if it is found to contain multinuclear endothelial cells, and cells with atypical mitotic

figures. Tuberculous peritonitis can be excluded by means of the tuberculin test and by the result of injecting several c.c. of the ascitic fluid into guinea-pigs.

Hydatid disease of the peritoneum runs a slower course than malignant peritonitis, and echinococcal cysts may be found in the ascitic fluid if it is tapped. General abdominal swelling may occur when multiple cysts representing the bladder stage of *Tænia echinococcus* develop all over its surface. As a rule, these are secondary after the rupture (accidental or by paracentesis) of a primary cyst in the liver, and are very numerous. They cause a slowly progressive enlargement of the abdomen, which appears to be filled with a solid or semi-solid mass; if the individual cysts are large, they can be seen outlined on the abdominal surface, and can be felt. They are freely movable, and do not appear to be connected with any of the viscera in particular; they do not, as a rule, give the hydatid thrill on percussion. Peritoneal hydatid disease is extremely rare, excepting in countries (Iceland, Australia) where the inhabitants live very closely in company with dogs that are the hosts of *Tænia echinococcus*. Eosinophilia may be found, and when the cysts are living and active the patient's blood-serum may give a specific hydatid precipitin reaction, though the absence of both this and eosinophilia does not exclude hydatid disease.

III.—LOCAL INTERNAL ABDOMINAL SWELLINGS.

A. Due to General Causes.—It often happens that the causes which produce general swelling of the abdomen fail to do so in particular cases, and give rise only to a local swelling. Thus in *encysted ascites*, left behind after an acute diffuse peritonitis, or accompanying a chronic peritonitis, an accumulation of fluid bounded by fibrinous or fibrous adhesions between the adjacent viscera may be found in any part of the peritoneal cavity, but most often in the flanks and about the pelvis. If a good history of the case can be obtained, the diagnosis of the nature of such a cyst will at least be suggested; the physical signs will be those of a fixed cystic or semi-solid tumour, and the diagnosis will often be obscure until laparotomy has been performed.

Abdominal swellings of the most various size and position may occur in *tuberculous peritonitis*. Many of them are composed of the infiltrated and rolled-up omentum, others of enlarged and tuberculous mesenteric glands, others of doughy masses of adherent intestine and fibrin. The amount of ascitic fluid varies widely in different cases. When there is much, and the patient is an adult, the diagnosis of cirrhosis of the liver is likely to be made; when the peritonitis is dry (the so-called obliterative form), the abdominal cavity may be smaller than normal, and occupied by a doughy, rather tender mass that presents areas of resonance alternating with areas that are dull on percussion. The physical signs here will naturally vary from day to day according to the amount and position of flatus in the intestine. The symptoms of tuberculous peritonitis are very variable; as a rule the patient is thin, anæmic, seriously ill, with a drawn aspect; abdominal pain and tenderness are usually observed, nausea and constipation with chronic intestinal obstruction are frequent. If there is ulceration of the large intestine, diarrhœa occurs, and blood may be passed in the motions. The discovery of signs of tuberculosis in some other part of the body, or of a family history of tuberculosis if the patient is a child, are strong arguments for regarding a case with signs like those described above as tuberculous.

In patients who have swallowed the ova of *Tænia echinococcus*, single or multiple *hydatid cysts* may occur in any part of the abdominal cavity. Usually they are single, and the large majority of them occur in the liver, because the six-hooked embryo into which the swallowed ovum develops, travels by way of the vascular system and starts from the alimentary canal. Having reached the

liver, or in rarer cases the spleen, omentum, mesentery, or peritoneum, the embryo or prosclex develops a laminated chitinous envelope and forms what is called a hydatid or echinococcal cyst. The cyst grows slowly, and is spherical except in so far as it is moulded by the pressure of adjacent structures. It contains a clear saline fluid, in which may be found hooklets (*Fig. 6*, p. 57), like those on the head of the adult worm or scolex that infests the intestine of the dog, brood-capsules bearing external and internal scolices, and secondary cysts or bladders that are completely detached from the walls of the primary or parent cyst. Until it has become large enough to cause mechanical obstruction and pressure-symptoms, the single hydatid cyst gives rise to little pain or complaint. It then produces a bulging of the overlying abdominal wall; on palpation it can be felt as a smooth rounded and more or less tense tumour, sometimes elastic. On percussion, the cyst is dull, and if it is of a certain degree of tenseness it may yield the hydatid thrill—just as any other cyst may. Hydatid cysts in the mesentery, omentum, or peritoneum are often multiple, and may be felt as scattered, rounded tumours; otherwise their physical signs, and the scanty symptoms to which they give rise, are like those of the single hydatid bladder. The diagnosis of hydatid disease is often easy, particularly when it occurs in persons who have lived in Iceland, Australia, or South America, and who present the marked physical signs and the comparative absence of symptoms indicated above. In other cases, exploratory laparotomy may be necessary before the diagnosis can be established; exploratory puncture of any cystic tumour in the abdomen cannot be advised. Eosinophilia is sometimes observed in hydatid disease, but not always; hence its absence does not exclude that condition. A specific serum reaction is reported by some observers.

In consequence of bacterial infection spreading towards the peritoneum from within or from without, any part of the abdomen may swell from the formation of an *abscess*. Several forms of abdominal abscess are more or less localized, and these are considered below (see *B*); others present more generalized abdominal signs and symptoms, and will for that reason be considered here. A *subphrenic abscess* is any abscess in contact with the under surface of the diaphragm except those situated in the liver or in the spleen. It is intra-peritoneal in more than half the instances; it contains gas in about half the cases. The *simple* or *non-gaseous abscesses* are generally the result of appendicitis or of suppuration in the liver, and so are usually on the right side of the body; less often they are secondary to gastric or duodenal ulcer, or to suppuration spreading from the pancreas, kidney, Fallopian tubes, spleen, or thorax. They are deep-seated, and tend to produce abdominal swelling, with signs and symptoms that are indefinite. The onset is insidious, often consisting in nothing more than failure to recover from the primary disorder—appendicitis, hepatic abscess—after it has been surgically treated; the patient remains seriously ill, with fever and quick pulse, leucocytosis, and often a septic aspect. If the abscess is at the back, the signs may point to pleurisy or pleural effusion, with the appropriate pain and friction sounds. If it pushes forwards, the hypochondrium and epigastrium may bulge in front and become tender. The diagnosis of subphrenic abscess may be very difficult when there is no obvious antecedent to suggest its occurrence, especially if the abscess is behind and below the liver, and is complicated by pleurisy or empyema. If it is above the liver, it may be very difficult to say whether the pus is inside the liver or outside it, or, indeed, both; enlargement of the liver downwards is in favour of intrahepatic abscess. Examination with the x -rays is often of great assistance; but often it is necessary to give the patient a general anæsthetic and insert a 4-in. exploring needle successively into the intercostal spaces (tenth to sixth) in the scapular and mid-axillary lines (Barnard). It must be thrust

in deeply. As viewed by the *x*-rays the diaphragm is depressed by empyema or pleural effusion, elevated by subphrenic abscess, and immobilized by either.

The etiology, signs, and symptoms of a subdiaphragmatic abscess that contains gas, or *subphrenic pyopneumothorax*, are different from those of simple subphrenic abscesses. The gas-containing abscess is commoner in females than in males, and is usually due to the perforation of a gastric ulcer, less often to perforation of a duodenal ulcer or to appendicitis; in rare instances it is secondary to a suppurating hydatid cyst or to an ulcer of the colon. It is usually on the left side. The onset is generally sudden, with the acute abdominal pain and collapse often seen when a gastric ulcer perforates; but both the ulcer and its perforation may be latent, and nothing more than a history of chronic dyspepsia may be obtainable. The abdomen soon becomes distended; hectic fever, with rigors, rapid pulse, marked leucocytosis, and shortness of breath, are the symptoms likely to appear. The physical signs, on the whole, resemble those of PNEUMOTHORAX (*q.v.*); the diaphragm is pushed up into the thorax, and the gas in the abscess-cavity below it causes the signs of pneumothorax to develop in the upper part of the abdominal cavity and the lower part of the thorax. The picture is complicated by the fact that the inflammatory process habitually spreads through the diaphragm, so that the signs due to pleurisy, with or without effusion, are added. The diagnosis has to be made between this condition and true pneumothorax. The points that serve to distinguish the two are, that in pneumothorax the gas seems to occupy the whole of one side of the thorax, the heart is pushed or pulled over to the sound side, and the physical signs are limited to the thorax; whereas in subphrenic pyopneumothorax the signs occur at the base of one or both lungs but not at the apex, the heart is displaced upwards but not to either side, and the upper part of the abdominal cavity is involved as well as the thorax. Examination with the *x*-rays is of the greatest service, for it shows that the gas-containing cavity is below the diaphragm and not above it; the readiness with which the level of the fluid in the abscess changes as the patient alters his position can also be noted, and proves that the abscess-cavity contains gas as well as fluid.

The abdomen is not infrequently the seat of *phantom tumours*. These are felt as fixed and more or less rounded smooth swellings, either in or immediately underneath the abdominal wall; they are dull on percussion, and may be tender on palpation. They are caused by involuntary contractions of the muscles in the area in which they occur; they persist when the patient's attention is distracted, and also during sleep, but disappear under the influence of a general anæsthetic. Phantom tumours are commoner in women than in men, and in the neurotic or hysterical than in the normal, more stolid adult. They often persist for long periods, but may vanish when the patient believes that they have been cured. A phantom tumour in the region of the liver may be taken as evidence of cholecystitis, hepatic abscess, or gumma; in the left hypochondrium for a gastric carcinoma adherent to the abdominal wall; in the appendix region for an appendicular abscess; above the pubes, a phantom tumour may resemble the gravid uterus, and lead to the diagnosis of pregnancy (*pseudocyesis*).

In *enteroptosis* (Glénard's disease), or downward displacement of abdominal viscera, any or all of the organs may slip away from their normal position and attachments (*Fig. 39*, p. 147, and *Fig. 41*, p. 149). The diagnosis must be made by the discovery that one or more of the viscera are out of place, and are also abnormally mobile.

B. The Regional Diagnosis of Local Abdominal Swellings. — For clinical purposes the abdomen may be subdivided into nine areas or regions, by two vertical lines drawn through the middle of Poupart's ligaments, and by two horizontal lines, one of which passes through the lowest points of the tenth

ribs (the subcostal line), the other being drawn at the level of the highest points of the iliac crests or through the tubercles on the outer edges of the iliac bones about two inches behind the anterior superior iliac spines. These areas are shown in *Fig. 189*; the structures and viscera, or portions of viscera, they commonly contain, are given in the table below:—

THE NORMAL CONTENTS OF THE ABDOMINAL REGIONS.

1. Right Hypochondriac	2. Epigastric	3. Left Hypochondriac
Liver Gall-bladder Hepatic flexure of colon Right kidney	Liver Stomach and pylorus Transverse colon Omentum Pancreas Duodenum Kidneys Suprarenal capsules Spleen Lymphathic glands	Liver Stomach Splenic flexure of colon Spleen Pancreas Left kidney
4. Right Lumbar	5. Umbilical	6. Left Lumbar
Riedel's lobe of the liver Ascending colon Small intestine Right kidney	Stomach Transverse colon Omentum Urachus Small intestine Duodenum Kidneys Lymphatic glands Aorta	Descending colon Small intestine Left kidney
7. Right Inguinal	8. Hypogastric	9. Left Inguinal
Cæcum Appendix Lymphatic glands	Small intestine Cæcum, sigmoid, and appendix Distended bladder Urachus Enlarged uterus and ad- nexa	Sigmoid flexure of colon Lymphatic glands

The abdominal swellings that may be felt in and about these nine regions will now be considered seriatim, excluding the tumours situated in the abdominal wall itself that have been described under heading I. above.

1. Right Hypochondriac Region.

(a). The superficial part of this area is mostly occupied by the liver and gall-bladder, and the majority of the tumours in it are connected with one or other of them. *Swellings in the liver*, such as gumma, new growth, abscess, hydatid or other cysts, can be felt as more or less rounded masses interrupting the normally smooth and impalpable surface of the liver; they move up and down with the liver on respiration, lie in front of or above the colon, and are very rarely fixed by adhesions to the abdominal wall. If multiple, they are in all probability secondary malignant deposits, when they often have an indented or umbilicated surface. It may be difficult to distinguish, by touch alone, between the hobnail liver of hepatic cirrhosis and the liver nodulated by malignant disease. It may be very difficult to distinguish between an abscess or cyst in

the liver itself, and an abscess or cyst situated just outside it—a pancreatic cyst pressing the liver forwards, for example, or a subphrenic abscess; if the tumour is in the liver, general enlargement of that organ is usually present (see LIVER, ENLARGEMENTS OF THE). To regard the firm and rounded swelling produced by the upper segment of the right rectus abdominis muscle as evidence of tumour, enlargement, or induration of the liver, is a mistake easily and frequently made.

(b). Disease of the *gall-bladder* may make that viscus palpable; cholecystitis, cholelithiasis, and new growth are the most likely to occur. The gall-bladder may be felt as a rounded tense mass when distended, and may be recognized by the fact that it is separated from the liver by a sulcus; gall-stones are occasionally to be felt within it. (See GALL-BLADDER ENLARGEMENT.)

(c). Tumours in connection with the *hepatic flexure of the colon*, excluding scybala, are rare. Scybala may be recognized by their general shape, the fact that they tend to move onwards towards the rectum, and most of all by the ease with which they can be moulded or indented, as they lie in the intestine, by the pressure of the fingers; such tumours are dispersed by a purgative. In rare instances malignant disease or tuberculosis of the colon may produce a palpable tumour here; and so may the process of intussusception (see 4 (b) below). The diagnosis must rest upon the previous history and the course of the disease.

(d). Tumours of the *kidney and suprarenal gland* rarely present themselves in this region of the abdomen (see 4 (d) below).

Fig. 189.—The regions of the abdomen. For the significance of the numerals, see the table on opposite page.

2. Epigastric Region.

(a). *Abnormal lobes in the liver*, tumours in either of its lobes or in its falciform or round ligaments, may be felt here (see 1 (a) above).

(b). The normal *stomach* occupies a large part of this region, and comes to the surface in its left-hand part. In thin people and children the curvatures of the organ when it is full may often be seen dimly outlined in the epigastrium under normal circumstances, the lower curvature habitually, the upper less often, and the gastric succussion-splash can often be elicited here in healthy persons as well as in those with dilatation of the stomach. If an epigastric splash is obtained, it is usually gastric in origin, but may be colonic. In *dilatation of the stomach* due to obstruction at the pylorus (caused in infants by spasm or hypertrophy of the pylorus, in adults by malignant or cicatricial stenosis), waves of peristalsis travelling from left to right may be seen in the epigastrium. Similar waves, but travelling from right to left, occur in the colon of patients with obstruction in the rectum or sigmoid (see below). *Tumours of the stomach*, usually carcinomatous, rarely sarcomatous, or due to inflammatory deposits round a gastric ulcer, may sometimes be felt here, particularly when the patient takes a deep breath and drives the abdominal viscera down from out the cover

of the diaphragmatic dome ; this manœuvre is particularly useful in the case of the pylorus—it must not be forgotten that the normal pylorus can sometimes be felt in an infant, child, or thin adult, as a rounded finger-like mass deep in the right side of the epigastrium. The connection of a gastric tumour with the stomach can often be made out more clearly if that organ is inflated with gas ; or by the method, little used in this country, of gastroduaphany.

(c). The *transverse colon* goes across the lower part of the epigastrium in some cases, more usually across the upper part of the umbilical area. Its sacculations and peristalsis are often outlined on the abdominal walls of pot-bellied rickety children or of thin adults, particularly when they are flatulent or constipated. In acute or chronic obstruction the peristalsis becomes much more marked, as it does in the rare idiopathic dilatation of the colon (Hirschsprung's disease, (see par. C, p. 718) of young children. Tumours of the transverse colon are very rare, except the common occurrence of scybala in it—see 1 (c) ; a few cases of chronic hyperplastic tuberculosis of this part of the colon have been recorded, with great diffuse thickening of its wall and stenosis of its lumen.

(d). Swellings in connection with the *omentum* lie below the colon and in immediate relation with the anterior abdominal wall, in front of the mass of small intestine. In tuberculous peritonitis it often forms an irregular rope or mass composed of inflammatory tissue, cheesy tubercle, or encysted exudate, that may lie in the epigastrium, or extend into any of the regions of the abdomen—when the diagnosis of malignant disease of the intestine or some other viscus may possibly be made. Similar nodular enlargement and deformity of the omentum are common in chronic peritonitis of any sort ; and it may become the seat of an abscess in cases of perforated gastric ulcer. Cysts of the omentum, single or multiple, are not very rare, and are often inflammatory in origin. Occurring in the epigastrium, tuberculous or inflammatory masses of omentum are readily diagnosed ; they often adhere freely to the anterior abdominal wall as well as to the neighbouring viscera.

(e). Swellings derived from the *pancreas* push forwards from the depths of the abdominal cavity towards the epigastric and the upper part of the umbilical areas, and, whilst small, present themselves as deeply-seated vaguely-felt masses on palpation. They have the stomach, or the stomach and colon, in front of them, and are fixed to the posterior abdominal wall ; they are usually made out best by examination under an anæsthetic ; they move little on respiration, and often transmit from the adjacent aorta a non-expansile pulsation. They are separated from the liver and from the spleen by areas of resonance. These swellings may be carcinomatous, in which case wasting, anæmia, and jaundice are likely to be observed, with death in a few months' time ; or due to chronic pancreatitis, when the course of the disease will be slower and there will be more epigastric tenderness and pain, with clayey stools and perhaps intermittent jaundice and glycosuria. In acute pancreatitis the swollen pancreas has only exceptionally been palpated before laparotomy ; the main symptoms are acute epigastric pain, vomiting, constipation, fever, and proneness to collapse, and are such as to tempt the surgeon to immediate laparotomy.

Pancreatic cysts, so-called, are often cysts not in the pancreas but in its neighbourhood, and therefore better called peripancreatic cysts. Pancreatic cysts proper are single or multiple retention-cysts, usually the result of chronic pancreatitis ; they form deeply-seated, smooth, rounded tumours, possibly giving a feeling of fluctuation. At first they occupy the lower epigastric or hypochondriac regions ; but if they enlarge much they may fill the whole upper part of the abdomen, or extend down to the pubic symphysis or flanks. The symptoms of chronic pancreatic disease should be present—chronic indigestion, the passage of pale and bulky stools, glycosuria, perhaps jaundice from time to

time if pancreatic calculus is present. *Peripancreatic* or *retroperitoneal* cysts, due to accumulations in the lesser sac of the peritoneum, or to growths originating in residues of the Wolffian body behind the peritoneum, may produce apparently identical cysts; the evidences of chronic pancreatic disease should be absent in these cases, but the diagnosis may be impossible until laparotomy has been performed. Cammidge's urinary reaction (see p. 115) is said to be of assistance in diagnosing these cases.

(f). Swellings in connection with the *duodenum* are felt in the right side of the epigastric and umbilical areas, and are usually due to primary malignant disease. In many cases they escape palpation because they are so deeply placed, and they usually have to be diagnosed from such conditions as cancer of the stomach, pylorus, pancreas, bile-ducts, and portal fissure generally, not by their physical signs but by the general symptoms and progress of the disease. A growth in the first part of the duodenum produces symptoms like those of cancer of the pylorus—wasting anæmia, progressive dilatation of the stomach with visible peristalsis, attacks of copious vomiting, and occasional hæmatemesis perhaps; the motions contain bile, but the vomit does not; jaundice is absent unless secondary growths appear in the portal fissure. Malignant disease of the second part of the duodenum, in or involving the biliary papilla, soon produces obstructive jaundice and distention of the gall-bladder, and often leads to suppurative cholangitis, when ulceration has destroyed the growth and removed the obstruction, whereas a cancer in the head of the pancreas or bile-ducts produces a steady jaundice and is not followed by suppuration in the bile-passages. Cancer in the third part of the duodenum or below the bile papilla produces duodenal stenosis, with dilatation of the duodenum and stomach and frequent vomiting; but in this case the vomit is habitually bilious and contains the pancreatic ferments. If there is no stenosis, the bilious vomiting will be less, and the case may be indistinguishable from one of cancer of the stomach. In most of these cases the exact diagnosis is more often made post mortem than ante mortem.

(g). Swellings in connection with the *kidneys* and *suprarenal* capsules occur in the epigastrium only after they have reached a considerable size. They rise up out of the loin and flanks, and their diagnosis is considered below (see 4 (d)).

(h). Enlargement of the *spleen* may bring its blunt anterior end or its notched upper edge into the epigastric area. The splenic swelling lies always in contact with the anterior wall of the abdomen, with the stomach above and behind it (see 3 (d), and SPLEEN, ENLARGEMENT OF THE).

(i). In every region of the abdomen there is a plentiful supply of *lymphatic glands*, and any of these may become enlarged and palpable in cases of Hodgkin's disease, chronic peritonitis, tuberculous peritonitis, or malignant disease. The enlarged glands are felt as nodulated chains or masses, usually hard and rounded, but softer and even cystic if their contents caseate or break down into pus; they may also calcify, when they become hard and stony. The enlarged glands that will be felt in the epigastric area are those connected with the stomach, liver, and mesentery; the diagnosis must be made on general and anatomical lines (see LYMPHATIC GLAND ENLARGEMENT).

3. Left Hypochondriac Region.

(a). An abnormally lobulated *liver* may make a superficial tumour in this area continuous with the main mass of the liver in the epigastric region. In the same way, a tumour in the left lobe of the liver may project superficially into the left hypochondrium.

(b). Part of the *stomach* lies in this region normally ; the diagnosis of gastric swellings has been considered above (see 2 (b)). A gastric tumour may often be differentiated from a tumour of the adjoining spleen by the fact that while the spleen is anchored at its hilum, and so is capable of but little movement, the stomach is highly mobile, changing its position with the position of the patient, and also in accordance with its fullness and distention.

(c). The diagnosis of a tumour of the splenic flexure of the *colon*—scybalous, tuberculous, or malignant—is considered above (see 1 (c) and 2 (c)).

(d). The normal *spleen* is not palpable per abdomen. The first degrees of its enlargement are best detected when the patient is lying down and has his abdominal wall relaxed. The observer stands on his left side and palpates the left hypochondrium by hooking his fingers over the costal margin about the eighth or ninth costal cartilages ; the fingers are tucked in under the ribs as the patient inspires deeply, their pressure being relaxed as he expires. The lower pole of the moderately enlarged spleen can then be felt as a rounded mass just touching the finger-tips at the end of inspiration. As it progressively enlarges, the spleen passes on towards or a little below the umbilicus, and then towards the right anterior superior spine of the ilium. The diagnosis of the various causes of its enlargement are discussed under SPLEEN, ENLARGEMENT OF THE. It is usually to be recognized by the fact that it comes down from under the left costal margin in direct contact with the anterior abdominal wall, descends on inspiration, has a smooth surface, and a notched upper and inner margin. In exceptional cases, however, the enlarged spleen seems to adopt a more compact and cubical form in place of its usual elongated prismatic shape, and also to lie back in the loin and left lumbar region instead of occupying the anterior and upper part of the abdominal cavity. When this is the case, it will simulate a tumour of the left kidney or suprarenal body, and unless the blood and leucocyte count give a definite lead, the diagnosis may be settled only by a laparotomy. Conversely, a spleen-shaped hypernephroma or suprarenal tumour, or a calculous and cystic kidney, may easily be mistaken in an anæmic patient for an enlarged spleen, unless the possibility of the error be kept in mind (see 6 (a) below).

(e). Tumours of the *pancreas* and *retroperitoneal cysts* may project into the left hypochondrium (see 2 (e) above).

(f). Tumours of the left *kidney* and suprarenal body rarely appear in the left hypochondrium unless they are very large (see 6 (c) below). They have the stomach or the stomach and colon in front of them, and so are variably resonant on percussion—according to the amount of gas in those viscera,—and are also less distinctly palpable than tumours arising from the spleen, stomach, colon, or omentum, that may be felt in the same situation.

4. Right Lumbar Region.

(a). When the *liver* is abnormally lobulated, either congenitally or as the result of tight lacing, a thin flange of liver-tissue, known as *Riedel's lobe*, may be met with as a superficial tumour, continuous with the liver above it, in this region. Sometimes it is freely movable, and then may be mistaken for a movable kidney or for a dilated gall-bladder.

(b). The *ascending colon* can usually be palpated and rolled under the fingers as a tube-like structure at the confines of this and the umbilical region ; when empty and contracted it may feel almost rod-like. Its contents are usually fluid, but it may contain semi-solid or solid faecal masses that can be moulded by pressure, in constipated patients. In patients with obstruction lower down, it may be distended—up to 18 in. in circumference—and show sacculations and

visible peristalsis. It may become much thickened with inflammatory tissue, or even come to lie in an abscess of its own production, in pericolitis, perityphlitis, typhlitis, appendicitis, and hyperplastic tuberculosis of the colon, forming a thickened and tender mass immediately under the abdominal wall; the patient will be more or less acutely ill, with local pain and tenderness, constipation, often vomiting. In the more chronic of these cases, the diagnosis of malignant disease of the colon will often be suggested.

General thickening of the ascending colon, with tenderness and characteristic mucous or blood-streaked stools, is common in muco-membranous colitis, in dysentery, and in ulcerative colitis. The first of these is met with in nervous constipated women; dysentery, amœbic or bacterial, is caught abroad, and is commoner in men than women; while ulcerative colitis, whether it be dysenteric or no, is a severe and progressive painful diarrhœa, often associated with vomiting and irregular fever, that commonly leads to emaciation and death from exhaustion or intestinal hæmorrhage in a few weeks or months.

The ascending colon can be felt as a sausage-shaped tumour in acute, subacute, and chronic ileocæcal and ileocolic *intussusception*: at first in the right flank, then extending across the abdomen above the umbilicus, and finally down the left flank and into the pelvis. The chief symptoms are spasmodic abdominal pain, vomiting, the passage of blood and mucus by the rectum, and tenesmus; the palpability and consistency of the elongated tumour vary according to the degree of muscular spasm in it.

(c). The *small intestine* is but rarely the cause of abdominal swelling in this region, excepting when it becomes the seat of enteric *intussusception* (see (b) above).

(d). Tumours in connection with the *right kidney* and *suprarenal body* usually make their first appearance deep down in this region, having the ascending colon and small intestine in front of them. They can be lifted forwards *en masse* from behind by a hand placed at the back of the loin. For their diagnosis see KIDNEY, ENLARGEMENT OF.

The lower pole of the right kidney can be felt in normal persons on deep abdominal palpation; but when the kidney is abnormally mobile, the whole of it may be felt, and in rare cases it may be found in any of the adjoining abdominal areas. The shape and consistency of the movable kidney are characteristic, and the patient complains of a peculiar sickening sensation when it is grasped bimanually and squeezed; in the lesser degrees of mobility it disappears readily into its normal position under cover of the diaphragm, and ceases to be palpable until the patient drives it down again by a deep inspiration. As regards its diagnosis, the movable right kidney will hardly be mistaken for anything else in this region; on the other hand, Riedel's lobe of the liver, the enlarged gall-bladder, fæcal accumulations or a cancer of the ascending colon, and omental masses, have all been mistaken for it, although they are all superficial to the kidney, and lie in contact with the anterior abdominal wall. Other wandering tumours, e.g., of the ovary, Fallopian tube, mesentery, hydatid disease, may give rise to the same error if reniform.

5. The Umbilical Region.

(a). In recent years examination with the x -rays after a bismuth-meal has shown that the *stomach* is a far more mobile organ under normal circumstances than was previously supposed, and that in health its lower margin often descends even below the level of the umbilicus. But if much of the stomach habitually occupies the umbilical region, it is probable that it is

dilated to a pathological degree, either from atony or from pyloric obstruction (*Fig. 190*).

(b). Tumours in connection with the *transverse colon* have been considered under the headings 1 (c) and 4 (b) above.

(c). Tumours in connection with the *omentum* are common in this region: those arising from the *small intestine* are rare. Both are superficial, and their diagnosis has been given above (see 2 (d)).

(d). Abdominal swellings in connection with the *urachus*, which runs from the umbilicus to the bladder, are considered below (see 8 (c)).

(e). Swellings arising from the *duodenum*, *kidneys*, *suprarenals*, *pancreas*, and *mesentery*, may all present themselves in the deeper parts of the umbilical region, usually as more or less fixed masses arising from or connected with some definite part of the posterior wall of the abdomen. Their diagnosis will depend mainly upon the success with which the origin and connections of the tumour can be made out; if the patient is fat, or if relaxation of the abdomen cannot be obtained, palpation while a general anæsthetic is given may be desirable. Consideration must also be given to any general symptoms the patient may present—such as may point to renal calculus, hydronephrosis, pancreatitis, for example.

(f). The *aorta* bifurcates half an inch below and just to the left of the umbilicus. In thin, nervous, and excited patients, particularly young women, great pulsation of the aorta can often be felt in the umbilical and lower epigastric areas, and may lead to the wrong diagnosis of abdominal

Fig. 190.—Idiopathic dilatation of the stomach. The organ post mortem almost filled the abdominal cavity. —*Introduction to Surgery* (Rutherford Morison).

aneurysm. Careful examination will almost always show that this pulsation is no more than a throbbing, an up-and-down movement as the patient lies, and that a lateral expansile pulsation is lacking. Aneurysm of the abdominal aorta is very rare; it is seen in patients who have had syphilis, and is commoner in men than in women. The aneurysmal sac is distinctly larger than the normal aorta, and presents the diagnostic expansile lateral pulsation, when grasped between the fingers, that is met with in no other condition. These abdominal aneurysms often leak into the retroperitoneal tissues; and large irregular clots of blood, weighing several pounds and of the most varied extent and distribution, may form gradually in the flanks, pelvis, and back of the abdomen generally, causing the patient great pain and rendering him anæmic and breathless. The abdominal aneurysm also causes pain and stiffness in the back by eroding the bodies of the vertebræ upon which it presses.

6. *Left Lumbar Region.*

(a). The enlarged *spleen* (see 3 (d) above) may intrude into this area ; it forms a firm mass, dull on percussion, and is in contact with the abdominal wall, driving the splenic flexure of the colon inwards or downwards before it. The spleen, when enlarged, comes down into the abdomen in front of all the other structures in the left side, and its abdominal dullness is continuous with its thoracic dullness, which extends back and up into the axilla along the line of the ninth or tenth ribs. Tumours of the stomach, omentum, suprarenal, kidney, or descending colon, may all be in contact with the anterior abdominal wall, and though usually nodular and irregular, may present a smooth and spleen-like surface on palpation. They may be distinguished from the enlarged spleen by the fact that they produce no such typical area of thoracic dullness in continuity with the dullness of abdominal tumour ; while the renal and suprarenal tumours may in addition be shown to occupy the back of the loin, so that they can be tilted forwards by the fingers placed behind just outside the edge of the erector spinæ muscles, and so pushed against the other hand, which is placed on the anterior surface of the loin. A suprarenal tumour may be associated with sexual precocity (see *Figs. 125, 126*, pp. 453, 454).

(b). The diagnosis of tumours of the *small intestine, kidney, and suprarenal gland* in this region has been given sufficiently already (see 4 (d) and 6 (a)).

7. *Right Inguinal Region and Right Iliac Fossa.*

Abdominal swellings in the right inguinal region are rarely confined to it, and usually extend into the outer part of the hypogastric region, occupying what may be described somewhat indefinitely as the right iliac fossa.

(a). New growths, inflammatory thickenings, and abscesses in connection with the *cæcum* and *appendix* may all extend into this region of the abdomen, giving rise to more or less acute and severe abdominal symptoms—pain, fever, vomiting, constipation, with a tumour in the right iliac fossa. The physical signs are very variable, depending on the extent and acuteness of the process, the degree to which the abdominal wall can be relaxed, the exact position of the tumour—an abscess to the inner side of and behind the *cæcum* and *appendix* may lie too deeply to be felt per abdomen. The rare condition of sarcoma or lymphosarcoma of the *cæcum* may be associated with fever ; the tumour is soft, and the diagnosis of some chronic inflammatory condition will probably be made. A *cæcal carcinoma* is usually a harder mass and of slower growth ; it tends to constrict the bowel, with the result that *fæcal* accumulation occurs behind it, and so the new growth may be overlooked when the hard mass of impacted *fæces* is discovered. The diagnosis of appendicular abscess has been made in patients with movable right kidney during a Dietl's crisis ; fever is usually absent in the latter ; careful examination will generally show that the tumour in the right iliac fossa is an enlarged and movable kidney, and a history pointing to intermittent hydronephrosis, with polyuria after the acute attacks, should be obtainable. Inflammation of the right ovary or tube, or ovarian neuralgia occurring with the catamenia, may all give rise to symptoms in nervous patients that closely simulate those of appendicitis ; and if *scybalæ* are present in the *cæcum*, and are vaguely felt as a tumour through the rigid abdominal wall, the mistaken diagnosis of appendicitis may easily be made ; but as a rule pelvic symptoms and signs will be found, and pain be felt in the pelvic region and the lower part of the back ; the diagnosis will be cleared up by a vaginal or rectal examination—which, indeed, should never be omitted when there is any doubt as to the exact causation of an inflammatory swelling in the iliac fossa—and by the previous history of the case.

(b). Inflammatory swellings and abscesses in the right iliac fossa may arise in connection with *psoas abscess*, *abscess* originating in the *sacro-iliac joint*, *hip-joint*, or *ilium*, and from the swelling or breaking down of *lymphatic glands* (the external iliac) infected from some perhaps trivial wound in the leg or perineum. The symptoms of bony disease about the hip or the pelvic girdle will be present; the leg will be held more or less stiffly in some abnormal attitude of flexion and inversion to relieve the pain, and movement of the leg will be painful. Unless local peritonitis is present, there will be none of the special symptoms that point to appendicular or cæcal disease.

8. Hypogastric Region.

(a). In rare instances, tumours arising in the *small intestine*, and more often the sausage-like swelling of an enteric intussusception, may be felt in the hypogastric area (see 4 (b)). Tumours extending into it from the iliac fossæ are described under headings 7 above and 9 below.

Fig. 191.—Idiopathic dilatation of the bladder. The physical signs were those of a cystic tumour occupying the lower part of the abdomen.—*Introduction to Surgery* (Rutherford Morison).

(b). In infants, the *bladder* reaches half way to the umbilicus when moderately full, and does not fall below the pubic symphysis when empty. In the adult, the distended bladder is a common hypogastric swelling, particularly in females with *retroverted gravid uterus* or in males of about sixty with *enlargement of the prostate*; it may reach up as an ovoid elastic mass arising from the front of the pelvis almost to the umbilicus under conditions that are in no way pathological, as well as when the retention is due to some pathological cause. Such a distended bladder (Fig. 191) has been tapped as ascites, operated upon as ovarian or urachal cyst, and diagnosed as the pregnant uterus: mistakes that are not likely to occur if these possibilities be remembered, and are put out of court by micturition or the use of a catheter before the diagnosis is made.

(c). The *urachus* is a fibrous cord running in front of the peritoneum from the top of the bladder to the umbilicus, in the middle line; it represents the obliterated distal part of the intra-abdominal portion of the fetal allantois. It sometimes becomes the seat of cyst-formation, more often in women than in men. The urachal cyst is a rounded tumour lying between the umbilicus and pubes, soft or firm according to the tension of its contents; it may produce hypogastric pain. It must be distinguished from encysted tuberculous peritonitis, from ovarian cystadenoma, and from the distended bladder.

(d). Abdominal swellings arising from the *uterus*, *ovaries*, *tubes*, and *uterine ligaments* may all rise up out of the pelvis and present themselves as swellings

in this region, and, as they grow larger, may spread into the whole or any part of the abdomen. While they are comparatively small and manifestly connected with some intrapelvic organ, their origin is not difficult to determine; their diagnosis is considered under SWELLING, PELVIC. But when they have grown

up into the abdomen, or have acquired a long pedicle, or have become fixed by adhesions to some distant part of the abdominal wall or to some other viscus, perhaps causing it to become inflamed and impairing its functional activity, these pelvic tumours may give rise to signs and symptoms suggesting any disease rather than one that is pelvic, and the true diagnosis may be very difficult to make. The possibility of pregnancy in the female should always be remembered.

9. *Left Inguinal Region and Left Iliac Fossa* (see 7 above).

(a). The *sigmoid flexure of the colon* can be felt normally as a tube-like cord passing from the left lumbar region down into the pelvis, and rolled under the fingers. It very frequently contains hard ovoid scybalous masses. In rare instances it may be uniformly thickened and tender in consequence of chronic inflammation, tuberculous or otherwise. It is occasionally the seat of cancerous new growth, when the patient will complain of chronic intestinal obstruction, with cachexia, tenesmus, and the passage of blood-stained stools, phenomena that may also be met with in hyperplastic or stenotic tuberculosis of the sigmoid.

(b). The left iliac fossa may be the seat of abscess or inflammations similar to those described under 7 (b) above. In addition, suppuration around an exaggerated colonic diverticulum, with symptoms not unlike those of appendicitis on the wrong side, has been known to occur; such a condition has been spoken of as *acute diverticulitis* of the colon.

A. J. Jex-Blake.

SWELLING, AXILLARY.—Swelling in the axilla is due in the great majority of cases to enlargement, from one cause or other, of the lymphatic glands; an abscess, either acute or chronic, is also of frequent occurrence. Any other form of tumour is distinctly rare.

In examining a case, therefore, these two causes should be uppermost in the mind, and indeed, on inspection only, the diagnosis may be obvious, e.g. :—

Acute Abscess may be recognized at once by the well-marked signs of local inflammation and the general febrile disturbances. There is one form of acute abscess that may not be obvious, namely, one situated in the upper part of the axilla and covered by the pectoral muscles. On account of the distance of the abscess from the surface, the local signs of inflammation may not be great, though the general signs are marked. There will be great disinclination to move the arm on account of pain, and there is usually some cause, such as a whitlow on the finger, to account for the trouble. It must be remembered, however, that the abscess may be “residual”; that is to say, the original source of infection, such as the whitlow, may have healed completely two, three, or even more weeks before the axillary abscess declares itself.

Chronic or Tuberculous Abscess forms a single fluctuating swelling which, if large, may extend upwards under the pectoralis major. Owing to the fact that few, if any, of the local signs of inflammation may be present, difficulty arises in distinguishing this form of abscess from a soft lipoma. The duration and the rapidity of growth of the swelling are a good guide, for though the duration of a chronic abscess may run into months, it does not exist for years as does a lipoma.

Enlargement of the Lymphatic Glands.—Next, supposing that examination proves that the swelling is not an abscess, attention should be directed to ascertain whether it is glandular, and it is therefore necessary to recall the anatomical position of the glands. The axillary lymphatic glands are ten to twelve in number, and are arranged in three sets. One chain surrounds the axillary vessels and receives the lymphatics from the arm; a small chain runs along the lower border of the pectoralis major as far as the mammary gland, receiving the lymphatics from the front of the chest and the breast; the third chain is

placed along the lower margin of the posterior wall to receive lymphatics from the integuments of the back.

If the glands are affected in any way, all need not necessarily be enlarged, but it would be extremely unusual if only one were picked out, and commonly two or three, or one entire group are found enlarged. Therefore, axillary swellings due to glandular enlargement are almost always multiple, and are situated in that part of the axilla where glands are normally present. This may not be quite accurate when much inflammation has occurred around the glands and they are matted together, as happens with tuberculous infection; but even then the mass may be felt to be made up of many glands.

For the differential diagnosis of glandular swellings, see LYMPHATIC GLAND ENLARGEMENT.

Primary Tumours of the Axilla are distinctly rare.

Lipoma is the most common. It may attain a large size in this situation, and extend up under the pectoral muscles. It should be diagnosed by its long history, slow growth, definite outline, and free mobility. When very soft, the tumour may give the feeling of fluctuation, and so be mistaken for a chronic tuberculous abscess.

Cystic Hygroma of the axilla is very rare. It is usually congenital. It forms a soft, fluctuating, painless swelling, which sometimes grows rapidly. It may easily be mistaken for a lipoma.

Primary Malignant Tumours may arise, but are of extreme rarity.

Aneurysm of the Axillary Artery does occur, but is uncommon. It is easily recognized, because it is comparatively superficial and it gives an expansile pulsation, synchronous with the heart's beat; the veins of the forearm may be distended on account of pressure on the axillary vein, and the radial pulse on the affected side is diminished in size and delayed. There may be a definite history of local injury, or in cases of apparently spontaneous aneurysm, there may be signs or symptoms of fungating endocarditis.

George E. Gask.

SWELLING, FEMORAL.—By the femoral region is meant Scarpa's triangle. It is very easy to define on paper what is a femoral swelling, but in a fat patient it may be very difficult. The two great landmarks which, with care, can always be made out, however fat the patient, are the spine of the pubes and the anterior superior spine of the ilium; a line joining these two points and curving slightly downwards separates the inguinal from the femoral region, and indicates Poupart's ligament. Mistakes are often made, especially in fat people, because a horizontal crease in the thigh which lies below—sometimes as much as two inches below—is mistaken for the ligament.

The first point in making the diagnosis is to decide definitely that the swelling is femoral, and then to decide its nature.

It may be obvious at once what the swelling is: for instance, a well-marked acute abscess, with redness and oedema of the skin and an undoubted source of infection, such as a sore toe; or, a rare occurrence, an aneurysm of the femoral artery, showing marked expansile pulsation.

Supposing, however, the signs are not so clear, the various conditions may be classed broadly under two heads: (1) *Swellings that are reducible and give an impulse on coughing*; (2) *Swellings that are irreducible and do not give an impulse on coughing*.

Reducible Swellings with an Impulse are: (a) Femoral hernia—reducible; (b) Saphena varix; (c) Psoas abscess.

All these three conditions give an impulse on coughing; they all are, or may be, reducible on pressure; they all may disappear on lying down and reappear on standing. How then is one to distinguish between them?

(a). *Femoral Hernia (reducible)*.—The sex of the patient is no real guide, for though it is more common to find a femoral hernia in a woman than in a man, this is not sufficient to base the diagnosis on. Below the age of puberty it is very rarely found in either sex. A femoral hernia leaves the abdomen through the femoral canal, and turns directly forward, forming a tumour in the upper and inner part of the femoral region. Then, following the line of least resistance, it turns upwards, extending often above Poupart's ligament, thus simulating an inguinal hernia. More rarely, the hernia extends downwards along the femoral vessels. The course of the hernia must be remembered in attempting to discover whether the swelling is reducible. If the hernia is large and contains intestine, it will be resonant, and a gurgling noise may be heard on reduction, which distinguishes it at once from all other femoral swellings. If the hernia is reduced and the finger held over the femoral aperture, the hernia will be felt projected quite forcibly against the finger when the patient is asked to cough.

If a swelling is complained of, and none is found even on standing and straining, it is suggestive of femoral hernia, with only occasional descent, and the patient should be examined at another time after exercise.

(b). *Saphena Varix* is a localized dilatation of the saphenous vein at the saphenous opening, immediately before it joins the femoral vein. It may easily be confounded with a femoral hernia, for it forms a swelling in the ordinary position of a femoral hernia, it disappears on lying down, reappears on standing, and gives an impulse on coughing. A little care, however, should suffice to distinguish the two. The impulse is quite different—in a saphena varix it is more in the nature of a thrill such as may be felt in a varicocele or in big varicose veins in the leg. If, while the patient is standing, a finger is pressed on the swelling, it collapses, and as the finger is withdrawn the swelling follows, regaining its shape like an air-ball, whereas a hernia comes out with a pop. A saphena varix is almost always associated with varicose veins in the leg, though, owing to the persistence of valves, none may show between the knee and Scarpa's triangle.

(c). *Psoas Abscess*.—The need to differentiate between this and the two conditions above mentioned only exists when the abscess has extended from the iliac region, has passed under Poupart's ligament and the femoral vessels, and is pointing in the inner part of Scarpa's triangle. As before, there is an impulse on coughing and the swelling is reducible; but another swelling is to be found above Poupart's ligament, and fluctuation is to be obtained between the two. Conclusive proof can be found by an examination of the back. This should be made with the patient standing and the whole length of the back and the hips exposed. An undoubted angular kyphotic curve may be seen at once, or, if that is not present, there may be marked rigidity and impaired movement, denoting some disease on the anterior surfaces of the bodies of the vertebrae.

Irreducible Swellings without Impulse: (a) Femoral hernia — irreducible; (b) Lymphatic glands—inflammatory or malignant; (c) Primary tumours—lipoma, fibroma, sarcoma; (d) Ectopic testis.

(a). *Femoral Hernia*.—The irreducibility may be accounted for in four ways: (i) Strangulation; (ii) A piece of omentum adherent to and plugging the neck; (iii) An empty sac, but a mass of extraperitoneal fat round the sac; (iv) A hydrocele of the sac.

If strangulation has occurred, there will be the signs of intestinal obstruction, viz., vomiting and constipation. It must be remembered that the swelling may be but a small one, and when the patient is very fat it may be missed.

It is usual to find around the sac of a femoral hernia a quantity of extra-peritoneal fat, even in a thin person, and it is quite impossible to say without

dissection whether the swelling is due to a plug of omentum inside the sac or to a collection of fat outside it.

A hydrocele may be formed as a result of a long-standing hernia into which there has been no descent of bowel or omentum, and in which the communication with the general peritoneal cavity has become constricted or closed. The sac then may become cystic and filled with fluid. The feeling of fluctuation can now be obtained in the swelling, though it is often only on dissection that the exact nature of the condition is revealed.

It is to be noticed that in all cases of hernia the swelling is single, and that though it may be movable in some directions, it is always tied down by its neck to the aperture of the femoral canal.

(b). *Enlarged Glands* may be: (i) Inflammatory; (ii) Malignant—secondary.

Inflammatory Glands.—The glands may be acutely inflamed as the result of an infection from some part of the limb; all the signs of inflammation and perhaps abscess may be present, and the diagnosis is obvious. Chronically inflamed glands are very different, and it may be exceedingly hard to differentiate them from a small irreducible femoral hernia. The whole limb is to be examined to see whether there is any possible source of infection, and the whole patient to see whether there is a general enlargement of the glands, as in lymphadenoma. The chief distinguishing feature between the two conditions is that femoral hernia forms only one swelling, whilst it is very rare for only one gland in its group to be picked out by an infecting agent, and not the others. Therefore, if there is more than one swelling the chances are that these are glands. Perchance both conditions are present, a femoral hernia and enlarged glands: a very difficult combination unless the femoral hernia happens to be reducible or gives an impulse on coughing. In such a case an attempt should be made to feel the neck of the sac running up to the femoral canal.

Malignant Glands.—To account for these there will be a primary growth in some part of the limb, e.g., a melanotic sarcoma or an epithelioma of the skin or penis, or a sarcoma of bone.

(c). *Primary New Growths* are rare in this situation. They may be lipoma, fibroma, or sarcoma. The innocent tumours are noted for their free mobility in all directions. A primary sarcoma is diagnosed rather by exclusion and by its malignant characteristics.

(d). *Ectopic Testis.*—One of the places into which a testis may be drawn abnormally is Scarpa's triangle, which it reaches by passing over Poupart's ligament. The facts that the swelling has the shape of the testis, though generally smaller than normal, and that the corresponding half of the scrotum is empty, make the diagnosis easy.

Mention may be made here of those swellings which are neither truly femoral nor truly inguinal, but betwixt and between, and bulge Poupart's ligament forwards. They are generally deep, and on that account obscure. They may be due to:—

1. Distention of the hip joint, as in tuberculous disease of the hip.
2. Distention of the bursa between the tendon of the ilio-psoas muscle and the capsule of the hip joint. If large, the swelling may be quadrilateral in shape, and owing to its sensitiveness to pressure the leg is kept in the position of greatest ease, i.e., slightly flexed, abducted, and externally rotated. It is often difficult to distinguish from psoas abscess or from distention of the hip joint, with which, indeed, it often communicates. Diagnosis may be aided by puncturing the swelling with an aspirating needle.
3. Osteophytic outgrowths from the acetabulum in osteo-arthritis of the hip joint.
4. A parametric abscess.

George E. Gask.

SWELLING IN THE ILIAC FOSSA (LEFT).—For general method of examination, compare SWELLING IN THE ILIAC FOSSA (RIGHT).

Swellings connected with Structures normally present in the Left Iliac Fossa.

The Sigmoid Flexure cannot be felt normally. It becomes palpable as a cylindrical swelling if distended with fæces or thickened, as it may be, in chronic ulcerative colitis and congenital dilatation of the colon.

Carcinoma of the Sigmoid.—Next to the rectum, the sigmoid colon is the most common seat of cancer in the bowel. If of the scirrhus or ring type, no lump may be felt, and the condition may not be discovered until intestinal obstruction has supervened. When infiltrating the bowel widely, and especially when the tumour is undergoing colloid degeneration, a swelling forms which is most evident on bimanual examination, after the bowels have been well cleared by enemata. If a lump can be felt in the sigmoid flexure of a middle-aged patient, the strong probability is that it is a carcinoma, and whether there are other clinical signs or not, the diagnosis should be made sure by actual inspection of the swelling by means of the sigmoidoscope, or even through an abdominal incision.

Enlarged Lymphatic Glands.—The glands forming a chain round the external iliac vessels may be swollen as the result of pyogenic infection, which has spread up through the femoral lymphatics or from secondary deposit of some malignant growth starting either in the leg, the external genitals, or the pelvis. The enlargement is seldom very great; the source of infection is usually obvious.

Aneurysm of the external Iliac Artery is very rare. It is recognized at once by its expansile pulsations.

Swellings connected with Structures not normally present in the Left Iliac Fossa.—These may be: Swellings coming down from above, extending upwards from the pelvis, or pushing forward from behind.

Swellings coming down from above.—*The Spleen*, if much enlarged, may reach even as far as the left iliac fossa. It is recognized by its rounded margin, and the notch on the inner edge. (See SPLEEN, ENLARGEMENT OF THE.) *A kidney*, if freely movable, may be displaced as far as the pelvis; on rare occasions it becomes fixed there by inflammation.

For swellings extending up from the pelvis and those pushing up from behind, compare article on SWELLING IN THE ILIAC FOSSA (RIGHT); they are the same on each side.

George E. Gask.

SWELLING IN THE ILIAC FOSSA (RIGHT).—It is not always easy to say whether there is or is not a definite swelling in the right iliac fossa, for it may be only small and deep, or be masked by abdominal rigidity or fat. In all cases a careful inspection of the abdomen is first to be made, the patient lying on the back with the whole of the abdomen and the lower thorax exposed. Most mistakes result from want of a complete examination, which cannot be made through a tiny gap in the clothes. Before even touching the abdomen, much may be made out by the use of the eyes, and the points to observe are:—

1. The presence or absence of an obvious tumour.
2. Whether the abdominal muscles move freely.
3. The conformation, etc., of the tumour, should one be present, and whether it moves on respiration.

Palpation is then to be employed, and this method will go a long way to elucidate the complaint, for it will at once be recognized whether there is a well-defined swelling, such as a carcinoma of the cæcum; or an indefinite swelling, such as is common in appendicitis.

It must be remembered that distention with wind may cause a considerable swelling, as will also an accumulation of fæces; but any doubt existing may

readily be cleared up by the administration of an enema. If the swelling persists, the questions that arise are : is it connected with one of the structures normally present in the right iliac fossa, e.g. the cæcum, appendix, or mesentery, or is it springing from the bone ; or, again, is it arising from some organ invading this space ; for instance, one of the pelvic viscera, or some structure displaced downwards, as the gall-bladder, stomach, or kidney ?

A.—SWELLINGS CONNECTED WITH STRUCTURES NORMALLY PRESENT
IN THE RIGHT ILIAC FOSSA.

The Appendix.—*Appendicitis* is so common that it is put first. Most well-marked attacks of appendicitis are associated at some period with a swelling, though in the acutest and gravest forms the latter may be absent. The appendix itself, even if swollen and thickened, can rarely be felt by palpating the abdomen, and the swelling may be due to one of two causes—paralytic distention of the cæcum, or the formation of an abscess.

The chief indications of appendicitis are : pain, tenderness, and swelling in the right iliac fossa, associated with a furred tongue, vomiting, constipation, an increase of the pulse-rate, and a rise of temperature. Usually there is also diminished muscular movement in the lower part, or it may be over the whole, of the abdomen. Any movement is painful, and in order to relax the tension the patient lies with the right leg drawn up. A rectal examination should be made, for a bulging abscess may be felt by this route. Micturition is frequently abnormal, with a tendency to be either painful or unduly frequent. A leucocyte count is of great service, for in almost every case of acute appendicitis the number of white cells is increased.

Tuberculosis of the Cæcum or of the Lymphatic Glands in the neighbourhood of the Cæcum.—This is not nearly so common as appendicitis, but is not so rare as is often imagined, and when it does occur it is frequently mistaken for appendicitis ; it may be only after the abdomen has been opened that the mistake is discovered. The glands become enlarged and painful, and there may be some local peritonitis over them which makes the diagnosis very difficult. Usually there is some other tuberculous focus about the patient, especially in the lungs, which should be examined with particular care, the *x*-rays and sputum analyses not being omitted in cases of doubt. If doubt exists recourse may be had to a diagnostic injection of Koch's old tuberculin, and the opsonic index may be taken both before and after abdominal massage. Von Pirquet's test is not very trustworthy.

Actinomycosis starting in the cæcum and appendix is another inflammatory condition which may cause a swelling and give the signs of a chronic abscess. The diagnosis can only be made with certainty by an incision, and the finding in the pus of the characteristic yellowish granules (occasionally black—the gunpowder variety), and the recognition under the microscope that these granules are formed of a Gram-staining streptothrix (*Plate XII, Fig. S*).

Carcinoma of the Cæcum gives rise to a swelling which occasions few symptoms, unless the passage of fæces is affected and intestinal obstruction results. It is important, however, from the point of view of treatment that an early diagnosis be made. The presence of a non-inflammatory swelling of long standing in the right iliac fossa, with a history of wasting, is very suggestive of a carcinoma, and early recourse should be had to the only sure diagnostic method, namely, laparotomy. Very rarely is there passage of blood or mucus by the bowel to help one.

Intussusception usually occurs in children, especially during the latter half of the first year of life, and its presence is indicated by the signs of intestinal obstruction, namely, vomiting and constipation, and by the passage of blood and mucus by the rectum. The intussuscepted portion may be palpable, and

in some cases it lies in the right iliac fossa, though more frequently in the right hypochondrium. Chronic intussusception may also cause a swelling which generally baffles diagnosis, and is commonly mistaken for an enlarged kidney.

B.—SWELLINGS CONNECTED WITH STRUCTURES NOT NORMALLY PRESENT IN THE RIGHT ILIAC FOSSA.

These may be: Swellings coming down from above, swellings extending upwards from the pelvis, or swellings pushing forward from behind.

Swellings coming down from above.

The liver, an enlarged or abnormal lobe of the liver—Riedel's lobe—is sometimes very deceptive. The facts that there are few symptoms, that the mass moves on respiration and is continuous with the liver, and that there is no intervening area of resonance between it and the liver, should assist the diagnosis; but cases are not infrequently mistaken for enlargement of the gall-bladder. A *suppurating gall-bladder* has been opened in the right iliac fossa under the mistaken diagnosis of appendix abscess, for there is often no jaundice in these cases. Laparotomy may be the only means of certain diagnosis.

Carcinoma of the Stomach—with extreme distention of the stomach. It is a surprising fact that the stomach may be so distended as to enable the pylorus to lie in the right iliac fossa. The history of copious vomiting, the wasting, and the distention of the stomach, make the diagnosis easy.

Swellings extending upwards from the Pelvis—and attached to the uterus and its appendages. Usually these can be felt dipping into the pelvis; vaginal and rectal examinations will assist the diagnosis; and there are symptoms, such as disturbances of menstruation, indicating their nature. Such swellings might be a large *fibroid of the uterus*, a laterally-placed *ovarian cyst*, *pregnancy*, or an *abscess* extending from the broad ligament.

It happens not infrequently that there may be difficulty in determining between an inflamed appendix and an enlarged and tender ovary, particularly when the attacks of pain are coincident with the menstrual periods. These generally turn out to be due to the appendix, though both may be implicated, the appendix having become adherent to the ovary or tube.

Pyosalpinx is easily confused with appendix abscess; the fact that it is associated with vaginal discharge, or is subsequent to parturition, puts one on the right track. Vaginal examination is essential in these cases.

Swellings pushing forward from behind.

These may be solid, such as *sarcoma* or *chondroma* of the pelvic bones. Here the tumour will be immovable apart from the pelvis, and a skiagram makes the condition clear. If the swelling is fluid it may depend on *suppurative osteomyelitis* of the ilium; or on a *tuberculous* affection of the ilium, either primary, or secondary to hip-joint disease; or on *tuberculosis*, *necrosis* or *suppuration of the lumbar vertebræ*.

If the swelling cannot be attributed to any of the causes mentioned above, it is to be remembered that a wandering organ, such as a spleen or kidney, may find its way into the right iliac fossa.

George E. Gask

SWELLING, INGUINAL.—A variety of swellings may appear in the groin, and be very difficult to differentiate. The following are some of the most important:—(1) *Enlarged glands*: (a) inguinal; (b) femoral; (c) iliac. (2) *Abscess, acute or chronic*. (3) *Hernia*: (a) inguinal; (b) femoral; (c) obturator. (4) *Retained testicle*. (5) *Hydrocele*. (6) *Tumours of the cord or round ligament*. (7) *Aneurysm and other vascular swellings*. (8) *New growths*. (9) *Distended psoas bursa and other cysts*.

1. Enlarged Glands.—There are two chief groups of glands in the groin. The

most commonly affected are the *inguinal*, which lie in the subcutaneous tissues about Poupart's ligament, and drain the external genitals, the anus, the umbilicus, the lower parts of the abdomen and back, the buttock and the upper third of the thigh. The *femoral* glands rest below the saphenous opening and drain the lower limb below the upper third of the thigh. It must be remembered, however, that the lymphatic drainage is somewhat erratic, so that a sore toe may sometimes induce enlargement of an inguinal gland only. The *iliac* glands drain the inguinal and femoral set, and consequently often enlarge secondarily to these; but they also communicate freely with the abdominal lymphatics and may become infected from them.

Enlarged glands in the groin are nearly always multiple, and usually subcutaneous, so that they are easy to recognize as glands; but a solitary one adherent to the saphenous opening may be almost impossible to distinguish from an irreducible omental femoral hernia or a hydrocele of a hernia sac.

The iliac glands just above Poupart's ligament are more difficult to palpate, because they lie deep to the abdominal muscles, but their enlargement is generally secondary to disease of the superficial glands, and this often gives the key to the diagnosis of an obscure swelling in this region.

Some Causes of Enlargement of the Groin Glands.—(a) Mechanical or chemical irritation; (b) Septic infection, for instance, from genital sores or from sores on the toes or legs; (c) Tubercle; (d) Syphilis; (e) Other specific diseases, such as rubella and bubonic plague; (f) Lymphadenoma; (g) Lymphatic leukæmia; (h) Malignant diseases: secondary carcinoma; secondary or primary sarcoma.

(a). The glands become slightly enlarged and tender as a result of the *mechanical irritation* of a truss, and more frequently the *bites of parasites* such as the *Pediculus pubis*. The glands generally remain movable, and they rarely suppurate.

(b). *Septic infection* may follow insect bites; but more commonly a septic sore or recent scar can be discovered upon examination of the area drained by the glands. Septic glands either soon subside or cease to be tender after the removal of the source of infection, or they enlarge rapidly, become adherent, and suppurate within three or four weeks of their first enlargement.

(c). This, and the amount of inflammation of the skin over them, distinguish septic from *tuberculous* glands which do not suppurate for some months, and then with but little inflammatory reaction. Epitheliomatous glands may suppurate towards the end.

(d). The true *syphilitic gland* is hard, movable, and only moderately enlarged, and the existence of the indurated chancre usually makes the diagnosis easy. The *Spirochæta pallida* may be detected, or Wassermann's serum test may be positive; but a negative reaction is not conclusive.

It must not be forgotten that, as an apparently soft sore (septic) may later become hard and definitely syphilitic, therefore suppuration of a bubo does not disprove syphilitic infection. Instances of mixed infection by sepsis and syphilis are fairly common.

(f). In *lymphadenoma* the groin glands are rarely affected alone, and the smooth, soft enlargement of many glands without signs of inflammation, associated with increasing anæmia and intermittent pyrexia, makes the diagnosis fairly easy. The spleen may be affected at the same time.

(g). Blood examination will give pathognomonic results in cases of lymphatic leukæmia.

(h). *Malignant disease* of the groin glands is nearly always epitheliomatous, and secondary to a primary epithelioma of the skin or mucous membrane in the area drained by the glands. The primary growth, especially at the anus, may be very small, and the patient may be unaware of its existence. The other

main points in distinguishing epitheliomatous glands are their exceeding hardness ; their progressive but slow growth ; their early adhesion to the deep fascia and skin ; and the amount of pain which they give rise to without signs of inflammation. Late in the disease they may suppurate or slough, with severe hæmorrhage.

Sarcoma of the groin glands is rare ; it may be primary or secondary. Usually these are not the only glands affected. They grow with great rapidity and remain smooth and fairly soft until they attain a great size, when they may fungate through the skin. They are distinguished from lymphadenoma by their very rapid growth and the absence of pallor until late in the disease. Melanotic growths of the skin give rise to rapidly growing smooth glands, whose pigment may be visible through the skin. The primary growth or ulceration in connection with the skin, particularly of a toe, may not show pigmentation, and its serious import may thus be overlooked.

2. **Abscess.**—(a.) *Acute.* The only common cause of acute abscess in the groin is suppuration of the glands, and a search must always be made for a primary source of infection, especially about the genitals. A hernia may occasionally suppurate, and an appendicular abscess may point just above Poupart's ligament ; but there is then a history of the characteristic symptoms of appendicitis, and the pus when released has the suggestive smell of the products of the *Bacillus coli communis*. Both tuberculous and epitheliomatous glands may become acutely inflamed and suppurate.

(b.) *Chronic abscess* here may be due to caries of the sacro-iliac joint or to hip disease, or it may arise from tuberculosis of the superficial or deep glands. Psoas abscess, due to caries of the spine, is distinguished by fluctuation from the loin to the groin, and often bimanually, above and below Poupart's ligament, external to the femoral vessels. There are also some tenderness and rigidity, and often deformity of the lumbar or lumbo-dorsal spine. Iliac abscess does not extend up into the loin, and is placed further out than psoas abscess. Moreover, there may be pain and tenderness over the sacro-iliac joint, and a limping gait. In hip disease, especially in children, the floor of the acetabulum may give way, and an abscess may thus enter the true pelvis, whence it often ascends and becomes palpable above Poupart's ligament. The diagnosis of the cause is easy from the well-marked signs of hip disease.

3. **Hernia.**—In examining swellings in the groin, hernia must always be considered. Three chief varieties occur here : inguinal, femoral, and very rarely obturator hernia. A hernia gives an impulse on coughing, but so do psoas abscess, psoas bursa, and a saphena varix. All these may also be reducible like a hernia. A psoas abscess presenting below Poupart's ligament has been mistaken for a femoral hernia ; but it is distinguished by its position—external instead of internal to the femoral vessels. Moreover, it is dull on percussion, whereas a hernia is resonant except when it contains omentum alone. Psoas bursa is also placed outside the vessels. A saphena varix has often been mistaken for femoral hernia ; but it can be easily distinguished from the latter because it returns after complete reduction, even though the finger is kept pressed against the femoral canal. It is not always easy to distinguish the three herniæ which occur in the groin, but close attention to the following points usually leads to a correct diagnosis. An inguinal hernia is both seen and felt to be *above* the fold of the groin and *above* Poupart's ligament ; whereas a femoral hernia is seen and felt to be *below* the fold of the groin and *below* Poupart's ligament. It is to be remembered that when a femoral hernia becomes very large and loculated, it generally extends upwards and inwards over Poupart's ligament. Still, the bulk of it remains below the fold of the groin in the upper and inner part of the thigh. An inguinal hernia often extends into the scrotum

or labium; a femoral hernia never does this. The neck of an inguino-scrotal hernia is above and internal to the spine of the pubis, whereas the neck of a femoral hernia is below and external to this bony prominence. Inguinal hernia is most easily reduced by pressure directed upwards, backwards, and outwards, whereas a large femoral hernia is most easily reduced by pressure directed at first backwards and downwards, and then directly upwards. In difficult cases it is a good plan to reduce the hernia, then to get the patient to stand up, while the surgeon makes firm pressure over the internal ring and asks the patient to cough. A femoral hernia may then come down, but not an inguinal. Similarly, pressure can be made on the femoral canal; this prevents the return of a femoral hernia, so that if it now comes down it is inguinal. In this connection it may be well to remember that femoral hernia is rare in males, and also in all females under maturity. The prevalent belief that femoral hernia is more common than inguinal in grown-up women is wrong, the latter being more common at all ages and in both sexes. It is excessively difficult to differentiate between an irreducible femoral hernia containing omentum and an enlarged gland at the saphenous opening or in the femoral canal. A hydrocele of a hernial sac gives rise to the same difficulty, and sometimes an exploration becomes necessary on account of the danger of overlooking femoral hernia, and the risk of strangulation.

The diagnosis between femoral and obturator hernia is not very difficult; it is far more common to overlook an obturator hernia altogether. When an external swelling is caused by an obturator hernia, it is placed further inwards, and it is more vague than a femoral hernia. Moreover, there is pain shooting along the inner side of the thigh, and generally the signs and symptoms of strangulation. Further, a tender swelling can be felt at the obturator foramen upon vaginal or rectal examination.

The two chief varieties of inguinal hernia, the oblique and the direct, are usually distinguished quite easily. Direct hernia is rare, and is more globular in shape than the indirect or oblique hernia; the spermatic cord is antero-external to it, and postero-internal to the ordinary oblique hernia. Direct hernia is placed a little further in and higher up than the oblique. It is generally much more easily reduced, but returns again with striking abruptness when the patient coughs. It rarely travels into the scrotum, and it is uncommon before the age of thirty. There is often a history of sudden onset after some violent straining effort.

4. **Retained Testicle.**—The most important points in the diagnosis of this condition are the absence of the organ from its proper place, and the presence of a swelling about the inguinal canal. Occasionally, the testicle may be mal-descended, or after leaving the external ring may have found its way into the upper and inner part of the thigh, where it simulates a femoral hernia, or into the perineum. The swelling in the groin may give the characteristic testicular sensation, or the condition may be associated with attacks of pain which have been mistaken for appendicitis or intestinal colic. It is practically always accompanied by actual or potential hernia into the tunica vaginalis, which is in direct communication with the abdominal cavity.

5. **Hydrocele.**—The neck of the sac of either a femoral or an inguinal hernia may become obstructed, and a hydrocele of the sac may then develop. This may become inflamed and give rise to considerable difficulty in diagnosis. Strangulated or irreducible omental hernia may be simulated, and sometimes an exploration is the only way of settling the diagnosis. It is more easily distinguished from strangulated hernia containing bowel, because it is dull on percussion, and the bowels are not obstructed. An encysted hydrocele of the cord occupying the inguinal canal is sometimes difficult to distinguish from inguinal hernia; but it is not completely reducible, and it is dull on percussion.

It is not granular like an omental hernia, and it can even be shown, with some difficulty, to be translucent. Like a hernia, it gives an impulse on coughing.

6. **Tumours of the Cord or Round Ligament.**—The only common tumours of these structures are (a) Lipoma and (b) Fibro-myoma of the round ligament. The former is so soft and displaceable that it gives an impulse on coughing, and is often mistaken for an omental hernia, especially in stout patients. The latter is hard and smooth, somewhat simulating the ovary or a thick-walled hydrocele of the canal of Nuck, for either of which it may be mistaken, a certain diagnosis only being possible by exploration.

7. **Aneurysm and other Vascular Swellings.**—Aneurysm of the external iliac artery may be mistaken for a vascular sarcoma arising from the pelvis. It can generally be recognized by the classical signs of aneurysm, such as expansile pulsation, bruit, weakening and delay of the corresponding femoral pulse, and marked reduction of the size of the swelling as a result of pressure on the common iliac artery. Saphenous varix has been referred to above.

8. **New Growths.**—Sarcoma of the pelvic bones or of the soft parts in this neighbourhood is hardly altered in size by pressure upon the common iliac artery, nor does it give such a loud bruit or the *expansile* pulsation, which are characteristic of aneurysm. The x-rays may give evidence which is valuable in distinguishing aneurysm from sarcoma.

9. **Distended Psoas Bursa** may give rise to pulsation communicated from the external iliac artery. On careful examination it can be distinguished by the absence of the classical signs of aneurysm already mentioned, by its translucency and irreducibility. There may also be signs of osteo-arthritis of the hip joint.

R. P. Rowlands.

SWELLING, INGUINO-SCROTAL.—The most important swellings which occupy both the inguinal and scrotal regions are :—(1) *Hernia* ; (2) *Varicocele* ; (3) *New growth* ; (4) *Hydrocele* ; (5) *Lymphangioma*.

Hernia is by far the most common, and when it is reducible there is very little difficulty in the diagnosis. It gives the characteristic impulse on coughing, is resonant on percussion, and when it contains bowel it gurgles on reduction. When it contains omentum only, the diagnosis is more difficult. To distinguish it from a *varicocele* it is only necessary to reduce the swelling and then to place the finger firmly upon the inguinal canal ; a *varicocele* returns in a few seconds, but a *hernia* does not. Moreover, an omental hernia has a granular feel which distinguishes it from *varicocele*. An irreducible omental hernia is distinguished from *varicocele* by its irreducibility ; but it may be confused with a very rare condition, *lymphangioma* of the cord. An irreducible hernia may be confused with encysted hydrocele of the cord. When a hernia contains bowel its resonance distinguishes it ; but when it contains omentum there is more difficulty. An *encysted hydrocele* or a *hydrocele* of a *hernial sac* is more even and elastic than an omental hernia, which is usually nodular. Moreover, it may be possible to show that a hydrocele is translucent. This help is not available when the cyst is deep or contains blood, which it occasionally does as the result of injury or strangulation of the omentum at the neck of the hernial sac. A *strangulated hernia* is distinguished from an inflamed hydrocele by the greater severity of the vomiting and other constitutional symptoms, and the completeness of constipation. Moreover, as stated above, a *strangulated hernia* containing bowel is resonant on percussion. *Strangulated omentum* may be very difficult to distinguish from an inflamed hydrocele or a hydrocele of a *hernial sac*, especially as either of these may complicate it. In such cases an exploration is the final appeal. It should not be forgotten that two or more varieties of inguino-scrotal swellings may co-exist. For instance,

it is common to overlook a hernia which may complicate a varicocele, and this is especially true when the hernia contains only omentum. Again, it is quite common for a hydrocele of the tunica vaginalis or of the lower part of the cord, to complicate an ordinary omental hernia. In such a case, a part of the swelling may be reducible, and, unless the patient is examined in the upright position, the upper part or the hernia may fail to appear during the examination. Again, the bowel may be reducible, while the omentum, being adherent, is not reducible, and may be mistaken for an encysted hydrocele of the cord. It is very important in all these cases to examine for translucency.

Growths of the testicle invading the inguinal region are, as a rule, easily diagnosed, because of the history and the observed course of the disease, and the general condition of the patient at the later stages. *Growth of the retained testis* may give rise to more difficulty; it may be confounded at first with hydrocele of the tunica vaginalis, hydrocele of the hernial sac, or omental hernia, unless care be taken to ascertain if both the testicles are present in the scrotum. *Torsion of a retained testicle* with strangulation of its vessels, has sometimes given rise to inguinal or inguino-scrotal swelling which has closely simulated strangulated hernia; but although there may be much abdominal pain and local tenderness, vomiting is rarely so severe as in strangulated hernia, and the bowels are not really obstructed. Retained testicle is dull on percussion, and thus is distinguished from strangulated hernia containing bowel, and can only be confused with strangulation of the omentum.

The oblique hernia is the only common one to reach the scrotum. It may be acquired or congenital. In about one-tenth of the congenital herniæ the bowel and the testicle are in the same peritoneal sac; in the great majority of congenital herniæ the two sacs are distinct, the testicle lying below the hernia. The same is true of acquired inguinal hernia. It is important to remember that nearly all inguinal herniæ descend into congenital or pre-formed sacs, and this is especially true of herniæ appearing apparently for the first time in young adults. In such cases, on careful inquiry, it may be found that a hernia existed and was apparently cured by a truss, in infancy. Again, it may be learned that the hernia reached the scrotum on its first descent, whereas acquired inguinal hernia very gradually develops as the result of straining in men past middle age. The swelling at first appears only in the inguinal region, and there the swelling increases in size, and extends into the scrotum only after some months or years. Very rarely, a direct hernia may reach the scrotum; it is distinguished from oblique hernia by the fact that the cord is antero-external to it, instead of postero-internal, as in an oblique hernia. It may be possible in some cases to identify the contents of a hernia. Attention has been drawn above to the method of distinguishing the bowel from the omentum. Sometimes the appendix can be felt distinctly, especially in right-sided hernia. Occasionally the bladder may be identified, as in Astley Cooper's classical case. When the patient has apparently emptied the bladder, the surgeon reduces the hernia, and the patient is immediately able to pass more water.

R. P. Rowlands.

SWELLING, MAMMARY.—*Method of Examination.*—The clothes should be removed to the waist, so that a clear view of both breasts, the thorax, axillæ, and supraclavicular fossæ may be obtained. Both breasts should then be looked at to see whether there is any obvious enlargement or abnormality such as redness of the skin, dilatation of veins, tumour, or ulcer. Next, palpation is to be employed, using the flat of the hand and not the tips of the fingers; the surgeon should place himself in a convenient position, using the right hand to examine the left breast and the left hand to the right breast. In the same manner the axillary fossæ are to be explored, it being remembered that the

lymphatic glands affected in diseases of the breast lie on the surface of the thorax and not round the axillary vessels. (See SWELLING, AXILLARY.) It often facilitates palpation of the breast with the flat hand if the observer stands behind the patient when she is seated in a chair. In cases of suspected cancer the examination must not be concluded without investigation of the supraclavicular fossæ for fullness or enlargement of glands, and of the thorax and liver for signs of secondary growths.

Swelling in Pregnancy and Lactation is normal and physiological. Both breasts are equally enlarged, and feel tense and nodular. The superficial veins are usually prominent, and on gentle squeezing a few drops of milk are discharged from the nipple.

True Hypertrophy of one breast is rare. It may be found in nursemaids who have put children to the breast. The enlargement in the majority of so-called cases of hypertrophy is really due to the presence of one or more fibro-adenomata.

Acute Mastitis occurs usually during lactation, occasionally during pregnancy, and is most often due to infection with pyogenic organisms which have gained entrance through cracks in the nipple. At the beginning of the illness, there is shivering, followed by fever and a feeling of weight and pain in the breast; the pain soon becomes very acute. In the early stages the swelling is limited to one part of the breast, which feels more resistant than normal; the skin is not reddened at first, nor are the lymphatic glands enlarged. Pressure over the swelling may cause extrusion of a drop of pus from the nipple, and this is distinguished from milk by its viscosity and yellow colour. Later, fluctuation may become evident, and, as the inflammation approaches the skin, this becomes red and œdematous, and ultimately the abscess may point and burst through it; at the same time other foci of suppuration form, until the breast may be nothing but a bag of pus. The presence of fever and the intense tenderness of one portion of the breast are sufficient to distinguish acute mastitis from the physiological engorgement.

It is not uncommon to find a small *alveolar abscess*, the size of a hazel-nut, in virgins.

Soon after birth and at puberty, a diffuse enlargement may occur in both sexes, and a small quantity of milk may be secreted. If the breasts are handled or squeezed, this congestive condition may pass into true inflammation and suppuration.

Chronic Mastitis may attack numerous lobes of the breast, so that the whole organ has a granular feel (chronic lobular mastitis), or the inflammation may be confined to one segment and form an inflammatory swelling of considerable size. The attention of the patient is usually first called to the breast by the presence of vague pains and tenderness. If the lump is picked up with the fingers it is easily palpable, but if pressed back against the chest wall the induration is much less distinct than with carcinoma or fibro-adenoma. The swelling is elastic, and its outline quite diffuse, more so than in the case of carcinoma. The axillary glands may or may not be enlarged; if they are, they are generally numerous, not so hard as in cancer, and are met with at an earlier period in the disease. The opposite breast is very liable to be diseased in a similar manner. The diagnosis is often very difficult, ordinary carcinoma of the breast being confounded with it. The two tumours resemble each other, in that in both their outlines are badly defined and the axillary glands are enlarged. In cancer, however, the tumour is densely hard, and at an early period adhesions form, so that the skin puckers on attempting to move it over the swelling. A further difficulty arises from the fact that a cyst may form in connection with chronic mastitis. If this is lax, fluctuation may be detected,

but it is usually so tense that it feels hard and solid. This again may be mistaken for a carcinoma or a fibro-adenoma. Where there is the least doubt as to the nature of the swelling and any possibility of the presence of a carcinoma, the right course is to have a microscopic section cut at once.

Multiple Cystic Disease of the Breast.—This condition may follow on chronic lobular mastitis. One, or sometimes both breasts, become filled with cysts, large and small, some microscopic and others as large as walnuts, so that the organ has a bossy appearance. The whole organ is often very painful, the pain radiating from the breast and shooting down the arm. There are epithelial changes in the lining membrane of the cysts, and some authorities think that these are precursory stages in the formation of a cancer.

Cysts, unless in connection with chronic mastitis or fibro-adenomata, are very rare. A simple serous cyst is described, and is due to lymphatic obstruction.

Galactocoele is a cyst containing milk, and is formed by dilatation of one of the larger lacteals owing to obstruction. These galactocoeles occur only during lactation; they form movable, fluctuating swellings, and on pressure milk can be squeezed out of the nipple. They are rare.

Tuberculosis of the Breast is not so uncommon as was previously supposed, and a certain number of cases of chronic mastitis and chronic abscess are really tuberculous. The disease is insidious, starting as a painless irregular swelling, the periphery of which is hard and the centre soft. Later, the skin becomes reddened, and an abscess forms which may burst and leave a sinus. It differs from an acute abscess in that the duration is much longer, there is little or no pain or fever, and the pus, if examined, reveals no cocci. The facts that its history is a long one, that the swelling or the edges of it are hard, and that the axillary glands are enlarged, render this condition liable to be confounded with carcinoma, of the ordinary form, or one in which suppuration has occurred. The various clinical pathological tests for tuberculous disease may be applied, but the best method is to cut into the swelling and remove a portion of the wall for histological examination.

Chronic submammary abscess causes a projection forward of the whole breast; it is due to tuberculosis of the underlying ribs, or in rare instances to post-typhoidal periostitis, which may have remained latent. The diagnosis is made bacteriologically.

Innocent Tumours.—*Pure fibromata, lipomata, and enchondromata* are of rare occurrence, and merely call for mention here. *Fibro-adenoma* is the only common innocent tumour, and though there are many pathological varieties, and some contain cysts and some intra-cystic growths, for the purposes of this article all will be classed under this heading.

Fibro-adenoma is an encapsulated tumour, generally single, sometimes multiple, varying from the size of a nut to that of an orange. Because it is encapsulated, the surrounding tissues are not infiltrated; therefore, if superficial, the outline is very clearly defined and the mass is freely movable, both under the skin, over the pectoral muscle, and, most important of all, in the breast substance. The axillary glands are not enlarged. The tumours cause no pain, and are usually discovered accidentally. Generally they occur in women between the ages of twenty and thirty. After attaining a certain size they remain more or less stationary, unless they are cystic, when they may go on growing as the result of dilatation of the cyst by fluid. The diagnosis is generally quite easy, but if the breast is fat and the tumour deep-seated, it may not always be quite easy to distinguish from an early carcinoma. The consistency of this, however, is hard, while the adenoma is elastic.

From chronic mastitis it is distinguished by being less intimately associated with the breast than is the case with the inflammatory nodules, and by its

sharper definition. On account of the well-known possibility of error, however, no definite diagnosis or prognosis should be given until the tumour has been removed and a pathological report on its character received.

Malignant Tumours are carcinoma and sarcoma. *Carcinoma* is the most important tumour of the breast. It is essentially a disease of the female, only about one per cent of the cases occurring in males. The great majority are married, and between the ages of thirty-five and sixty.

In advanced cases the disease is obvious; the tumour is large and hard, fixed to and often fungating through the skin; the axillary glands are enlarged and hard, and the patient is often cachectic.

What is wanted is a diagnosis in the early stages, while the patient still looks and feels in perfect health, before secondary deposits are found in the axillary glands, and while successful treatment is still possible. Too much insistence cannot be given to this point; it is attainable, and should always be attempted.

The Early Diagnosis of Carcinoma of the Breast.—Usually the patient feels no pain, but discovers a lump in the breast accidentally during ablutions; therefore its duration must generally be a matter of doubt. Clinically, it is felt as a small tumour which, unless the patient is very fat, can be palpated easily with the flat of the hand. Its chief characteristic is that its outline is not sharply defined, and that it is hard—stony hard. In the very early stage, the tumour is freely movable over the pectoral muscles and under the skin, but it is not so movable in the breast substance as is a fibro-adenoma. Very soon, bands of fibrous tissue that connect the breast with the skin become involved, and by their contraction prevent free movement of the skin over the swelling, and cause dimpling and puckering. If the tumour is situated anywhere near the centre of the breast, milk-ducts become involved in the growth, and as they contract cause retraction of the nipple. If a nipple which was previously well formed becomes retracted, this is a very important piece of evidence; it is to be remembered, however, that nipples are often permanently retracted. Many cancerous tumours, even when extensive infiltration has occurred, cause a shrinkage, so that the affected breast may appear smaller than the healthy one, and in the atrophic form the gland may almost disappear. In the ordinary form (scirrhus) it will be rare to find any discharge from the nipple: a blood-stained discharge may be an indication of a duct-carcinoma. (See DISCHARGE FROM THE NIPPLE.)

After the disease has lasted six months the axillary glands are usually enlarged and hard, the first affected being those running along the lower border of the pectoralis minor. Too much attention must not be given to the absence of palpable glands, because, first, it is hoped that the diagnosis may be made before they are enlarged; and secondly, if the patient is at all fat, it is exceedingly easy to overlook them. Attention is to be centred on the lump itself. As stated before, this is stony hard, and that fact alone may be sufficient ground on which to base a diagnosis. The two main conditions which have to be distinguished from an early carcinoma are fibro-adenoma and chronic mastitis. In the former, the swelling is well defined, elastic, and freely movable; in the latter, a tumour cannot be felt distinctly with the flat of the hand; it is soft, and the whole breast is often nodular.

The difficulties in diagnosis are great and the sources of error numerous; none of the swellings may be typical: they may be obscured by the obesity of the patient, and a fluid swelling may be so tense as to simulate a solid one. This being so, the course to adopt, whenever the slightest doubt arises, is to incise the swelling and submit a portion to microscopical examination. Seeing the vital importance of avoiding mistakes in this connection, and recognizing the extent of human fallacy, there is a growing feeling among surgeons that all

tumours of the breast, whatever the belief as to their character, should be removed, or at least cut into, so that their true histological constitution may be ascertained early and with accuracy.

Sarcoma of the breast is rare. It generally occurs in women under the age of thirty. In the early stage it is not easily distinguishable from a fibro-adenoma, particularly one which is enlarging rapidly on account of a cyst or intracystic growth. It is soft, grows rapidly, infiltrates the tissues, and forms a large fungating tumour. It disseminates rapidly, both via the lymphatics and by the blood-stream.

George E. Gask.

SWELLING OF THE FACE.—In this article are included only swellings of the skin and subcutaneous tissues. Malignant and other diseases of the facial bones, etc., are considered under **SWELLING OF THE JAW**, and **SWELLING OF A BONE**.

Contusions and injuries to the face are so obvious that they need no mention. The remaining swellings will be classified as (1) *Non-inflammatory*; and (2) *Inflammatory*.

1. *Non-inflammatory Swellings.*

Renal and Cardiac Edema.—If the whole face is puffy and the eyelids are œdematous, the urinary and cardiac systems are to be examined for disease. For swelling due to *obstruction of the superior vena cava* by mediastinal fibrosis, aneurysm, or new growth, see **ŒDEMA: and VEINS, VARICOSE THORACIC**.

Angio-neurotic Edema is a disease characterized by the occurrence, sometimes periodical, of local œdematous swellings, more or less limited in extent and of transient duration. It is not confined to the face, but the eyelid is a common situation (*Fig. 128*, p. 458), and also the lips and cheek. It may be simulated closely by *urticaria* following the taking of fish or pork.

Tumours are not common. They may be fibroma, lipoma, epithelioma, or sebaceous cyst.

2. Inflammatory Swellings.—Often the cause is obvious: for instance, a *boil*, *carbuncle*, or *suppurating wound*; or the “blubber-lips” that result from chronic lymphangitis.

Erysipelas is prone to occur on the face. It is marked by a vivid red œdematous swelling, associated with signs of fever. The redness tends to spread, the edges being raised and well defined from the healthy skin. The œdema may be continuous, or it may disappear in one place and re-appear in another. In the very severe cases the fever is high, rigors occur (*Fig. 166*, p. 614), the cuticle may be raised in blebs, and sloughing may ensue.

Alveolar Abscess and *Dental Caries* are fertile sources of facial swelling. (See **SWELLING OF THE JAW**, p. 747.)

Parotitis—either the suppurative or epidemic form (mumps)—is easily recognized by the swelling being acute and limited to the region of the parotid gland.

Anthrax chiefly affects operatives in wool and horse-hair factories, and workers of raw hides. The disease is characterized by the formation of a vesicle, which bursts, forms a scab, and then becomes surrounded by a ring of vesicles, and around this is an area of œdema. The diagnosis is made by the microscope. A drop of fluid from one of the vesicles contains large, square-ended, Gram-staining bacilli, which have a characteristic growth on culture media.

Vaccinia.—An accidental infection about the face may be mistaken for an anthrax pustule. If inquiry into the attendant circumstances is not sufficient to exclude the graver disorder, a bacteriological examination should be made.

Primary Syphilitic Sore, if found on the face (*Fig. 10*, p. 86), is generally situated on the upper lip. It is not so indurated as when on the glans penis,

but the surrounding œdema is more marked, and the neighbouring lymphatic glands are considerably enlarged. The condition is often missed because it is not expected. An absolute diagnosis can be made by finding the spirochætæ in the serum discharged from the ulcer (*Plate XII, Fig. J*), and by Wassermann's test.

Insect Bites—from mosquitoes, gnats, bees, etc.—often cause large, lumpy, irritating swellings. The only difficulty in diagnosis is when they become infected with pyogenic organisms.

The various skin diseases which may be associated with swelling of the face are considered under PUSTULES; VESICLES; WHEELS; ETC. *George E. Gask.*

SWELLING OF THE JAW, LOWER.—Swelling of the lower jaw may sometimes be mistaken for, or masked by, swelling of the cellular tissues in front of it. The real site of the swelling is first to be ascertained by opening the mouth and running the finger along the outer and inner borders of the mandible and comparing the two sides.

There are many causes for enlargement, and they may be subdivided under the following headings:—

1. *Injury.*
2. *Inflammatory affections.*
3. *Tumours* { Innocent—Fibroma, osteoma, and odontoma.
Malignant—Sarcoma and epithelioma.
4. *Acromegaly.*
5. *Leontiasis ossea.*

1. **Injury.**—A *hæmatoma* or traumatic *periostitis* may follow on a blow. If the injury has been sufficient to cause a *fracture*, the signs are obvious. The abnormal mobility of the fragments, the irregularity of the line of the teeth and arch of the jaw, and the laceration of the gums, are sufficient to indicate the injury. The nearer the line of fracture is to the symphysis, the more marked is the mobility, and diagnosis is only difficult when the fracture is of the ascending ramus and underneath the masseter muscle. A skiagram may then be needed. It must be remembered that a fracture of the mandible is commonly compound, and therefore is often complicated by septic infection. Later, *callus* will form a tumour which might be mistaken for one of some other kind until the course of the case has been watched.

2. Inflammatory Affections.

Alveolar Abscess.—This is a very common swelling, and is known to all as associated with toothache. An ordinary gum-boil forms at the edge of the gum, and is quite superficial. A more troublesome form of abscess is that which develops at the root of a tooth, which, generally carious, may yet appear healthy on the surface. Pus usually points between the gum and the cheek, but it may travel a long way between the bone and the mucous membrane, and point on the cheek, in the submaxillary region, or on the chin. As in the case of injury, *periostitis* extending up under the muscle may be difficult to diagnose, and it is sometimes mistaken for *parotitis*.

In the early stages the only sign is toothache, but as suppuration becomes established, there are also pain, swelling of the gums, a furred tongue, trismus, enlargement of the lymphatic glands, a raised temperature, and other febrile symptoms. The presence of a septic tooth indicates the diagnosis.

Necrosis of the Jaw, often preceded by an acute periosteal abscess, may follow injury, alveolar abscess, syphilis, or mercurial or phosphorus poisoning, and in rare cases acute exanthemata or typhoid fever. In many cases it may be impossible to say whether the bone is necrosed or not, for the signs are much the same as in suppuration in connection with alveolar abscess. It can only

be diagnosed for certain if a piece of loose bone can be felt with a probe or seen by the aid of a skiagram. Its presence may be inferred by the long continuance and profuseness of the discharge.

Syphilitic disease of the lower jaw is rare, and if present will not usually be confined to the jaw. If there is doubt, a Wassermann's reaction will be of service.

Actinomycosis.—A long-standing and obstinate suppuration about the lower jaw, with cellulitis of the neck and formation of sinuses in the skin, should lead to the suspicion of the nature of the trouble. In the beginning it gives rise to inflammatory changes which simulate alveolar abscess, and the similarity is increased by the presence of carious teeth, through which the fungus is believed to gain access to the jaw. In the pus, the small yellow granules are to be sought for, and the Gram-staining mycelium on microscopical examination (*Plate XII. Fig. S*).

3. **Tumours**.—In many cases there will be no difficulty in deciding whether a swelling is inflammatory or a new growth. In the early stages, however—and it is never to be forgotten that an early diagnosis in the case of malignant disease is of extreme importance—there may be grave doubt. Therefore, all possibility of inflammatory mischief should be excluded by a careful, thorough examination of the mouth and teeth for any source of infection, and for this purpose it is frequently advisable to invite the co-operation of a dentist.

Innocent tumours are osteoma and fibroma (more commonly called a fibrous epulis).

Osteoma.—This is a rare tumour. It is very slow growing, is very well defined, bony hard, and does not usually attain a very large size. A not uncommon place to find it is at the angle of the jaw, projecting into the mouth. It may be bilateral.

Fibrous Epulis.—This is a common tumour, soft, composed of fibrous tissue, and covered by the mucous membrane of the gum. It arises in connection with the root of a decayed tooth, and if not treated may attain a sufficient size to cause displacement of the teeth or even distortion of the arch of the jaw. Sarcomata may start in this manner; therefore all such tumours should be submitted to microscopical examination before a definite diagnosis or prognosis is given.

Malignant tumours are *primary*, sarcomata, and *secondary*, epitheliomata, which start in the gum or on the floor of the mouth and invade the jaw by direct extension.

Sarcomata.—The diagnosis of these may be quite easy, or attended by the greatest difficulty. They occur at any age, even in young infants. They may be of rapid growth, associated with constitutional changes which simulate inflammatory conditions before a large size has been attained, or they may be of such slow development as to be confounded with innocent growths. The necessity of early diagnosis cannot be urged too strongly, for it is on this that successful treatment depends.

Seeing that a growth may be mistaken for a swelling due to suppuration, examination should first be directed towards seeing if any of the ordinary signs of inflammation are present, and whether there is an obvious source of infection. The history of the duration of the illness may be of great service, and also the nature of the swelling itself. Is it hard or soft, is the bone expanded, are tissues round the bone infiltrated, are the glands enlarged? Exercising the greatest care, diagnosis may still be difficult, and much service is rendered by a skiagram, with the aid of which it may be discovered whether the swelling is really bony, or in the case of periosteal sarcoma if the bone has been eaten into.

If the diagnosis can be settled by no other means, the growth should be cut into and a piece removed for microscopical examination, even if the tumour is bony and a chisel and mallet be required.

Epithelioma—better termed squamous-celled carcinoma—is a very insidious and dangerous form of growth, and in its early stages very apt to be overlooked. It may start as a small ulceration of the gum about a decayed tooth, and so be mistaken for a simple ulcer, and it may not be until a large tumour has formed that the condition is recognized, when most valuable time will have been lost from the point of view of treatment. The diagnosis will be made by careful examination, and noting that the ulcerated gum is hard and indurated and does not heal when the decayed tooth is removed. The name “*boring epithelioma*” has been well applied to this condition. To make the diagnosis sure, a piece from the edge of the ulcer should be removed for histological examination at the earliest moment that suspicion is aroused as to its malignancy.

An epithelioma may also spread from the tongue or floor of the mouth and cause a swelling involving the jaw. The diagnosis here is obvious.

Tumours of the Teeth, Odontomata.—These are tumours arising from any portion of the dental tissue, either from the tooth germ or from the fully-formed tooth. It is more common to find them in young people, and clinically they are innocent tumours.

The method of diagnosis is to examine the teeth and find out if any of them are missing or abnormally arranged. It is easy to distinguish them from a periosteal sarcoma, but confusion may arise between them and a very slow-growing endosteal or myeloid sarcoma. A skiagram will generally reveal the true state of affairs, for any abnormality or misplacement of the teeth is clearly shown. It is well to remember the existence of these tumours, for unnecessarily severe operations have often been performed in ignorance.

Two diseases in which the mandible becomes enlarged, but in which the swelling is not confined to the one bone, and is only one of the manifestations of the complaint, remain to be mentioned :—

4. **Acromegaly.**—The lower jaw is often conspicuously enlarged in this disease, becoming prominent and massive (*Fig. 88*, p. 263). There is hypertrophy of the whole bone rather than a swelling in it. The other bones of the face are enlarged, the superciliary ridges are exaggerated, and the general effect of the disease is to give the patient the appearance of a dull, coarse-featured person. In addition, the hands and feet become much enlarged; also, in the late stages of this very chronic illness, headache and muscular debility become prominent symptoms, and owing to swelling of the pituitary body, bilateral temporal hemianopia is to be expected (see *Fig. 102*, p. 334).

5. **Leontiasis Ossea** is the name given to a rare disease in which hyperostoses of the facial and cranial bones are the distinguishing features. It is not likely to be confounded with any of the above-mentioned swellings, except perhaps acromegaly, from which it is distinguished by the absence of changes in the hands and feet.

George E. Gask.

SWELLING OF THE JAW, UPPER.—(See article on SWELLING OF THE JAW, LOWER.) The remarks there made apply equally to swellings in the upper jaw.

Special attention, however, is required concerning tumours arising in the antrum of Highmore, for many cause no pain or discomfort until the late stages. Though innocent tumours may start in the antrum, the commonest is sarcoma. Rapid growth, bulging into and invasion of surrounding fossæ, pain, and discharge of blood and pus are momentous indications of malignant disease. In the case, though, of slow-growing tumours and in the early stages, differentiation between innocent growths or suppuration is extremely difficult. Transillumination (see PAIN IN THE JAW, UPPER) is to be employed (*Fig. 62*, p. 205), also puncture of the antrum, and if necessary exploration.

George E. Gask.

SWELLING OF THE LEGS.—(See ŒDEMA.)

SWELLING ON A BONE.—It is presumed that the swelling has been ascertained to be of the bone, immovable apart from it, and that it is not merely some tumour lying close to it.

The following method of examination should be adopted :—

1. Inquiry into the clinical history, mode of onset, duration.
2. Search for the signs of inflammation.
3. Evidence as to whether the swelling is a localized projection or involves the whole circumference of the bone.
4. Investigation for involvement of other bones or further signs of disease, e.g., tuberculosis, syphilis, rickets, etc.
5. A skiagram should always be taken if possible.
6. If a discharge is present, a bacteriological examination is to be made.

The various swellings may be classified under the following headings :—

(I.) *Injury* ; (II.) *Infective Diseases* ; (III.) *General Diseases*, not limited to one bone ; (IV.) *Tumours* ; (V.) *Cysts*.

I.—INJURY.

A blow or kick may give rise to a swelling due to *extravasation of blood* or serous fluid under the periosteum. This disappears rapidly, but may leave a small permanent thickening or node. Such a node is found not infrequently on the shins of football players. A fracture of bone is followed by the formation of *callus*, which forms a large swelling if the broken ends do not lie in accurate apposition, or if there is too much movement between them. After four to six weeks the callus begins to be absorbed, and it may disappear entirely ; in most cases a small permanent swelling indicates the site of fracture. A green-stick fracture may not show any swelling at first, and may be overlooked on this account, only being discovered when the formation of callus draws attention to it.

II.—INFECTIVE DISEASES.

These give rise to inflammatory changes in bone, the signs of which are more or less obvious, according to the nature and virulence of the infection. These changes have usually been named according to the chief starting-point (periostitis, osteomyelitis, etc.), though they seldom remain confined to one particular part of the bone. In this article the classification will be made according to the nature of the infecting organism, viz., pyogenic (staphylococci and streptococci), tubercle, syphilis, etc.

A. With Pyogenic Organisms.

1. *Acute infection* may occur through wounds or injuries, or via the bloodstream. The resulting swelling is due to the formation of pus between the periosteum and the bone ; this may be of the nature of a localized abscess, or the whole of the periosteum may be stripped off and the bone lie bare in a bag of pus. The disease usually occurs in young people, and the intimate attachment of the periosteum at the epiphyseal lines limits the spread of suppuration ; in long-standing cases the pus may burrow further and even burst into the joint. Suppuration is rarely limited to the surface of the bone, but spreads into the marrow, causing osteomyelitis ; lymphatic absorption and septic embolism are liable to give rise to a general blood-infection and pyæmia.

The signs of inflammation are abundant : the swelling is acutely painful and tender, the skin over it red and œdematous, and the constitutional signs of fever are marked. If the blood is examined, a high leucocytosis will be found.

It is important not to mistake *erythema nodosum* for this affection; in *erythema nodosum* the red swellings are generally multiple, bilateral, and confined to the shins; it is rare for acute osteomyelitis to be bilateral and symmetrical, and confined to the parts between the knees and the ankles.

2. *Chronic infection*.—Such a condition as detailed above may often become chronic and cause a swelling which may last for months, years, or through life. If the pus formed under the periosteum escapes, either by bursting or through an incision, sinuses form, and the periosteum, in the process of repair, becomes thickened. If during the height of the inflammation, a portion of the bone has died—necrosis—this acts as a foreign body, keeps up inflammation and suppuration, and great thickening of all the constituent parts of the bone results (Fig. 192). Usually the diagnosis can be arrived at without difficulty. Occasionally, if the inflammatory changes have not been great, and the amount of necrosis is small and deeply-seated (central necrosis), a condition resembling a slow-growing sarcoma may result. If a skiagram is taken it will be observed that the chronic inflammatory periosteal thickening is added on to or “applied” to the original compact layer of bone, whereas in the case of sarcoma, though there may be thickening and formation of bony or calcareous spicules in the growth, the compact layer is eaten away (Figs. 196, 198, 199, pp. 754, 756). However, this may be somewhat slender evidence on which to base the diagnosis between so important a condition as sarcoma and inflammation, and if doubt arises an incision should be made into the tumour, so that a portion may be removed for pathological investigation.

B. Tuberculous Disease usually starts in the cancellous tissue of the small bones of the carpus, tarsus, and phalanges, and at the ends of long bones. The inflammatory changes, which are slight, give rise to caries of the affected bone; the external signs of inflammation are little marked, and it is comparatively rare for any swelling of the bone to result, though the soft parts around the bone may be swollen considerably.

Tuberculous dactylitis (Fig. 193) furnishes an instance in which the disease forms a periosteal swelling. It is found most often in quite young children, and the bones commonly affected are the metacarpal bones and phalanges of the hand. The affected digit exhibits a fusiform enlargement, slightly tender, which on rest tends to diminish. Tuberculous periostitis may develop in any

Fig. 192.—Skiagram from a case of chronic periostitis of the ulna, due to pyogenic infection.
Skiagram by Dr. Hugh Walsham.

long bone, on the ribs and the humerus most commonly, and it then has to be differentiated from syphilis.

Chronic abscess of bone occurs most frequently in the young adult, and nearly always in the articular extremity of a long bone, by preference in the upper end of the tibia. Enlargement of the bone is only found when the abscess approaches the surface and involves the periosteum. The skin then becomes a little red and oedematous, and there is generally a small spot that is exquisitely tender on firm pressure. It is to be noted that when secondary infection with pyogenic organisms occurs—a not infrequent event—all the swellings described under "acute infection" may result. A skiagram will generally reveal the true condition; if not, a diagnostic injection of Koch's old tuberculin may be made, or von Pirquet's skin reaction tested.

C. **Syphilis** in the acquired form may lead to periosteal thickenings in the secondary stage and to gummata in the tertiary. The former give rise to

excessively tender swellings on the surface of the tibiae, clavicles, sternum, ribs, or skull. They are generally multiple, two or three often being found on the same bone. The patient complains of pain, particularly when in bed, because the extra warmth causes further dilatation of already inflamed vessels. Relief is given almost at once by taking potassium iodide. Sometimes one of these swellings is followed by the formation of compact periosteal bone, giving rise to a node which fades gradually into the surrounding parts, like a hill rising gently from a plain.

Gummata may form localized swellings, or may invade the whole substance of the bone, causing osteomyelitis and general thickening. The condition has to be distinguished from tuberculosis, chronic pyogenic infection, and sarcoma; such recognition is arrived at by means of the Wassermann test, and the fact that antisypilitic remedies cause a marked and rapid improvement. Diagnosis by incision has rarely to be resorted to.

Fig. 193.—Skiagram from a case of tuberculous dactylitis of the first phalanx of the index finger of a child.

Skiagram by Dr. Hugh Walsham.

In *congenital syphilis* two forms of bony swelling are common:—

(a). Periosteal thickenings of the bones of the vault of the skull, called Parrot's nodes—the hot-cross bun or natiform skull.

(b). In new-born infants, epiphysitis and separation of the epiphyses. So painful is a limb thus affected that it is kept motionless, and may be thought to be paralyzed.

D. **Typhoid Fever.**—In the course of this disease a periosteal node or abscess may form. From the fluid a pure culture of typhoid bacilli may be obtained, perhaps for a long time after the fever. The nodes by no means always break down into pus.

III.—GENERAL DISEASES NOT LIMITED TO ONE BONE.

1. *Rickets*.—The ordinary form is well known, and can hardly be confused with any other disease. The typical bony swellings it gives rise to are thickenings, due to irregular growth about the epiphyses of the long bones, particularly the lower ends of the radius and femur, and at the costo-chondral junctions, forming the so-called "rickety rosary." There may also be bossing of the bones forming the vault of the skull.

2. *Scurvy-rickets* is quite distinct from rickets. It arises generally in infants under twelve months old, who have been fed too exclusively on artificial foods or preserved milk. The disease therefore is more common among the children of the rich than the poor. The child is often brought to the doctor on account of the sudden appearance of an exceedingly painful swelling of a long bone, such as the femur. The swelling may fluctuate, and yield on aspiration blood-stained fluid. Spontaneous fracture is liable to occur. The diagnosis is indicated by the fact that the child is anæmic, and has spongy gums and hæmorrhages from the mucous membranes. The condition is most likely to be confused with acute suppurative periostitis and traumatic fracture.

3. *Osteitis Deformans* (see Figs. 47, 48, p. 182) is a senile disease, very chronic, and characterized by thickening, lengthening, and bending of the bones. The whole osseous system may be affected, but attention is first drawn to the disease by bending of the limbs and enlargement of the head. In the rare event of one bone only being affected, it may be confused with syphilitic osteitis, and only be recognized on the failure of antisyphilitic remedies and by the subsequent involvement of other bones. The patient suffers from neuralgic pains, and in the later stages from dyspnœa. In such cases death sometimes occurs from the development of multiple sarcomata of the bones.

4. *Acromegaly* (Fig. 88, p. 263) is characterized by enlargements of the hands and feet, and thickening of the membrane and bones of the skull and face; the superciliary ridges and the lower jaw particularly are enlarged. There is also periosteal thickening, with enlargement of the ridges of insertion of muscles and ligaments.

5. *Leontiasis Ossea*.—In this disease there are irregular bony outgrowths from the cranial and facial bones.

Fig. 194.—Skiagram of a common variety of cancellous exostosis of the femur.

Skiagram by Dr. Hugh Walsham

6. Swellings of bones associated with diseases of joints may be found in *gout*, *osteo-arthritis*, and *pulmonary hypertrophic osteo-arthropathy*. (See JOINTS, AFFECTIONS OF.)

IV.—TUMOURS.

These are innocent and malignant. Innocent tumours as a whole are characterized by their long history, slow growth, localized projection, and the absence of all signs of inflammation.

Varieties of Innocent Tumours.

1. *Osteoma* or *exostosis* is the commonest form (Fig. 194). The usual site is in the neighbourhood of the epiphyseal line of a long bone. In this position the tumour becomes pedunculated, is capped with cartilage, and often is surmounted by an adventitious bursa containing fluid.

Fig. 195.—Skiagram of an enchondroma of the fifth metacarpal bone. Compare with Figs. 197, 198, 199. Enchondroma and sarcoma do not appear unlike in skiagrams.

Skiagram by Dr. Hugh Walsham.

The ungual phalanx of the great toe is another common site for a similar tumour. Multiple exostoses are not uncommon, and they may be hereditary. Diagnosis can be made at once by means of a skiagram, and with this aid it can be seen that the swelling is composed of cancellous tissue continuous with that of the bone. A spurious osteoma may arise by ossification of a tendon or by an extension of the ridge into which the tendon is inserted.

Ivory exostoses may be found on the flat membrane bones of the skull, in the auditory meatus growing from the petrous bone, and causing displacement of the eye if springing from the orbital plate of the frontal bone or the walls of the frontal sinus.

Fig. 196.—Skiagram of a periosteal sarcoma of the tibia.

Skiagram by Dr. Hugh Walsham.

2. *Chondromata* may grow from any bone. They are most commonly multiple, affecting the phalanges and metacarpal bones of the hand (*Fig. 195*). The result is increasing deformity, with pain and ulceration of the skin.

3. *Fibromata* grow from the fibrous tissue of the periosteum, but are rare except in the form of an epulis of the jaw. (See also SWELLING OF THE JAW, LOWER.)

4. *Lipomata* are extremely rare. They grow from the outer layer of the periosteum.

Malignant Tumours.

These may occur either primarily (sarcoma), or secondarily by metastasis or by invasion (sarcoma and carcinoma).

Fig. 197.—Skiagram of an early myeloid sarcoma of the lower end of the radius. This and the two succeeding figures should be compared with *Fig. 195*, which shows that enchondroma and sarcoma are not distinguishable by x-rays alone.

Skiagram by Dr. Hugh Walsham.

1. *Periosteal sarcomata* are of so many types, and of such varying degrees of malignancy, that it is a difficult task to lay down any rule as to their characteristics. As a rule, the softer their consistency and the nearer they approach to the embryonic type of the tissue, the more malignant they are; the nearer they reach the fully-formed tissues and contain cartilage, bone, or fibrous tissue, the slower growing and less malignant they are. A typical case may be represented as a rapidly growing tumour, generally about the end of a long bone (*Fig. 196*). It is not usually painful, and the signs of local inflamma-

tion and general fever are little marked or absent. The patient is commonly a young adult, who often gives a history of injury to the part, and may lose weight and strength before actual cachexia sets in. The veins over the swelling become prominent, the lymphatic glands enlarged, and metastases by the bloodstream occur early. It has to be distinguished from chronic and syphilitic periostitis. If a skiagram is insufficient, a piece of the tumour may have to be excised, decalcified, and a microscopic section from it prepared. This form of sarcoma is the worst possible, and seeing that amputation does not cure and often does not prolong life, this extreme resource may be delayed where either gumma or chronic periostitis is still a possible diagnosis.

Fig. 198.—Skiagram giving the antero-posterior view of a myeloid sarcoma of the lower end of the radius. The growth is at a later stage than that depicted in Fig. 197.

Fig. 199 shows the same growth as Fig. 198, but seen from the lateral aspect.

Skiagrams by Dr. Hugh Walsham.

2. *Endosteal or myeloid sarcomata* are of much slower growth; so slow are they that some pathologists are inclined to denote them as benign tumours. They are prone to affect the ends of the long bones, particularly the lower end of the femur, the upper end of the tibia, the upper end of the humerus, the lower end of the radius (Figs. 197, 198, 199), the sternal end of the clavicle, and the upper jaw (malignant epulis). Attention is first called to the part by pain; then a more or less uniform swelling appears. This is at first bony hard, and only as the shell of bone yields does softening occur, or crackling on pressure. The lymphatic glands are not enlarged, and metastases do not occur. In the early stages, diagnosis has to be made from rheumatism and chronic abscess, and

later from chronic osteomyelitis and periosteal sarcoma; it is easily made by the aid of x -rays as a rule, but it is most important not to mistake the callus that is produced after fracture for a sarcoma; this mistake is not always obviated even by the use of the x -rays, unless the latter reveal the line of fracture as well as the callus around it.

3. *Carcinoma* is always secondary. Squamous-celled carcinoma may spread from an epitheliomatous ulcer of the leg, or to the jaw from the lip or floor of the mouth. It is mostly spheroidal-celled carcinoma which infects bone by metastatic growths, particularly from the breast. A swelling of bone may be found, but this is rarely discovered until attention is called to it by a spontaneous fracture.

V.—CYSTS.

1. *Blood cysts* are found in degenerating sarcomata.

2. *Hydatid cysts* are uncommon in this country. They affect the diaphyses of the long bones, converting the shaft into a thin-walled tube, which undergoes spontaneous fracture.

3. Cysts of the jaw, or *dentigerous cysts*, are considered in the article on SWELLING OF THE LOWER JAW.

George E. Gask.

SWELLING, PELVIC.—There are so many swellings which may rise up out of the pelvis into the abdomen, and also which may appear to be pelvic when they are really primarily abdominal, that a list in tabulated form may be of value :—

Bladder.—Simple distention of. New growth.

Vagina.—Hæmatocolpos.

Uterus.—Pregnancy : normal or abnormal, or associated with tumours of the uterus or ovary

New growths : Fibromyoma. Sarcoma. Carcinoma.

Hæmatometra. Chorion-epithelioma.

Ovary.—Cysts. Solid new growths.

Fallopian Tubes.—Hydrosalpinx

Pyosalpinx

Salpingo-oöphoritis

New growths

Carcinoma

Tubal gestation

Progressive extra-uterine gestation.

Pelvic Peritoneum.—Encysted peritoneal fluid

Hæmatocele due to extra-uterine gestation

Hæmatocele due to hæmorrhage from a corpus luteum

Pelvic abscess

Ascites

Hydatid cysts

Retroperitoneal lipoma.

Pelvic Cellular Tissue.—Cellulitis. Pelvic hæmatoma.

Appendix Vermiformis.—Abscess around

Appendicitis with pregnancy.

Pelvic Bones.—New growths of.

Omentum.—New growths of. Cysts of.

Phantom Tumours.

Pancreatic Cysts.

Kidney.—Tumours of. Hydronephrosis. Pyonephrosis.

Gall-bladder.—Distention of.

Spleen.—Enlargement of.

Urachus.—Cyst of.

It is obvious that many of these lesions are not pelvic at all ; but they are not omitted from the list, because they are liable to be mistaken for pelvic tumours. Thus *pancreatic, renal, splenic, and gall-bladder tumours* may reach the pelvic brim, but the history ought to show that they have grown down from above, not up from below. Further, *renal tumours* may be associated with urinary changes, or absence of urinary secretion on the affected side, as detected by the cystoscope. *Splenic enlargements* may be associated with blood-changes, and *gall-bladder distention* with icterus. *Pancreatic cysts* are the least likely to be mistaken for pelvic swellings, but they have been difficult to distinguish from ovarian tumours with long pedicles.

Naturally, the commonest difficulty which arises in the diagnosis of pelvic swellings is to differentiate between the *distended bladder, pregnant uterus, ovarian cyst, and uterine fibromyoma*, and the commonest mistakes are made between these swellings. The *distended bladder* is clearly the easiest to dispose of, because the passage of a catheter will settle the question ; and yet the neglect of this simple procedure has led to more than one abdomen being opened.

The history is of value in differentiating the other swellings, for amenorrhœa is the rule in pregnancy, menorrhagia in fibromyoma, and no change in menstruation in ovarian tumours. These assumptions are absolutely correct in almost 99 out of every 100 cases, but exceptions do exist. The cardinal point in diagnosis is not to think of the possible fallacies until the common rule has been thoroughly considered. Normal menstruation during pregnancy is almost unknown, but it is believed that menstruation is possible up to the third month of pregnancy. This is physiologically unsound, for menstruation represents the failure of the uterus to receive a fertilized ovum, and should not be even possible if conception does occur. That hæmorrhages occur during the early months of pregnancy is true ; but in most cases these hæmorrhages represent threatened abortion, and not menstruation. Further, fibroids are associated with hæmorrhages. This is absolutely true in the case of interstitial or submucous growths ; but there may be no disturbance of menstruation in subperitoneal fibroids. Ovarian tumours only disturb menstruation when they are double, and destroy all ovarian tissue. As long as a small piece of ovarian tissue remains undestroyed, there is no reason why menstruation should not occur normally.

Palpation of these tumours may be fallacious, although there is no difficulty in distinguishing foetal parts when the foetus is big enough. In the early months the pregnant uterus may fluctuate like a cyst ; a softened fibroid may do the same, whilst on the other hand a tense ovarian cyst may feel so hard as to be mistaken for a *fibroid*. Whilst the presence of the foetal heart is characteristic of pregnancy, its absence cannot be taken as evidence of a fibroid or of an ovarian tumour. It is not always possible to hear the foetal heart even in advanced pregnancy. If the pedicle of a tumour can be felt definitely attached to one uterine cornu, it is strong presumptive evidence of an ovarian tumour. It is useful to pull down the uterus with a tenaculum, at the same time pushing up the tumour so as to make tense the pedicle, which might then be palpated by the vaginal touch. When small tumours are in question, the first point which arises is, Can the tumour be separated from the uterus bimanually ? If so, it can be neither a fibromyoma of the uterus nor a normal uterine pregnancy. This point can only be made out by careful bimanual examination, and undoubtedly may require considerable skill in some cases.

Early pregnancy in a retroverted uterus should not give rise to diagnostic difficulties if it be remembered that the soft, boggy fundus is felt through the posterior fornix, that the cervix looks down the vagina or forwards to the symphysis, and that the posterior mass is continuous with the cervix. If the retroverted uterus is associated with vesical distention, the picture is usually clear enough.

The history of constant dribbling of urine (distention with overflow), amenorrhœa, other signs of pregnancy, and the presence of two tumours—one in front, tense and elastic, the other behind, soft and boggy—and finally, the passage of a catheter, will settle the question. The diagnosis of solid ovarian tumours is not always possible, for the pedicle is often short, and the tumour is then so close to the uterus that the two cannot be separated. They are therefore likely to be mistaken for fibroids of the uterus. They do not often cause menorrhagia, however, and this may be remembered as a cardinal point.

Large tumours arising in the pelvis are not often difficult to differentiate from one another, bearing in mind that ovarian tumours, uterine fibroids, pregnancy, and ascites are the common conditions which are met with. In this connection, it cannot be repeated too often, that amenorrhœa stands for pregnancy, and occasionally, for ovarian tumours when double. Menorrhagia goes with uterine fibroids except in the case of subperitoneal tumours. Exceptions to these general statements are uncommon, and mistakes in diagnosis will occur but seldom if they are borne in mind. Ascites has to be differentiated from ovarian cysts, and occasionally from hydramnios. In general, ascites gives dullness in the flanks on percussion, with resonance over an area somewhere about the umbilicus, whilst ovarian cysts give dullness all over the front of the abdomen, with resonant areas in the flanks and epigastric angle. When ascites exists along with ovarian tumours, the free fluid may be so large in amount that the tumour cannot be felt; as a rule, however, it can be touched on dipping through the fluid. Ascites with an ovarian tumour does not necessarily mean malignancy, but it may do so. Fibroma of the ovary, and simple ovarian cyst with a twisted pedicle, will always be accompanied by some fluid.

When *pregnancy is associated with tumours*, the diagnosis may be of great difficulty. The difficulty, however, does not lie in the recognition of the pregnancy; amenorrhœa, breast changes, foetal movements, and the foetal heart will usually make that clear enough; it lies in deciding the nature, or even the presence, of a tumour along with the pregnant uterus. In the early months, when the presence of two tumours can be demonstrated, the diagnosis is easier, but in the later months, the great size of the abdomen, and the way in which the swellings merge into one another, may obscure the picture. The relation to the uterus, whether a part of it, or attached to it by a pedicle; the feel of the tumour, whether solid or cystic, soft or hard; and the previous history; will always be of assistance in making out the nature of the growth. It must not be forgotten that fibroids are extremely likely to soften and degenerate during pregnancy, so that they are liable to be mistaken for ovarian cysts.

In the case of *ovarian tumours*, it is often impossible to be sure of the exact nature of the growth, and this has to be decided microscopically after removal. It is, however, important to distinguish malignancy in growths of the ovary, and certain points will stand out in favour of this. Thus, fixation of the growth in the pelvis, obvious ascites, emaciation of the patient, and rapid growth in size of the abdomen, are points in favour of malignancy.

In the case of definitely *uterine tumours*, the diagnosis of malignant growths is not often difficult, but may have to be settled by the microscopic examination of curetted fragments. Fibroids are only likely to be mistaken for malignant growths when they produce constant bleeding as a result of extrusion, infection, and sloughing. Rapid growth of a fibroid is more likely to be the result of degenerative changes, such as formation of cysts or necrobiosis, than to the development of a sarcoma or other malignant growth along with it.

With small tumours confined to the pelvis, or rising only a little above the brim, diagnosis is often a matter of extreme difficulty. In practice, however, *extra-uterine gestation* and its resulting blood-tumours stand out pre-eminently

as swellings which must be recognized at once, if successful treatment is to be adopted. Before rupture or abortion has occurred, a tubal gestation is essentially a small tumour in one postero-lateral corner of the pelvis, attached to the uterus, indefinite in consistence, and perhaps—though not always—associated with amenorrhœa of short duration, and attacks of pain in the pelvis of an acute nature. Definite signs of pregnancy may be entirely wanting. It may be mistaken for a chronic salpingo-oöphoritis, a small cystic ovary, a small pedunculated fibroid, or a small ovarian dermoid. The differential diagnosis may be absolutely impossible; but attacks of pain unassociated with menstruation are not likely to occur in any of the latter conditions. The attacks of pain are usually the result of over-distention and stretching of the tube from hæmorrhage into its wall or lumen around the fertilized ovum. When tubal abortion has occurred, or tubal rupture, the signs of internal bleeding, accompanied by sudden pain and collapse, with hæmorrhage from the uterus, usually make up a complete and unmistakable picture. Hæmorrhage is more commonly severe and copious in tubal rupture than in tubal abortion. If the patient recovers from the initial bleeding, the clinical picture may be that of a retro-uterine hæmatocele, or of a peritubal hæmatocele. In this form, the uterus is pushed forwards and upwards against the symphysis pubis, and the mass of blood-clot can be felt posteriorly bulging the posterior fornix, and also the anterior wall of the rectum. The tumour is usually partly resonant in front, because intestine adheres to it. Tubal abortion is most likely to be mistaken for an ordinary uterine abortion; but the presence of a mass on one side of the uterus, with a closed cervix, and the absence of uterine contractions or extrusion of any products of conception, should make the case clear.

Progressive extra-uterine gestation is a rare occurrence, and is the result of continued growth of an embryo after a partial separation from the tube, as a result of rupture, or extrusion from the fimbriated end (abortion). The continued enlargement of a mass beside the uterus, with amenorrhœa and progressive signs of pregnancy, are the most characteristic points. The diagnosis, however, is difficult, because there is always some effused blood which is likely to obscure the outlines of the uterus, and make it appear to be a part of the pelvic mass.

The swellings due to *salpingo-oöphoritis* are usually quite easy to distinguish. They form fixed masses in the pelvis, seldom of any definite shape, but occasionally presenting the characteristic retort shape, with its narrow end near the uterus, which the tube assumes when distended with fluid. The history is usually that of an acute illness at some period, with pain in the pelvis, rise of temperature, and peritoneal irritation. It is preceded, as a rule, by uterine discharges and menorrhagia. This inflammatory disturbance in married women is associated with long periods of sterility, owing to the sealing up of the tubes. The diagnosis of suppuration with salpingo-oöphoritis is often impossible, but is always important, because the treatment may depend on it. Constant rises of temperature of the hectic type, wasting, and daily sweating, are the usual accompaniments of suppuration here as elsewhere.

A large *pelvic abscess* may accompany salpingo-oöphoritis, or may occur alone without infection of the tubes, as we see occasionally in puerperal septic infections. When it does occur, it is of course peritoneal; it fixes the uterus in a central position, bulges into the posterior fornix and rectum, tends to rupture into the rectum, is acute in onset, and accompanied by signs of local peritonitis. It is likely to be confounded with *pelvic cellulitis*, in which the uterus is fixed in a laterally displaced position. It bulges one lateral fornix, tends to burrow along the round ligament to the groin, is slow and chronic in onset, and is not accompanied by signs of local peritonitis. It always follows labour, whereas pelvic abscess of peritoneal origin may occur with salpingo-oöphoritis quite apart from pregnancy. Pelvic cellulitis never bears any relation to salpingo-oöphoritis.

Encysted peritoneal fluid, hydatid cysts, and retroperitoneal lipoma are generally diagnosed as ovarian cysts, and their true nature is only discovered at operation. There are no definite signs by which these conditions may be diagnosed, and as they all require operative treatment, post-operative diagnosis meets their requirements.

Distention of the vagina by menstrual fluid is not likely to be mistaken for anything else, if only on account of the absolute closure of the hymen which gives rise to it. *Hæmatocolpos* is practically the only central tumour met with between the rectum and the bladder, reaching from the hymen to the pelvic brim. The uterus can usually be felt like a cork movable upon its upper extremity.

Urachal cysts occur in front of the uterus and in close relation to the bladder; but in spite of this they are usually mistaken for ovarian cysts. It is to be remembered, however, that ovarian cysts only get in front of and above the uterus when they are large. Urachal cysts rarely attain a large size.

Appendicitis with pregnancy occasionally occurs, and may be mistaken for such a condition as torsion of an ovarian pedicle. The swelling due to appendix inflammations is, however, in close relation to the anterior superior spine of the ilium, and apparently adherent to the iliac fossa. The lump is ill defined, and rarely fluctuates unless there is a large abscess. The acute onset may be similar to that of torsion of an ovarian pedicle. There is usually a definite fluctuating tumour when an ovarian cyst is present, and some interval between it and the iliac crest can usually be felt.

Phantom tumours are due to diaphragmatic contraction, causing the abdominal wall to bulge. They are usually mistaken by patients for pregnancy, but are not accompanied by any of the signs of pregnancy. Amenorrhœa must be excepted from this, however, because these cases usually occur about the menopause. Their true nature can usually be discovered by making the patient breathe normally, relaxing the diaphragm; but if any doubt exists, the protrusion will disappear under an anæsthetic.

Growths of the pelvic bones are very rare tumours, usually cartilaginous or sarcomatous. They are only likely to be mistaken for adherent inflammatory masses, due to salpingo-oöphoritis. They will be found to be continuous with the bones forming the pelvis, and when growing from the sacrum may have the rectum in front of them; all other tumours have the rectum behind them. They may, however, bear no relation to the rectum at all if they occur on the right side of the pelvis. In most cases of this nature, the uterus and adnexa can be palpated bimanually, and shown to be free from disease and unconnected with the mass. When complicated by the presence of a pregnant uterus, their true nature may be very difficult to determine. Bearing in mind that they are absolutely fixed and continuous with the bones of the pelvis, the diagnosis ought not to be uncertain.

Thos. G. Stevens

SWELLING, PERINEPHRIC.—(See KIDNEY, ENLARGEMENT OF.)

SWELLING, POPLITEAL.—Popliteal swellings may be divided into:—

1. Fluid Swellings:

Bursa	Abscess
Baker's cyst	Aneurysm.

2. Solid Swellings not connected with Bone:

Enlarged glands	Innocent tumours.
Malignant tumours	

3. Solid Tumours connected with Bone:

Exostosis	Periostitis
Sarcoma	Separation of the epiphysis.

I. FLUID SWELLINGS.

Bursa.—The bursa underneath the insertion of the semimembranosus muscle into the posterior aspect of the inner tuberosity of the tibia is often enlarged. When the leg is extended it stands out as a tense fluctuating swelling on the inner side of the popliteal space; on flexion it disappears completely. It may be found enlarged in young athletes and cause no symptoms whatever. On account of its frequent communication with the knee joint, it is often distended when that joint is the seat of osteo-arthritis, and the changes found in the synovial membrane of the knee are found also in the synovial membrane lining the bursa, for the two are continuous. When much fluid is present, fluctuation can be detected between the joint and the bursa.

The bursa under either of the two heads of the gastrocnemius muscle may be enlarged, but this is rare.

Baker's Cyst occurs in connection with chronic tuberculosis of the knee joint, and is formed by the extension of a chronic abscess which spreads along a plane of fascia. Such an abscess may present itself in the popliteal space. The condition of the knee joint will indicate the disease.

Acute Abscess is recognized by the signs of acute inflammation; the skin is red and œdematous, the pulse and temperature are raised, and the swelling is very painful. The knee is kept flexed in order to avoid pressure. The abscess may be caused by suppurating lymphatic glands or by suppurative periostitis or necrosis of the lower end of the femur. In the former case the abscess will be superficial, and in the latter, deep to the popliteal vessels.

Aneurysm of the Popliteal Artery (*Plate XIII*) gives rise to an expansile pulsating tumour, the pulsation being synchronous with the heart's beat. Pressure on the femoral artery above will cause a diminution in size of the swelling and cessation of pulsation. The pulse at the ankle on the affected side may be smaller than that on the opposite, and delayed. If a stethoscope be placed over the swelling a distinct bruit can be heard. The complaint of the patient will probably be of pain, which may be referred down the leg if either popliteal nerve is pressed on, or in the site of the swelling if the bone is eroded. Varicose veins are almost always present on account of pressure on the popliteal vein. Owing to its pulsatile character, an aneurysm is not often mistaken for anything else, but it must be remembered that every swelling that pulsates is not an aneurysm. A soft vascular sarcoma growing from the end of the femur may be pulsatile, and over it a bruit may be heard, but the tumour is not as compressible as an aneurysm, and the effects on the distal pulse are not so marked. A skiagram will usually settle the question at once. Distinction must also be drawn between a tumour that pulsates and a tumour to which pulsation is communicated. For instance, an abscess or a solid swelling lying over the popliteal artery may appear to pulsate, but the movement is heaving in character and not expansile. In the rare event of an aneurysm having become filled with clot, it might be taken for a solid tumour growing either from the soft parts or from the bone. Under this delusion a leg has been amputated for sarcoma.

2. SOLID SWELLINGS NOT CONNECTED WITH BONE.

Enlarged Glands.—It is not common to find the popliteal glands enlarged from any cause. It is possible that they may become infected with pyogenic organisms from a sore on the back of the leg.

Tumours are rare. They may be innocent, e.g., *lipoma*; or *sarcomatous*, starting in the connective tissue of the popliteal space, or attached to one of the muscles. The innocent tumours are of long history and well defined; the malignant, rapidly growing and infiltrating.

PLATE XIII.

POPLITEAL ANEURYSM

Guy's Hospital.*

3. SOLID SWELLINGS CONNECTED WITH BONE.

In all cases of bony tumour a skiagram is of immense service, and should always be obtained if possible.

Innocent Tumours.—*Cancellous exostoses* may be found, generally in children and young adults, growing from the region of the epiphyseal cartilage of the femur (*Fig. 194, p. 753*). There may be others in other parts of the skeleton, and sometimes several members of the family are affected similarly. The swelling is of slow growth, well defined, and rarely gives any trouble. It is most often found at the inner side of the popliteal space. There is one thing that may be confounded with it, namely, *ossification of the insertion of a tendon or muscle*. The adductor longus muscle is the one most commonly affected.

Malignant Tumours are endosteal and periosteal sarcoma. *Central sarcoma* in its early stages so closely resembles chronic osteitis and periostitis that it may be impossible to come to a correct conclusion without the aid of a skiagram. With this help the difficulty vanishes, for a myeloid tumour is seen clearly as a well-defined tumour causing enlargement of the bone (compare *Figs. 197, 198, 199, pp. 755, 756*).

Periosteal sarcoma causes a general enlargement of the whole of the lower end of the femur or upper end of the tibia (*Fig. 196, p. 754*), not swelling in the popliteal space only. It is mentioned here because of its occasional confusion with periostitis with popliteal necrosis.

Periostitis.—Popliteal necrosis with abscess formation may give rise to a big swelling. The signs of inflammation will usually be well marked and accompanied by constitutional symptoms and leucocytosis. Chronic periostitis, or chronic abscess of the bone, or central necrosis, may be extremely difficult to distinguish from a periosteal sarcoma. A skiagram should be taken, and if necessary an incision is to be made down to the tumour, and a piece removed for histological examination. (See SWELLING ON A BONE.)

Separation of the Epiphysis.—In the somewhat rare accident of separation of the lower epiphysis of the femur, the lower fragment becomes displaced backwards, forms a prominence in the popliteal space, and presses on the vessels, sometimes to a dangerous extent.

Georgé E. Gask.

SWELLING, PULSATILE.—When a tumour can be felt pulsating, the first point to decide, if possible, is whether the pulsation is expansile or whether it is merely transmitted by a non-expansile tumour which is in direct contact with large pulsating vessels. The distinction is sometimes obvious, especially when the tumour has developed in a place where there are no particularly large blood-vessels to transmit pulsation, for instance in the foot, or in direct connection with a long bone at some spot not immediately adjacent to the main artery of the limb. The chief difficulty arises when the mass is either in the root of the neck or in the abdomen and, to a less extent, when it is in the axilla, the inner aspect of the upper arm, in front of the elbow, in the groin, or in the popliteal space. Careful palpation is probably the best means of determining whether there is actual expansile pulsation or not; in the case of the abdomen it is important to make the examination with the patient, not only upon his back, but also in the knee-elbow posture, for sometimes a tumour which is in contact with the aorta in the dorsal position falls away from it and ceases to transmit pulsation in the ventral posture.

If it can be decided definitely that the tumour is itself pulsating, most probably it is either an *aneurysm* of an artery or else a very vascular growth, especially *osteosarcoma*. The existence of egg-shell crackling with pulsation in a tumour would be highly suggestive of *osteosarcoma*, though it is conceivable that it might also be felt over an aneurysm that had extensively

eroded the adjacent bones. Aneurysm will be the probable diagnosis when the markedly pulsatile swelling occurs directly along the course of a known artery. Absence of pulsation does not, however, exclude aneurysm, for the latter may be either too deeply situated for the pulsation to be felt, or else the sac may be partly or wholly filled by organized or organizing clot.

Sometimes there may be doubt as to whether there is really pulsation or not, when digital examination alone is relied upon; in such cases, direct application of the ear to the part in such a way that the pinna is in uniform contact with the patient's skin, will sometimes bring pulsation to the notice very clearly when its amount, appreciable to the membrana tympani, is too slight for the hand to detect; this applies particularly to deep-seated intrathoracic aneurysms.

It must be remembered, on the other hand, that marked pulsation may suggest aneurysm without any being present, particularly at the root of the neck and in the abdomen; a normal subclavian artery may sometimes seem to be abnormal, particularly if it is pushed forward or displaced by a mass below or behind it, for instance an accessory cervical rib. Undue pulsation of the abdominal aorta, especially in women, is also to be remembered as a possible source of erroneous diagnosis (see PULSATION, UNDUE ABDOMINAL AORTIC).

It should also be remembered that normal arteries cause very violent pulsation in cases of marked aortic regurgitation, and in severe cases of exophthalmic goitre, in which the whole neck, including the enlarged thyroid gland, may be seen to be pulsating vigorously.

We need not here discuss in detail the differential diagnosis between one kind of aneurysm and another, though one might mention in particular the so-called cirroid aneurysm of the scalp (*Plate XIV*), which is rather a conglomeration of many abnormally dilated arteries in the form of an arterial nœvus than a true aneurysm. Its position on the scalp will at once suggest the diagnosis.

A pulsatile orbital tumour will generally be due either to an osteosarcoma, or to an arterio-venous aneurysmal communication between the internal carotid artery or its ophthalmic branch, and the cavernous sinus. The presence of a loud bruit would be in favour of the latter.

It is important not to mistake for the ordinary pulsatile tumours those which may move synchronously with respiration, such for instance as hernia pulmonalis, hernia cerebri, and certain congenital abnormalities of the brain and spinal cord, such as meningomyelocele (*Fig. 75*, p. 254).

It is unlikely that a pulsatile liver will be mistaken for any other kind of pulsatile tumour. The cases in which it occurs are those of chronic failure of cardiac compensation, generally mitral stenosis with œdema of the legs, lividity, orthopnoea, and perhaps ascites, which have generally been present for some time before the nutmeg liver becomes obviously pulsating.

Rarely, the cardiac pulsations may be transmitted direct to fluid contained in a pleural cavity, so that the bulging intercostal spaces may pulsate synchronously with the radial artery and simulate some more serious pulsatile tumour. The history and the physical signs, including displacement of the heart towards the opposite side, will generally indicate the correct diagnosis, though there may be some trepidation on the part of the operator who decides to insert the exploring needle into the pulsating swelling.

Herbert French.

SWELLING, SCROTAL.—It is first essential to prove that the swelling is really limited to the scrotal region, and this is best done by grasping the root of the scrotum between the fingers and thumb, and thus ascertaining if the swelling does or does not extend into the inguinal region along the cord. Failure to take this obvious precaution has led to the tapping of a hernia with disastrous results. True scrotal swellings may arise in any of the following tissues:—

PLATE XIV.

CIRSOID ANEURYSM

*Reproduced by permission from a water-colour painting in the Gordon Museum,
Guy's Hospital.*

(1) Skin ; (2) The various connective-tissue coverings of the testicle ; (3) Tunica vaginalis ; (4) Testicle ; (5) Epididymis ; (6) The lower end of the spermatic cord ; (7) The urethra ; (8) The bones of the pubic arch.

1. **The nature of swellings affecting the Skin** is usually obvious. The only common ones are : Boils, soft sores and chancre, sebaceous cysts, warts and epithelioma. The latter soon ulcerates, commonly occurs in sweeps, and the groin glands soon become enlarged.

2. **Swellings of the various Connective-tissue Coverings** are very rare, but occasionally a fibrosarcoma may occur. These swellings are movable upon the testicle. The symmetrical enlargement called *elephantiasis scroti*, due to the *Filaria sanguinis hominis*, is limited to the tropics.

3. **The Tunica Vaginalis** may become distended with fluid, thus forming the ordinary *vaginal hydrocele*. Except in late cases, this is translucent, and is thus distinguished from a hæmatocele of the same cavity. It should not be forgotten that a hydrocele with thick walls may fail to give translucency. When proved to be translucent, it has to be distinguished from encysted hydrocele of the epididymis and encysted hydrocele of the cord. Vaginal hydrocele occupies the lower part of the scrotum and *envelops the testicle*, which cannot be felt as a separate object. *Encysted hydrocele of the epididymis* is placed *behind and above the testicle*, from which it is distinct, although attached at the upper and posterior part. Moreover, this variety of hydrocele never attains a large size, rarely getting larger than a tangerine orange. It is not tightly distended, but is usually flabby, and it contains a characteristic milky fluid in which cholesterol crystals (*Fig. 94, p. 281*) are present. *Encysted hydrocele of the cord* is placed *above the testicle*, which can be felt as a separate object. It rarely attains a large size, and is often elliptical in shape, extending upwards along the cord. All the hydroceles fluctuate. To test for this it is necessary to fix the swelling against some hard object. Bleeding may occur into any of them as a result of injury or constitutional disease. It is almost impossible to distinguish between an opaque hydrocele and a hæmatocele without tapping the swelling. In syphilitic disease, with irregular adhesion between the parietal and the visceral walls, a loculated hydrocele may occur.

4. **Swellings of the Body of the Testicle** may be inflammatory or neoplastic. Acute inflammatory swellings rarely attain a large size, and they are usually associated with enlargement of the epididymis, and occur as a part of acute epididymo-orchitis due to urethritis of some kind, or to *mumps* or as a *post-typhoidal* phenomenon. Chronic inflammatory swellings give rise to more difficulty. They are usually either *tuberculous* or *syphilitic*, or else due to *chronic torsion*. In the former disease, swelling of the epididymis is practically always primary and more advanced ; but in infants the body of the testis becomes involved at a very early stage. The enlarged epididymis can be felt enveloping the posterior border, and the upper and lower poles of the testicle. There is often a little hydrocele which may obscure the shape of the testicle. If there is adhesion, with perhaps an abscess or a sinus at the posterior and lower part of the scrotum, it is characteristic of suppurative disease of the epididymis, usually of a tuberculous nature. Moreover, in tuberculous disease, the vas is thickened, usually in a nodular manner. It is important to examine all the palpable part of the vas, for sometimes the nodules are limited to the inguinal region. Von Pirquet's tuberculin reaction is a valuable aid if its limitations are remembered. In striking contrast with this, syphilitic enlargement of the testicle leaves the epididymis unaffected, and is limited to the testicle, which enlarges unevenly, often affecting the tunica albuginea and the tunica vaginalis in a nodular manner. The syphilitic testicle rarely attains three times the natural size. It is curiously devoid of pain. The testicular sensation is often

lost, and there is little or no thickening of the cord. Its anterior surface is uneven and may become adherent to the coverings, which may later ulcerate, and ultimately give rise to a *hernia testis* on the front of the swelling. This contrasts with the postero-infero-lateral position of tuberculous sinus or *hernia testis*. *Chronic torsion of the testis* is generally the result of a blow, or of an injury in the saddle; the symptoms may be obscure until the testicle begins to swell. Operation is generally resorted to with the idea that the condition is tuberculous or malignant, and even then the diagnosis may be in doubt until microscopical examination of the organ has been made.

It is often very difficult to distinguish syphilitic enlargement of the testicle from that due to *growth*; but a course of large doses of antisyphilitic remedies and the Wassermann reaction may settle the matter. Malignant new growth nearly always grows steadily, and being entirely within the tunica albuginea it maintains the shape and smooth surface of the testicle until it reaches a size much larger than that of a syphilitic testicle. Moreover, it causes much more pain, and usually some thickening of the cord, with later enlargement of the glands in the loin. In some cases the diagnosis between syphilitic testicle, growth, and hæmatocele may be so difficult and so urgently necessary as to demand an exploration.

Malignant growths of the testicle can be divided into four varieties: (a) Carcinoma; (b) Sarcoma; (c) Embryoma; (d) Endothelioma.

Carcinoma is far more common than sarcoma, although the contrary has been believed for many years, owing to the fact that many carcinomatous growths with small alveoli have been wrongly labelled sarcoma. The average age of patients with carcinoma testis is 43, and of those with sarcoma testis, 34. The average duration of carcinoma before operation is $1\frac{1}{2}$ years; of sarcoma, 11 months. Sarcoma advances much more rapidly and kills earlier than carcinoma. The former disseminates through the veins, whereas the latter travels along the lymphatics and infects the lumbar glands. Embryoma is, according to Nicholson, "the commonest new growth of the testicle, but it is often overlooked." It can be shown to contain structures derived from all the three blastodermic layers of the embryo. The average age at the time of operation is 29, the average known duration before operation is $5\frac{1}{2}$ years. "Although not necessarily malignant, it may produce metastases composed of all the tissues of the primary growth, or one tissue may become actively malignant, in which case the deposits will be formed of that tissue alone." It may spread along the lymphatics or disseminate through the veins.

5. **The Epididymis** may become enlarged as the result of (a) Inflammation (b) New growth; (c) Cystic degeneration.

a. *Inflammatory swellings* are characterized by being elongated in a vertical direction; by their relation to the testicle, which they overlap at its posterior border, and its upper and lower poles; and lastly, by being flattened from side to side, so that the antero-posterior diameter is greatly increased. Inflammatory swellings may be:—(i) Gonorrhœal; (ii) Septic, secondary to some other form of urethritis; (iii) Tuberculous.

i. The *gonorrhœal* variety is distinguished by its acuteness, great tenderness, the surrounding œdema, and the bacteriological examination of the urethral discharge. Its onset is usually between the second and tenth week. Occasionally a subacute form develops later, at any time during the course of gleet. This is very difficult to distinguish from the tuberculous variety. Most cases of tuberculous epididymitis end in suppuration, but the gonorrhœal variety very rarely breaks down.

ii. The inflammation of the epididymis following other varieties of *urethritis* (such as ulceration near a stricture or due to impacted calculus, instrumentation, or prostatectomy), is often sufficiently indicated by the history if care be

taken to go into this thoroughly. The swelling following prostatectomy is apt to suppurate. Some of these can be mistaken very easily for tuberculous disease.

iii. *Tuberculous epididymitis*, as a rule, is far more insidious and painless in its onset than other forms of epididymitis; but it should not be forgotten that early subacute or even acute attacks of inflammation may accompany this disease, and that these are often the means of drawing the patient's attention for the first time to a disease which has been going on insidiously for some months. It has frequently been said that tuberculous nodules are limited to the globus major, and that those left after gonorrhoeal urethritis are confined to the globus minor. It is more true to say that the latter are limited to the globus minor, whereas tuberculous disease may attack any part of the epididymis. Wherever the tuberculous disease starts, the inflammatory products soon spread through the thin fibrous capsule of the epididymis, and then gravitate towards the postero-infero-lateral corner of the scrotum, where adhesion occurs, followed later by an abscess and a sinus. In the diagnosis of tuberculous from other forms of epididymitis, the general state of health, and especially the presence or absence of other tuberculous lesions, are of great importance. Nodular thickening of the vas deferens and of the vesiculæ seminales and prostate are also valuable signs when the disease is well advanced. It should be remembered that the disease travels upwards along the vas, so that in its early and hopeful stages the upper part of the vas and vesiculæ seminales are not enlarged.

b. *Primary new growth* of the epididymis is excessively rare, so that it need not give rise to much concern in diagnosis; it will generally be regarded as tubercle until after operation and microscopical examination of part of the tissue excised.

c. *Cystic disease* of the epididymis may occur in the form of: (i) Solitary cysts (*vide supra*); (ii) Multiple cysts. The latter condition rarely occurs except in men past middle age, and is analogous to cystic degeneration of the breast. The condition is almost painless and harmless. These swellings are translucent.

6. **Swellings of the Lower End of the Cord.**—The most important swelling of the lower part of the spermatic cord is *varicocele*. It is apt to be mistaken for omental hernia, but the mistake should never be made, because of the characteristic feel of the varicocele, and the reappearance of the swelling after it has been completely reduced and the finger is firmly pressed on the external abdominal ring.

7. **Urethral Conditions.**—Occasionally a *peri-urethral abscess* may form a swelling in the scrotum. Tenderness, oedema, and fluctuation, together with the history and evidence of urethral disease, serve to make the diagnosis clear. *Primary epithelioma of the urethra* is distinguished by the great pain and urethral obstruction that it engenders.

8. **Diseases of the Pubic Bones.**—Inflammatory products may travel into the scrotum from disease of the bones of the pubic arch, especially from the neighbourhood of the symphysis pubis. *Acute necrosis* of these bones is sufficiently indicated by the grave constitutional symptoms which always accompany it. *Caries* gives rise to more difficulty. The writer has known a case of tuberculous caries of the lower part of the symphysis pubis in which the inflammatory products gravitated backwards and to the left, so as to form a large firm swelling in the left half of the scrotum, where it gave rise to much difficulty in diagnosis, and was thought to be either a sarcoma arising from the fibrous covering of the crus penis, or possibly a gummatous mass in the same situation. Sufficient attention was not paid to the fact that the man had chronic phthisis.

R. P. Rowlands.

SWELLING, VULVAL.—The differential diagnosis of vulval tumours must necessarily include not only true swellings of the vulva, but also swellings which appear at the vulva as a result of the displacement of other structures, such as occur in prolapse and cystocele, and in addition lesions like kraurosis vulvæ, which are not strictly swellings at all. The lesions of the vulva may be tabulated under various headings, as set forth in the following scheme :—

Inflammatory Lesions.—

Simple vulvitis	Tuberculosis
Gonorrhœal vulvitis	Furunculosis
Soft chancre	Leukoplakic vulvitis
Papillomata	Kraurosis vulvæ
Syphilis :	Pseudo-elephantiasis
Hunterian chancre	Esthiomène.
Condyloma	
Tertiary lesions	

Cystic Swellings.—

Hydrocele of the canal of Nuck	Mucous cysts
Sebaceous cysts	Implantation cysts
	Dermoid cysts.

Blood Cysts.—

Varicocele	Traumatic hæmatoma.
Rupture of a varicose vein	

New Growths.—

Caruncle	Endothelioma
Fibroma	Squamous-celled carcinoma (epithelioma)
Lipoma	Columnar-celled carcinoma
Angeioma	Sarcomata of various kinds.
Neuroma	
Fibromyoma of round ligament	

Herniæ.—

Inguinal	Perineal.
Posterior labial	

Displacement —

Prolapse of urethral mucous membrane	Cystocele
Prolapse of uterus	Inversion of the uterus
	Fibromyoma of the vaginal wall.

Unclassified.—Simple anasarca.

Certain of these lesions stand out pre-eminently as presenting difficulties in diagnosis. The general principles by which solid tumours are distinguished from cystic, inflammatory swellings from new growths, or new growths from herniæ, need not be insisted upon here. Perhaps the commonest difficulty which arises in practice is the diagnosis of gonorrhœal vulvitis from simple vulvitis, and also between the gonorrhœal soft chancre and the syphilitic condyloma, the latter differentiation being of much more practical importance than the former as far as the patient is concerned. In the acute stage of a *gonorrhœal vulvitis* there is a chance of recognizing the gonococcus in the discharge, if films made from it are suitably stained. Practically, *all* acute forms of vulvitis appear alike clinically, so that the recognition of the gonococcus becomes a matter of importance. The way to recognize the gonococcus is to make films of the discharge on a slide, dry, fix by passing them through a flame; then stain by Gram's method, and counterstain by neutral red. The

gonococcus is not stained by Gram's method, but is coloured red by the counter-stain. The gonococci are seen in pairs *inside* leucocytes of the polymorphonuclear type (*Plate XII, Fig. R*). In chronic gonorrhœal infections with vulval swelling, as a rule the organism cannot be found in the general vulval discharge, but might be found in the urethra or in the cervix. A gonorrhœal infection may be suspected if the patient gives a history of an acute onset, accompanied by scalding on micturition, and when there are redness of the orifices of Bartholin's glands, and much redness and swelling of the carunculæ myrtiformes. Papillomata or warts of the vulva may occur also in chronic gonorrhœal infections, and there is no evidence of a reliable nature to show that they occur in any other kind of infection.

The *soft chancre of gonorrhœa* may be mistaken for the *condyloma of secondary syphilis*, but as a rule this difficulty should not occur. The soft chancre is a typical punched-out ulcer with a somewhat red base and clean edges, discharging pus. The condyloma, on the other hand, is a raised, flat-topped excrescence, with sodden, epithelium-covered surface. Soft chancres are not very numerous, as a rule, and are generally limited to the vulva. Condylomata are numerous, and may occur all over the labia, around the anus, and even on the skin of the thighs and gluteal region. Condylomata are from the start, or will be very soon after their origin, accompanied by a sore throat and a typical papular skin rash. In other words, condylomata are always accompanied by typical secondary syphilitic lesions. Soft chancres clear up with antiseptics; condylomata persist for long periods, but clear up in two or three weeks as a rule under mercurial treatment. It must not be forgotten that soft sores and condylomata may occur together in the same patient, in which case the diagnosis may be still more difficult.

Another practical differentiation which gives rise to anxiety is that between the *Hunterian chancre* or primary syphilitic sore, and *squamous epithelioma* of the vulva. This is a question which is of vital importance to the patient, if valuable time is not to be lost in the treatment of a malignant epithelioma. The two lesions look much alike at first; they form raised hard indurated masses in the skin, which may ulcerate quickly as a result of necrosis of the superficial portions. Both give rise to a thin watery discharge, and to enlarged glands in the inguinal region which do not suppurate at first, but may do so later in the case of an epithelioma. It must not be forgotten that a primary chancre is very seldom seen in women, whilst squamous epithelioma is relatively common. Of course the chancre will be followed in due course by secondary lesions, but it is not safe to wait for these to appear in a doubtful case. The only reasonable way to deal with such a case is to excise the doubtful swelling at once and submit it to microscope examination by an expert. A squamous epithelioma is easily detected in this manner in quite early stages, and does not in the least resemble a syphilitic lesion microscopically. The *Spirochæta pallida* may be recognized in scrapings of a hard chancre fixed and stained by Giemsa's or Levaditi's methods (*Plate XII, Fig. J*). In sections, too, the spirochæte may be demonstrated, but it must be remembered that for this purpose the excised growth *must* be fixed in 5 per cent formalin solution. Wassermann's serum test may assist the diagnosis.

Tertiary syphilitic lesions are by no means common on the vulva. When they do occur, they give rise to spreading ulceration, with great destruction of tissue, and scarring in the older healed portions. Here, the only likely lesions to be mistaken are some forms of epithelioma, and tubercle. Obviously, in such conditions the only reliable method of diagnosis is to be found in excision of parts of the lesion and microscopic examination of sections made from them. The disease known as *esthiomène* is probably a tertiary syphilitic affection.

Pseudo-elephantiasis of the vulva is usually a syphilitic affection of the labia minora, giving rise to great enlargement, with a rough and thickened appearance of the skin. It could only be mistaken for real elephantiasis due to lymphatic obstruction by the *Filaria sanguinis hominis* (Plate XII, Fig. F), a disease which is practically never seen in this country.

Unilateral œdema of a labium minus is a fairly common condition, and is usually associated with an infected wound or with a primary syphilitic chancre. *Bilateral œdema* is almost always associated with general anasarca, the result of renal disease, cardiac disease, or pressure upon pelvic veins. It is not likely to be mistaken for any other disease.

Leukoplakic vulvitis and *kraurosis vulvæ* have certainly been confounded with one another clinically, and also in the published descriptions of the lesions. In the former, the labia majora and minora and the prepuce of the clitoris are affected, whilst the vestibule always escapes. In the latter, the lesion affects the vestibule, the orifice of the vagina, and the labia minora. There is much greater contraction of the vaginal orifice in kraurosis. Leukoplakia often precedes a squamous epithelioma; kraurosis is said not to do so. Leukoplakia occurs at all ages, whilst kraurosis is a disease of post-menstrual life. Leukoplakic vulvitis appears as a white sodden hardening of the skin, with flattening and shrinkage of the labia. Kraurosis at first looks red and swollen, but later takes a yellowish tinge. Leukoplakia causes intense itching; kraurosis gives rise to great pain and tenderness, with a very severe form of dyspareunia.

Apart from a cyst developing in Bartholin's gland or duct, cystic swellings of the vulva are not common. A *Bartholinian cyst* is recognized by its position on one side of the vaginal entrance, distending the posterior part of the conjoined labia, and also within the hymeneal ring. As a rule, the orifice of the gland can be seen on the inner side of the cyst. The contents of this form of cyst may be glairy mucoid fluid, or may be purulent if the infecting agent is virulent. In practice, a Bartholin cyst is not likely to be mistaken for anything else; but it is wise to remember that the *posterior labial hernia* occurs in the same situation, and that new growths of the vulva may occur there as elsewhere. Bartholin cysts are always the result of infection, and as a rule a history of vulval inflammation can be obtained.

Varicocele of the vulva occurs practically only in connection with pregnancy, and is unmistakable. It has the same "bag of worms" feel as a varicocele in a man, and as the veins are close to the skin, a bluish colour is always to be noted. It is attended by much aching pain, especially on standing. The veins are degenerate, and liable to rupture as a result of labour or traumatism.

Hæmatoma of the vulva is recognized as a blue or violet-coloured swelling covered by tense shiny skin, and often spreading up into the pelvis by the side of the vagina. The history alone will often decide the nature of the swelling, but the appearance is quite typical as a rule. Hæmatoma of the vulva may occur apart from pregnancy, and then is always traumatic.

Urethral caruncle and *prolapse of the urethral mucous membrane* may be mistaken for one another. The former, however, is always a pedunculated or sessile new formation, invariably springing from the posterior wall of the urethral orifice. It bleeds readily, is often, but not always, exquisitely painful, and is usually the result of infection. Prolapse, on the other hand, appears as a raised projection with rounded margins, and with the urethral canal in the centre as a dimple. The prolapsed portion may not necessarily include the whole ring of the mucous membrane. It may give rise to pain, and being always more or less strangulated, it is prone to bleed, much in the same way as a caruncle. It occurs as a result of some straining effort, or may accompany pelvic floor prolapse; it is not the result of infection.

The differential diagnosis of the new growths of the vulva presents no points of difference from their diagnosis in other parts of the body. The only common benign tumour is the *pedunculated fibroma*, or *molluscum fibrosum*, whilst *squamous carcinoma (epithelioma)* is the only malignant growth which occurs at all frequently.

If the general characters of a *hernia* are borne in mind, there should be no risk of overlooking or mistaking any of the varieties which occur in the vulva. The resonance on percussion if the hernia contains bowel, the reducibility of the contents, and the protrusion through a pre-existing opening, will usually suffice to distinguish herniæ from other swellings. An obstructed or strangulated hernia is not so easy to recognize, but the accompanying acute symptoms and the previous history, usually suffice to make the case clear.

Hydrocele of the canal of Nuck, an uncommon condition, may be mistaken for an inguinal hernia; but as a rule it is irreducible, definitely fluctuating and circumscribed, and has no obvious neck running into the inguinal canal. When the canal of Nuck has a patent peritoneal communication, the swelling disappears as the patient lies down, but it is not reducible in the characteristic manner of a hernia. Such a condition is very rare.

The *displacements* included in the list above are all dealt with under the heading of PROLAPSE OF THE UTERUS.

Thos. G. Stevens.

SYNCOPE.—(See COMA.)

TACHE CÉRÉBRALE.—*Tache cérébrale* is the term used to denote that condition in which, after the finger has been drawn with moderate firmness across the patient's skin, the line along which it has passed becomes of a bright red colour from dilatation of the superficial arterioles and capillaries, as a result of the mechanical stimulation; the phenomenon develops within thirty seconds or a minute of the finger stroke, and the red mark remains evident for two or three minutes, or more. If letters or figures are marked out on the skin in this way, they appear as though they had been written in red, so that the condition has also been termed dermatographia. It was at one time thought to be a characteristic symptom of tuberculous meningitis, but not only is it sometimes absent in cases of the latter, but it is also present in a very large number of other different conditions, and sometimes in perfectly healthy people. All forms of meningitis may give rise to it, so that it is not even a means of distinguishing one type from another. It is seen in an extreme degree in cases of urticaria, particularly the factitious variety in which numerous wheals may develop as the result of hardly more than ordinary touching of the skin. A similar condition has sometimes been observed in the later stages of severe febrile illnesses in general.

Herbert French.

TACHYCARDIA, or abnormal rapidity of the heart's action, might, strictly speaking, be held to include every condition under which the pulse-rate is faster than the normal; but by common consent it is restricted for clinical purposes to cases in which there is no pyrexia. Nearly all fevers produce undue rapidity of the heart's action, though some, such as typhoid fever, tuberculous meningitis, cerebral abscess, yellow fever, and influenza do so to a much less extent than others. The rapid heart-action of fevers, however, does not generally come into one's mind when one uses the term tachycardia; indeed the latter is chiefly employed for conditions in which it is rapid without there being anything which at first sight would seem to be a sufficient cause. Probably the best example of this condition is to be found in cases of pronounced Graves' disease or exophthalmic goitre.

The following is a list including this and some other causes of tachycardia :—

- Graves' disease or exophthalmic goitre
- Paroxysmal tachycardia
- Nervousness and excitement
- Exertion, especially when the patient is out of training or anæmic
- Tobacco heart
- Mitral stenosis
- Pneumogastric irritation by :—

Caseous glands	Thoracic aneurysm
Mediastinal fibrosis	Thoracic new growth
- Pneumogastric " neuritis " after :—
 - Diphtheria, influenza, and other microbial infections
- Drugs :

Digitalis	Belladonna.
Alcohol	

The four classical symptoms of *Graves' disease* are : A staring appearance of the eyes, generally spoken of as exophthalmos, though there need be no actual protrusion of the eye-balls ; moderate and almost symmetrical enlargement of the thyroid gland ; a pulse-rate between 120 and 180 per minute—usually about 140 when the attack is moderately severe ; and extreme nervousness, with fine tremor of the outstretched fingers. When all these symptoms are present at the same time, there can be no doubt as to the diagnosis, but very often some of them are absent, and it is possible for tachycardia to be the only symptom of the disease ; indeed, in a patient, particularly a woman between twenty and forty years of age, a persistent pulse-rate of over 120 would arouse serious suspicion that the case was really one of Graves' disease, even if the other three classical signs were absent.

Paroxysmal tachycardia should be distinguished at once from Graves' disease in which tachycardia alone has developed, by the fact that the tachycardia is not persistent, but occurs in paroxysms ; the patient is more often a woman than a man, and may have long periods of perfect health ; almost suddenly, the result sometimes of a fright or shock, sometimes without apparent cause at all, there will be a sense of something the matter in the precordial region, amounting as a rule to little more than a fluttering or palpitation, together with a feeling of faintness and lack of strength, and perhaps of numbness or of pins-and-needles in the extremities, and when examined the patient may present no other abnormality than a pulse-rate of perhaps 160 or even 200 to the minute. The attack may last a few minutes, or an hour or two, rarely for days or weeks ; it will cease as suddenly as it began, and a similar attack is almost certain to recur after a longer or shorter interval—the main symptom of the complaint being summarized by the title "*paroxysmal tachycardia*."

The very rapid heart action that may be produced by *nervousness*, or *excitement*, or by some ordinary exertion such as coming rather rapidly upstairs when one is *out of training*, or when the patient is suffering from some degree of *anæmia*, or during *convalescence* after an illness, or after the over-use of *tobacco*, is a familiar phenomenon ; the tachycardia rapidly disappears when the patient rests, and the diagnosis is not as a rule difficult. If ordinary resting for a while does not cause the rate of the heart-beat to return nearly or quite to normal, there may be doubt as to the diagnosis, unless the patient can be re-examined on another occasion ; if there is persistent tachycardia a suspicion of incipient Graves' disease will be aroused.

Mitral stenosis is of all the valvular lesions of the heart the most liable to lead to rapidity of the heart's action ; but it seldom happens that the pulse-beat

is fast until there has been other evidence of failure of the cardiac compensation. The diagnosis will generally be obvious from the history of acute rheumatism or chorea, the typical facies and malar flush, and the cardiac bruits.

It is exceedingly difficult to be certain of a diagnosis of *irritation of a pneumogastric nerve* within the thorax unless the existence of mediastinal *new growth*, *aneurysm* or *fibrosis* is already known on account of the abnormal physical signs, the visible tumour, or the varicose distention of the superficial thoracic veins; if an intrathoracic abnormality is known to exist, and tachycardia becomes a prominent feature of the case, it will probably be due either to mechanical interference with the heart's action or to similar interference with one or other vagus nerve. *Caseous glands*, irritating the pneumogastric nerve, are still more difficult to be sure of; but occasionally one ventures upon this diagnosis when a child, who has been fed on untested or unsterilized cow's milk, develops obscure ill-health associated with persistent tachycardia. Such diagnosis would be still further suggested if there were at the same time enlarged glands in both sides of the neck, if there were pyrexia without any obvious explanation of it, or if there were any evidence of obstruction to the right bronchus, for the right bronchial gland is enlarged far more often than is the left.

Diphtheria, *influenza*, and possibly other microbial infections, are occasionally followed by very marked and persistent tachycardia during convalescence, or even for weeks, months, or years afterwards. After diphtheria, the condition is generally fatal. Influenza is always a dangerous diagnosis because it is so difficult to establish, but in certain cases in which the original diagnosis has been influenza, tachycardia to the extent of 200 heart-beats per minute may be present for months without the patient suffering from any severe cardiac symptoms, and the condition ultimately terminates in recovery with a return of the heart-beat to the normal rate. Precisely what is the nature of these cases it is impossible to say, but it has been thought by some that the symptom is due to inflammatory changes in the pneumogastric nerve, produced by whatever one means by the toxins of the disease. Whether this be so or not, the fact that persistent tachycardia may arise out of febrile illnesses should be borne in mind.

There are certain drugs which cause the heart's beat to be very rapid, the best known perhaps being *digitalis*, *belladonna*, *thyroid extract*, and *alcohol*. Certain patients suffering from cardiac symptoms seem unable to bear digitalis, the heart being driven into the condition spoken of as *delirium cordis*; the diagnosis is not difficult when the drug that is being given is known. When alcohol is the cause of the tachycardia, the fact is generally obvious. Belladonna in small doses slows the heart, but there are great variations in the degree to which different patients tolerate this remedy, even pharmacopœial doses sometimes producing toxic symptoms of which tachycardia is one. Widely dilated pupils and dryness of the tongue will help to point to the diagnosis in cases in which the belladonna is taken otherwise than medicinally. Tachycardia is the chief symptom by which one recognizes that a patient for whom thyroid extract has been prescribed is receiving too large a dose.

Herbert French.

TALIPES.—(See CLUB-FOOT.)

TASTE, ABNORMALITIES OF.—Abnormalities of taste may be grouped under three main headings, namely: (1) *Impairment or loss of ordinary taste sensations*; (2) *Perverted taste sensations*; (3) *Sensations of a foul taste in the mouth*. The following are the conditions that may produce each of these:—

1. Impairment or Loss of Taste (*Ageusia*) :*(a). Due to nerve lesions :*

Paresis or paralysis of the lingual branch of the fifth nerve
 Paralysis of the facial nerve, including the chorda tympani
 Glosso-pharyngeal nerve paralysis
 Bulbar paralysis
 Cerebral tumour, especially of the uncinate gyrus
 Hysteria.

(b). Due to affections of either the mouth or nose :

A common cold	Other varieties of nasal obstruction
Hay fever (<i>coryza e feno</i>)	Bromism
Atrophic rhinitis	Iodism
Hypertrophic rhinitis	Mercurial and other varieties of stomatitis (p. 88).
Nasal polypus	
Adenoids	

(c). Febrile conditions, especially when associated with coating of the tongue.*(d). After destruction of the nerve endings* in the tongue by corrosives taken accidentally or with suicidal intent.**2. Perverted Taste Sensations (*Parageusia*) :**

Pregnancy	Epileptic aura
Hysteria	Insanity.

3. Foul Taste in the Mouth (*Cacogeusia*) :*(a). Local conditions of mouth or nose :*

Caries of the teeth	Epithelioma of the tongue or mouth
Retention of food particles between healthy teeth	Stomatitis from any cause (p. 88)
Furred tongue from any cause	Septic infection of the antrum of Highmore, or one of the other sinuses communicating with the nose.
Excessive smoking	
Mouth breathing at night	
Gumboil	
Septic stumps under tooth-plate	

(b). Severe fevers associated with dryness of the mouth and coating of the tongue especially in :—

Pneumonia	Peritonitis
Typhoid fever	Septicæmia, etc.

(c). Septic lung conditions, especially—

Phthisis, with secondary infection of cavities	Gangrene of the lung
Bronchiectasis	Liver abscess ruptured into the lung
Bronchiolectasis	Subdiaphragmatic abscess ruptured into the lung.
Fœtid bronchitis	
Empyema ruptured into the lung	

(d). Certain drugs or poisons, especially—

Mercury	Asafoetida
Copper	Creosote
Arsenic	Guaiaicol
Lead	Valerian
Iodides	Cod-liver oil
Paraldehyde	Castor oil.

From a diagnostic point of view, impairment of taste sensations is of little consequence except when it occurs in people who are otherwise apparently well. When it is the chief symptom in the case, however, it may be of considerable importance. When there is simple impairment of taste, and it can be determined that this is unilateral, the symptom is almost certainly due to a lesion involving either some portion of the third branch of the fifth nerve, the chorda tympani, or the glosso-pharyngeal nerve. It is not often difficult to distinguish between these three, for if the chorda tympani is involved it is almost certain that the facial nerve will also be affected upon the same side, and this will be evidenced by paresis or paralysis of the face of the infranuclear type (p. 536); there may be excessive watery secretions from the submaxillary gland upon the same side; the commonest condition to cause these symptoms is disease of the middle ear extending to the Fallopian canal. If it is found that sensations of taste are impaired only in the posterior third of the tongue upon one side, the lesion probably affects the glosso-pharyngeal nerve, and it is very possible that there may be paresis of the same side of the palate or partial paralysis of the pharynx at the same time. When the lingual branch of the fifth is involved, the impairment of sensation is in the anterior two-thirds of the tongue on the same side. The lesion may be a tumour or an injury affecting the lingual nerve in the mouth; or it may be part of a more general affection of the fifth nerve of that side, with corresponding interference with cutaneous sensibility of more or less of the skin of the face, according to the extent to which the different branches of the fifth nerve are involved; if the motor root is affected, the fact can be ascertained by feeling the masseter and temporal muscles, which, when the patient clenches his teeth, do not harden so much on the affected as on the sound side.

When sensation on both sides of the tongue is affected, it is possible that the lesions described above may be bilateral; but it is much more likely that the defect is then not primarily nervous, unless it is due to bulbar paralysis, the progressive labio-glosso-pharyngo-laryngeal weakness of which is pathognomonic.

When the cause of impaired sensation is in the nose, as in the case of coryza, rhinitis, polypi, or adenoids, it will be found that some substances can be tasted easily and others not at all; this depends upon the fact that taste consists of two parts, flavour and savour; savour depends upon sensation transmitted by the olfactory nerves—the so-called taste of roast beef for instance; savours will be defective when the nose is the cause of abnormal taste-sensations; while flavours such as the taste of sugar, gentian, or salt, which are transmitted by the gustatory nerves of the tongue, will still be fully preserved.

The differential diagnosis of the other conditions enumerated in the above list need not be detailed, for the conclusion come to will depend upon the result of careful inquiry into the history, investigation of the abnormal physical signs, and the other symptoms in the case. One would only emphasize the possibility of caries, or decomposing food existing between teeth that superficially look quite sound, and the fact that septic infection of the accessory sinuses of the nose may be long overlooked, though in each case abnormal taste sensations may be prominent.

Herbert French.

TENDERNESS IN THE CHEST implies that pain is felt when some part of the chest wall is touched or pressed. Such tenderness is quite a common symptom, and may occur in a great variety of diseases. In some instances the pain felt is a direct pain, due to stimulation of sensory nerves actually in the diseased area. In others—perhaps the majority—the pain is a referred pain (the “somatic pain” of Ross), felt in the skin and subcutaneous tissues that are tender, but due to a visceral lesion remote from the tender area.

CAUSES OF TENDERNESS IN THE CHEST.

These may best be considered and classified in accordance with the situation of the lesion to which it is due.

1. **Lesions of the Chest Wall :** the pain is for the most part direct :—

Inflammations of the skin	Intercostal neuritis
and underlying tissue	Injury of the intercostal nerves
Intercostal myositis	Intercostal neuralgia
Myalgia	Hysteria
Pleurodynia	Herpes zoster
Affections of the ribs and	Pleurisy
sternum	Mediastinal disease
Blood diseases	Pericarditis.

2. **Lesions of Thoracic and Abdominal Viscera :** the pain is usually a referred pain ; felt in lesions of the—

Lungs	Stomach and œsophagus
Heart and aorta	Liver.
Diaphragm	

1. **Lesions of the Chest Wall.**—Tenderness in the chest is probably the chief complaint in *superficial inflammatory lesions* of the chest wall, such as bruises, burns, cuts, and superficial infections of all sorts, the diagnosis of which will probably leap to the eye, and need not be discussed further.

Pain will be the chief complaint in *intercostal myositis*, often vaguely called rheumatic, that occurs after chill or strain of the intercostal muscles ; but the affected muscles will also be tender on pressure, the tenderness being in the deeper structures, not in the superficial tissues. The condition is also known as *intercostal myalgia* or *pleurodynia* ; it has to be distinguished from pleurisy by the absence of friction-sounds on auscultation ; and from disease of, or pressure on, the intercostal nerves. No doubt the tenderness is due to irritation of the sensory fibres in the intercostal muscles. Similar, but more transient, pain and tenderness may be met with in the *stitch* to which the untrained athlete is prone ; here the tenderness is very possibly due to trauma of fibres of an intercostal muscle.

Tenderness in the chest may result from *disease or injury of the ribs or sternum*, when it will be localized to the injured spot ; fracture, inflammation, or new growth may be the immediate cause. If fracture is present, a history of a fall or injury should be obtainable ; and crepitus between the fragments on movement, or deformity, should be made out. Sternal or costal osteitis, or periostitis, may follow injury ; or occur in the course of such diseases as enteric fever, tuberculosis, pyæmia or septicopyæmia ; the local signs of inflammation (pain, redness, heat, swelling) and the general condition of the patient, should make the diagnosis fairly simple. Tenderness in the chest due to *new growth* in the ribs or sternum—such as hydatid, sarcoma, secondary deposits from carcinoma of the thyroid gland, prostate, or ovary—is a rarity that need only be mentioned. Tenderness of the ribs and sternum, as well as of the long bones of the limbs, is not uncommon in certain *blood diseases*, in which hyperplasia of the red marrow, or excessive accumulation of white cells in it, may occur : such as pernicious anæmia or leukæmia. The diagnosis here must be made on the results of examination of the blood. In all these instances the tenderness is deep, and due to irritation of the sensory nerves of the periosteum or bone ; the pain felt on pressure is a direct pain.

Tenderness at certain points of, or all along, the course of an *intercostal nerve* is common in various affections of these structures. The particularly tender

spots are three in number, and correspond to the points at which the posterior primary, the lateral cutaneous, and the anterior cutaneous branches are given off, near the spinal column, the mid-axillary line, and the sternal margin, respectively. Such tenderness may be marked in intercostal neuritis, which is rare; in intercostal neuralgia, which is often diagnosed when some more serious intrathoracic disorder is really present, such as pneumonia or pleurisy; and in cases of pressure on an intercostal nerve, such as may be set up by abscess about the spinal column, aneurysm of the descending aorta, or new growth invading the spinal canal. Whenever a patient complains of severe or obstinate pain and tenderness in the side, careful and repeated physical examinations should be made while the possibility that some such deep-seated disease may be present is kept in view, before the diagnosis of intercostal neuralgia, or of functional nervous disease (hysteria), is made. In exceptional cases of *hysteria*, zones of tenderness in the chest, possibly, too, Charcot's spasmogenic zones, may be found.

Pain and tenderness along an intercostal nerve are common in *herpes zoster*, and may be present before, during, and after the appearance of the characteristic rash. The tenderness often has the three spots of maximum development mentioned above; it is particularly in the second half of life that herpes may be followed by a long period of pain and tenderness along the course of the affected nerve. Until the rash has appeared, or in the comparatively infrequent cases when the rash leaves no scarring behind it, the diagnosis of herpes may be difficult; the rash, once seen, can hardly be mistaken.

Tenderness of the chest is a common complaint in *pleurisy*, and is no doubt due to inflammation of the sensitive nerve-endings in the adjacent periosteum and the tissues of the intercostal spaces; the pleura itself would appear to be devoid of nerves of sensation. The physical signs of pleurisy should suffice to make the diagnosis a simple matter if a careful physical examination be made. The tenderness is deep as a rule, and not exhibited by the skin and loose subcutaneous tissues.

The sternum may be tender in the rare cases of *mediastinal inflammation* or *tumour* that are met with from time to time; tenderness and direct pain may similarly be caused by the pressure of *aneurysms* on the internal surface of the chest-wall. The diagnosis in these cases must be made on the results of the physical examination of the patients, and will not be detailed here.

Tenderness with pain over the precordia is fairly common in pericarditis, but it will hardly be the patient's chief complaint, and should not give rise to trouble in diagnosis. It may be so extreme as to preclude percussion or a satisfactory physical examination. Similar pain and tenderness have also been found at the epigastrium and the upper costal angles in these cases; due, perhaps, to involvement of the diaphragm in the inflammatory process.

2. **Lesions of the Underlying Viscera.**—Tenderness in the chest is very frequently a symptom of disease in the underlying viscera, thoracic or abdominal, when the pains to which it gives rise are in most cases referred pains. The tenderness is therefore, as a rule, superficial, confined to the skin and subjacent areolar and fatty tissues; if these can be drawn aside, pressure can be made on the deeper tissues that normally underlie the tender area without provoking pain. Properly speaking, "tenderness in the chest" can only refer to tactile hyperæsthesia, or the eliciting of pain on pressure, whether light or heavy. Such tactile hyperæsthesia, or the production of unpleasant sensations or pain by the very lightest touch, is common in neuralgia and in neuroses, or in cases of referred pain. But a similar hyperæsthesia for cold, or less often for heat, sometimes occurs in the chest—in tabetic patients, for example; this may perhaps be regarded as a special form of "tenderness." In the same way hyper-

æsthesia for pain, or hyperalgesia, in which a normally painless stimulus or impression becomes transformed into an acutely painful sensation, is to be regarded as a form of "tenderness" in the chest. Further, perversions of sensation sometimes occur in organic nervous diseases, such as syringomyelia or tabes. Thus, tenderness may be elicited by the continuous application of a pressure that is painless if applied only for a short time (summation of painful stimuli); or the pain may be first felt some little time after the application of the stimulus to the tender area (retarded sensation).

Chest tenderness is not rare in cases of *acute or chronic disease of the lungs*, particularly *tuberculosis*; in these, it is hard to be sure that one is not dealing with referred pains due to old or recent pleurisy or pleural adhesions. The tenderness may be either superficial or deep; sometimes it is so marked as to be elicited even by the pressure of the clothes. It is generally felt most about the region of the apices of the lungs, the curve of the shoulder, or the scapula. It is often a very chronic trouble, vanishing during periods of general improvement, returning again when the patient's health is low or the pulmonary lesion is progressing. Similar tenderness is often met with in *acute bronchitis*, or with *chronic bronchitis and emphysema*; the diagnosis must be made on general lines. It must be remembered that identical areas of referred chest-tenderness may be observed in disorders of such various organs as the heart, lungs, liver, and stomach; and that a patient may be long treated for "rheumatism" of the shoulder, for example, when he is really suffering from one or more of such widely different disorders as tuberculosis, gall-stones, gastritis, or coronary sclerosis.

Direct tenderness about the precordia is sometimes seen in *heart disease*; as a rule, however, the tenderness is due to hyperæsthesia of referred origin. It is most marked in angina pectoris, and often persists after the anginal pains have passed off. Both the pain and the tenderness are felt within the area of distribution of the first to the eighth dorsal nerve roots; the roots usually receiving the first and most intense impressions are the second dorsal. The left ventricle, the commonest primary seat of pain, is in relation with the second to the fifth dorsal nerve-roots; the auricle with the fifth to the eighth; the ascending aorta with the third and fourth cervical and the first to the third dorsal. It is commonly stated that the pain and tenderness in morbus cordis are of two sorts, direct and referred; but Mackenzie argues with some force that they are in reality always referred—a viscerosensory reflex. The nerve-connections stated above explain the extensive radiation and wide distribution that may be exhibited by the tenderness and pain in the superficial tissues that may form such prominent symptoms of heart disease; for the chest, neck, and arm may all be affected. The tenderness of angina pectoris commonly occupies the same areas as the pain, takes the form of a soreness, smarting, or of hyperalgesia to touch, and may last for days after the pain is over. In some cases, touching or stimulating the hyper-algesic area on the chest, arm, or neck, may reflexly induce an anginal attack—even the pressure of a stethoscope applied for auscultation may suffice—which is a strong argument for regarding the tenderness as a viscerosensory reflex or a referred tenderness. Such anginal attacks and tenderness are commonest in coronary sclerosis, aortic aneurysm, aortic reflux, and acute aortitis; they may also be seen in any form of heart-disease in which hypertrophy and dilatation have taken place, and the heart has to do more work than it can manage. In well-marked cases, the cardiac origin of areas of tenderness in the chest should not be difficult to diagnose, owing to their association with severe anginal pains on the one hand, and with the fact that the pain is brought on by exertions or emotions that increase the work of the heart. Identical areas of tenderness may

be found in pleurisy or chronic pulmonary tuberculosis; but here the pain will be connected with respiration or coughing in an unmistakable manner, and there will be the history and signs of pulmonary rather than of cardiac disease. Identical areas of chest tenderness may be found in diseases of the stomach, in the areas of distribution of at any rate the fourth and fifth dorsal nerves; the diagnosis here will turn on the history of gastro-intestinal disorder, and on the radiation of the pain and the discovery of tenderness in the epigastrium.

Tenderness in the chest may be seen in *injuries* or *inflammations of the diaphragm*, the lower costo-chondral margin being affected. The diaphragm is innervated by the phrenic nerves mainly, and so is connected with the third, fourth, and fifth cervical nerve-roots; accordingly, referred diaphragmatic pain and tenderness may also be felt in the top of the shoulder, an area innervated by the fourth cervical nerve. In most cases, these areas of tenderness will be due to *diaphragmatic pleurisy*.

Diseases of the stomach, particularly gastric ulcer and flatulent dyspepsia, may give rise to pain and tenderness in the chest that may be very hard to distinguish from those due to cardiac disease. As a rule, the history of gastric disturbances should be of great assistance in coming to a correct diagnosis; although it must be remembered that flatulence and temporary gastric upsets are not infrequently seen in true angina pectoris. Further, the pain and tenderness due to diseases of the stomach are mainly abdominal, are in the epigastric and left hypochondriac regions, and in the lower half of the back of the chest; whereas in cardiac disorders they are characteristically situated higher up in the chest and back.

It is possible that disease or painful stimulation (as by hot drinks) of the *œsophagus* may produce an area of referred tenderness in the chest, over the lower third of the sternum and in the middle line, in correspondence with the pain that is felt here in these conditions.

Tenderness in the right side of the chest near the costal margin is not rare in *diseases of the liver and gall-bladder*, corresponding to the cutaneous distribution of the seventh, eighth, and ninth dorsal nerves; for the most part, however, the pain and tenderness are in the epigastrium and the right hypochondrium. In addition, the right phrenic nerve (third to fifth cervical) sends twigs to the liver and gall-bladder, so that tenderness and pain may also be felt in the right shoulder, just as they may be in disorders of the diaphragm. It is particularly in cases of gall-stone or biliary colic that these areas of tenderness are likely to be found. In patients with hepatic abscess, the spread of inflammation to the chest wall may give rise to direct pain and tenderness in the chest, with the development of characteristic local and general symptoms and signs; the diagnosis here will have to be made from such things as axillary abscess, empyema making its way through the chest wall, or abscess arising in the chest wall.

A. J. Jex-Blake.

TENDERNESS IN THE EPIGASTRIUM.—In thin and nervous subjects, particularly women, tenderness may be elicited on deep pressure in the epigastrium over the cœliac plexus. In the absence of other symptoms this is of no significance. The upper bellies of the recti may be tender after strain, e.g., from hard exercise, vomiting, coughing, or retching. The fact that the tenderness is in the abdominal wall may be proved by pinching it up laterally when the muscles are relaxed. Epigastric tenderness may also be due to dilatation of the right ventricle, to pleurisy, or to any of the painful conditions of the liver, stomach, or pancreas, the differential diagnosis of which is considered under the heading of PAIN IN THE EPIGASTRIUM.

Robert Hutchison.

TENDERNESS IN THE HYPOCHONDRIMUM (LEFT).—(See PAIN IN THE HYPOCHONDRIMUM, LEFT.)

TENDERNESS IN THE HYPOCHONDRIUM (RIGHT).—(See PAIN IN THE HYPOCHONDRIUM, RIGHT.)

TENDERNESS IN THE ILIAC FOSSA (LEFT).—There is no particular condition to be recorded in which tenderness in the left iliac fossa is unaccompanied by either pain or swelling. (See PAIN IN THE ILIAC FOSSA, LEFT; and SWELLING IN THE ILIAC FOSSA, LEFT.)

George E. Gask.

TENDERNESS IN THE ILIAC FOSSA (RIGHT). (See also SWELLING IN THE ILIAC FOSSA, RIGHT.)

If a patient complains only of tenderness in the right iliac fossa, if there are no other guiding symptoms and no swelling, and if the case is not acute, it may be supposed that there is some slight *inflammation of the cæcum or vermiform appendix*, or irritation of the mucous membrane of the cæcum by the accumulation of fæces. It is not uncommon, in very acute abdominal conditions obviously requiring immediate laparotomy, to find that tenderness in the right iliac fossa, without swelling, is associated with signs of acute general peritonitis. There are three chief causes for this:—

1. Acute perforative or gangrenous appendicitis.
2. Perforated gastric or duodenal ulcer.
3. A ruptured tubal gestation.

The commonest of the three is appendicitis.

Acute Appendicitis.—The fact that the pain and tenderness started and are most marked in the right iliac fossa points to the diagnosis. There may have been a previous attack in which the symptoms were more definitely localized.

Perforated Gastric or Duodenal Ulcer.—Usually the tenderness will be in the hypogastrium, but there are cases in which confusion arises because the tenderness is most marked in the right iliac fossa, and because there is no previous history of indigestion, hæmatemesis, melæna, or vomiting. In any case where grave symptoms are prominent, an exploratory laparotomy is not to be delayed, and it is only a question of whether the abdomen is to be opened over the appendix region or over the stomach.

Ruptured Tubal Gestation.—It is highly desirable that a diagnosis of this complaint should be made early. There will generally be the signs of internal hæmorrhage—pallor, fall of temperature, rise of pulse-rate, and the presence of free fluid in the abdomen; the patient is usually a week or more overdue as to a menstrual period, and the acute symptoms come on synchronously with a loss of blood per vaginam that may be mistaken for the onset of the ordinary menses

George E. Gask.

TENDERNESS IN JOINTS.—(See JOINTS, AFFECTIONS OF.)

TENDERNESS IN THE LIMBS.—(See PAIN IN THE LIMBS, GENERAL; and SENSATION, SOME ABNORMALITIES OF.)

TENDERNESS IN THE SCALP occurs in two main varieties:—

1. **Direct Tenderness**, due to injury or disease, such as—

Bruising or infected wounds

Inflammation or suppuration complicating pediculosis, ringworm, favus, eczema, pruritus, acne, etc.

Herpes and dermatitis herpetiformis, erysipelas

Lupus erythematosus, von Recklinghausen's disease

Sclerodermia, Brocq's "pseudopelade"

Diseases of the skull—rickets, syphilis, tumour.

2. **Referred Tenderness**, either due to disease elsewhere, or functional:—
 Meningitis, increased intracranial pressure, intracranial tumour, concussion of the brain, otitis media.
 Neuralgia, major and minor, whether primary or due to disease of the eyes, ears, teeth, or viscera.
 Neurasthenia and hysteria.

Fig. 200 exhibits the cutaneous nerve-supply of the scalp and face, indicating the areas in which tenderness and pain are to be expected when disease or disorder of the various nerves is present.

1. If tenderness in the scalp is due to *bruising* or *wounds*, it should not be difficult of diagnosis when the history has been obtained. A similar tenderness is naturally to be expected whenever inflammation or suppuration occurs as a complication or later stage of any of the numerous skin diseases to which the scalp is liable, such as *pediculosis*, *ringworm*—a suppurating ringworm is known as *kerion—seborrhæic dermatitis*, *favus*; the itching of *eczema* or *pruritus* may be so severe as to lead to scratching which breaks the skin, with the result that impetigo or pus-infection ensues. In young men and women *acne* may spread back to the scalp from the forehead, face, or neck; *acne decalvans* is a mild staphylococcal infection of the hair-follicles that slowly creeps across the scalp, and leaves it bald by destroying the hair-follicles. *Furunculosis* of the scalp, and inflammation of a *sebaceous cyst*, need only be mentioned in this connection.

In *herpes ophthalmicus*, or herpes zoster of the area supplied by the ophthalmic or first branch of the trigeminal or fifth cranial nerve, extreme tenderness over the affected area may be noted while the eruption lasts; and after it has disappeared, tenderness and itching may be left behind for many months or years. *Dermatitis herpetiformis* is a somewhat similar grouped vesicular or bullous eruption, with ringed and other erythematous lesions, but characterized by a much more extensive distribution than herpes zoster; when it involves the scalp much tenderness may ensue, although the chief complaint will be of itching, and the course of the disorder is long and uncertain. *Erysipelas* is common in the scalp, and should be diagnosed readily. *Lupus erythematosus* of the scalp may cause tenderness while progressing actively, when it may resemble even a severe persistent erysipelas; as a rule it is a very chronic, slowly progressive disorder, commoner in females than in males, starting between the ages of twenty-five and forty-five. It produces smooth and depressed areas of complete and permanent baldness, reddened by abundant injected venules. In *von Recklinghausen's disease*, subcutaneous neurofibromas are found all over the body, in association with freckling and pigmentation; occurring on the scalp, these tumours will make it tender, whereas the tumours of fibroma molluscum (Fig. 201), a disorder at first sight resembling von Recklinghausen's disease, are not sensitive to pressure. *Sclerodermia* of the scalp may occasion much tenderness, particularly in its early stages; it is a chronic diffuse infiltration of the skin that ends in atrophy, and by many is supposed to include

Fig. 200.—The cutaneous nerve-supply of the scalp. GA, Great auricular nerve; GO, SO, and Th.O., Great, small, and third occipital nerves; V1, V2, V3, Ophthalmic, superior maxillary, and inferior maxillary divisions of the trigeminal (or fifth cranial) nerve.

the "*pseudopelade*" of Brocq, an atrophic indurative affection of the scalp giving rise to depressed areas of absolute and permanent baldness that adhere to the underlying skull, and connected by Brocq with alopecia areata.

Tenderness of the scalp is common in *rickets*, and is the main cause of the head-rolling and restlessness of the recumbent rickety child. It is due to hyperæmia and disordered growth of the cranial bones; and can often be diagnosed at sight by the thinness of the hair or positive baldness of the occipital region to which the head-rolling leads. A similar tenderness of the cranial bones is seen in *congenital syphilis*, and is caused by the rarefying (craniotabes) or hyperplastic (hot-cross-bun skull) osteitis present. In adults with neglected syphilis the skull may be tender from *secondary syphilitic periostitis* or *tertiary gumma*; besides the tenderness, pain is present, and is characteristically worse at night. *Tumour of the cranial bones* may give rise to tenderness of the overlying scalp or periosteum; in adults such tumours are usually secondary to malignant disease of the breast, thyroid gland, testis, or prostate. In children they are often secondary to sarcoma of the suprarenal gland, and may be the first clinical evidence that anything is amiss.

Fig. 201.—Molluscum fibrosum in a comparatively early stage.

From photograph lent by Dr. A. Rendle Short.

2. Tenderness in the scalp may be due to organic disease that is not in direct connection with it. In *meningitis*, whether syphilitic, tuberculous, or due to pus-producing microbes, local or general tenderness of the scalp may be a marked feature; and the same is true in cases with *increased intracranial pressure* due to any cause whatever. The chief complaint, however, will be of headache (*q.v.*). In *intracranial tumour* the scalp and periosteum are sometimes tender to pressure in the neighbourhood of the growth; the associated signs, such as vomiting on change of position, slow pulse, optic neuritis, and local paresis or paralysis, should aid the diagnosis. Tenderness of the scalp in the occipital region and below it has often been noted after *concussion of the brain*, whether mild in degree or severe, and apart from neurasthenia; the pain and tenderness may each be both superficial and deep.

Tenderness of the scalp is often marked in *neuralgia*, a vague term applied to any severe pain that follows, or seems to follow, the distribution of a nerve. In *trigeminal neuralgia*, *neuralgia major*, or *tic douloureux*, the pain and tenderness often spread back to the vertex and parietal eminence, in correspondence with

the cutaneous distribution of the first or ophthalmic branch of the fifth nerve. Pressure over the tender area will often bring on a paroxysm of pain; yet while the pain is raging, the patient often gains some relief by firm pressure over the painful part. When the paroxysm is recently past, pressure does not have any obvious effect in some cases. Identical neuralgic pain and tenderness may be met with in the rare cases where a tumour presses on the trigeminal nerve or its roots, as may happen in patients with meningeal new growths; the diagnosis here is important, because operative removal of the Gasserian ganglion would be useless in such a case. Definite loss of sensation occurs if the nerve is involved in a tumour, whereas in tic douloureux there is no anaesthesia; in addition, the other signs of intracranial tumour should be looked for.

In another group come the cases of *neuralgia minor*, in which pain and tenderness in the scalp form a visceral reflex, and are due to disease in the eyes, teeth, ear, and thoracic or abdominal viscera. A referred visceral pain usually brings with it superficial tenderness, and both the pain and the tenderness, according to Head, are found over "segmental" areas, or areas that do not correspond with the distribution of the peripheral nerves, but follow a central distribution

THE SEGMENTAL AREAS OF THE SCALP (*after Head*).

Fig. 202.—The segmental areas.

Fig. 203.—The maxima of the segmental areas shown in Fig. 202.

Fr. n, Fronto-nasal; Mo., Mid-orbital; Oc., Occipital; P, Parietal; T, Temporal; V, Vertical.

(Figs. 202, 203). In other patients, however, the same lesions produce areas of pain, and less often of tenderness also, that do follow distributions corresponding with those of the peripheral nerves; and these are described as cases of *neuralgia minor proper*. To give examples of reflex neuralgia, disease of the *upper bicuspid*s may cause pain and tenderness in the temporal region; disorders of the *eye*, particularly astigmatism and hypermetropia, iritis, and glaucoma, may cause headache and tenderness spreading from the forehead to the vertex and to the temporal area; suppuration in the *middle ear* may make the whole side of the head tender. Certain areas on the head are segmentally united with other areas on the body; the temporal area of the scalp is connected thus with the seventh dorsal segment, and so diseases of the *heart, lungs, or stomach* may all bring about temporal pain and tenderness, associated with the segmental area of cutaneous tenderness about the level of the epigastrium that directly represents the seventh pair of dorsal nerves. It is probable that a number of patients with undetected disease of the teeth, eyes, ears, or viscera, are treated for "neuralgia" for long periods, when a more careful examination of their history and investigation of their physical condition would lead at once

to the proper diagnosis. In a certain number of cases pain and tenderness in the scalp are due to *general diseases* such as diabetes mellitus, malaria, and rheumatism; a fact that leaves room for much looseness in diagnosis.

In both *neurasthenia* and *hysteria* complaints of pains and tenderness are common, and the scalp may be affected just as any other part of the body may. The neurasthenic often has occipital tenderness, with pain referred to the hair; brief mental effort may bring on pain and tenderness in the sinciput or vertex. The hysterical patient may be prostrated by headache, with extreme tenderness of the scalp. It is not necessary to say that the greatest care to exclude organic disease of every sort should be taken before the diagnosis of neurasthenia or hysteria is made in a patient complaining of tenderness in the scalp. It is noticeable that any conditions tending to build up the strength and improve the nutrition of neuralgic, neurasthenic, or hysterical patients, are likely to lessen the pains and areas of tenderness of which they so often complain. Conversely, these persons are always much worse when their health is low, and particularly when they are anæmic.

A. J. Jex-Blake.

TENDERNESS IN THE SPINE occurs in conditions of two different sorts. In the first it is due to local disease of the skin or subcutaneous tissues, fasciæ, muscles, bones, or nerve-tissue in the immediate neighbourhood of the spine; and the pain felt when the tender spot is touched is a direct pain. In the second there is no local disease, and the pain felt on stimulation of the tender area is a referred pain, due in most cases to organic disease of one or other of the viscera, in a few to some obscure nervous disorder. The tenderness varies widely in degree. In the severest cases, whether direct or referred, the pain may be such that the patient cannot endure even the light pressure of the clothes ordinarily worn, and is in agony the moment a finger is laid upon the tender place.

1. **When due to Local Disease**, the tenderness is usually associated with rigidity of the spine in the tender section, a protective reflex designed to give rest to the diseased part. This is particularly well marked when it is bone—the vertebral column—that is diseased. A similar but less complete and more extensive rigidity will be noted when the local disorder is in the muscles or fasciæ of the back. Should the local disease or injury be so extensive as to involve or compress the spinal cord, special symptoms (girdle-pain, paresis, anæsthesia, etc.) will be added. The chief morbid states in which such tenderness of the spine occurs are summarized in the following table:—

<i>Diseases of the skin and subcutaneous tissue</i>	}	Trauma, infected wounds, abscess-formation, etc.
<i>Diseases of the muscles, fasciæ, or nerves</i>		Gout, rheumatism, trauma, herpes, etc.
<i>Diseases affecting the vertebræ</i>	}	Tuberculosis and other infections
		Caries sicca, spondylitis deformans, "typhoid spine"
		Erosion by aortic aneurysm
		Invasion by malignant disease
<i>Traumatic neurasthenia, with local lesions that are not demonstrable</i>	}	Trauma, with or without injury to the cord.
		"Railway spine."

To consider these lesions in detail: Obviously the skin and subcutaneous tissues may be tender over the spine after falls or blows on the back, infected wounds, in acne and furunculosis, in abscess-formation, whether the infection

is derived from without, or from within as in pyæmia ; a psoas abscess has been known to point and discharge on the back over the vertebral column. Tenderness in the spine due to *affections of the fasciæ and muscles* may be experienced by any ill-trained person who over-uses or strains his spinal muscles ; it is also common in gouty patients ; and frequently it is associated in the rheumatic with attacks of lumbago. Deep-seated inflammations in this region are not rare, and are seen usually in connection with spinal caries ; less often the inflammation may be due to pyæmia, empyema perforating spontaneously, trichiniasis and other very rare forms of myositis, when they chance to attack the spinal region. In a few instances, no doubt, *disease of the spinal nerves*, particularly when their posterior primary divisions are affected, gives rise to tenderness in the spine as well as along the course of the nerves themselves ; this may occur when pressure on the nerves or their roots exists, and in cases of herpes zoster or neuritis. Most of the causes of spinal tenderness enumerated above are comparatively rare ; and their diagnosis should not be difficult if a careful examination of the patient be made, and his other signs and symptoms of disease be noted.

The cases in which the tenderness is due to disease of the vertebræ are far more important than the above, and probably commoner also, as well as far more serious from the point of view both of prognosis and treatment. Excluding spinal trauma, which usually declares itself obviously and is considered below, the three disorders to which the vertebræ are liable in this connection are tuberculosis, invasion by malignant disease, and erosion by an aneurysm. In other rarer instances they may be affected with similar symptoms and results by actinomycosis, pyæmic abscess, the spread of infection from adjoining parts (retropharyngeal, mediastinal, subdiaphragmatic, perinephric, or pelvic abscesses), hydatid disease, spondylitis deformans, and vertebral arthritis due to the gonococcus and other microbes. When caused by *vertebral tuberculosis*, the spinal tenderness is local, and is generally accompanied by more or less angular deformity of the spinal column, collapse of the diseased and softened anterior part of the vertebral body, causing abnormal projection of its dorsal spine at the same time. If it is the posterior part of the affected vertebra that collapses, the spinous process will sink inwards ; it must be remembered, however, that congenital defect or deficiency of a spinous process is not very rare, and may be mistaken for the result of injury or disease. Whether deformity accompanies spinal caries or no, rigidity of the diseased part of the spinal column is sure to be present. It is maintained by involuntary contraction of the appropriate muscles, and becomes conspicuous when the patient is encouraged to bend his back in any direction, or to rotate the body on the pelvis. In addition, pain will be felt in the back when the patient's vertex, shoulders, sacrum, or legs are jarred ; his gait, too, and method of holding himself and turning, designed to relieve the diseased part of the spinal column from shock or strain, will be characteristic. In children who are not well looked after, this spinal tenderness and deformity may be unnoticed and the diagnosis of spinal caries not established until a psoas abscess has formed and has declared itself by pain in the leg, or lameness. The importance here of early diagnosis cannot be overstated ; spinal tuberculosis is commonest in children, but may occur at any age. It often happens that rickety children are suspected of "spinal disease" by their parents ; they present marked spinal curvature, due to flabbiness of the muscles, and, like all their bones, their spines may be tender on pressure. But there is no localized spinal tenderness in rickets, there is no angular deformity, the spinal curvature vanishes when the child is suspended by the head or arms, no pain is caused by jarring or rotating the spinal column, and there is no rigidity of the back. And the other ordinary

evidences of rickets will be present, so that the diagnosis should not be difficult. In adults, however, and particularly during the second half of life, it may often be difficult to determine whether a persistent tenderness over some part of the spine, associated with persistent pain and rigidity, is due to *tuberculosis*, *aneurysm*, or *malignant disease* affecting the vertebral column. The occurrence of angular curvature, due to softening and collapse of the vertebral body, would argue in favour of tuberculosis, being comparatively rare in aneurysm or malignant disease; evidence of tuberculous mischief in the patient's joints, lungs, or larynx, a history of cough or blood-spitting, or a marked family history of tuberculosis, would all point in the same direction. Aortic aneurysm, eroding the vertebral column and causing pain and tenderness by pressing on the nerves in its vicinity, would be suggested if the patient were a middle-aged man giving a history of syphilitic infection, and exhibiting more or less arterial degeneration. Examination under the *x*-rays and testing for the presence or absence of Wassermann's reaction might be of great assistance here; deep abdominal palpation, under an anæsthetic if necessary, might reveal the expansile pulsation of an aortic aneurysm. Secondary deposits of malignant disease, invading or encompassing a vertebra, may occasion marked spinal tenderness and pain in the back of the severest description; in rare cases, the malignant growth may be primary. The vertebræ are the bones most often invaded by secondary malignant growths; the primary growths most frequently responsible for secondary deposits in the bones are carcinoma of the thyroid, testis, prostate, and mamma, primary sarcoma of bone, and melanotic sarcoma. Here again the diagnosis may be very difficult, in the earlier stages of the disorder particularly, because the primary growth may be small and deep-seated, and may have given rise to no signs or symptoms leading to its discovery, so that the presence of secondary deposits is not suspected. In the later stages, the growth often burgeons into the spinal canal, and causes symptoms of paraplegia by compressing the spinal cord. When this occurs the diagnosis is easier, for the site of the compression may be indicated by a girdle-pain and a zone of hyperæsthesia; while anæsthesia, with paresis or paraplegia, is found below it, the sphincters are affected, the knee-jerks are increased, and ankle-clonus and Babinski's extensor plantar reflex can be elicited. But, as has been pointed out already, it may be impossible to find any definite physical signs in a patient complaining of very severe and intractable pain and tenderness in some part of his spinal column; and most physicians of experience must have met with sad cases where such patients have been treated as malingerers, the honesty of their complaints failing to win recognition until a pathological basis for them has been established at an autopsy.

Little more need be said about most of the other local diseases that may make the affected region of the spine both tender and painful. *Caries sicca* is the name given to an obscure rarefying osteitis of chronic course, non-suppurative, that may attack the vertebræ. The signs and symptoms of *vertebral actinomycosis* resemble those of tuberculosis. In *chronic pyæmia* a vertebral abscess may arise, and in patients with abscesses in the spinal region—such as *pelvic*, *perinephric*, *subdiaphragmatic*, *mediastinal*, or *retropharyngeal*—a spread of infection to the vertebræ may conceivably occur, giving rise to tenderness in the affected part of the spine; *hydatid disease* of the spinal canal or vertebral column may do the same in persons exposed to echinococcus infection. But in all these instances the tenderness in the spine will be but a minor symptom of a serious and more or less acute disorder, with other features that are more characteristic. Tenderness in the spine is often marked in *spondylitis deformans*, the name given to practically any chronic non-suppurative form of vertebral arthritis. It is no doubt an infectious process, and occurs after gonorrhœa,

influenza, enteric fever (the "typhoid spine"), tonsillitis, and other bacterial disorders. It is characterized by stiffness in some portion of the vertebral column, with irregular deposits of new bone in the adjoining ligaments, particularly the anterior common ligament, well seen by the use of x -rays. The chief sign is stiffness in the back, and in a few of the cases osteo-arthritis of some joints of the limbs occurs as well; in instances where the hip or shoulder is thus involved the disease has been named "*spondylose rhizomélisque*" by Marie. Men are affected four or five times as often as women, and the disease usually begins between the ages of twenty and fifty. Its diagnosis may be difficult, because the chief complaint may be of pain in the hips, legs, abdomen, or thorax, or of "sciatica" or "lumbago," so that disease of the vertebral column may be neither suspected nor looked for. In most patients, the affected region of the spine is tender; much spasm of the dorsal muscles is found in the more acute cases, while in those of long-standing, atrophy from disuse will be found. The *typhoid spine* is a rare sequela of enteric fever, usually occurring early in convalescence. The patient complains of tenderness and the most acute pain in the lower part of the vertebral column, after an initial stage of backache. Fever is present at first in half the cases, and no doubt the condition is commonly due to vertebral periostitis set up by the *Bacillus typhosus*. The symptoms last for many months as a rule, and deformity of the spine is left in half the patients; but suppuration of the affected vertebræ seems to be unknown. Men are more often affected than women, and the diagnosis should not be a matter of great difficulty. In milder cases no physical signs of vertebral disease appear, and so the affection has been described as hysterical, the spine as an irritable spine; in yet other instances, the spinal cord appears to be involved, as if the periostitis affected the spinal canal, loss of control over the sphincters being observed, with paresis of the legs, and changes—usually increase—in the reflexes.

Tenderness in the spine due to *trauma* may be the expression of either organic or functional disease resulting therefrom, and the precise diagnosis may be extremely difficult. The trauma is usually a railway or other accident of locomotion ("railway spine"), a fall, a sudden shock or concussion; in another group of cases it is either a single sudden muscular over-strain, due to over-exertion or the effort to avoid an accident, or the more chronic over-strain to which rowing men, football players, and the like are exposed. A gross injury may produce fracture of a vertebra, with or without displacement of the fragments such as can be demonstrated by use of the x -rays; subperiosteal or subdural hæmorrhage, hæmorrhage into the spinal canal, hæmorrhage into or bruising of the cord, all of which will give rise to localizing cord-symptoms (girdle-pain at the level of the lesion, varying degrees of paresis and anæsthesia below it) when the lesion is marked. At the other end of the scale are found the sufferers from *traumatic neurasthenia*, who have been exposed to identical injury or over-strain, but present no definite signs of disease in the spine or cord, although quite incapacitated for months or years, by weakness and severe pains in the injured region. These patients often have increased knee-jerks and even ankle-clonus; but definite evidences of organic disease are wanting, the sphincters are unaffected, Babinski's extensor plantar reflex is not obtained, muscular wasting is not found, unless from disuse, and the various pains and tendernesses of which complaint is made have a neurasthenic or even a hysterical distribution and character. Traumatic neurasthenia may follow after surgical operations or comparatively slight injuries to the head, back, or testicle, in addition to the severer traumas and strains already mentioned; and it must be noted that a delay of one or more weeks, an incubation-period, may intervene between the receipt of the injury and the development of the neurasthenic pains. It would be unfair to take such a delay as evidence of a hysterical factor in the case, or of malingering.

It is clear from the foregoing paragraph that traumatic neurasthenia includes cases in which it is not possible to say for certain whether a local organic lesion of the spine exists or not. Such instances form a natural transition to those in which there is:—

2. **Tenderness in the Spine due to Functional Disorders, or to Disease in Other Parts of the Body.**—In very few of these is there any deformity of the spinal column; it is flexile and not rigid; and pain is rarely produced when it is carefully bent, twisted, or jarred, so long as direct stimulation of the tender part is avoided. As a rule, the tenderness is superficial rather than deep, and it is often associated with other areas of tenderness in the side or front of the body.

In hysteria, complaint of pain and tenderness in the spine and back is not rare—the “hysterical spine.” The tenderness over the vertebræ is often accompanied by tenderness on either side of it; in extent it may change from time to time, involving a single vertebra or even most of the vertebral column.

In neurasthenia the spine may be tender from top to bottom, and more or less rigidity is often found also. When the tenderness is localized to a small part of the back, it may easily be taken as evidence of local organic disease; but the presence of other neurasthenic symptoms—headache, irritability, fatigability after brief exertion—and the absence of signs of definite local disease or involvement of the cord, should help in the diagnosis. To distinguish clearly between neurasthenia and hysteria is often difficult, and particularly so in the milder cases of traumatic neurasthenia, because they may develop hysterical features such as areas of anæsthesia, a craving for sympathy, a tendency to exaggerate the symptoms, and so forth. The harmful effects of mental worry on neurasthenia, of the uncertainty attaching to an impending law-suit in which, perhaps, damages for injury are being claimed, are well known.

Tenderness in the spine is very commonly a reflex from disease in one or other of the thoracic, abdominal, or pelvic viscera. The tenderness is characteristically superficial in these cases, and acute pain may result from light pressure on the area involved; and if the tender tissues can be pulled aside sufficiently, it will be found that pressure on the spine itself causes no pain whatever. The different viscera produce this tenderness with some regularity in different and definite visceral areas, and the fact, worked out by Head, Mackenzie, and others, is of service in diagnosing the site of the actual lesion from which the patient is suffering. A scheme of the areas is given in the diagram (Fig. 204).

Fig. 204.—Areas of referred spinal pain and tenderness (after Mackenzie). A, In diseases of the heart; B, In diseases of the stomach; C, In diseases of the liver; D, In diseases of the rectum and uterus.

The organs and diseases most often giving rise to this referred tenderness and pain in the spine are as follows: The *aorta*, in aortitis, arteriosclerosis, and aneurysm; the *heart*, in coronary sclerosis particularly, myocarditis, myocardial fibrosis, acute dilatation and failing compensation; the *stomach*, in gastric ulcer, malignant disease, gastritis; the *liver*, in cholelithiasis, cholangitis, new growth, and the venous congestion of tricuspid reflux; the *intestine and rectum*, in acute inflammatory disorders and in constipation; the *uterus*, in labour, menstruation, and inflammatory affections. It would appear that the lungs, whether inflamed or wounded, do not give rise to a referred tenderness; on the other hand, the whole or any part of the thoracic spine may become tender in disorders of the *pleura*, such as pleurisy, pleural adhesions, or new growth. To illustrate the frequency with which pain and tenderness of the spine occur, may be quoted the axiom of many hospital out-patient departments, that there is no woman in London who has not got a pain at the bottom of her back—a libel on the sex, one may hope.

The importance of distinguishing between the cases in which the physical signs of organic disease in the vertebral column or cord are absent, and those detailed in Class 1 above, need not be emphasized further. The referred pains and tendernesses disappear or are relieved with the cure or relief of the cardiac, gastric, or other disorder to which they are due. The diagnosis of the cause of tenderness over the fourth dorsal vertebra, for example, which may be due to disease of the heart, pleura, or stomach, must be made on general lines, and by consideration of the other signs and symptoms exhibited by the patient.

A. J. Jex-Blake.

TETANIC CONTRACTIONS.—(See CONTRACTIONS.)

THERMO-ANÆSTHESIA.—(See SENSATION, SOME ABNORMALITIES OF.)

THIRST, EXTREME.—Cases of extreme thirst may be subdivided into two main groups; namely, those with and those without polyuria. To the former belong such conditions as diabetes mellitus, diabetes insipidus, hysteria, and so on, which are discussed under POLYURIA. To the other group belong such conditions as are for the most part so obvious as to require no more than simple enumeration under main headings, as follows:—

1. Prolonged abstention from drinking, purposeful, or the result of necessity.
2. Fevers and febrile states.
3. Excessive loss of fluid: (a) From the skin by profuse perspirations, natural or pathological; (b) From the stomach, from repeated vomiting; (c) From the bowel, from excessive diarrhœa; (d) Into serous membranes, as in acute peritonitis.
4. After severe hæmorrhage: (a) External, e.g., post-partum; (b) Internal, e.g., from duodenal ulcer.
5. Gastrectasis due to pyloric stenosis, owing to the fact that the stomach absorbs little fluid as compared with the intestines.
6. Poisoning by such drugs as dry up the secretions of the mouth, notably belladonna and its allies, or astringents such as alum, gallic acid, tannic acid, or perchloride of iron.
7. The exhibition of excess of various salts, particularly sodium chloride, either as such, or incorporated in various food-stuffs.

It is clear that in some cases more than one factor at a time may be causing extreme thirst.

Herbert French.

THRILLS, PRECORDIAL.—In order to arrive at a diagnosis of the cause of any thrill which is felt over the præcordia, two facts must first be ascertained, namely, (1) *The situation of the thrill*; and (2) *Its rhythm*. Having discovered a thrill over the mitral area, that is, in the region of the apex beat, and found

that it is presystolic in rhythm, it is obvious that it is due to *mitral stenosis*. The valvular lesion will be confirmed by the presence of a presystolic bruit, as it is rare to find the thrill without a bruit being associated with it. On the other hand, if the thrill be systolic in time, and *mitral regurgitation* be present, the thrill is due to this valvular lesion. A systolic thrill at the cardiac apex may also be caused by *pericardial friction fremitus*, or pleuritic fremitus. A pericardial friction fremitus can be distinguished from an endocardial thrill by being more rubbing in character, usually occurring both during systole and diastole, while an endocardial thrill is a more purring vibration, and it only occurs during systole in this situation. The pericardial friction is confirmed by auscultation. *Pleuritic fremitus* in this region may be distinguished from an endocardial thrill and pericardial friction fremitus by asking the patient to hold his breath, when the fremitus will disappear. These distinguishing features between endocardial thrill, pericardial friction fremitus, and pleuritic fremitus, apply to any area in which thrills are detected. A pericardial friction fremitus may be present over the whole or any part of the præcordia, but the most common situation is near the base of the heart.

A systolic thrill in the second right intercostal space close to the sternum may be due to *aortic stenosis*, *thickening of the aortic valve*, *atheroma*, and *dilatation or aneurysm* of the ascending portion of the thoracic aorta, and the diagnosis of the cause of the thrill can only be made by the other physical signs which indicate the morbid condition present. Thus, if there be dullness in the second right intercostal space, over which the thrill is felt, there is dilatation or aneurysm of the arch of the aorta. There is no dullness in this situation when the thrill is due to aortic obstruction or to atheroma of the aorta. Not only may dullness on percussion accompany the thrill, but there may be pulsation, and even a pulsating tumour, in this region, showing that there is an aneurysm of the aorta. Other signs of an aneurysm may be present, and an x-ray examination is helpful in confirming the diagnosis.

A diastolic thrill may also be felt in the second right intercostal space close to the sternum, but it is rare; when present, it is due to *aortic regurgitation*, and is accompanied by the characteristic diastolic bruit. Sometimes the thrill, like the bruit, is most marked in the third left space close to the sternum.

It must also be remembered that pericardial friction fremitus may be felt in the aortic area, and can be distinguished by the diagnostic signs which have already been considered.

In the pulmonary area, viz., in the second left intercostal space close to the sternum, systolic thrills also occur, and are due to *congenital affections* of the heart, especially pulmonary stenosis, and patency of the ductus arteriosus. An extensive thrill felt over the base of the heart in young children is nearly always due to a congenital malformation of the heart, and can be distinguished by the other signs of congenital heart disease which are usually present, especially cyanosis and clubbing of the fingers. When thrills in this area are due to congenital malformation, the apex beat is generally near its normal position. The cardiac dullness usually extends to the right of the sternum as the result of the enlargement of the right ventricle, and there is commonly a loud universal systolic bruit, having its point of maximum intensity over the base of the heart. The following signs of congenital malformation of the heart, other than patent ductus arteriosus, are also to be expected: cyanosis, either continuously present or occurring at intervals, dyspnoea, especially upon exertion, clubbing of the fingers and toes, and polycythæmia. With patent ductus arteriosus there may be no symptoms accompanying the abnormal physical signs. Thrills due to congenital malformations of the heart may occur almost anywhere over the præcordia; they are systolic and sometimes diastolic in time, often felt over a

large area, and of very marked intensity. When present, they are always accompanied by ample evidence of congenital disease.

It must be remembered that a thrill may occur in the second left intercostal space close to the sternum, and be associated with a *functional pulmonary bruit*. In such a case, the functional origin of the thrill may be distinguished by the general condition of the patient, who will be suffering from anæmia or some debilitating condition. The signs of congenital heart disease, just mentioned, will be absent, so that the diagnosis of the cause of the thrill is usually quite easy.

Presystolic and systolic thrills sometimes, but very rarely, occur to the right of the sternum in the *tricuspid area*, due to *stenosis* and *incompetence* of this valve.

J. E. H. Sawyer.

THYROID GLAND, ENLARGEMENT OF THE.—An enlarged thyroid gland gives rise to a swelling in the mid-line of the neck, internal to the sternomastoid muscles and the carotid vessels, which, if the swelling is large enough, are pushed outwards. The gland is intimately connected with the larynx; hence the most important sign of a thyroid tumour is that it rises and falls with the larynx and trachea during deglutition. In the great majority of cases the presence of this sign alone is sufficient to make a correct diagnosis. There are two sources of fallacy: (1) A swelling not thyroid in origin but lying in front of it, such as a sub-hyoid bursa or sebaceous cyst, and also a suppurative or syphilitic perichondritis of the thyroid cartilage, may present the above sign; (2) A thyroid swelling, if fixed, as it may be by inflammation or malignant growth, may not present it. In the vast majority of cases, however, a swelling in the position of the thyroid gland which moves on deglutition indicates an enlargement of that gland.

Varieties of Enlargement and their Differential Diagnosis.—During *menstruation* and *pregnancy* the thyroid is said to become enlarged, but this is rarely sufficient to cause symptoms; if the gland happens to be the seat of pre-existing disease the increase of swelling may be sufficient to induce respiratory difficulty.

Parenchymatous Goitre, or a general hypertrophy of the whole gland, is the commonest form of enlargement. All parts of the gland are affected more or less equally; the tumour being bilateral, the normal shape is preserved. The swelling is freely movable, painless, and soft in consistency. It is rarely congenital, and more often appears about puberty. Its rate of growth is usually very slow, and it may attain an enormous size without causing any other symptoms.

Cystic Goitre is a loose term used to cover any form of enlargement of the thyroid which is chiefly caused by the presence of one or more cysts. If the cyst is large and lax, fluctuation may be made out. The cysts, however, are often small and tense, and cannot be distinguished from solid adenomata. Cysts are rarely present without some enlargement of the rest of the gland.

Adenomatous Goitre.—The common cause of unilateral enlargement is the presence of an adenoma, a definite encapsuled tumour which may contain cysts and grow to a large size. A hæmorrhage into one of these cysts may cause a very rapid enlargement, and so give rise to a suspicion of malignancy. Adenomata may be single or multiple; when present in both lobes, the enlargement may be difficult to distinguish from the parenchymatous form.

Malignant Disease is seldom met with. It occurs with equal frequency in both sexes, and is rarely seen before the age of forty. In the early stages, while still confined within the capsule of the gland, it may be difficult to differentiate from the other forms of goitre. It should be recognized by its rapid growth, its hardness, and irregular and bossy outline. When the neoplasm has penetrated

the capsule and invaded surrounding structures, the diagnosis is made with more ease. The tumour may become fixed, no longer moving on deglutition; often one or other vocal cord is paralyzed, a condition rarely seen with innocent goitre; and involvement and ulceration of the trachea are common. The lymphatic glands may be enlarged, but as those first implicated are placed deeply, defying detection, not much help is gained from this source.

Exophthalmic Goitre (Graves' disease, von Basedow's disease) is far more common in women than in men (*Fig. 85, p. 261*), and rarely occurs before puberty or after middle life. The most prominent features of the disease are: (1) Exophthalmos; (2) Tachycardia with palpitation; (3) Enlargement of the thyroid gland, often pulsatile; (4) Tremulousness of the hands and general nervous excitability; (5) Breathlessness on exertion. The vision is normal, but when the eyeball is moved downwards the upper lid does not follow as in health (von Graefe's sign). The palpebral aperture is wider than in health, owing to retraction of the upper and lower lids (Stellwag's or Dalrymple's sign). Pigmentation of the skin may be intense and simulate Addison's disease, but the mucous membrane of the mouth is not affected as in the latter malady.

A well-marked case is quite characteristic, but there are others extremely hard to separate from simple parenchymatous enlargement, for with this, especially in young girls, anæmia is often associated, and with it the symptoms of tachycardia, palpitation, and breathlessness. It often becomes a matter of opinion whether a given case should be styled simple parenchymatous goitre or incipient Graves' disease.

The above are the commonest forms of enlargement. Others much rarer are: *Enlargement due to pyogenic infection*, either acute or chronic. In pyæmia it is not uncommon to find the thyroid the seat of multiple abscesses. *Tuberculous and gummatous disease* may also cause enlargement, and a slight degree of goitre has been noted in *typhoid fever, acute rheumatism, malaria, variola, cholera, and secondary syphilis*. *Hydatid cysts* of the thyroid gland have been noted on a few occasions. It having been ascertained that the swelling in the neck is definitely thyroid in origin and its nature defined, it remains to see whether there are any pressure signs on the surrounding structures.

Pressure on the Trachea.—Dyspnœa is by far the most important of all the symptoms that may be produced by enlargement of the thyroid gland. It may be the only thing complained of by a patient not even aware of the presence of a goitre. The size apparently is not so important as the shape and situation, for one reaching to the waist may cause no obstruction, and one the size of a cherry, if situated between the sternum and trachea, may give rise to the most intense dyspnœa. If the goitre is unilateral, the trachea is pushed over towards the opposite side and flattened; if bilateral, as in the parenchymatous form, it is compressed laterally. The dyspnœa may be constant and distressing, or only noticeable on exercise or on lying down. Most such patients like to lie high in bed, propped up on pillows. An idea as to the amount of pressure on the trachea may sometimes be gained by a question on this point.

Pressure on Nerves.—Unless malignant, a goitre rarely causes much pressure on nerves. Those that may be involved are: (a) The recurrent laryngeal, resulting in paralysis of a vocal cord; (b) The sympathetic, shown by contraction of the pupil on the affected side and ptosis; (c) The vagus; (d) Rarely the nerves of the brachial and cervical plexuses. If any of these nerves are involved, suspicion must arise as to the malignancy of the tumour.

Pressure on the Œsophagus.—Being placed behind the trachea, the Œsophagus generally escapes pressure by a goitre, though this is to be remembered as a rare cause of dysphagia.

Pressure on Veins is common, particularly on the internal, external, and anterior jugulars. The pressure is rarely more than sufficient to make them stand out prominently.

George E. Gask.

TINEA, VARIETIES OF.—(See FUNGUS AFFECTIONS OF THE SKIN.)

TINNITUS is a symptom which occurs in a large proportion of cases of disease of the ear, and occasionally when there is no obvious lesion of the auditory mechanism. The sounds complained of are usually subjective, but they may occasionally have an objective origin. Tinnitus may be continuous or intermittent. Its intensity and character vary greatly in different patients; to some it is an intolerable annoyance, and occasionally has even been the cause of suicide. The character of the sound should always be ascertained, as this may give some clue to the cause. Thus a pulsatile or rhythmic sound may be produced by the flow of blood through the internal carotid artery, which in its course through the carotid canal is separated from the tympanum only by a thin plate of bone, which may be deficient. A creaking noise may be produced by cerumen, or a foreign body, in the external auditory meatus. A bubbling noise may be due to the presence of exudation in the middle ear, the result of catarrhal inflammation. A cracking or clicking sound may be caused by spasmodic contraction of the dilatator tubæ and salpingopharyngeus muscles which are attached to the Eustachian tube. When the character of the sound is described as humming, hissing, roaring, whistling, or musical, its origin is subjective, and is due to some irritation of the auditory nerve, rarely cerebral or in its course, but usually at its terminations in the labyrinth.

A distinction must be made between tinnitus and hallucinations of hearing, the latter usually taking the form of hearing voices, and indicating mental trouble, usually of a serious nature. Tinnitus, however caused, is usually influenced markedly by the general health and environment of the patient. Thus, sometimes the noises are less marked when the patient is in the open air, when his attention is occupied by other matters, or when the sense of hearing is occupied by listening to objective noises. Similarly, the trouble may only be present at night, but may appear in the day-time if the patient closes the external auditory meatus with his finger. Generally speaking, tinnitus becomes less marked and more bearable when the general health of the patient is good, and increases when the sufferer is out of health or overworked, either mentally or physically. Working in close, stuffy rooms, or in proximity to noisy machinery, over-indulgence in alcohol, and excessive smoking, have a bad effect; in women the trouble may be increased during pregnancy, menstruation, or the menopause.

Though tinnitus is very common in diseases of the ear, yet serious lesions of the middle ear, internal ear, or auditory nerve, may be present without this symptom. There is no constant relation between tinnitus and deafness. The former may be present with perfect hearing, but when long continued the hearing nearly always becomes impaired. The sounds, too, may persist when the patient has become totally deaf.

Tinnitus may occur in the following diseases of the ear:—

- i. The presence of *cerumen*, *aural polypi*, or a *foreign body* in the external auditory meatus. Removal of the offending body will in this case probably lead to the cessation of the tinnitus.

2. In any *inflammatory disease, acute or chronic, suppurative or non-suppurative, of the middle ear*. In catarrhal inflammation of the middle ear, the noise frequently has the character of bursting bubbles, and is due to movements of the viscid exudation in the ear itself. In otosclerosis, tinnitus is a very

prominent and usually early symptom. It may occur before any alteration in hearing is present.

3. In diseases of the internal ear, tinnitus is especially liable to occur in a severe and intractable form. Thus, it is especially likely to be present in *Ménière's disease*, *syphilitic disease* of the internal ear, and in those lesions of the internal ear which may arise in the course of *typhoid* and other *specific fevers*. *Extension of suppuration to the labyrinth* from the middle ear is also an important cause; and it may be present, usually associated with deafness, after a fracture of the base of the skull.

Tinnitus has been recorded as occurring in a *cerebral tumour* involving the roots of the auditory nerve, but this is a very unusual condition.

"Noises in the ears" may be present in a considerable number of general diseases, either with or without a lesion of the ear. Thus, it is frequently present in *anæmia*, and in diseases such as *leukæmia* or *pernicious anæmia*, in which anæmia is a prominent symptom.

Some *cardiac lesion*, especially aortic regurgitation, may be found in the pulsatile variety of tinnitus, treatment of which may lead to the disappearance of this symptom. *Gout*, *chronic nephritis*, and *arteriosclerosis* with high blood-pressure, may also be responsible for tinnitus, and it may occur during attacks of *migraine*. Sometimes it has apparently a reflex origin, being associated with neuralgia or digestive disturbances. *Malaria* may also be a cause, though here the trouble is likely to be the result of large doses of *quinine*. Other drugs likely to cause the trouble are *salicylates* and *antipyrin*.

It must be remembered that tinnitus may be an exceedingly severe symptom, and that patients not infrequently present themselves for treatment on this account rather than for any coexistent deafness.

Philip Turner.

TREMOR occurs when the normally continuous contractions of a muscle at work, or the normally uniform tone of a muscle at rest, are replaced by a succession of separately perceptible muscular twitches. In these circumstances, a movement which is normally uniform becomes tremulous; a position that can be steadily maintained under normal conditions is now kept unsteadily or shakily.

The normal muscular contraction is due to the discharge of a rhythmic series of nervous impulses from the motor neurons that govern the muscle. It is estimated that, in health, from five to fifty such nervous impulses leave the motor nerve-cells and reach the contracting muscle-fibres every second, the actual number per second varying in different motor neurons, and also in the same neuron according to its temporary condition of nutrition or fatigue. It is when the number of nervous impulses received per second by the contracting muscle-fibres becomes low, that steady and apparently uniform muscular contractions are likely to be replaced by tremors.

Tremors are of very various periods, amplitudes, and general characters in different cases. Their physiology and pathology are not at present fully understood, so that it is not yet possible to classify them etiologically. From a clinical point of view they may be classified roughly in accordance with their more obvious physical characteristics—their fineness, periodicity, regularity, and the circumstances that favour or inhibit their production. But it must be understood that an unbroken series of graduated tremors can be traced in various diseases, passing by imperceptible degrees from the rapid and minute oscillations observed in paralysis agitans to the extremely coarse and irregular movements composing the intention-tremor of disseminated sclerosis. A similar variety of regular tremors may be observed sometimes in a normal person, as the temperature of his body falls from exposure to cold, or during the occurrence of a rigor. Hence a rigid clinical classification of tremors is impossible.

CLASSIFICATION.

Fine Tremor.

Exposure to cold, nervousness, emotion	Chronic intoxications, e.g., by—	
Muscular fatigue or weakness	Alcohol	Cocaine
Convalescence	Tobacco	Mercury
Congenital and familial tremor	Absinthe	Lead
Senile tremor	Morphia	
Paralysis agitans	High pyrexia	
General paralysis of the insane	Hysteria	
Graves' disease	Neurasthenia	
Occupation neurosis	Railway spine	
	Uræmia.	

Unilateral Fine Tremor.

Cerebral tumour	Chronic hemiplegia	Hysteria	Chorea.
-----------------	--------------------	----------	---------

Coarse Tremor.

Exaggerated degrees of fine tremors	Familial and hereditary ataxias	Chronic hemiplegia.
-------------------------------------	---------------------------------	---------------------

Intention Tremor.

Disseminated sclerosis	Congenital cerebral diplegia
Hysteria	Some cerebral or cerebellar lesions.

Fine Tremor.—This consists of regular oscillations of small amplitude due to alternating contractions in antagonistic muscles or groups of muscles, repeated from three to nine times per second. It is usually most marked in the extremities, but may also—as in old age and in paralysis agitans—affect the head and neck. It may occur only when some movement is attempted; or it may continue also when the patient is at rest. Fine tremors cease almost invariably during sleep; emotion habitually increases them. They are not purposive movements; and should be distinguished from the fibrillar contractions (see CONTRACTIONS) of individual muscle-fibres or muscle-bundles, seen in some degenerations of muscular tissue.

Fine tremors occurring in consequence of *cold, nervousness, excessive emotion, convalescence*, and *muscular fatigue or weakness*, are matters of the commonest daily observation. They are most noticeable in the upper extremities, although in Homer's time the lower limbs would seem to have been most seriously affected. They tend to pass off as the patient's condition of mind or body improves, and should occasion little trouble in diagnosis, if the fact of their existence and frequent occurrence be kept in mind.

Congenital and familial fine tremors occur mostly in children or young adults, mainly in the hands and arms, face, or tongue. The oscillations are often absent while the patient is at rest, but make their appearance whenever movement is attempted, and are increased by nervousness or emotion. They can often be suppressed for a time by a strong effort of the will, and in many instances they disappear as the child grows up, or the adult grows older. They cause practically no inconvenience, and are not accompanied by any other abnormalities in the neuro-muscular apparatus. Their diagnosis should be made plain by the patient's past personal and family histories.

Senile tremor and *paralysis agitans* may well be considered together. Senile tremor comes on with old age in the form of fine regular or irregular oscillations affecting the arms and the head. Both sides of the body are involved, the head is involved early, and the tremor ceases during repose and in sleep. The muscles of the affected parts are neither rigid nor weak. These senile tremors must be carefully distinguished from the tremors of paralysis agitans, or Parkinson's disease, a progressive and far more serious disorder. In paralysis agitans, the

tremors are of several varieties. A fine oscillatory to-and-fro tremor, with from three to six excursions per second, affects the extremities and head in some cases. In others, the tremor is coarser, rhythmical, slower, and to some extent purposive; in typical instances it produces the alternating movements in the thumb and index finger described as "bread-crumbling" or "cigarette-rolling." These may be combined with more irregular movements of flexion and extension at the wrist, pronation and supination of the forearm. The progressive development of these tremors and movements is often characteristic; beginning in one hand, the fine tremor may spread to the other after some months or years, and ultimately the lower limbs, the head and neck, the lips and tongue, and even the muscles of the trunk, may become involved. As a rule, the movements continue when the patient is sitting, or lying at rest; in severe cases they may persist, even during sleep. In most instances they can be lessened by an effort of the will, and diminish also on passive or voluntary movement. If, on the other hand, they increase on voluntary movement, a tolerable imitation of an intention tremor may result. They are augmented by emotion or excitement. In cases of some duration a well-marked coarse shaking of the arms may be a noticeable feature; while contractions alternating in the flexor and extensor muscles of the legs may cause the feet to chatter when they are placed on the floor; the thighs are commonly held in adduction.

Paralysis agitans is characterized by other signs that facilitate its diagnosis, and the chief of these are:—(a) *Muscular rigidity*, causing a fixed, expressionless facial aspect (see *FACIES*), a monotonous voice, a bent and rigid carriage, and a shuffling, hesitating gait, with festination, propulsion, and retropulsion. Festination implies that the patient in walking from one point to another, starts with slowness and difficulty, but he accelerates as he goes along, much as if he were running after his own centre of gravity, and at the end he may even fall down forwards unless there is some object at hand for him to catch hold of. Propulsion, retropulsion, and the rarely observed lateropulsion, are terms meaning that when the patient is standing at rest and is sent off with a vigorous push to walk forwards, backwards, or sideways, the same acceleration and proclivity to fall down at the end—forwards, backwards, or sideways—are observed. (b) *Muscular weakness* of the tremulous or rigid parts. (c) *Paræsthesiæ*, such as aching pains about the limbs or body, flushes of heat or cold. The sphincters and mental faculties are not affected in paralysis agitans, while the deep reflexes are usually normal, but may be increased. It must not be forgotten that cases of Parkinson's disease occur, in which tremor is absent; the presence of the other signs mentioned above, however, should suffice for its recognition. *Bilateral cortical degeneration*, with its slowly increasing rigidity and muscular weakness, and its set facial expression, may resemble paralysis agitans; but it is accompanied by progressive mental failure, increase of the deep reflexes, sphincter troubles, and the other evidences of cortical degeneration.

The tremor of certain types of *general paralysis of the insane* is a fine, irregular oscillation, often with a twitching character. It first appears in the hands and arms, and may spread till it is conspicuous in the tongue, lips, and face, when it is associated with the characteristic changes—slowness and blurring—in the speech. For the most part this tremor occurs on exertion; it varies in extent, and may almost disappear during periods of general improvement. In the later stages of the disease a coarse universal tremor sets in, combined, perhaps, with grinding of the teeth. In these patients the moral and intellectual changes, tottering gait, alterations in the tendon- and pupil-reflexes, and other phenomena of general paralysis, will probably not escape attention.

In *Graves' disease* a fine, regular, and rapid tremor, about eight to the second,

on exertion, is one of the cardinal signs. It affects the arms and hands most, less often the legs; and it is increased by movement or by excitement. In addition, attacks of trembling that affect the whole body may occur. It is only in aggravated cases, however, that these tremors are so severe as to interfere with the customary employments of the hands. The tremors of Graves' disease are likely to be of comparatively sudden onset, and the patient will generally exhibit many of the other prominent signs or symptoms of hyperthyroidism, such as thyroid enlargement, exophthalmos and the other ocular phenomena, tachycardia, attacks of palpitation, wasting, sweating, or mental changes, so that the diagnosis ought not to be difficult.

Fine tremors are frequently observed in many of the *chronic intoxications*, particularly those due to alcohol, absinthe, lead, mercury, nicotine, carbon disulphide, morphine, cocaine, and many other organic compounds that may be taken in excess in rare cases, whether intentionally or by accident. *Alcoholic tremor* is fine, regular, and rapid; it is well shown in the outspread fingers of the extended hand and in the feet. In many cases it can be felt by the observer's hand more readily than it can be perceived by his eye; or it may be rendered more conspicuous by laying a sheet of paper on the backs of the outspread pronated fingers and hand. It is absent during rest, and is increased by movement, excitement, or fatigue. It may also affect the tongue, lips, and facial muscles, taking the form of a rapid and rather irregular twitching, increased on exertion. This tremor is an early sign of alcoholism, and is often more marked in the morning hours, when it is due, perhaps, to fatigue and want of alcoholic stimulation; it can be controlled to some extent by the will. Associated with it is a certain general nervousness and jumpiness; in addition, the patient will no doubt exhibit some of the other signs of chronic alcoholism—venous stigmata or acne rosacea on the nose and face, restlessness, insomnia, gastric disturbances—particularly the morning vomiting of mucus on an empty stomach—paræsthesia and weakness of the extremities, mental and moral deterioration, and so forth. If the main facts of the case can be made out, tremors due to alcoholism should not be hard to diagnose. A history of chronic alcoholism should always be inquired after most carefully, both from the patient, who may deny it *in toto*, and from the patient's friends, who may hasten to admit more than the facts warrant. This is of importance, because mere *nervousness* at the prospect or realization of an interview with a medical man, will often bring on a fine but temporary tremor, indistinguishable, for the time being, from the lasting fine tremor of the heavy drinker. If such a tremulous, but teetotal, patient has indigestion and acne rosacea, and repudiates any veiled suggestion of alcoholism with apparently unnecessary warmth, there is some danger lest these evidences should be taken as confirming the apparently natural, but erroneous, diagnosis of alcoholism.

The tremor of *mercurial poisoning*, a very rare complaint nowadays, is at first fine, but later becomes coarse and even choreiform. It begins in the face, hands, and arms, and may spread to all parts of the body. At first, it is brought out only by excitement, or on attempted movement. Later, it may persist even during sleep, and speech may be interfered with from involvement of the muscles of the tongue, pharynx, and larynx. Other prominent symptoms of mercurialism that should not be absent are profuse salivation, stomatitis, anæmia, and cerebral symptoms of various kinds. Mercurial tremors may have to be diagnosed from those of paralysis agitans or disseminated sclerosis.

In *lead poisoning* a fine tremor of the affected limb is sometimes met with in cases marked by paralysis. The oscillations may also be seen in the tongue and lips, particularly in the rarer instances of chronic plumbism that exhibit cerebral symptoms and simulate general paralysis of the insane.

The diagnosis of these unusual cases would be difficult unless a suspicion of lead-poisoning were aroused, either by a history of exposure to the intoxication, or by the occurrence of other and well-known signs and symptoms of plumbism; especially anæmia, blue-black line on the gums, colic, constipation, and dropped wrist.

In *hysteria* the clinical picture of any or every disorder of movement or sensation may be more or less closely reproduced; and tremors of every variety may be met with in hysterical patients. The diagnosis may be extremely difficult until hysteria is suspected, when it may be confirmed by the discovery of signs and symptoms that, singly or together, are pathognomonic. Such would be the occurrence of hysterical fits; of hemianæsthesia, or of anæsthetic or paræsthetic areas, varying from day to day, and not corresponding with the known distribution of the peripheral nerves; of flaccid or spastic paralyses, that change from time to time with great suddenness, and perhaps vanish when the patient believes herself to be no longer under observation; of emotional outbursts and psychical changes. Certain symptoms are so characteristic that they have been labelled as hysterical: such as the hysterical aphonia due to bilateral adductor paralysis; the globus hystericus, or sensation of choking due to the rising of a ball into the throat; the clavus hystericus, a peculiar vertical headache that feels as if it were due to a nail driven into the top of the head. The diagnosis of hysteria should never be made lightly; but only after a careful consideration of the history, signs, and symptoms, and when all evidences of organic disease have been looked for and found wanting. Unless a careful examination be made, the tremor of intracranial tumour, for example, or of disseminated sclerosis, may be wrongly diagnosed as hysterical.

Unilateral Fine Tremor is but rarely seen. It may be a *hysterical* manifestation, functional, and significant of no underlying lesion of the central nervous system; the diagnosis of hysterical tremor has been considered immediately above. Unilateral tremor may occur in *tumour of the frontal region of the brain*; if present, it occurs in both arm and leg, and only on the same side of the body as the tumour. The patients will often exhibit mental changes, such as inattention, incoherence, loss of memory, alterations in character; sometimes, too, irritative phenomena occur.

Unilateral fine tremor may develop on either the same or the opposite side of the body in *tumour of the mid-brain and sub-thalamic region*. The general symptoms of cerebral tumour will be present, and in addition certain localizing signs may make their appearance. The chief of these would be paralysis of the third nerve, loss of sensibility over the area supplied by the fifth nerve, eccentric position of the pupil, defective reaction of the pupil to light, and weakness of the upward movements of the eyeballs.

It may be added that fine tremors occasionally occur in the paretic limbs after *hemiplegia*. The history of the case and the presence of other signs characteristic of hemiplegia should make the diagnosis here a comparatively straightforward matter. Fine tremor may be seen in *chorea*, and may, of course, be unilateral in such cases.

Coarse Tremor.—Coarse tremors may be developed as temporary exaggerations or later developments of the fine tremors occurring in several of the morbid states already considered. Thus, when the body is thoroughly chilled or fatigued, or when a patient is in a rigor, the initial fine tremor will often pass on into a very coarse tremor, as the amplitude of the involuntary muscular contractions increases, their rhythm remaining much the same. The fine tremor of paralysis agitans or general paralysis may similarly grow into a coarse tremor; coarse tremors are not infrequently seen in hysteria. The diagnosis in all these cases must be made on the lines already indicated.

Coarse tremor is met with sometimes in the various forms of familial and hereditary ataxia. Thus in *Friedreich's disease*, in addition to the intention tremor considered below, irregular involuntary motions, described as coarse tremors in some cases, as choreiform in others, take place in the arms while the patient is at rest. Irregular nodding or tremulous movements of the head and trunk, also occur in advanced cases; the muscles of articulation and of the face may exhibit irregular purposeless contractions or quiverings when conversation is attempted. In *spino-cerebellar ataxia*, irregular choreiform movements, or constant tremors, large and small, may be seen in the head, trunk, and limbs, whenever the attempt is made to hold them steady, but unsupported. Similar disturbances have been recorded in *cerebellar ataxia* and in the *olivo-ponto-cerebellar atrophy* of Dejerine and Thomas. In all these conditions the ataxia is the prominent symptom, the coarse tremor being no more than an occasional epiphenomenon; the diagnosis between them must be sought in special manuals, and also under the heading ATAXY (*q.v.*).

The coarse tremor of the affected limbs seen in patients with chronic or spastic *hemiplegia* or *diplegia*, and in some other cerebral disorders, is a variant of the athetoid or choreiform movements that are characteristic of those conditions. They are considered under the heading CONVULSIONS (*Paramyoclonus multiplex*). As has been mentioned already, it is practically impossible—were it, indeed, desirable—to draw any hard-and-fast line between the grosser fine tremors and the finer coarse tremors. In the same way, coarse tremors merge insensibly into the lesser degrees of athetotic and choreiform convulsions.

Intention Tremor—known also as *action* or *volitional tremor*—has been defined as tremor produced, or, if not produced at least exaggerated, by voluntary movements. These tremors affect the upper extremities, and sometimes the head and trunk also; the limb is quiet when not in actual use, but as soon as voluntary movement is attempted irregular and involuntary to-and-fro motions begin in it, and are superadded to the intended movement. These to-and-fro motions become more marked, and sometimes more rapid the more nearly achievement of the desired movement is reached. The greater the amount of precision demanded by the voluntary action, the greater becomes the amplitude of these involuntary excursions. Wishing to drink, the patient may lift the cup from the table steadily enough; but as the cup approaches his lip, the involuntary movements

Fig. 205.—Movements in intention tremor.

Fig. 206.—Movements in ataxia.

The dotted lines show the direction of the movement attempted.

appear and rapidly increase till its contents are jerked wildly in all directions as it reaches his mouth. The tremor may spread from the muscles that are being put into action, and cause extensive jerky movements of the head and trunk. The pathogeny of intention tremor is obscure. Very possibly it is due to destruction of the short intersegmental nerve-fibres in the substance of the spinal cord. The destruction of these fibres would render impossible the accurate mutual adjustment of the contractions of antagonistic muscle-groups

that is essential for the smooth performance of even the simplest willed movements.

Intention tremor is one of the most characteristic features of *disseminated sclerosis*. The arms are most often and most markedly affected; but careful observation will often show that none of the voluntary muscles escape involvement. The head may oscillate whenever the patient is holding it up; the trunk may exhibit jerky movements whenever he sits or stands; and the legs whenever he stands or walks, after the disease has made some progress. Disseminated sclerosis has been carefully studied of late years, and has shown itself to be a protean disorder. Typical examples, however, may be recognized by the occurrence of intention tremor (*Fig. 205*), muscular rigidity, nystagmus, pallor of the optic discs, and staccato or scanning speech. The deep reflexes are increased; the gait is spastic or ataxic; Babinski's sign is present; subjective sensory signs are far commoner than objective: and control over the sphincters may sometimes be impaired fairly early in the disease. In many instances, however, some, or even many, of these characteristics are absent; the diagnosis of disseminated sclerosis may then be far from easy, especially in its early stages. In *hysteria*, for example, intention tremor may occur in just the same way as a fine or a coarse tremor may; and other points of correspondence between hysteria and disseminated sclerosis may often be found in the age and sex of the patient, in the remittent course pursued by either of the disorders, in the frequent occurrence and partial recovery of various paralyses and of amblyopia with contraction of the visual fields, and in exaggeration of the deep reflexes. But distinct differences between the two are, fortunately, not wanting. In hysteria, the objective sensory signs are well marked, the optic discs are not affected, nystagmus is absent, Babinski's sign probably never occurs, and control over the sphincters is not lost. Attention to these points should suffice to clear up the diagnosis between hysteria and disseminated sclerosis; but in the earliest stages of the latter it may be necessary to keep the patient under observation for some little time before a definite opinion can be pronounced. Intention tremor has also been described as an exceptional feature in patients suffering from *neurasthenia*.

An intention tremor is not very rare in the *familial* and *hereditary ataxias*, among which may be mentioned Friedreich's disease and cerebellar ataxy; but the disturbance of movement in these disorders is characteristically an ATAXY (*q.v.*).

It is necessary to refer briefly to certain intracranial conditions in which intention tremor occasionally or exceptionally occurs. The *congenital* or *acquired cerebral diplegia* of backward or mentally defective children, occasionally appearing as a familial disease, and characterized by bilateral spastic paralysis affecting the limbs, or limbs and body, is sometimes associated with intention tremor. It is athetosis (*vide supra*) that is characteristic of these cases; but disordered movements of all sorts occur in them. In addition, the sphincters are commonly affected, the deep reflexes are increased, optic atrophy or inequality of the pupils is frequently found; and if the patient is able to get about, a spastic or "scissor" cross-legged gait is to be seen. A congenital cerebral diplegia in which the spastic weakness is most marked in the legs, is described as a case of *Little's disease*. The intention tremor occurring in birth palsy or in infantile hemiplegia has, unfortunately enough, been described under the name *chorea spastica*.

Intention tremor has also been recorded in a few instances of lesion of the *superior cerebellar peduncle*, *corpora quadrigemina*, or *optic thalamus*, particularly when the tegmentum, red nucleus, and rubro-spinal tract are involved. It may be noted in patients with so-called *extra-cerebellar tumours* growing in connection

with the eighth nerve, and occupying the posterior fossa of the skull between the pons and cerebellum. It is seen in a certain proportion of the cases of cerebellar atrophy, whether the degeneration is primary parenchymatous, progressive and due to interstitial and vascular lesions, or acute and following some acute specific fever. Intention tremor is also present in some patients with *olivoponto-cerebellar atrophy*. The diagnosis of these rare instances will naturally depend upon the development of other general and localizing signs of intracranial disease.

A. J. Jex-Blake.

TRISMUS.—Trismus, or lockjaw, signifies a maintained closure of the jaws by tonic muscular spasm, so that the mouth cannot be opened. It is best seen in cases of tetanus. The term does not include mechanical inability to open the jaws owing to such affections as mumps, alveolar abscess with surrounding inflammatory oedema, angina ludovici, quinsy or severe tonsillitis, an odontoma, epithelioma of the mouth, myositis ossificans, and so forth; but there are at least two mechanical conditions that may not at first sight be obvious, but which may lock the jaws together and simulate true trismus—*impaction of a wisdom tooth*, and *arthritic changes in the temporo-maxillary joint*. These will be diagnosed as the result of a careful local examination of the teeth and of the joint respectively, and in the latter case there may be osteo-arthritic changes in other joints also.

Circumstantial evidence will generally serve to distinguish trismus due to *hysteria* or to *facial neuralgia*; and if there is any doubt as to the nature of the case at first, this will disappear if the patient can be watched for a while. If there are convulsive seizures in a hysterical patient with trismus, they can generally be distinguished from those due to tetanus or to strychnine poisoning by their polymorphous character, and by the fact that touching the patient, and other similar stimulation, does not bring them on so certainly as would be the case with strychnine or tetanus.

The rigidity of the face muscles that may be found in certain cases of *tuberculous* or *posterior basal* or *cerebrospinal meningitis* never occurs by itself, and it is a minor symptom amongst others that generally point to the correct diagnosis. The same applies to *epilepsy* and to *uræmia*.

Malingering may sometimes take the form of lockjaw, and it may be a little while before the fraud can be detected; sleep is sure to come in time, and as the result of fatigue the malingerer's muscles relax completely.

Catalepsy may include trismus amongst its varieties of maintained muscular contractions; the general mental symptoms will assist the diagnosis, and as a rule there are no convulsive seizures.

Trichinosis is very rare nowadays, but if infected pork is eaten raw, or insufficiently cooked, the larvæ of the parasites find their way to many different muscles, and they show some predilection for those of the tongue, mouth, and jaws. The resultant irritation, pain, and stiffness cause trismus, whose nature may be difficult to determine unless the history points to pork as the origin. The patient is very ill in the earlier stages, with high fever, and the condition is often fatal. There may be an epidemic of the malady. The blood exhibits marked eosinophilia. The final criterion of the diagnosis is the discovery of the typical parasites coiled up in their little oval cysts amongst the affected muscle fibres.

Hydrophobia and **tetany** seldom exhibit trismus as a prominent symptom. The former, though it is almost unknown in Great Britain now, would suggest itself if any convulsive illness developed after a definite bite by a dog, wolf, or other similar animal, particularly if the spasmodic muscular difficulty was markedly increased by efforts at swallowing. The symptoms may not develop

for weeks or months after the bite, so that the patient may fall ill when he has come home, after being bitten abroad. *Tetany*, also rare, is at once distinguished by its typical carpo-pedal contractions (*Fig. 1*, p. 3), and by the fact that, though it may be severe for a time, it does not kill. It is apt to follow pregnancy, or operations on the thyroid gland, or to be associated with gastrectasis. A mild form occurs in rickety children.

Strychnine poisoning gives rise to generalized twitchings and convulsions long before trismus, the lateness of the development of the latter serving to distinguish it from tetanus. There may be evidence of strychnine having been taken or administered, either by the mouth or hypodermically; the symptoms develop very acutely, and are apt to be rapidly fatal.

Tetanus is the cause par excellence of trismus; and the diagnosis is often obvious enough if there is a clear history of an illness developing steadily in an otherwise healthy person or new-born infant, starting with stiffness of the neck muscles, spreading to those of the face and jaw, and thence to the rest of the trunk and limbs, with a tendency to extremely painful exacerbations on the slightest stimulation, even by a stroke with a feather or the banging of a door; risus sardonius; opisthotonos; no complete relaxation of the stiffening muscles unless chloroform is given; a duration of days rather than hours, and a termination in death more often than in recovery, especially if all these things follow a few days, or a week or more, after a small penetrating wound with a rusty nail, or a piece of stick or other similar body that may have been contaminated with tetanus bacilli from the soil (see *Plate XII, Fig. T*). It may even be possible to demonstrate the drum-stick bacilli in films prepared from the deeper parts of the wound. The chief difficulty arises when there is no clear history, or when the wound has been so small that it has healed or cannot be found. Even then, most cases are so typical that they can be diagnosed as tetanus without much difficulty.

Unnecessary anxiety arises chiefly in cases of impacted wisdom teeth, and of hysteria, where tetanus may at first be suspected, though the subsequent course of the malady soon serves to exclude this.

Herbert French.

TUMOURS.—(See SWELLINGS.)

TUMOURS OF THE SKIN.—The malignant tumours which affect the skin include carcinoma, epithelioma, Paget's disease, sarcoma, mycosis fungoides, and xeroderma pigmentosum.

As a rule, *cancer en cuirasse* and *nodular* (lenticular) *cancer* are secondary to cancer of the breast or other parts, and their diagnosis is self-evident. In *melanotic carcinoma* the tumours differ greatly in size, and also in colour, varying from a slate tint to bluish-black; they appear more frequently on the genitalia and the extremities than elsewhere. The only condition from which melanotic cancer requires to be distinguished is *pigmented sarcoma*, and for this histological examination is necessary.

Paget's disease, occurring chiefly in women after the age of forty, begins as a reddening of a patch of skin, usually on or around the nipple, followed by branny desquamation. Infiltration soon produces a bright-red, granular, indurated surface, with a sticky, yellowish discharge, which by forming crusts may obscure the nature of the lesions, save at the border, which continues to be characteristic—sharply defined, indurated, and sometimes distinctly raised. After a period, which is usually about two years, but may be much longer, deep-seated parts may become affected, this extension of the disease showing itself on the breast by retraction and induration of the nipple and the formation of a tumour in the substance of the gland. In the early stage Paget's disease

has to be distinguished from *chronic eczema*, which it closely resembles. Its differentiating features are the bright-red, granular surface exposed after removal of the crusts, the induration at the well-defined edge, the intractability, the age of the patient, and (later) the retraction of the nipple. The diagnosis may be made certain by microscopic examination of scrapings in iodized serum or liquor potassæ, when the bright, oval, nucleated bodies styled psorosperms will be seen, some still contained within the host-cells, others surrounded by distinct capsules.

Epithelioma begins usually as a single growth, superficial, deep-seated, or papillary, but all the forms alike are marked by peripheral extension, infiltration and destruction of neighbouring parts, central ulceration, and (except in rodent ulcer, for which see **ULCERATION OF FACE**) a tendency to the formation of secondary growths in lymphatic glands, in viscera and elsewhere. *Epitheliomata* have a predilection for the natural orifices, for such moist parts as the glans penis, for exposed regions, and parts exposed to friction and trivial injuries. A wart, a mole, an ulcer, lupus vulgaris lesions, or an *x*-ray cicatrix, may be the starting-point. If the tumour begins in the skin, it appears first as a papule; if in a gland, as a nodule. In the former, the more frequent case, the papule becomes firmer and extends laterally; infiltration is evidenced by the hard, raised, pearly border. Ulceration occurs in the centre of the growth while extension is proceeding in the depths and at the sides. If the necrotic process involves the vascular tissue, there is more or less hæmorrhage. If the lateral extension predominates, the discoid type of epithelioma, as in sweep's cancer of the scrotum, is the result; the surface is raised, with a steep border, and is bright-red, with a firm, granular surface. If the granulations are of large size, the growth is of the papillary type. The chief diagnostic features of epithelioma are: the origin as, usually, a single growth, the site, the starting-point, the slight discharge, the characteristic border, the secondary growths in glands and elsewhere. From a wart or a mole, epithelioma can be distinguished conclusively only by microscopical examination or by long-continued observation, and should signs of ulceration or crustation appear in such growths, epithelioma should be suspected. The so-called tubercular ulcerating syphilides are, as a rule, multiple, and not rounded, but rather segmental. (For the diagnosis of epithelioma from lupus vulgaris, see under **NODULES**.)

Sarcoma of the skin is most frequently secondary to growths commencing in the lymphatic glands or the deeper structures. *Sarcomata* vary considerably in colour, from reddish to brown or bluish-black, and also in consistence; those of the spindle-celled type are fairly firm, the small-celled ones soft, with all intervening grades of density. They may appear in any part of the body, but are often found on moles, warts and ulcers. The diagnosis usually depends upon histological examination, and it must suffice to say that a tumour which arises in previously healthy skin, or in a mole or wart, or at the site of an injury, which is soft and reddish from the vascularity that is a marked feature of this kind of tumour, or bluish from pigment, and which, after a period of slow growth, rapidly enlarges, projects above the surface, and readily ulcerates and bleeds, is probably a sarcoma.

In the early stage of *mycosis fungoides* the lesions are dull red or livid patches, sometimes slightly tinged with yellow, varying in size from the area of a finger-nail to that of the palm of the hand, with border sometimes well marked, sometimes fading off, most frequently raised or thickened, but occasionally flat. At first the patches are smooth and dry, afterwards they become scaly, and later still they may be moist or covered with crusts. Presently the surface becomes infiltrated, and tumours as small as a pea or as large as an apple, firm and

lobulated, broader at the free than at the attached end, and somewhat resembling tomatoes, project above the level of the skin ("fungoides"). As a rule, progressive thickening occurs, leading on to fungation. The lymphatic glands may be enlarged throughout the body. In the premycotic or eczematous stage—which is sometimes absent—the diagnosis may hesitate between mycosis fungoides and an eczematous or urticario-eczematous condition, and in some cases it may be impossible at this stage to distinguish definitely between the two. But in mycosis fungoides the lesions will make little response to therapeutic measures, the red of the patches may be slightly tinged with yellow, and they are more persistent than those of eczema. The only malignant condition which mycosis fungoides in the mycotic stage at all resembles is sarcoma, but there is seldom any difficulty in distinguishing between the two.

The initial lesions of *xeroderma pigmentosum* (Kaposi's disease) are small spots resembling freckles, but rather darker, which appear chiefly on the face, neck, arms and legs, and generally begin within the first two years of life. Usually they disappear in winter and return in summer; but after a time they become permanent, and often quite black. At first the condition suggests nothing but excessive freckling, but presently amid the "freckles" appear white, glazed, atrophic spots, telangiectases, and superficial ulcers discharging pus which dries into yellow crusts. After some years, small, warty-looking growths develop on the "freckles." Tumours now form and ulcerate, producing fungous masses, and the process extends both widely and deeply, and destroys every tissue it encounters, not excepting bone. It is only in the earliest stage that there can be any difficulty in recognizing this very distinctive disease. In that stage it may be mistaken, as is suggested above, for simple lentigo, from which there may be nothing but the more extensive distribution to distinguish it. With the appearance of the later lesions lentigo will be dismissed from consideration, and it should be not less easy to rule out sclerodermia.

The *benign* tumours of which the diagnosis may be, in very different degrees, open to doubt, are sebaceous and dermoid cysts, fibroma molluscum, von Recklinghausen's disease, neurofibromata, myoma cutis, myxoma, the xanthomas, rhinoscleroma, molluscum contagiosum, colloid milium, benign adenoides cysticum, and keratosis follicularis.

Sebaceous cysts, most frequently seen on the scalp, the face, and the back, rounded, often somewhat flattened on the top, and sometimes as large as an orange, are distinguished from *fatty tumours* by the absence of lobulation and the fact that the sebaceous contents can be squeezed out when there is an opening. *Dermoid cysts* may resemble *fibromata*, but if they are incised a sebaceous-looking material escapes. *Fibroma molluscum*, a pear-shaped or rounded fibrous tumour, usually covered by smooth skin and pedunculated, varying in size from a pin's head to an orange, and nearly always multiple (*Fig. 201*, p. 782), differs from a sebaceous cyst by its solid structure, and from a fatty tumour by its usual pedunculation and the absence of lobulation. *Von Recklinghausen's disease*, of which the lesions consist of nodular tumours, on and around which there is coffee-coloured pigmentation, is differentiated from ordinary fibroma in that the tumours are composed of fibrous and nervous, and not simply of fibrous, tissue. There is also a perceptible thickening of the nerves of the arms. *Neurofibromata*, which have their origin in the tendon-sheaths or the sheaths of the nerve fibres, and range in size from a pin's head to very large dimensions, are sometimes mistaken for rheumatic nodules, but instead of specially affecting the region of the elbows and the scalp, they occur on the trunk and extremities generally, nor is there (except from coincidence) a history of rheumatism.

Superficial *myoma cutis* occurs in the form of nodular tumours on the arms, back, chest, and cheek; the deeper kind, originating in the subcutaneous muscular structures, occurs as a solitary tumour, commonly on the breasts and genitals. The former growths are soft and elastic, and, like the latter, are often painful. The distinctive clinical feature of *myoma cutis* generally is that it contracts under the influence of cold. This, with the pain, the absence of any tendency to ulceration, and the aspect and slow course of the growth or growths, should enable the affection to be identified.

Myxoma, when it arises in the skin—most frequently in the loose skin of the scrotum and labia—usually forms rounded, pedunculated, translucent tumours which tend to enlarge slowly. They have to be distinguished from *molluscum contagiosum*. This begins by the formation of small growths that have been likened to tiny mother-of-pearl shirt-buttons. They are usually flattened at the top, where as a rule there is a depression in which can be seen a small aperture leading into the interior of the tumour. Through this orifice a whitish material, or sometimes a milky fluid, can be squeezed out. When they are very small the tumours resemble the vesicles of *varicella*, but a microscopic examination of the contents will obviate the confusion. A small molluscum body on the genitals may resemble a hard chancre, but similar growths will be found elsewhere.

Xanthoma planum, often associated with jaundice and migraine, and characterized by the formation of yellow or yellowish-white plaques (rarely nodules), usually in the upper eyelid and sometimes affecting also the lower lid, is easy of recognition, the appearance of the yellow patches embedded in the corium, and almost imperceptible to the touch, being absolutely distinctive. *Xanthoma multiplex*, however, is not identified quite so easily. Here the lesions are nearly always nodular, and often observe a linear grouping, and the colour varies, a blackish or reddish pigment being mixed sometimes with the yellow. Usually the nodules occur in connection with hepatic disease. The condition has been confounded with *urticaria pigmentosa*, but there is no itching, there are no wheals, and it is impossible to produce factitious lesions. The tumours may be indistinguishable from multiple dermoids of the skin until microscopic examination is made. *Xanthoma diabeticorum* differs from other forms of xanthoma, *inter alia*, in the presence of a raised red area around the yellow spots. This feature has led, in the early stages of the affection, to confusion with *acne*, but if the lesions are punctured they will prove to be solid. In the same stage the lesions may simulate those of *lichen planus*, but the resemblance soon disappears.

Rhinoscleroma begins, usually before the age of forty, in and around the nostrils as nodules in the cutis, and in the deeper layers of the mucous membrane. These coalesce to form a hard, smooth, glistening growth which spreads inwards from the lip and downwards to the pharynx from the posterior nares. The growth does not break down spontaneously, but is generally slowly progressive. It is not likely to be mistaken for anything but *epithelioma*, which is prone to ulcerate, generally has infiltrated edges, seldom attacks the upper lip, and usually begins later in life. In *rhinophyma*, pustules are often present, the growth is soft, and there is vascular dilatation.

In *colloid milium*, small, yellow, cyst-like formations containing a gelatinous substance appear in the skin, chiefly on the upper part of the face. They may become depressed in the centre and be slowly absorbed, or may inflame and dry up. The only condition from which colloid milium needs to be distinguished is *epithelioma adenoides cysticum*, in which the tumours, shining and translucent, contain one or more white, brightly refracting, milium-like bodies. The face is the part most frequently attacked, but the growths may appear on almost

any part of the body. They are not yellow, like the growths in colloid milium, nor are they soft.

Keratosis follicularis begins as small brown or yellow crusts, hard and dry, which, when detached from the underlying tissue, are found to present on their under surface a softish prolongation which dips into a follicle. At first discrete, the lesions may become confluent, and there is thickening of the affected parts until nodular masses are formed, from which oozes an offensive discharge. The affection is slowly progressive. At the outset the condition may be mistaken for *keratosis pilaris*, but it is not confined to the situations affected by that disease. The prolongation into a follicle gives it some resemblance to molluscum contagiosum, but it has a less limited distribution, nor have the growths the pearly appearance of the molluscum bodies, while the aperture in the individual lesions is larger.

Malcolm Morris.

TYMPANITES.—(See METEORISM.)

ULCERATION OF THE CORNEA.—The course of all corneal ulcers conforms to a general type, though the clinical varieties may vary. The process begins with an infiltration in the substance of the cornea, either central or peripheral; the result of this infiltration is a local loss of transparency, though in early stages the surface of the cornea may still retain its polish. The infiltration proceeds to suppuration, which is followed by a loss of substance, the corneal surface being dull and irregular, and, in the centre of the ulcer, depressed below the surrounding level. The base of the ulcer is grey or yellowish, and the surrounding portion of the cornea may be opaque with more or less grey infiltration.

The suppuration is followed, in cases which have a favourable termination, by vascularization, superficial vessels from the surrounding conjunctiva encroaching on the cornea and invading the suppurating area. The vascularization is followed by cicatrization, the surface of the cornea again becoming polished but flattened and opaque. The opacities resulting from corneal ulcers are localized, well defined and opaque, in contrast to the diffuse indefinite haze which follows such non-suppurative forms of inflammation as interstitial keratitis. Corneal ulcers may not heal, but occasionally lead to perforation of the cornea, prolapse and adhesion of the iris, anterior polar cataract, or panophthalmitis. Iritis, iridocyclitis, and pus in the anterior chamber (hypopyon) may also be associated conditions. The usual subjective symptoms are pain, photophobia, and lachrymation. The presence of corneal ulcers is demonstrated most satisfactorily by the instillation of a drop or two of fluorescein, which stains necrotic corneal epithelium or exposed corneal substance, green. The brightly-stained ulcer shows up in marked contrast to the surrounding clear cornea.

Corneal ulcers may occur in the following clinical varieties:—

Catarhal, or simple infective ulcers. These usually occur as minute grey infiltrated spots in the centre or periphery of the cornea. They heal very rapidly as a rule. They may follow injury to the corneal epithelium by foreign bodies, or may be associated with acute conjunctivitis or rhinitis.

Phlyctenular ulcers are associated with phlyctenular conjunctivitis, the ulcer forming after the epithelium on the top of a phlyctenule has been rubbed off. They are usually marginal, but may occasionally make their way on to the cornea, a leash of conjunctival blood-vessels trailing after them. Similar ulcers may be associated with *acne rosacea*.

Hypopyon ulcer, or *ulcus serpens*. This is a shallow ulcer affecting chiefly the superficial layers of the cornea, in or about its centre. The middle layers of the cornea are comparatively unaffected, but at the posterior surface the infiltration again becomes dense, with much fibre and débris, associated with

the formation of more or less pus in the anterior chamber. The ulcers often perforate; they are usually due to infection with the pneumococcus. The pus in the anterior chamber is always sterile, unless there is perforation of Descemet's membrane. These ulcers do not react to ordinary methods of treatment as a rule, but require cauterization, either by pure carbolic acid or the galvano-cautery. The hypopyon then disappears rapidly.

Mooren's ulcer, or rodent ulcer of the cornea, is a chronic serpiginous ulcer, usually affecting the eyes of elderly people. It begins at the margin of the cornea and spreads slowly over the whole surface, the advancing edge being much undermined. The ulcer is always shallow, and perforation never occurs; the ulcer may heal in places, but this is seldom permanent, and the ulceration usually spreads over the whole surface of the cornea, whatever method of treatment may be employed to arrest its progress, though recently radium has been used with some success. No specific organism has yet been discovered.

A dendritic ulcer is characterized by its peculiar shape—a long central stem with small linear ramifications. It is not really an ulcer, but an infiltration under the corneal epithelium, which in the later stages may become necrotic and break down. It is best treated by rubbing off the affected corneal epithelium with a pointed stick dipped in absolute alcohol.

Corneal ulcers may occur in association with pannus in *trachoma*, their usual site being at the margin of the vascular area. Occasionally they penetrate more deeply into the corneal substance.

Corneal ulcers frequently follow *gonorrhœal* and *diphtheritic conjunctivitis*. They spread rapidly, and often lead to perforation of the cornea and panophthalmitis. The diagnosis depends on bacteriological methods and the discovery of the causative micro-organisms.

Keratomalacia, a disease of childhood, is associated with night blindness and xerosis or dryness of the conjunctiva. Characteristic foamy white patches are seen on both sides of the cornea. The cornea becomes dull, grey, and cloudy, and ultimately disintegrates from purulent infiltration, associated with very slight signs of ocular inflammation. The ocular condition is associated with marasmus and malnutrition. The prognosis, both as to eye and vision, is bad.

Keratitis e lagophthalmo is associated with paralysis of the seventh nerve. Owing to the failure of the orbicularis palpebrarum, the eye cannot be closed, and does not remain closed during sleep. The lower part of the cornea is exposed, becomes dry, and the corneal epithelium dies, with consequent ulceration of the cornea. The condition can be cured by diminishing the palpebral aperture by sewing the eyelids partially or completely together.

Similar exposure of the cornea and consequent ulceration are seen occasionally in cases of *EXOPHTHALMOS (q.v.)*, for instance in severe *Graves' disease*.

Keratitis neuromparalytica. In paralysis of the fifth nerve, or as a result of excision of the Gasserian ganglion, the cornea becomes dull and cloudy and necroses in the centre, only the periphery remaining clear. A hypopyon forms, and in some cases the whole eye is destroyed, though occasionally the keratitis may lead only to a permanent opacity. The condition is due to arrest of lachrymal secretion and absence of corneal sensation, which is followed by abolition of the winking reflex. Foreign bodies lodge on the cornea and are not removed. The prognosis is bad, and is little affected by treatment.

Corneal ulcers may be associated with *herpes frontalis*, vesicles forming on the cornea simultaneously with the vesicles on the skin, especially along the course of the supraorbital nerve. The ulceration is often severe and may lead to perforation and destruction of the eye, and is in any case followed by considerable corneal opacity. The cornea is usually insensitive, and the intraocular tension may be raised.

Tuberculous ulceration is not common fortunately, but it should be borne in mind as a possibility in chronic or resistant cases. The diagnosis depends on the history, the presence of tuberculous glands or other similar lesions, positive reaction to the various tuberculin tests, and, most conclusively of all, upon the detection of tubercle bacilli in the discharge from the ulcer itself.

Herbert L. Eason.

ULCERATION OF THE FACE. The ulcers most often met with on the face are lupous, scrofulous, syphilitic, or malignant. In *lupus vulgaris*, the ulceration is extremely chronic. The lesion begins as a papule, develops into a nodule, and after a while, in the majority of cases, the lupous tissue breaks down and forms a granular sore covered with greenish-black crusts; but around the ragged edge will still be seen the characteristic "apple-jelly" nodules in different stages of development. The ulceration may extend through the whole thickness of the skin and may become the seat of warty vegetations. In the nose, where the integument is thin, it may cause necrosis of cartilage. The course the pathological process runs, from the papule onwards, as here described, and the frequent presence of the different lesions simultaneously, shed sufficient light on the character of the ulceration. I need only say further that the ulcer of lupus, however deeply it may extend, never erodes bone. This alone is sufficient to differentiate lupus from the ulcers of syphilis and cancer. It nearly always begins before the age of twenty.

In the ulcers of *scrofula*, though they have no absolutely distinctive characters, it will often be noticed that the edge is undermined and the surrounding skin blue and of low vitality. Their occurrence in children of strumous aspect, or in elderly persons who bear the stigmata of scrofulous lesions dating from childhood, and their tendency to become chronic owing to the feeble resistance offered by the tissues to morbid processes, leave no room for doubt as to their true nature.

It is in the late secondary and the tertiary stages of *syphilis* that cutaneous lesions on the face, as elsewhere, are prone to ulceration, instead of to the resolution to which typical secondary syphilides tend. The whole structure of the skin, or mucous membrane, is frequently involved, the ulceration is deep, and frequently the ulcers, while healing in the centre, extend at the margins, and so assume the characteristic circinate or serpiginous form. The appearance of the ulcers, with the history, and the marks of earlier syphilitic lesions, will supply all the guidance the diagnostician needs; Wassermann's serum test and the effects of mercury and iodide of potassium may serve to clinch the diagnosis.

As a rule *rodent ulcer* occurs in persons of more than middle age, and its favourite points of attack are the outer edge of the orbit and the side of the nose. It begins as a small, circumscribed nodule, dull brownish-red in colour, flat, depressed in the centre, and firm to the touch. After, it may be, years, the cuticle covering it is broken, and an ulcer with depressed granular centre and infiltrated border is formed. Very slowly this extends, both in circumference and in depth, infiltrating and destroying the subjacent tissues, including bone. Usually the destruction of the underlying parts is more marked in the centre, so that the ulcer becomes crateriform. Its invariable features—the inconsiderable suffering it inflicts, the singular slowness of its progress, its depressed centre, and the firm, raised, rolled edge, its failure to affect neighbouring glands, and its incurability except by extirpation or by physiotherapy—are so characteristic as to leave little scope for diagnosis. Epitheliomatous in structure, it differs from epithelioma in that the latter growth has a very hard and everted edge, and a foul base roughened with granulation, is often attended by severe pain, is much more rapid in its course, and infects the glands in its vicinity. (See also TUMOURS OF THE SKIN.) It differs from lupus vulgaris in its mode

of onset, in the absence of the "apple-jelly" nodules, and in not being a disease that starts in childhood. It may be diagnosed from tertiary syphilitic ulcers by the characters described above, and also by its usually solitary character and its resistance to treatment.

Malcolm Morris.

ULCERATION OF THE FOOT.—The ulcer which attacks the foot specially, though not exclusively, for the hand may be affected in the same way, is that known as perforating ulcer (*Fig. 207*). The exciting cause is pressure upon or injury to a foot in which there is interference with the nerve supply, either from peripheral lesion, as in peripheral neuritis, or from damage to the nerve-trunk, as in leprosy, syphilis, or diabetes mellitus, or to the nerve-centre, as in locomotor ataxy and general paralysis. The commonest situation of the ulcer is at the point of greatest pressure—the ball of the great toe, or the under aspect of the metatarso-phalangeal joint of the big or little toe. The ulcer, which is more of a sinus than a true ulcer, and is usually painless, may be simple or multiple, and both feet may be affected. It often begins by suppuration under a corn. When the horny covering is cast off, a track is seen which extends downwards until the bone is exposed. The process is usually very slow, and if the pressure from walking is continued the thickened epidermis forms a kind of corn-shield around the opening. The more essential symptoms of the neurotic disorder of which perforating ulcer is but an incidental manifestation, will disclose the true nature of the lesion. The only malady with which it can be confused is a suppurating corn. From this it is distinguished by the absence or small degree of pain, and by its irresponsiveness to the simple surgical treatment to which a suppurating corn readily yields.

Fig. 207.—Perforating ulcer of foot; from a case of *tuberculosis*.

Mycetoma is a fungous disease that is known alternatively as Madura foot, because, endemic in Madura and other parts of India, it usually affects the foot or the leg, though sometimes the hand, and in rare cases the shoulders or the scrotum. The affection appears in several forms, according as they are due to different species of *discomyces* and *aspergillus*. The lesions may be black ("melanoid") or pink ("ochroid"). The disease begins with slight swelling and redness or local induration, and as it progresses the foot swells and the swelling surface becomes dotted with small nodules, each containing the opening of a sinus which discharges a viscid, syrupy, slightly purulent, sometimes blood-streaked fluid, in which are suspended rounded granules, greyish or yellowish in colour. In other cases the granules are black, at first resembling gunpowder,

though later they may form black or dark brown masses. As the foot enlarges, the leg, from disuse, atrophies. The only condition from which mycetoma needs to be discriminated is *actinomycosis*. This affection usually begins in the bone or other deep structures of the jaw, face, or neck, may thence spread to the surface, and may involve the viscera. In the discharge the ray fungus may be found in the form of tiny, friable, yellowish or greyish bodies, though microscopical methods and the discovery of the characteristic ray fungi (*Plate XII, Fig. S*) will generally be required before the nature of the case can be confirmed.

Malcolm Morris.

ULCERATION OF THE LEG may be classified under three headings:—
 (1) *Non-infective Ulcers*.—These include those that are not due to any specific infection, but which are caused by various factors which interfere with the vitality of the part by injury, lack of circulation, or innervation of the tissue.
 (2) *Infective Ulcers* resulting from the direct action of a definite specific infection, e.g., tuberculosis or syphilis. (3) *Ulcerating Tumours*.—These are malignant tumours, which have originated in or invaded the skin.

1. Non-infective Ulcers.—*Varieties and Causes.*

Varicose Ulcer.—The presence of varicosity in the veins of the leg diminishes the free return of blood, and so leads to congestion and interference with nutrition, and thus to ulceration. In the majority of cases the ulcer is situated on the inner side of the leg about three inches above the ankle. It may be small, or may encircle the limb. For some distance round the ulcer the skin suffers from the effects of passive congestion. It becomes indurated and of a purplish-brown colour, and numerous small varicose veins may be seen in it. Any slight injury may cause an abrasion of this weakened skin, and thus another ulcer be formed. On a patient the subject of a varicose ulcer, the scars of previous ulcers are frequently found. The presence of varicose veins associated with an ulcer will usually lead to the conclusion that the latter is dependent on the former, and that view will probably be correct, but it may not be the whole truth, for syphilitic and varicose ulcerations may be present at the same time. Before the introduction of Wassermann's test for syphilis, it was common practice to give antisyphilitic remedies in order to clear up the diagnosis, and this may still be done when the serum test cannot be carried out.

Lymphatic Obstruction also leads to loss of nutrition, and ulceration may result. The best instance is seen in elephantiasis due to *Filaria sanguinis hominis*. In this country elephantiasis is rare. Other instances that may be cited are swellings of the leg following a badly united fracture; the cicatricial contractions of extensive burns; phlegmasia alba dolens, or white leg, during pregnancy or after labour.

Atheroma of the Arteries leads to a feeble or imperfect circulation of the blood, and so to loss of nutrition. Ulcerative conditions of the lower part of the leg are therefore common in such cases, and even gangrene may result.

Old Age.—Owing to a weaker condition of the tissues, ulcers are much more frequent in old people than in the young.

Cold.—A similar condition is brought about by exposure to cold, especially in persons whose nutrition is imperfect, whether from bad or insufficient food. The first effect of cold is to produce a chilblain; this if rubbed or irritated may degenerate into an ulcer.

Trauma.—In a normal individual, any lesion of the skin of the leg, such as that caused by a kick, a scratch, or a cut, will heal quickly, and no ulcer result. Circumstances may arise which interfere with the healing process. Perhaps the most frequent cause which leads to the formation of an ulcer is infection with pyogenic organisms, and the prevention of the discharge from the wound.

Occasionally there is also accidental contamination of the wound with some specific organism, such as that of diphtheria or phagedæna.

An important cause of want of healing of an ulcer is interference with its contraction. If contraction is impossible, as when a sore is situated over and adherent to a bone, healing may come to a standstill.

Deficient Innervation leads to loss of nutrition. Examples are seen in infantile palsy; rubbing of the foot or pressure of an instrument is prone to be followed by an obstinate ulcer. In cases of hemiplegia, even when the patient is lying on a water-bed, ulceration in the form of bed-sores will occur much more rapidly on the paralyzed side than on the other. Perforating ulcer of the foot is a well-known sequel of tabes dorsalis.

Diabetes mellitus is an instance of a constitutional condition leading to the formation of an ulcer. All the preceding were local causes. Ulceration and GANGRENE (*q.v.*) are prone to occur, no doubt because the resistance of a diabetic individual to micro-organisms is lowered, also because the arteries are often atheromatous, and possibly because the innervation of the whole body is interfered with.

2. **Infective Ulcers.**—It is possible for the legs to be attacked by any form of acute infective ulcer, such as *anthrax* or *glanders*, but such an event is rare. The chief ulcers that belong to this group are chronic, and due to syphilis or tuberculosis.

Syphilitic Ulcers are the result of gummata which have formed in the subcutaneous tissues. These ulcerated gummata are almost always circular, and present a punched-out appearance (*Fig. 208*); they are generally multiple and tend to run into one another, so that the ulcer has a serpiginous outline. They tend to heal at one side, while they progress at another. On the leg, especially about the front of the tibia, circular scars of old ulcers can usually be found. The scars are thin and supple, and if in the lower part of the leg, usually pigmented. Gummata are often found with varicose veins or ulcers, and it seems probable that the low state of nutrition of the tissues caused by the obstruction of venous return is favourable to their formation. Diagnosis can in most cases be made on the distribution and shape of the ulcers, especially if they are on the outer aspect of the lower third of the leg, and on the presence of other signs of syphilis. In cases of doubt, a Wassermann's reaction is of service.

Tuberculous Ulcer usually follows the formation and bursting of a tuberculous abscess, starting either in the subcutaneous tissue or in a bone, and the history may help materially in diagnosis. The ulcer is very chronic, and is characterized by undermining of the skin for a considerable distance from the edge (*Fig. 209*).

*From Introduction to Surgery,
by Prof. Rutherford Morison.*

The surface is pale, and the granulations very small, with here and there small areas of caseation.

Primary tuberculosis of the skin, or lupus, is not often found on the leg, though it may occur there as in any other part of the skin. A useful guiding rule is that lupus never starts later than the age of twenty and lasts for years, whereas a gumma starts at a later period and tends to heal spontaneously. In lupus the chief characteristic is the presence of minute, semi-transparent nodules at the margin of the ulcer and in the skin around, resembling apple jelly. If further methods of diagnosis are required, a diagnostic injection of Koch's old tuberculin may be used, or von Pirquet's skin test applied.

3. Ulcerating Tumours.

Epithelioma may develop in a simple varicose ulcer that has existed for many years. The change may be very slow, or rapid. The ulcer spreads, the edges become heaped-up, everted, and indurated (*Fig. 210*). The glands become enlarged and, if the disease is allowed to progress, the bone is attacked. If any doubt arises as to a change in the character of an ulcer, a piece from the edge should be removed for pathological investigation.

Rodent Ulcer (*Fig. 211*) usually attacks the face, though it may be found on any part of the body. It has to be distinguished from lupus and gumma.

Sarcoma, starting in the deeper tissues, may fungate through the skin, which has given way before the pressure of the tumour.

George E. Gask.

ULCERATION OF THE THROAT.—(See SORE THROAT.)

ULCERATION OF THE TONGUE.—To enable a good view to be obtained of the affected part, the patient should be seated in a strong light and the protruded tongue gently wiped with a piece of soft linen to remove moisture. The presence of an ulcer being ascertained, its nature may be considered under the following heads:—

- | | |
|------------------|---|
| 1. Carcinomatous | 4. Tuberculous |
| 2. Syphilitic | 5. Dyspeptic |
| 3. Dental | 6. Ulcer in connection with stomatitis. |

1. Carcinomatous Ulcer.—This is much commoner in men than in women, probably owing to the fact that chronic glossitis due to smoking and syphilis is more common in the male sex. It is practically unknown before the age of thirty, and rarely starts before forty-five. The ill and wearied expression of the patient may awaken suspicion before the tongue is seen, for the pain and trouble caused by an epithelioma have a very rapid and marked effect. The tongue in a normal individual can be protruded from one to one and a half inches beyond the teeth; if the protrusion is limited, or if it is not protruded straight, it can generally be inferred (except in cases of paralysis) that there is some tumour binding it down, and a very careful search should be made for an ulcer, which may be patent at once, or if on the under surface might escape a superficial glance. Next, the position of the ulcer is to be studied, and its relation to any sharp and carious tooth. Usually an epithelioma is on the side of the tongue, but there is no rule; it may be anywhere on the anterior two-thirds, on the under surface, or on the floor of the mouth.

As regards the ulcer itself, the typical appearance, when fairly developed, may be described as irregular, deep, foul, sloughy, with raised nodular everted edges, and a surrounding area of induration, the result of infiltration. The lymphatic glands are enlarged and hard, and they may be fixed. The sub-maxillary set is generally the first affected, but it is of interest to note that the disease sometimes misses these and infects the carotid and even the supra-clavicular glands. Examination, therefore, should not be concluded before

the whole of the neck has been looked at. The diagnosis should have been made, however, before the disease had developed thus far; in its earliest stages an epithelioma may be represented by a superficial ulcer, a sixteenth of an inch in diameter, by a crack or a small lump, without any enlargement of the glands. In all these conditions, however, the ulcer is hard, and, moreover, is very resistant to any form of treatment. Any ulcer of the tongue occurring in a middle-aged man, and lasting for more than two or three weeks, should awaken suspicion.

Diagnosis from Syphilitic Ulcer.—This may be a very real difficulty, owing to the fact that the two conditions may exist side by side, and that the syphilitic leukoplakia or leukomic wart may be, as is believed by many clinicians, the actual precursor of a cancer. A positive Wassermann's reaction, therefore, would not be proof that an epithelioma is not present. If a well-formed gumma is present, antisyphilitic remedies soon make a great change in its appearance, and a diagnosis may be made in this way, but not more than ten or fourteen days should be allowed to pass in uncertainty.

There are many cases in which the cleverest surgeon is in doubt, and seeing the rapid course this disease runs, and the vital importance of securing an early diagnosis, it is urged here with the greatest possible insistence that the only certain method, and the one to be employed early, is that of taking out a piece of the ulcer, or, if small, the whole ulcer, and submitting it to histological examination.

Diagnosis from Dental Ulcer.—The ulcer in this case is caused by a bad tooth, and therefore is in a position on the tongue corresponding to the latter. Further, the ulcer is soft to the touch, and heals rapidly when the offending tooth is stopped or extracted. There is seldom difficulty in differentiation except when the ulcer is of very long standing.

2. *Syphilitic Ulcer.*—This may be primary, secondary, or tertiary. *Primary Syphilis* or *Chancre* is certainly rare on the tongue and, owing partly to its rarity and partly to the fact that it is unexpected, it is frequently missed. It is more common in men than in women, but it may occur even in children. It starts as a small pimple, which ulcerates and becomes indurated, though the induration is not so marked as when it is situate on the glans penis. General enlargement of the lymphatic glands is an early and marked feature, and this is an important help to diagnosis. Pathological aids to diagnosis are Wassermann's reaction, and the examination for spirochætæ (*Plate XII, Fig. J*) in serum from the sore. Furthermore, the sore heals rapidly under the influence of mercury, and the appearance of secondary symptoms will certainly settle the question.

Secondary Syphilis manifests itself by the formation of mucous patches and superficial ulcers. The latter are almost always multiple, and situated along the edges and tip of the tongue, and with them are also found similar sores on the mucous membrane of the cheek, lips, palate, and tonsil, and at the edges of the mouth. The ulcers are small, round, painful, with sharply cut edges and a greyish floor. All the constitutional signs and other secondary symptoms will be present, so that there should be no difficulty in forming a correct diagnosis.

Tertiary Syphilis or Gummatous Ulcerations.—These are divided into superficial and deep. *Superficial* gummata begin as small round-celled infiltrations in the mucous and submucous tissue. The ulcers are usually shallow, often irregular and associated with chronic glossitis, fissures, and leukoplakia. They are extremely important, for, as stated above, such a condition is very often followed by an epithelioma. They are also very resistant to antisyphilitic remedies, which only adds to the difficulty of diagnosis. The ulcers themselves are not at first indurated, but if surrounded by interstitial fibrosis may appear

hard. Therefore a histological examination is eminently desirable if there is the least doubt.

A *deep* gumma starts as a hard swelling in the substance of the tongue; later it softens, breaks down, and shows itself, generally in the middle line, as a deep cavity with irregular, soft, undermined walls, and a wash-leather-like slough at its base. It is not painful, and does not increase in size. The important thing is to distinguish it from epithelioma and tuberculous disease. Unlike epithelioma, it is not hard, and its history is short. Furthermore, it yields very rapidly, under the influence of potassium iodide or salvarsan.

3. **Dental Ulcer** is a traumatic ulcer due to repeated small injuries received from the sharp edge of a decayed tooth. It is therefore situated in such a position, generally on the side of the tongue, that it is opposite the tooth. The ulcer is single, small, superficial, and not indurated unless it is of long standing. It is therefore not easily mistaken for any other kind of ulcer, or if doubt arises it is allayed by stopping or extracting the tooth, when the ulcer quickly heals.

There is a form of dental ulcer which is found on the frænum of the tongue in children suffering from whooping-cough; during the violent expiratory spasms peculiar to the illness, the under surface of the tongue may suffer from rubbing over the lower incisor teeth.

DESCRIPTION OF PLATE XV.

Fig. A.—Old leukoplakia of many years' duration. Quite recent development of epithelioma, in the form of a very slightly raised smooth red plaque, feeling about as thick as a sixpence. Between it and the middle line is a tiny nodule resembling a pimple.

Fig. B.—Area of thin leukoplakia on the right border of the tongue, with a small epithelioma, which had developed in the site of a bite received several months previously.

Fig. C.—Leukoplakia of many years' duration, with the very earliest condition of epithelioma to the left of the middle line in the form of a very small area of leukoplakia (*a*), slightly more raised and a little firmer than the rest. The diagnosis depended as much on the slight hardening as on the appearance.

4. **Tuberculous Ulcer of the Tongue** is rare; but it occurs at that period of life during which tuberculous disease of the lung is common, that is to say, between the ages of fifteen and thirty-five. It is due to infection with tubercle bacilli brought up into the mouth, and if a patient is found to be suffering from tuberculous disease of the lungs or larynx and also from an ulceration of the tongue, there is a strong probability that the latter is of the same nature as the former. The ulcer itself may be situated on the tip or side of the tongue; it has an irregular outline, and the base is nodular, sloughy, or caseous. It has often been mistaken for epithelioma or gumma. The facts that it is not hard, and that phthisis is present, should put one on one's guard. As against gumma, a Wassermann's reaction would be negative. A von Pirquet's test or a diagnostic injection of Koch's old tuberculin might be employed, but a more reliable method is the removal and microscopical examination of a piece of the ulcer, when the histological appearances of tubercle will be seen. The tubercle bacillus (*Plate XII, Fig. K*) is not always found.

5. **Dyspeptic Ulcer**, as the name implies, is connected with disorders of digestion. The ulceration is often multiple, each ulcer being round, small, often covered with a greyish slough, and with a bright ring of inflammation round it. They

Fig. C.

Reproduced by permission from "The Medical Annual."

are placed on the dorsum of the tongue near the tip. The mouth, too, is very foul, and the cervical glands may be enlarged.

5. **Ulcers in connection with Stomatitis (Ulcerative Stomatitis).**—Septic infection of the mouth due to a variety of causes, such as irritation from decayed teeth, alkalies, acids, or mercury, may be accompanied by the formation of small vesicles which, on bursting, give rise to superficial ulcers. They are not limited to the tongue, but appear on the mucous membrane of the cheeks and gums as well. Aphthous stomatitis commonly occurs in conjunction with the febrile diseases of childhood. It is characterized by the formation of whitish spots on the buccal mucous membrane, and by the shedding of epithelium small superficial ulcers may be formed.

The ulcers of the tongue are here, so to speak, accidental, occurring in the course of a general inflammation of the mouth, and will hardly be confounded with any other form of ulcer.

George E. Gask.

UNCONSCIOUSNESS.—(See COMA.)

UNEQUAL PULSES.—(See PULSES, UNEQUAL.)

UNEQUAL PUPILS.—(See PUPIL, ABNORMALITIES OF THE.)

URATE DEPOSIT IN THE URINE.—A precipitate of urates is often recognizable at once by its pink colour, which is due to their carrying down with them the uroerythrin pigment of the urine. Urates themselves are white, however, and if, as is sometimes the case, there is no uroerythrin present for them to carry down, they form a white precipitate which may be mistaken for mucus, phosphates, or pus. They may be distinguished at once, however, by warming the urine back to body temperature; they re-dissolve long before boiling point is reached. They are also soluble in liquor potassæ, unlike phosphates. Microscopically they are nearly always amorphous, though in rare cases they assume the form of small spheres with irregular projecting spicules—the so-called “thorn-apple” or “hedgehog” crystals.

Their only significance from a clinical point of view is that they indicate a concentrated urine. It does not follow that a urine is not concentrated if no precipitate of urates occurs, but the fact that the urates re-dissolve on warming serves to show that, although there may be enough water to keep them in solution at body temperature, the urine becomes supersaturated with them as it cools, and precipitates them out.

The reason for the urinary concentration has to be learned from collateral evidence. It may be that there has been much sweating, and in hot weather a precipitation of pink urates is a very common physiological condition which is apt to alarm some patients when they first notice it. On the other hand, the concentration may be due to pathological conditions, of which the commonest are fevers, chronic valvular disease with heart failure, and maladies which lead to loss of fluid by vomiting, sweating, or diarrhoea. The urates themselves afford hardly any clue to the cause of the concentration, and their appearance is just the same whether their deposition is due to physiological or pathological changes.

The most marked examples of uratic deposits are to be seen perhaps in cases of acute rheumatic fever, lobar pneumonia, and chronic heart disease with failing compensation. It is a general rule, moreover, that when the kidneys are themselves affected there is decidedly less tendency for uratic deposits to form than when the primary disease is in the heart or lungs; thus when one may be in doubt as to whether a given case of chronic heart failure is due to primary renal disease or heart disease, the occurrence of an abundant urate deposit

affords some evidence in favour of the latter and against the former. It is no absolute rule, however, and almost any concentrated urine may precipitate urates.

Students are a little apt to confuse the significance of urates with that of uric acid, though the two are entirely independent from a clinical standpoint.

Herbert French.

URETHRA, DISCHARGE FROM.—(See DISCHARGE, URETHRAL.)

URIC ACID DEPOSIT IN THE URINE.—The most typical form taken by a precipitate of uric acid in a urine is that known as the cayenne-pepper deposit. It is made up of numbers of unmistakable, though seldom voluminous, characteristic light-brown prismatic crystals (*Fig. 212*), arranged, either as separate "whetstones," or in overlapping bundles, or "rosettes"; occasionally, crystallization is imperfect, and they appear as "dumb-bells." Intrinsically, they are colourless; but they differ from all other urinary deposits in that they carry down with them the ordinary yellowish-brown urochrome pigment of the urine. For clinical purposes the best test for them is the microscope.

Besides the cayenne-pepper deposit, uric acid crystals may be present in considerable numbers in the midst of other precipitates, such as mucus, or oxalate

Fig. 212.—Uric acid crystals of various types ($\frac{1}{8}$ in. objective).

of lime; in which case they may not be discernible without the use of the microscope; or, again, they may become aggregated together into small pellets or calculi, which the patient may be conscious of as "gravel" on micturition.

A deposit of uric acid is generally found in a decidedly acid urine of high specific gravity; but it may occur in urines of almost any reaction or specific gravity. A great deal more importance has been attached to this uric acid than it deserves, on account of its relationship with gout. *A cayenne-pepper deposit by no means indicates gout*; indeed, it may be perfectly physiological, occurring abundantly sometimes in healthy young persons, particularly boys. It does not even follow from its occurrence that there is excess of uric acid, either in the urine or in the tissues; for the precipitation depends nearly as much upon the relative proportions of phosphates, chlorides, and inorganic sulphates to uric acid, and upon the absolute and relative amounts of sodium, potassium, and other bases in the urine, as upon the absolute amount of uric acid. The greater the tendency of the bases to form phosphates, by mass action or otherwise (see PHOSPHATURIA), the less the tendency for the soluble quadriurates, and the greater the liability for less soluble biurates, to be produced, the

relatively insoluble uric acid being liberated from the latter and deposited in crystalline form.

Considerable care has to be exercised, therefore, before any useful clinical deductions can be drawn from the fact that a urine contains a deposit of uric acid. It is true that a persistent tendency to it is often associated with gout; but the latter should be diagnosed from the collateral evidence rather than upon the uric-acid crystals in the urine. Many gouty subjects precipitate no uric acid in their urine at all. Naturally, there will be a greater tendency to such deposition when the total amount of uric acid present is greater than normal. Uric acid in the urine is derived from two sources—exogenous and endogenous. The exogenous sources are such foodstuffs as are rich in nucleoproteid, and in the so-called xanthin bases, or purin, or alloxuric bodies, xanthin, guanin, hypoxanthin, adenin, heteroxanthin, paraxanthin, episarkin, epiguanin, methylxanthin, and carnin, which are mainly derived from nuclein. Analyses of the various foodstuffs as to purin bases need not be given here, for it is easy to remember that, broadly speaking, these substances are contained in largest quantities in the richest food. A considerable proportion of the xanthin bases are excreted as uric acid, and it is common knowledge that rich foods tend to increase uric acid in the urine. Endogenous uric acid, on the other hand, is derived from the patient's own tissue metabolism. Birds excrete nearly all their nitrogenous waste as uric acid; man excretes his mainly as urea, and only to a minor extent as uric acid. Sometimes, however, too much of his nitrogenous metabolism stops short at the stage of uric acid, instead of the latter being nearly all converted into urea; he then excretes an abnormal total quantity of uric acid, with the result that it may be precipitated in crystalline form. One repeats, that this does not necessarily constitute gout, however; it occurs in certain healthy subjects, in leukæmia, in pernicious anæmia, during the course of certain fevers, and in some cases of chronic heart disease. Perhaps one of the best ways of avoiding too narrow a conception in regard to this uric acid is to remember that in some respects the human body is a fire; fires may burn their coal well or badly; if well, the residue is but a little ash; if badly, the residue is not ash, but clinker; uric acid is the clinker of the human body, and many different things that make human nitrogenous metabolism incomplete, may cause a deposition of this clinker in the urine. Gout is one such thing; but excessive eating, deficiency of exercise, biliousness, and various chronic imperfections of the circulation, or digestion, may do so; and the same may occur in apparently healthy subjects, who have never had any untoward symptoms at all. Oxalate of lime (see OXALURIA) is very possibly derived in part from similar imperfect combustion of carbohydrates or fats, and it is noteworthy how often crystals of uric acid and of oxalate of lime occur, either together, or alternating with one another. Still further, error of metabolism may produce glycosuria in association with uric-acid crystals, so-called gouty glycosuria.

Besides being evidence of overloading, or of imperfect combustion in a general sense, the occurrence of a uric acid deposit may be of particular clinical importance in certain cases; first, of *frequency of micturition*; secondly, of *urethritis*; and, thirdly, of *renal calculus*. Necessity to micturate frequently, only small quantities of urine being passed at a time, is a symptom that in young people suggests cystitis, possibly tuberculous; enlargement of the prostate in men over sixty; or some uterine or other pelvic malady in women. It is important to remember, however, that undue acidity of the urine, with a tendency to deposit crystals of uric acid, or oxalate of lime, may produce the same symptom in considerable degree. It is sometimes spoken of as irritability of the bladder; the highly acid urine irritates the vesical mucosa, and it may produce actual

cystitis. The same irritation may inflame the urethral mucosa, and produce a "gouty" urethritis; and, perhaps, epididymo-orchitis, which may be mistaken for one of gonococcal origin, unless pus films can be shown to contain no gonococci.

If the patient has suffered from renal colic, hæmaturia, or vesical pain, suggestive of calculus in the kidney, ureter, or bladder, the discovery of abundant uric-acid crystals in the urine affords confirmation of the diagnosis of a uric-acid stone, particularly if they are obviously aggregated together into tiny calculi; there are generally red corpuscles, excess of leucocytes, and tailed epithelial cells from the renal pelvis, or pyriform cells from the deeper layers of the bladder mucosa, at the same time.

The danger of diagnosing glycosuria in the absence of sugar, when uric acid is abundant in a urine, needs special mention. Uric acid has considerable power of reducing Fehling's solution. It seldom gives the copious brick-red or orange-yellow precipitate that is characteristic of abundance of sugar, but it may give just enough reduction or change of colour to make it doubtful whether sugar is present or not. More than a few proposers for life insurance have suffered unfairly on this account; no such partial reduction should be regarded as due to sugar, until the presence of glucose has been confirmed by other means, particularly the phenylhydrazine and the fermentation tests. *Herbert French.*

URINE, ABNORMAL COLORATION OF.—This may be due to: (I) The presence in abnormally large quantities of certain urinary pigments, such as uroerythrin and hæmatoporphyrin; (2) The presence of pigments formed in the organism, but which are not normally excreted in the urine, such as hæmoglobin and the pigments of the bile; (3) The presence of pigmentary substances derived from drugs or foods, or administered directly by the mouth.

Urines of unusual tints may be classified conveniently according to the colours which they exhibit, as follows: (I.) *Yellow and orange urines*; (II.) *Pink and red urines*; (III.) *Brown and black urines, including such as are of normal tint when passed, but darken on exposure to air*; (IV.) *Green and blue urines.*

I. Yellow and Orange-coloured Urines.—The normal yellow tint is wholly due to urochrome, for other urinary pigments are present in traces so minute that their presence has no obvious effect. However much it be diluted, normal urine remains yellow as long as any tint is visible. In some cases of diabetes insipidus the urine is almost colourless, and the abundant urine of diabetes mellitus usually exhibits a greenish-yellow tint which has not yet been explained.

Urobilin, when present in large amount, imparts a rich orange-yellow colour; and when seen in very thin layers, as near the apex of a conical glass, urines rich in urobilin have a pinkish tint, due to selective absorption in the middle of the spectrum. Such urines, when examined with the spectroscope, show a dark absorption band near the solar F line (*Fig. 23, p. 95*).

Urobilinuria—the excretion of excess of urobilin—may result from widely different causes, and as a consequence, its clinical significance is not so clear as might be expected. The symptom is met with in connexion with hæmolytic diseases, such as *pernicious anæmia*, in diseases of the liver, such as *cirrhosis*, and in cases in which *excessive bacterial action* is going on in the intestine. The bulk, if not the whole, of the urobilin of urine is derived from the intestine, where it is formed by the action of the bacteria present upon bilirubin. It is present in abundance in normal fæces, and in traces in normal urine.

Uroerythrin—the highly unstable pigment to which the colour of pink urate sediments is due—when abundantly present in solution in the urine imparts to it a rich orange-red colour, which may even be mistaken for that due to blood. The colour is changed to a pale greenish-yellow by addition of an alkali. *Hepatic*

derangements of almost all kinds, including the most trifling functional disturbances, may lead to the appearance of uroerythrin in the urine; but the most intensely pink urate sediments are seen in cases in which the liver is the seat of pronounced morbid changes, such as cirrhosis, or the passive congestion due to cardiac disease.

Choluria.—Urine which contains bilirubin has a rich orange colour with a greenish tint at the edge of the meniscus. The foam formed by shaking it has a yellow colour, whereas that of bile-free urine, even when deeply pigmented, is colourless. The colour of the urine may be much modified by the presence of biliverdin, in addition to bilirubin, and may approach to black or dark green.

The presence of bile pigment may be demonstrated by *Gmelin's test*. This is best carried out by allowing the urine to flow gently on to the surface of some nitric acid in a test tube; on gently shaking, the familiar play of colours is seen at the junction of the liquids, and the urinary layer often retains the green tint of biliverdin for a considerable time.

Again, a green ring is observed when tincture of iodine is allowed to flow on to the surface of the urine in a test tube.

When the quantity of bile pigment present is very small, the above tests may fail to reveal its presence, and *Huppert's test* may then be resorted to. A precipitate is formed by the addition, to a much larger volume of urine, of a solution of barium chloride and baryta water, or of calcium chloride and lime-water. The precipitate, which carries down any bile pigment which may be present, is filtered off and washed into a test tube with alcohol. Dilute sulphuric acid is then added, and the test tube is heated in a beaker of boiling water. If bile pigment be present, the acidulated alcohol acquires a rich green tint, due to biliverdin.

Choluria is merely a symptom of jaundice, but the appearance of bile pigment in the urine may precede any yellow coloration of the conjunctivæ or skin, or, as in cases of acholuric family jaundice, the skin may be tinted although the urine is free from bile pigment. In the very rare cases in which a fistula exists between the biliary and urinary tracts, choluria of pronounced degree has been observed, apart from any jaundice.

Certain drugs impart to urine a tint which, although yellow, is abnormal. This is seen when *santonin* is administered, or *chrysophanic acid*, which is a constituent of rhubarb and senna. In either case, the urine turns pink on addition of an alkali, but the pink colour is far more brilliant after santonin than after chrysophanic acid has been taken.

II. Pink and Red Urines.—The conditions which lead to the excretion of a pink or red urine may be classified as follows: (1) *Hæmaturia*, in cases in which the blood pigment appears in the urine mainly as oxyhæmoglobin; (2) *Hæmoglobinuria*—usually in cases which do not belong to the paroxysmal class; (3) *Hæmatoporphyrinuria*; (4) Administration of rosaniline as a drug; (5) Eating of sweetmeats coloured with eosin; (6) Presence of chrysophanic acid in an alkaline urine.

1 and 2. *Hæmaturia* and *hæmoglobinuria*.—For the significance of these symptoms, and the detection of blood pigment in urine, the special articles dealing with them may be referred to.

3. *Hæmatoporphyrinuria* is a symptom of considerable interest. The name is applied to a condition in which urine is passed which has a pink, port-wine, or nearly black colour, and which contains considerable quantities of the hæmoglobin derivative, hæmatoporphyrin. In the darker specimens the colour is mainly due to other little-known pigments which accompany the hæmatoporphyrin. For the recognition of the condition spectroscopic examination is necessary. It is most liable to be mistaken for hæmoglobinuria, but when the

urine contains no albumin the distinction is not difficult; when albumin is present in a pink urine, the diagnosis is more difficult, because the spectrum of hæmatoporphyrin in the combination in which it usually occurs in such cases resembles that of oxyhæmoglobin somewhat closely. However, the addition of hydrochloric acid changes the spectrum to that of acid hæmatoporphyrin instead of to that of acid hæmatin (*Fig. 21*, p. 95).

If a mixture of 10 per cent calcium chloride solution and lime-water be added to the urine, the precipitate formed carries down all the abnormal pigments, and the filtrate is yellow. From the precipitate the hæmatoporphyrin may be extracted with acidified alcohol, and its highly characteristic spectra may be observed and identified. The trace of hæmatoporphyrin present in normal urine escapes detection by such means, but the increased quantities present in a variety of morbid conditions may be revealed by faint bands, even in cases which do not fall into the class under consideration, and in which the urine shows no obvious anomaly of pigmentation.

In the great majority of cases, hæmatoporphyrinuria results from prolonged administration of *sulphonal* in medicinal doses, and forms one of a group of toxic symptoms of much gravity, which often usher in a fatal ending. These symptoms may only develop after the drug has been taken for months or even years, and even some days after its administration has been stopped. Their development calls for the free administration of sodium bicarbonate. It is a remarkable fact that such toxic effects of sulphonal are seldom seen except in women, and the few male cases on record have mostly been of a mild kind.

Much more rarely, hæmatoporphyrinuria, with deep red urine, is met with in cases in which it cannot be ascribed to any drug. Several patients have been sufferers from *hydraea æstivale*, others from tuberculosis, and others from maladies so different from each other that no definite diagnostic significance can yet be assigned to the symptom. In such cases the hæmatoporphyrinuria does not appear to have the grave import which it has in sulphonal cases, nor is there manifested any special liability of the female sex.

4, 5, and 6. *Coloration by constituents of foods and drugs.*—*Rosaniline*, which was at one time employed in the treatment of albuminuria, imparts a pink colour to the urine which, provided that it be known that the drug is being taken, offers no diagnostic difficulty. Aniline dyes have also, ere now, been deliberately added to the urine for the purpose of simulating hæmaturia.

Eosin has been extensively employed for the coloration of pink sweetmeats and lozenges, and the urine of those who eat such sweetmeats in considerable quantities acquires a rich pink colour, and shows a brilliant green fluorescence. The nature of such pigmentation can hardly be mistaken by anyone who is aware of the fact that eosin is so employed.

Drugs which contain *chrysophanic acid* are so frequently used as aperients that this compound may rank as a common constituent of urine; and if, from any cause, the urine be alkaline, it acquires a pink or red colour, which may easily be misinterpreted. However, the history of the taking of rhubarb or senna, and the fact that the addition of an acid changes the colour of the urine to a bright yellow, renders the diagnosis easy. The pink colour which alkalies impart to the urine of patients taking *santonin* is so fugitive that it does not call for consideration here.

III. Brown and Black Urines.—The urine may be brown or black in the following conditions: (1) Jaundice; (2) Hæmaturia; (3) Hæmoglobinuria; (4) Hæmatoporphyrinuria; (5) Indicanuria; (6) Melanuria; (7) Alkaptonuria; (8) Carboluria; and after the administration of certain other drugs, such as salol, salicylates, resorcin, gallic acid, and *uva ursi*.

In some of the above conditions the urine has such coloration when passed;

but in others, such as melanuria and alkaptonuria, the urine is usually of normal tint when freshly passed, and only darkens on standing in contact with the air.

1. Brown and black *jaundiced urine* is chiefly met with in cases of long-standing icterus, in which the skin has acquired a dull greenish tint, and the urine contains biliverdin as well as bilirubin.

2 and 3. In some of the early recorded cases of black urine, the colour was certainly due to *blood pigment*, and the smoky colour of many urines which contain blood pigment in the form of methæmoglobin is familiar to all. In *paroxysmal hæmoglobinuria* also, the urine is not infrequently almost black. The ordinary tests for hæmoglobin, together with microscopic and spectroscopic examination, serve to reveal the nature of such cases (*Figs. 17 et seq.*, p. 95).

4. That the urine of *hæmatoporphyrinuria* may approach to actual blackness, owing to the abundant presence of purple pigments which have no characteristic spectra, has already been mentioned in the account of that symptom above.

5. *Indicanuria*.—Urines which contain much indican may show no abnormality of tint; but occasionally, and especially in extreme cases, there are present in the urine, in association with the colourless indoxyl sulphate, other and higher oxidation products of indol, which impart to it a brown colour, intensified or developed on exposure to air.

This variety of brown or black urine is less well recognized than it should be, and it is probable that the condition has not infrequently been mistaken for melanuria. Such urine is not blackened, as that of melanuria is, by the addition of ferric chloride, nor by nitric acid in the cold, but does blacken when heated with nitric acid. The ordinary tests for indican reveal its presence in large amount. Thus, if a specimen of the urine be heated with an equal volume of hydrochloric acid, and a drop of a dilute solution of bleaching powder, or a drop of nitric acid, it becomes black. If, after cooling, the dark-coloured liquid be shaken with chloroform, the latter takes up indigo-blue and red and acquires a deep purple colour; but the supernatant liquid remains black. If the chloroform extract be separated and evaporated to dryness, the indigo red may be dissolved out of the residue with alcohol, whereas the indigo blue, which is insoluble in alcohol, may be taken up afterwards with chloroform.

Indicanuria signifies abnormal amount of protein decomposition in the alimentary canal, brought about by intestinal bacteria; but it is stated that it may also have its origin in collections of putrid pus, such as putrid empyemata. In such a case, which was recently under the writer's care, the abundant indican disappeared from the urine when a dose of calomel was given, and was probably of intestinal origin.

6. *Melanuria*.—This is a symptom which is met with in some cases of *melanotic sarcoma*. The urine, when freshly passed, contains a colourless chromogen, melanogen, and usually has a normal tint. On exposure to air, it quickly darkens, owing to oxidation of the melanogen to melanin, becomes brown, and eventually quite black. When nitric acid is added to such a urine, it causes prompt blackening, even in the cold, and immediate blackening also follows the addition of a solution of ferric chloride. This is the most valuable and characteristic of the tests for melanuria. Bromine water produces a yellow or brown precipitate which quickly blackens.

As a rule, melanuric urines, when treated with liquor potassæ and sodium nitroprusside, yield a deep Prussian blue on acidification with acetic acid, but this reaction is not due to the melanogen as such, is yielded by some other urines, and cannot be taken as diagnostic of melanuria.

It is frequently stated that melanuria may be met with apart from melanotic growths, in cases of wasting and other diseases. There is little doubt that some

of the cases quoted in support of this contention, and which were recorded before the more distinctive tests for the condition were known, were, in reality, examples of indicanuria, such as have been described above, and the writer has never met with true melanuria save in cases of melanotic sarcoma. Even in such cases it is not seen so long as the tumour is confined to its primary seat, but only when it has invaded the viscera, and especially the liver. Indeed, the quantity of melanogen excreted is apparently dependent upon the extent to which the liver has been invaded, and the amount of pigmentation in the growths of which it is the seat. Hence it usually happens that the diagnosis of the case has already been established before the peculiar pigmentation of the urine is developed.

7. *Alkaptonuria* is the outward sign of a very rare anomaly of metabolism which is almost always congenital, and persists through life without any serious detriment to the health of its subjects. The peculiar properties of the urine are due to the excretion in it of an aromatic acid, homogentisic or hydroquinone-acetic acid, a product of katabolism of tyrosin and phenylalanin. It is, in all probability, a product of normal metabolism, which in normal individuals undergoes complete destruction.

Alkapton urine seldom exhibits any abnormality of tint when passed; but quickly darkens on exposure to air, undergoing changes through brown to black, which resemble in the closest manner those seen in melanuria urines. However, the two conditions are readily distinguished by means of simple tests. When a dilute solution of ferric chloride is added to alkapton urine, a deep blue colour appears for a moment, and reappears after each subsequent addition of the reagent, until oxidation of the homogentisic acid is completed. Unless the reagent be very dilute, oxidation occurs too rapidly, and the blue colour is missed.

The addition of an alkali causes very rapid darkening, with absorption of oxygen, and heat increases the rate of blackening.

As homogentisic acid is a powerful reducing agent, alkapton urines give some of the reactions of glycosuria. Fehling's solution is freely reduced with the aid of heat, but the blackening effect of the alkaline reagent gives a peculiar appearance to the reaction. No black precipitate is obtained with Nylander's reagent, but the alkali therein causes conspicuous darkening. The safranin reaction is not obtained, and alkapton urine is optically inactive. An ammoniacal solution of silver nitrate is rapidly reduced, even in the cold, a reaction which is made use of for the quantitative estimation of homogentisic acid. It is because alkaptonuria is so rare, rather than because its recognition presents any special difficulty, that its properties are not widely known and not infrequently fail of recognition.

Ochronosis, i.e., a blackening of the cartilages, and deep pigmentation of regions of the skin, a bluish-black coloration of the ears, and pigment spots on the conjunctivæ, is sometimes the outcome of alkaptonuria; but there is a group of cases in which similar pigmentation results from the application of carbolic acid to chronic ulcers, over long periods of years. There is also some reason to believe that the lesions of joints which sometimes accompany ochronosis may also be results of alkaptonuria.

8. *Carboluria*.—A darkening of the urine, increased by exposure to air, is frequently seen after the administration of certain drugs which contain phenol, in carbolic acid poisoning, and as the result of outward application of carbolic acid. A carbolic-acid compress applied to the head of a child for the destruction of pediculi quickly induces carboluria, and the taking of salol is another common cause. The urine has a smoky tint, or in cases of carbolic acid poisoning may be actually black. In the slighter cases it is best described as brown with a greenish tinge, and the meniscus, when seen from the side, appears black.

There is no direct chemical test for carboluria, and the diagnosis is usually based upon the knowledge that phenol, or some derivative or compound thereof, has been administered or applied. After boiling the urine for some time with Fehling's solution, a slight reduction is observed; but this is in no way comparable with that seen with alkapton urine. Indirect evidence is obtained by the addition of a solution of barium chloride, which in cases of carboluria produces a very slight precipitate or none at all. If, however, the urine be first boiled with hydrochloric acid, a precipitate is obtained such as is yielded by normal urines. This is due to the fact that, in the presence of abundant phenol and oxidation derivatives thereof, the sulphates of the urine are for the most part, or even wholly, combined as aromatic sulphates, which yield no precipitate with barium salts, whereas, when the aromatic sulphates are broken up by hydrochloric acid a precipitate of barium sulphate is thrown down.

The diagnosis of the other varieties of brown or black urine which have their origin in the administration of drugs, is based upon the fact that salicylates, or other drugs capable of producing such pigmentation, have been taken.

IV. Green and Blue Urines.—In some cases of jaundice, the bile pigment excreted is so largely in the form of biliverdin that the urine has a dark green colour: but with this exception, practically all green urines met with in practice owe their colour to the taking of methylene blue, either as a drug or in sweetmeats. When the dose is small, the tint may be a rich green; but after larger doses, the urine is frankly blue. It is not always easy to account for the origin of such coloration of urine, for the patient may be quite unaware that he has taken methylene blue in any form, although examination of his urine may leave no doubt that he has done so. Sweetmeats are sometimes coloured with this pigment, as they are with eosin, and it is sometimes used to correct the colour of white sweetmeats. Again, a pill of methylene blue has before now found its way, either by accident or design, into a supply of pills of another kind. Absence of a known cause does not, therefore, by any means exclude this kind of pigmentation; and experience shows that unless it can be shown, by careful examination, that the colour of the urine is not due to methylene blue, it is needless to search for any other causation.

Although the green urine which follows the taking of methylene blue may appear perfectly limpid, the blue pigment is not held in solution but in suspension, and is, to a large extent, removed even by a single filtration. The green colour of the filtrate is greatly reduced, and the filter paper shows a blue stain. The pigment upon the filter yields a blue solution in chloroform, and if the chloroform solution, or the blue extract obtained by shaking the urine with chloroform, be shaken with liquor potassæ in a test tube the chloroform is decolorized, and the supernatant alkaline liquid acquires a pink tint. The original urine, or the chloroform extract, shows an absorption band in the red of the spectrum which may be mistaken for that of indigo blue.

There is no reason to think that indigo blue ever produces a green or blue coloration of urine similar to that due to methylene blue. By the spontaneous breaking down of indoxyl glycuronic acid, usually in alkaline urines, indigo blue may be set free, and may form a dark blue sediment, or may impart a blue colour to the phosphatic film upon the surface; and when, in the earlier years of the last century, indigo blue was somewhat frequently employed as a drug in the treatment of epilepsy, a dark purple colour of the urine of patients so treated was observed, but under no circumstances are indigo pigments spontaneously formed in quantities sufficient to bring about such a result.

VEINS, VARICOSE ABDOMINAL.—The point at which distention of veins becomes varicosity is arbitrary; most conditions that produce undoubted varicosity of the veins of the abdominal wall in some cases, merely dilate them in others. When this dilatation is considerable (*Plate XVI*), it nearly always has much diagnostic significance, particularly if the direction of blood-flow is reversed. Veins, however, may seem to be dilated when they are but unduly visible owing to wasting of the subcutaneous fat; or they may, in very rare cases, be simply varicose, like veins in the leg, owing to idiosyncrasy or hereditary predisposition. In neither of these cases, however, is the blood-current in them reversed. To test the direction of blood-flow, part of a vein should be chosen where there are no side branches, and the blood should be expressed from it by means of two

VARICOSE ABDOMINAL VEINS

A case of obstruction to the inferior vena cava by malignant disease.

fingers pressed down on the vein close together, and then drawn asunder, whilst pressure over the vein is maintained by each; when a length of the distended vein has been emptied in this way, one of the two fingers is taken off, and the time taken by the vein in re-filling is noted; the procedure is repeated, the other finger being taken off this time; it will generally be obvious whether the vein fills from below upwards or from above downwards. Normally, the blood flows from above downwards in the veins of the lower two-thirds of the abdominal wall; when the blood-flow is from below upwards, there is almost certainly an obstruction to the inferior vena cava, the blood, which is unable to return by it, finding a collateral circulation *via* the azygos veins or the superior vena cava.

Obstruction to the inferior vena cava is due to one or other of three main groups of conditions, namely:—

1. **Great general increase in the intra-abdominal tension**, owing to such conditions as: ascites; ovarian cyst; great splenic or hepatic enlargement.
2. **Thrombosis** without external obstruction.
3. **Obstruction by compression from without**, yet without there being obvious increase in the intra-abdominal tension; such local obstruction to the inferior vena cava results mainly from carcinoma or sarcoma, adjacent to the vena cava, especially secondary growths in the retroperitoneal glands.

When the obstruction of the inferior vena cava is due, not to the vein itself being thrombosed or invaded by new growth, but to the *general intra-abdominal pressure* becoming so great that the vein is, so to speak, flattened out, the varicosity of the veins upon the abdominal wall is but a late symptom, and the diagnosis will be made from the cause of the great abdominal distention, generally the result of ASCITES (*q.v.*), or a big tumour. If there is marked varicosity of the superficial veins early in a case of ascites, the probability is that both are due to malignant disease.

When the inferior vena cava is obstructed by "*simple*" thrombosis, the probability is that the clotting will not have started there, but will have extended to it from branches either in the legs or in the pelvis. Œdema of the legs will be a prominent symptom; and if a clear history is obtainable, it may generally be ascertained that one leg became œdematous and painful before the other; when this is so, it is always very suggestive of thrombosis starting in the saphenous or femoral veins (see (ŒDEMA, ASYMMETRICAL)); the other leg becoming affected later when the clot has spread up through the iliac veins of the one side to the inferior vena, and thence down the iliac veins of the other side. The higher the thrombus extends, the higher up the back will the œdema spread; and when the renal veins have been reached, albuminuria, with tube casts, and even hæmaturia, will be marked features of the case. Ascites may also be present. Distention or varicosity of the veins of the abdominal wall will be of assistance in distinguishing such a case from one of acute or subacute nephritis, besides which, there will be no œdema of the eyelids or face.

If there is no very tense distention of the abdomen; if the way the case began does not suggest thrombosis in one leg, or in the pelvis, extending upwards; and if, nevertheless, there is marked varicosity of the veins of the lower part of the abdominal wall, with the blood-flow in them reversed, so as to be from below upwards, the history being a relatively short one,—the probability is that the inferior vena cava is being obstructed by something that is in immediate contact with it. There will very likely be symmetrical œdema of the legs, and possibly albuminuria and hæmaturia. It is surprising how seldom an aortic aneurysm, or other non-malignant mass, obstructs a large vein sufficiently to produce this collateral varicosity; hence, the presumption is that such varicosity indicates *malignant disease*. It is worthy of note that carcinoma of the kidney is prone to extend into the renal veins, and thus into the inferior vena cava by a process

of direct extension—sometimes the malignant clot reaches as far as the right auricle, and produces a pedunculated polypus in the latter. In such cases there has generally been hæmaturia or other renal symptom before evidence of inferior vena-caval obstruction arose, whereby cases of growth in the kidney invading the inferior vena cava may be distinguished from cases of secondary growth in the retroperitoneal glands, which if they produced hæmaturia at all, would do so by first obstructing the inferior vena cava, and thence involving the renal veins. In such cases there are often other symptoms pointing to primary growth in some organ whose lymphatics drain into the retroperitoneal glands; the testes and ovaries should not be overlooked in this respect.

It is often said that *cirrhosis of the liver* leads to varicosity of the veins around the umbilicus—the so-called *caput Medusæ*. It is a very rare condition indeed, the great majority of cases of cirrhosis of the liver causing no distention of the superficial abdominal veins until such time as the general intra-abdominal tension has been greatly increased by the tenseness of the ascites which occurs late. Not even the telangiectases that occur so commonly in men past middle age around the lower part of the chest, in a line with the attachments of the diaphragm, indicate cirrhosis; they are quite as common in cases of emphysema without cirrhosis.

In short, varicosity of the superficial abdominal veins generally indicates either thrombosis of the inferior vena cava, secondary to direct spread of thrombosis up to it from veins in the pelvis or in the leg, or else stenosis of the vena cava by secondary malignant disease.

Herbert French.

VEINS, VARICOSE THORACIC.—Much of what has been said above about varicose abdominal veins applies also to those of the thorax. The veins on the chest wall may merely be unduly visible; but if they are really distended, there is probably obstruction to one or other innominate vein or else to the superior vena cava; and the suspicion that this is so becomes a certainty if the blood current in the distended veins can be shown to be from above downwards instead of from below upwards. If the distention is bilateral, and associated with œdema of both arms, and both sides of the neck, face and head, it is the vena cava that is obstructed; if the distention is unilateral, with œdema of the corresponding arm, but little if any of the neck or face, the obstructed vessel is probably one innominate vein. The superficial varicosity may be only slight (*Fig. 73, p. 235*), but sometimes it is extreme.

In arriving at a diagnosis of the cause of the venous obstruction, *malignant disease* within the thorax will be uppermost in one's mind—especially mediastinal sarcoma, starting in the thymus or in the lymphatic glands. It is only when the history and course are too long for primary or secondary malignant neoplasm, that other causes of venous obstruction will be regarded as more likely, such as *thrombosis* extending to an innominate vein or to the superior vena cava from a whitlow, boil, or other inflammatory affection of the hand, arm, axilla, head, face, neck, shoulder, or front of chest; or *chronic fibrous mediastinitis*, sometimes tuberculous or gummatous but often rheumatic in origin, and resulting from repeated attacks of pericarditis and pleurisy, with matting together, not only of the pleuræ to the diaphragm and pericardium, but also of all the structures in the superior, posterior, and anterior mediastina to one another; or, far less commonly, to *aneurysm* of the thoracic aorta, or a *non-malignant mediastinal tumour*, such as a hydatid cyst, a dermoid cyst, or a large congenital fibroma, which may have been quiescent within the chest for many years before starting to enlarge and obstruct structures in its neighbourhood; the latter conditions, except aneurysm, are rarities, and although an aortic aneurysm does sometimes obstruct the superior vena cava sufficiently to cause distention or varicosity of the veins

upon the chest wall, such varicosity is so much more marked in a case of intra-thoracic malignant disease that one may say that when the diagnosis lies between neoplasm and aneurysm the presence of marked distention of the veins of the chest wall indicates the former rather than the latter, though the converse of this is not true.

Herbert French.

VERTIGO, popularly known as dizziness or giddiness, depends upon a disturbance of the sense of equilibrium. In slight cases the trouble is perceptible to the sufferer either as the apparent movement of motionless objects (objective vertigo), or his own body may appear to be moving in relation to surrounding fixed structures (subjective vertigo). In more severe cases it may lead to reeling or staggering, and unless the patient can grasp some fixed support he may fall to the ground.

The equilibrium of the body is maintained by the co-ordinated action of various groups of muscles, and the nervous mechanism for this co-ordination is situated in the cerebellum. Afferent impulses are brought to the cerebellar centres from the muscles, skin, joints, eyes, and the semicircular canals. The cerebellum is also connected with the motor centres of the cerebral hemisphere, and thus the requisite contraction of the necessary muscles is ensured. Disturbances of equilibrium may therefore be the result of a lesion in the cerebellum itself or in one of the afferent tracts.

True vertigo depends mainly upon interference with the afferent impulses from the semicircular canals or from the eyes. The importance of the visual impulses in the maintenance of equilibrium is shown by the frequent occurrence of nystagmus during attacks of vertigo, even when this is due to a labyrinthine lesion.

Occasionally vertigo may be the result of altered cutaneous impulses such as are present in some cases of anæsthesia of the soles of the feet. Some people experience a slight feeling of giddiness on stepping on to some soft material such as turf or india-rubber pavement after walking on a hard road. Unusual cutaneous impulses are the probable explanation.

Interference with the afferent impulses from the muscles themselves, such as occurs in locomotor ataxy, will lead to reeling and staggering rather than to true vertigo. The ocular impressions correct the false sensations from the muscles, and hence loss of equilibrium is more likely to occur in the dark, or when these impressions are cut off by covering the patient's eyes.

Vertigo is sometimes divided into "general" vertigo and "special" vertigo. In the latter, objects appear to move, or the patient tends to fall in a definite direction. Special vertigo points to a lesion of a particular semicircular canal. Thus, if there is a lesion of the external semicircular canal, objects appear to move in a horizontal plane, and the patient tends to fall towards the affected side. When the superior canal is the source of the trouble, objects rotate in a vertical plane, and the patient will fall in a forward direction. Temporary vertigo, even of a very severe nature, may be produced readily in a healthy individual by prolonged movements of rotation or of swinging. In this case the cause of the giddiness is probably unequal pressure in the endolymph in the different semicircular canals. The dizziness with which many people are affected when near the edge of a high cliff is most likely ocular in origin, and depends upon the sudden cessation of visual impulses from near objects. Some persons are exceedingly susceptible to alterations in these impressions, and travelling by train or the movement of a boat may be sufficient to cause a considerable degree of dizziness.

Vertigo may also be of *toxic origin*. Alcohol and tobacco are familiar examples, but the dizziness associated with ptomaine poisoning, and in some cases of gastric disturbance, is also probably of this nature.

Vertigo is not infrequently of cerebral origin, either with or without some gross lesion. Thus it occurs in *migraine*, and is also a frequent *aura of an epileptic fit*. Attacks of vertigo occurring in elderly people with atheromatous arteries or suffering from *chronic nephritis* or *arteriosclerosis* must always be regarded as of serious import, since an attack of giddiness may be the precursor of cerebral hæmorrhage or thrombosis. Severe vertigo may be one of the symptoms of a *cerebral tumour*. It is more likely to be present when the growth is in the cerebellum, especially if the middle lobe is involved. A tumour involving the auditory nerve in its intracranial course will also give rise to this symptom. A *cerebral* or *cerebellar abscess* may also cause vertigo, but in this case there may also be suppuration in the middle ear, and the giddiness may be of labyrinthine origin.

Vertigo may be of *ocular origin*. It is especially likely to occur when there is some lesion of the nerves or muscles leading to diplopia.

Laryngeal vertigo is a very rare condition, where spasm of the glottis is accompanied by severe giddiness which causes the patient to fall down, and he may lose consciousness for a few seconds. Complete recovery ensues in a short time, but the attacks are likely to recur. This trouble may be of an epileptic nature.

Vertigo is, however, most commonly of aural origin, and is a frequent symptom of diseases of the ear, especially of the internal ear or labyrinth. In its most intense form it is one of the symptoms of "*Ménière's disease*." Its onset is then sudden, and so severe that the patient falls to the ground and even loses consciousness. Associated with the giddiness are severe tinnitus, and unilateral or bilateral deafness, while nausea, vomiting, and pallor of the face are frequently present. The vertigo passes off after a few hours or days, but impairment of hearing and tinnitus persist. The attacks tend to recur. Ménière's disease is probably caused by a sudden increase in pressure in the endolymph, and, in some cases at any rate, appears to be due to hæmorrhage into the semicircular canals. True Ménière's disease is very rare; but the occurrence of the symptoms, viz., vertigo, deafness, and tinnitus, in a less acute and sudden form, is by no means uncommon. They may be present without any obvious lesion of the middle or external ear, though sometimes there is some abnormality in one of these portions of the auditory apparatus.

Syphilitic disease of the internal ear may produce symptoms closely resembling those of Ménière's disease, in that giddiness, tinnitus, and labyrinthine deafness are associated, the onset being quite sudden. Vertigo is, however, occasionally absent. The trouble is usually unilateral, and may occur in the secondary or tertiary stages. The diagnosis will depend on the history of syphilis or other evidences of the disease. Similar symptoms may occur in congenital syphilis, usually between the ages of ten and fifteen years, though occasionally much later. Eustachian-tube obstruction is usually present also, but treatment of this fails to improve the hearing, and other characteristic troubles, especially interstitial keratitis, may be found. Aural vertigo may also be associated with some lesion of the external or middle ear. Thus in the former case there may be a foreign body, or even a plug of impacted cerumen, as the exciting cause.

Vertigo is not infrequently present in chronic middle-ear suppuration. This may be due to labyrinthine inflammation or irritation, but a definite labyrinthine lesion is not necessarily present. In many cases the giddiness is caused by pressure on the stapes or the fenestra rotunda. Some patients with a perforation of the tympanic membrane become giddy whenever the ear is syringed. Occasionally the use of unduly hot or cold lotions produces this trouble. It is usually the result of pressure on the stapes, though occasionally the vertigo may have the special character associated with a lesion of the external semicircular canal (*vide supra*). When this is the case there is probably some erosion

of the bony external canal. Similar giddiness may occur from a like cause on syringing the ear after a radical mastoid operation.

Vertigo may occur in otosclerosis, though it is not common in this disease, and is always of less importance than the DEAFNESS (*q.v.*) and TINNITUS (*q.v.*).

When a patient complains of vertigo, the ears should always be examined carefully. The hearing should be tested, and if the cause of the trouble is in the labyrinth, the deafness will have the characters of nerve deafness (*see* DEAFNESS). The onset of the trouble must be investigated carefully, and any associated symptoms ascertained. The eyes and ocular muscles must be examined, and if nystagmus is present the character of the movements should be observed. A general examination of the patient should also be made for some general constitutional cause such as gout, albuminuria, or arteriosclerosis.

Philip Turner.

VESICLES. — One of the primary lesions, the vesicle may be defined as a circumscribed epidermal elevation varying in size from a pin's head to a small pea, and containing serous fluid, which may become sero-purulent or be mixed with blood. Serous elevations larger than a small pea are classified as BULLÆ (*q.v.*). To bullæ, therefore, vesicles bear the same relation that papules bear to tubercles (*see* PAPULES). They differ from bullæ, however, not only in size, but in their mode of formation. They are always the result of an inflammatory process, whereas in the case of bullæ there is a veritable cleavage of the epidermis. Vesicles, again, often contain a number of chambers, at any rate in the beginning, whereas bullæ are from the outset unilocular. They may originate as vesicles, or may develop from papules. Vesiculation may be either parenchymatous or interstitial (Darier). In the one case, as in varicella, the plasma accumulates *within* the Malpighian cells, and the unicellular vesicles which are thus formed run into each other. In the other case, as in eczema, the plasma accumulates *between* the Malpighian cells.

In shape, vesicles are usually rounded, conical, or acuminate; but they may tend to the oblong form, as in scabies, or they may be both oblong and irregular, as in dermatitis herpetiformis. The larger ones are occasionally umbilicated, as in variola, and instead of being tense, as is usual with vesicles, may be flaccid, as in herpes and dermatitis herpetiformis. At first, the liquid they contain consists almost invariably of pure plasma, and is quite clear, or with the faintest tinge of yellow; but exceptionally the fluid is from the beginning mixed with blood. After a time the clear fluid becomes turbid. In some conditions, as in varicella and miliaria, they remain discrete and few in number; but usually, as in herpes, eczema, and dermatitis herpetiformis, there is a plentiful crop of them, forming groups or closely-set clusters. As a rule, they are of short duration: either they rupture and crust over, as in eczema, or they dry up and a crust is formed, as is usual in herpes; or they enlarge into blebs, as frequently occurs in dermatitis herpetiformis; or they are transformed into pustules, as in variola. On mucous membranes and the lips, and in folds of the skin, they break more quickly than in other situations, and leave excoriations. Since, as already stated, vesicles are the result of a more or less inflammatory process, they usually give rise to much burning and itching, though in some conditions, as in hidrocystoma, these symptoms are absent.

The most distinctively vesicular affections are herpes simplex and herpes zoster. In *simple herpes* the face and the genital organs are affected chiefly. The characteristic lesion is a cluster of transparent vesicles varying in number from two or three to twenty or more, seated on an erythematous patch, and surrounded by a narrow red zone. First, a slightly red spot appears on the skin; effusion quickly takes place under the epidermis, and vesicles are formed; these become

opaque—sometimes purulent,—shriveled up, and form yellowish-brown crusts, which after a few days become detached, usually leaving no scar, but a brownish stain that slowly fades and disappears. These four stages in the evolution of the lesion are styled by Brocq the congestive, vesicating, desiccating, and macular stages. On mucous membranes the lesion runs a rather different course. Here the vesicles are quickly reduced to a whitish pulp, which presents the appearance of a false membrane. When this becomes detached, it reveals a number of roundish excoriations, either scattered about irregularly or running into each other and forming largish ulcers. The favourite situations of the vesicles in herpes genitalis are, in men, the prepuce, especially its inner surface, the meatus, the sulcus, and the glans; in women, the labia and the cervix. In men, the vesicles are usually discrete, and the patient complains only of the itching and burning; but if they are neglected, or irritated by the application of caustics, there may be severe and extensive ulceration, with swelling of the inguinal glands. In women, the vesicles tend to become confluent, and the perineum, the inside of the thighs, and the mons veneris may be invaded. There may be a great deal of swelling, excoriation, and discharge, with intense itching and burning, and, as in men, there may be enlargement of the neighbouring glands.

In the crusted stage, facial herpes may resemble *impetigo*, but the rapid course it runs, its limited distribution, the facts that it is not auto-inoculable, and that in *impetigo* the lips are seldom attacked, should suffice to obviate the confusion. The points which distinguish herpes facialis from vesicular eczema are touched upon below.

The vesicles of genital herpes are too characteristic to be mistaken if they are seen before their real significance is obscured by ulceration. If, however, the ulceration is considerable, and especially if there is much suppuration, the herpes may be mistaken for *chancroids*. Generally, however, soft sores are multiple, have a fouler base, excavate more deeply, and the healing process is much slower. Soft sores, further, are flattened at the base, secrete very little liquid, and are auto-inoculable. In some cases there may be doubt as between herpes genitalis and true *chancre*, especially as, according to Fournier, a chancre not infrequently develops in the midst of a premonitory eruption of herpes. The points of differentiation are the absence, in herpes, of induration, the less considerable and more transitory gland-enlargement, the multiplicity, irregular form, and small size of the ulcers, and the intense burning and itching.

In *herpes zoster* (zona, shingles), clusters of vesicles seated on an erythematous base, appear in the region of skin distribution of one or more of the posterior spinal nerve roots, preceded or accompanied by neuralgic pain and tenderness in the part. The erythematous patches, more or less oval, with the long axis parallel to the underlying nerve, come out in crops, the number of lesions varying from two or three to twenty or thirty. Soon the surface of the patches is studded with papules, which are quickly transformed into vesicles, from ten to twenty on each patch, sometimes discrete, sometimes running into each other to form bullæ. An important diagnostic feature of the eruption is, that in the great majority of cases it is unilateral, and appears much more frequently on the right side than on the left. In rare cases, however, it forms a complete girdle round the body. The usual limitation to one side of the body, the distribution in one or more nervous territories, and the preceding or accompanying neuralgia, usually suffice to distinguish herpes zoster from erythema multiforme and from dermatitis herpetiformis. Another important point in diagnosis is the history, for zoster is not a recurring disease. These various characters serve to distinguish it also from herpes simplex and herpes genitalis. The neuralgic pain may be mistaken at first for pleurisy, but the course the affection runs

soon clears up the confusion. I should add that in herpes zoster the conjunctiva and the eyeball are frequently attacked, and sometimes the mouth, especially the tongue. In rare cases, as Head has reported, the lesions on the tongue are not associated with an eruption on the lips or the palate.

Although the vesicular stage is not, as some authorities consider, a necessary phase in the evolution of *eczema*, the vesicle is undoubtedly the most constant of all the primary lesions met with in that condition. Usually, following sensations of itching and burning, an erythematous blush appears, which is soon studded with numerous tiny vesicles. These grow larger and often coalesce, but they soon rupture or are broken by scratching, and a clear fluid exudes, the "weeping" continuing as later vesicles break. In mild cases, the inflammation gradually subsides, and as the discharge ceases, scales or crusts are formed; but much more frequently, fresh crops of vesicles start up around the edge of the earlier patches, while new centres are formed in other parts, until nearly the whole cutaneous surface may be involved. In some cases papules are the predominant feature, in others erythematous lesions; in yet others pustules, and in extensive cases, the several kinds of lesions may be all present simultaneously.

From herpes in general, eczema is distinguished by the characteristic exudation, by the crowds of tiny vesicles, which coalesce without forming distinct groups, by the slower evolution of the disease, and by the fact that as a rule there is some inflammatory thickening. From herpes zoster it is differentiated by the peculiar distribution of the vesicles in that affection (see above).

Doubt can seldom arise as between eczema and *dermatitis herpetiformis*. It is true that the earliest and perhaps the most characteristic lesion of the latter disease is a vesicular eruption, appearing on an erythematous base; but the disposition of the vesicles in herpetiform groups should prevent confusion between the two conditions. The vesicles soon dry up and form scabs, but, later, they tend to coalesce into bullæ, which scarcely ever burst spontaneously but, as their contents thicken, slowly shrink, and finally, if left to themselves, shrivel up to a thick brown scab. The "weeping" of eczema is therefore absent in dermatitis herpetiformis, of which, further, multiformity is a more pronounced feature—erythematous, vesicular, pustular, papular, and urticarial elements being mingled together in all stages of evolution.

The vesicles of *impetigo contagiosa* are distinguishable from those of eczema by the larger size and discrete character of the former, and by their tendency to dry and form yellowish crusts without breaking, or as soon as they have broken. Even when the lesions run together and large crusts are formed, there will be discrete vesicles and papules which will point to the true nature of the affection.

Miliaria rubra may sometimes resemble the vesicular stage of eczema, but here again the lesions, though numerous, remain discrete: they do not run together to form patches, they do not rupture, and there is no "weeping." Miliaria of all forms is a very transitory affection, and instead of the intense itching of eczema, the patient describes his sensations as those rather of pricking and tingling. In the form of miliaria which is known as hidrocystoma, or dysidrosis of the face, small vesicles like those of miliaria appear on the face, but they are so grouped as to form patches, which show no tendency to spontaneous involution.

Scabies is another affection in which the vesicles, like those of impetigo and of miliaria, are discrete. Sometimes the lesions, usually consisting of papules and pustules as well as of vesicles, take on an eczematous character, but they are not localized as are those of eczema, and instead of being small, acuminated, or circular, they tend to be linear. In uncleanly persons, the burrows between the

fingers and elsewhere which mark off scabies from all other affections, can hardly be overlooked. When they cannot be found, either because they have not yet been formed or because they have been laid open by scratching, the diagnosis of scabies must rest upon the irregularity of the lesions—vesicles, bullæ, and pustules being mingled with the marks of the finger-nails and the results of secondary inoculations—and upon the distribution, the parts most affected being those where the skin is least thick, namely, the webs between the fingers and toes, the front of the wrist, inside the umbilicus, on the lower abdomen, the genitalia, the nipples in women, and the axillary folds. The face nearly always escapes, except in infants in arms.

Another vesicular condition in which the hands are specially attacked is *cheiropompholyx*, in which numerous minute vesicles deeply imbedded in the skin, and showing through the epidermis like boiled sago-grains, are symmetrically distributed on the extremities—always on the hands, and frequently also on the feet. The general features of the affection—the limitation of the vesicles to the extremities and their proneness to unite and form bullæ which dry up, the tendency to recovery followed by repeated recurrence, and the constant association of the eruption with the summer season—are sufficiently distinctive, and the diagnosis is seldom in doubt. In some slight cases there is a general resemblance to certain subacute and limited cases of eczema in which the lesions may present the sago-grain aspect; but instead of rupturing and "weeping," the vesicles in *cheiropompholyx* tend to run together into bullæ, which shrink and crust over. This formation of bullæ by coalescence of vesicles differentiates the condition also from pemphigus.

In *erythema multiforme* the vesicle can seldom be difficult of interpretation, even in *erythema iris*, or as it is also styled, *erythema vesiculosum*. In one form of this affection a small red spot appears, upon which is formed a vesicle that is quickly surrounded by a zone of redness. When the central vesicle dries up it leaves a small scab, and a ring of secondary vesicles soon appears on the red zone. On the separation of the central scab, the skin beneath is seen to have a blue, congested appearance. The whole process may be repeated time after time until the concentric rings of vesicles and reddened skin suggest comparison with a target. In the form of *erythema iris*, which sometimes is infelicitously called *herpes iris*, a large central bulla is encircled by vesicles of considerable size. Outside the first ring of vesicles another circle may develop, and outside the second, sometimes a third. The symptoms of so-called vesicular erythema multiforme are so characteristic that the affection can hardly be mistaken for anything else.

Lichen planus is so characteristically a papular affection that the absence of vesicles is one of the points which distinguish it from eczema. In some cases, however—very rarely in adults, and rather less infrequently in children—vesicles appear, but never so as to confuse the diagnosis. In *lichen urticatus* a vesicle appears on the summit of the small wheal, and the condition may offer some resemblance to eczema; but the individual lesions do not tend to run together nor to spread centrifugally, as in eczema, and the itching is usually more intense.

The vesicular form of *secondary syphilis* is so rare, that by some authorities its existence is not recognized, and Stelwagon, who has never met with a case, justly points to the possibility of its being due, at any rate occasionally, to drug idiosyncrasy. The vesicles are reported as occurring in several forms: they may be minute, eczematoïd, disseminated and grouped, or larger, irregularly scattered, or disposed in herpetiform groups; and cases have been reported which simulate herpes zoster. The vesicles in syphilis are usually associated with papules, and they have a papular base, the disappearance of which leaves

a long-persisting dark stain. The papular base and the slow evolution are important diagnostic points; and usually other signs of syphilis will be present.

In *lymphangioma circumscriptum*, even more than in vesicular syphilis, the significance of the vesicles can hardly be missed. In circumscribed areas of the skin there is an eruption of clusters of small, deep-seated, thick-walled vesicles, straw-coloured, sometimes marked with red striæ, and filled with a clear alkaline fluid which contains a few lymph corpuscles. The affection, which consists in the over-growth and dilatation of lymph-vessels and the formation of new ones, is probably congenital, though not generally noticed until early childhood.

Varicella—to come to the eruptive fevers—is an essentially vesicular affection: only occasionally do the vesicles develop into pustules. They are usually preceded by reddish spots of slight elevation, and the commonest situations

Fig. 213.—Small-pox: showing distribution of the eruption.

From a photograph by Dr. D. S. Davies.

are the face, chest, shoulders, back, and scalp, but they may also be found on the mucous membrane of the palate, mouth, or lips. As a rule the rash comes out within twenty-four hours. Often there is but trifling systemic disturbance. In the infrequent cases in which the varicellar eruption becomes pustular, it may possibly be confused with a pustular syphilide; but in the syphilide the lesions are pustular from the outset, or develop out of papules, and although the lesions of varicella start as papules, these are almost invariably small and evanescent. The absence of itching in syphilis is another point of difference. In exceptional cases of strophulus (see under PAPULES) the vesicle on the summit may develop until it becomes visible macroscopically, and it may then be confused with varicella; but the cases are so rare as to be negligible.

It is with *small-pox* that chicken-pox is most often confused. In small-pox, the vesicles are usually multilocular; in chicken-pox they are usually unilocular.

In small-pox they are frequently umbilicated ; in chicken-pox they are never umbilicated, and seldom even dimpled. The differences between the two exanthems in respect of the rash and the lesions generally, as summarized by Ricketts in "The Diagnosis of Small-pox," are these: In variola, the rash is most abundant on the face and limbs, and least abundant on the abdomen and chest (*Fig. 213*) ; in varicella, the abdomen and chest are covered as thickly as the face, if not more thickly. In variola, the rash is much more abundant on the back than on the abdomen ; in varicella, the abdomen and the back receive equal attention. In variola, the rash is more abundant on the shoulders than across the loins, and on the chest than on the abdomen ; in varicella, the distribution as between these parts is indifferent. In variola, the rash favours the limbs and is distributed centrifugally ; in varicella it tends to avoid the limbs, and when it invades them is centripetal. In variola the rash, unlike that in varicella, favours prominences and surfaces exposed to irritation, and tends to avoid protected surfaces and depressions. As to the lesions generally, in variola they are deep-seated and have an infiltrated base ; are generally circular in outline and homogeneous in character ; whereas in varicella they are superficial and have no infiltrated base, are frequently irregular in outline, or else oval or elongated, and are not, as a rule, homogeneous.

Vaccinal eruptions may consist (1) of tiny vesicles or small superficial papules, or of a combination of those elements ; or (2) of a small papule with a vesicular or pustular head. In the second case the eruption may simulate modified small-pox, but almost always the vaccinal lesions are more superficial than those of the mildest cases of small-pox, and show a preference for the trunk.

In eruptions due to the use of *bromides*, *iodides*, and other *drugs*, the vesicle is but one of the elements, and the nature of the affection is usually indicated with sufficient distinctness by the history of the case, the remission that occurs when the drug is withheld, and the recurrence that takes place when its administration is resumed. Vesicles that follow the *bites* or *stings* of *gnats*, *mosquitoes*, etc., are always easily recognizable from the history, and from the central punctum to be seen in the lesions ; nor can there be any doubt as to the significance of those due to such accidental causes as *frostbite* and pressure from *splints*.

Malcolm Morris.

VISION, DEFECTS OF.—This subject may be considered in the following order :—(A) *Normal vision*, (B) *Amblyopia*, (C) *Partial blindness*, (D) *Complete blindness*, (E) *Colour blindness*, (F) *Abnormal sensations of size*, (G) *Day- and Night-blindness*.

A.—NORMAL VISION.

1. Visual Acuity.—The act of vision comprises the perception of form, colour, and brightness ; and, in vision with two eyes, the perception of space and distance. These faculties are possessed by all parts of the retina, though in varying degrees, and they are of varying importance. It is necessary to distinguish between peripheral and central vision ; or, in other words, between merely seeing a thing and looking at it. An object is seen by any portion of the retina that has visual perception ; but an object is only looked at when its image falls upon a particular portion of the retina, the yellow spot, which is situated at the posterior pole of the globe on the outer side of the optic disc. The act of so directing the eye that the image of a given object shall fall upon the yellow spot, is termed "fixation." The vision obtained by the fixation of the eye is termed "central vision," and owing to the anatomical structure of the retina at the yellow spot, the vision here is the most acute of which the eye is capable, though its area is very limited. In the normal eye, central vision is capable of distinguishing two points or parallel lines, which are separated by a space which subtends an

angle of $1'$ —approximately the diameter of a sixpenny-piece at 200 feet—and it is on this basis that ordinary test-types are constructed. Central vision, however, though acute, is very limited in extent, and it is estimated that the field of acute vision is only about the size of the thumb-nail held at arm's length, all vision outside this area being comparatively blurred and indistinct. This limitation of the field of acute central vision is barely appreciated under ordinary circumstances, owing to the rapidity with which the retina receives consecutive visual impressions, and the constant movements of the eyes. Compared with the visual acuity of the central portion of the field of vision, peripheral vision is relatively poor, though it is of extreme value in a different way. To appreciate the importance of peripheral vision it is only necessary to try to walk about looking through a roll of paper or music; though central vision is unimpaired, and the smallest object can be seen distinctly, locomotion is almost impossible, owing to the inability to see where one is going or to ascertain one's position in relation to surrounding objects, the peripheral portion of the field of vision being responsible for the automatic appreciation of these conditions. On the other hand, a person from some cause deprived of central vision, can see to get about quite well, and has useful vision for many purposes, though he is unable to read or write, recognize people when looking directly at them, or do any work in which fine vision is required.

2. **Colour Vision.**—A person with normal colour vision can recognize six or seven distinct colours in the solar spectrum, and is able to appreciate many hundreds or thousands of varieties of colour caused by mixtures of them, and the colour perception of the normal person is most acute in the central portion of the field; but the field of vision for colours has by no means the same boundaries as the field of vision for white. The fields of vision for all colours are smaller than that for white, and the fields for red, green, and blue vary in extent among themselves. The field for blue is the largest, for red is next in point of size, and the field of vision for green is the smallest of all, being roughly only about half to a third the diameter of the field for white.

3. **Brightness Perception.**—The central and peripheral portions of the field of vision vary very much in their perception of brightness. In ordinary illumination the central portion of the field is the most efficient, but in a very weak illumination the peripheral portion has a higher efficiency than the central part: in other words, there is in very dim lights a relative central scotoma or loss of vision. This fact has long been known to astronomers, who have found that in counting stars of low magnitudes, vision is much better if the particular constellation or group of stars is not looked at directly, the Pleiades being a well-known example; more of these stars can be counted when the vision is directed to a point a little above or below them or to one side, whereas direct vision is comparatively dim and confused; and the same holds good of vision for any object in a dim light. Walking along a country road on a dark night, it will be found that a foot-path or track can be seen more easily if the gaze is directed forwards and not at the ground itself. These facts concerning vision may be correlated with the actual anatomical structure of the retina itself. It is found that in the region of the yellow spot—the area of the retina endowed with acute vision—the cones are very numerous, with few rods; towards the periphery of the retina the cones become fewer and the rods more numerous. It is now generally held that the function of the cones is to work in light of considerable brilliance, that they are capable of extremely acute vision for small objects, and are also concerned in the perception of colour. The rods, on the other hand, have no perception of colour; their perception of form is poor compared with that of the cones; but in very weak lights their visual

acuity is greater than that of the cones. In support of this theory may be mentioned the fact that the retinae of nocturnal animals are more fully provided with rods than cones.

B.—AMBLYOPIA.

Amblyopia is the term applied to defective vision in which there is little or no evidence of any ocular condition which might account for the visual defect. It is not, therefore, employed where there is any obvious intra-ocular or intracranial lesion. The commoner forms of amblyopia are (1) Amblyopia ex anopsia; (2) Uræmic; (3) With nystagmus; (4) Alcohol, tobacco, lead, quinine, organic forms of arsenic such as atoxyl; (5) Migraine; (6) Cortical or crossed amblyopia; (7) With hysteria.

1. **Amblyopia ex Anopsia** is usually associated with a squinting eye, which may or may not have been put straight by operation. It is still open to discussion whether the amblyopia in such conditions is due to the loss of use by reason of the squint, or whether the squint is due to the visual defect; but the fact remains, that in many squinting eyes the visual acuity is very much below normal, though objectively the eye exhibits no abnormal symptoms.

2. **Uræmic Amblyopia** or **Amaurosis** may be recognized by its association with renal disease, whether complicated by pregnancy or not. It is characterized by its comparatively sudden onset, vision failing either partially or completely within a few hours. The failure of vision may be accompanied by well-marked retinitis in both eyes; but in many cases this is absent and the discs appear quite normal. The failure of vision lasts for from thirty-six to forty-eight hours, and then slowly disappears, the whole attack lasting, as a rule, under a week. In the majority of cases, unless there is some definite injury to the optic nerve or retina as the result of retinitis, the vision recovers entirely. In some cases of uræmia the blindness is complete.

3. **Amblyopia with Nystagmus** is usually associated with evidence of visual affections in very early life. At birth, fixation is not developed, and the higher visual acuity is only acquired after the first few months of infant life. Any affection of the eyes, therefore, that obscures the vision during the earlier weeks or months of life, prevents the due development of central vision and leads to a permanent amblyopia, as a rule associated with nystagmus. Such affections are ophthalmia neonatorum, which leaves more or less corneal opacity; perforation of the cornea with anterior polar cataract as the result of this ophthalmia; congenital defects, such as a persistent hyaloid artery or macular coloboma; and any retinitis or choroiditis affecting the region of the yellow spot.

4. The **Amblyopia due to Lead, Alcohol, Tobacco, Quinine, or Atoxyl**, is usually described as a toxic amblyopia, and the symptoms are somewhat similar in all the varieties. In tobacco amblyopia there is a central loss of vision for colours, green only in the earlier stages, subsequently green and red, and in extreme cases even a central scotoma for white; total blindness is practically unknown. The patient also states that he sees better in a dull than in a bright light, and that he is incapable of reading or writing, or distinguishing silver from gold coins. The ocular signs are usually very slight, being limited to some redness and blurring of the optic disc in early cases, or pallor of the outer side of the disc in later stages. Alcoholic amblyopia resembles in most of its symptoms the amblyopia due to tobacco, though vision for red is usually lost before vision for green. Amblyopia due to lead, quinine or atoxyl is rare, but it is also usually characterized by a central scotoma associated with some slight optic neuritis or atrophy.

5. The **Amblyopia of Migraine** is usually transitory, and may occur either in the form of a central scotoma, hemianopia, or monocular blindness. It is more

rarely seen in the form of a quadrant hemianopia or a ring scotoma. In all cases the diagnosis is comparatively easy, as the amblyopia seldom lasts more than a few minutes, and is followed later by the characteristic headache and sickness of migraine.

6. Amblyopia has also been described as due to **disease of the Visual Cortex**, and rare cases have been described of a **Crossed Amblyopia**, or defect of vision in one eye due to disease of the visual cortex of the other. The loss of vision is, however, usually associated with some slight defect of vision in the opposite eye, and hemianopia is much more commonly the symptom of disease of the visual cortex.

7. **Hysterical Amblyopia** may, like other hysterical affections, take various forms, such as loss of visual acuity, a loss of colour vision, or diminution in the visual field. The characteristic form of the visual field in hysteria is either a spiral contraction or an extreme concentric limitation. The symptoms, however, vary very much at different examinations, a point of much importance in diagnosis. In certain cases there may be a functional loss of vision in one or both eyes, which can be recognized as hysterical by the employment of Snellen's coloured types or some other device for deceiving the patient.

C.—PARTIAL BLINDNESS.

This may be (1) *Definite*, or (2) *Indefinite*.

1. **Definite**: (a) *Hemianopia*; (b) *Central scotoma*; (c) *Peripheral constriction*.

(a). *Hemianopia* (see HEMIANSOPSIA).

(b). *Central Scotoma*.—A scotoma is a local defect in the visual field, and, from its position, may be either central or peripheral; it may also be negative or positive. A negative scotoma is one where the defect of vision exists, but where the patient notices nothing abnormal. The best example of a negative scotoma is the blind spot in the field of vision caused by the entrance of the optic nerve. This area is blind, but the individual is not conscious of any visual defect. Scotomata of this character exist where there is some injury of the visual layers of the retina itself, or of the optic nerve or tract.

A positive scotoma is one in which the visual defect is noticed as a black or coloured spot or cloud which obscures the vision in some part of the visual field. Such positive scotomata are due to lesions of the retina, such as hæmorrhages or patches of pigment which do not destroy the visual layers. Vision still remains; but it is obscured by some unusual opacity in the retina itself or in the adjacent portion of the vitreous.

Scotomata frequently exist in the peripheral portion of the field of vision without being noticed, as they are of little importance in direct vision, and are not discovered unless carefully looked for. A central scotoma, on the other hand, is noticed at once, however minute, because it affects direct vision and produces a considerable defect in the visual acuity. A central scotoma may be either relative or absolute, and may exist for colours only or for objects. Central loss of vision for colours, more particularly red and green, is associated with *tobacco* and *alcohol poisoning*. The colours cannot be recognized in small objects when directly looked at, though a red or green object in the peripheral portion of the field of vision will be recognized as such. This scotoma is associated with greater or less diminution of the general visual acuity, and vision in such cases is generally better in a dull than in a bright light.

Absolute central scotomata are met with in *disseminated sclerosis*, in certain forms of *hereditary optic atrophy*, and may persist after the acute affection of the optic nerve known as *retrobulbar neuritis*, or in rare cases after severe attacks of *migraine*. In nearly 25 per cent of all cases of disseminated sclerosis a central scotoma exists, and the diagnosis in such a case will be confirmed by

its association with the general symptoms of the disease and with other ocular symptoms, such as optic atrophy, paralysis of accommodation, paralysis of the extrinsic ocular movements, or nystagmus. There is usually some pallor of the optic disc, though this is no indication as to the amount of visual defect. The diagnosis of a *hereditary optic atrophy* depends to a great extent upon the history of a similar affection among family relations and its usual period of incidence, namely, early adult life. It is associated with either neuritis or atrophy of the optic disc. *Retrobulbar neuritis* usually occurs in young adults, commonly attacks one eye only, and is sudden in its onset, vision failing from normal to no perception of light in a few hours. In the great majority of cases vision commences to return after the lapse of a day or two, and is ultimately restored in a fortnight or three weeks. If any defect remains it is usually central, and is due to some injury to those axial fibres of the optic nerve which supply the macular region. Central scotomata after *migraine* are rare, but may be ascribed to that cause when there is a definite history of sudden loss of sight associated with the characteristic hemicrania and vomiting. It is to be noted that central scotomata are not always easy to map out on a chart, owing to the patient's loss of power of fixation; a careful use of the perimeter by an experienced observer is necessary. A small central scotoma may cause considerable failure of vision, even though it is too small to chart on the ordinary perimeter. Scotomata may also be *paracentral*, in the immediate neighbourhood of the fixation point but not actually upon it, or may take an *annular or ring form*.

(c). *Peripheral constriction*.—Peripheral constriction of the visual field occurs commonly in affections such as acute or chronic *glaucoma*, *optic atrophy*, *disseminate choroido-retinitis*, *retinitis pigmentosa*, and various *functional conditions*. The constriction of the visual field in *glaucoma* is usually most marked on the nasal side, and can be recognized from its association with the acute symptoms of glaucoma, the circumcorneal injection, steamy insensitive cornea, dilated fixed pupil, hazy vitreous, and general symptoms such as trigeminal neuralgia, headache, and sickness. In chronic glaucoma it will also be associated with atrophy and cupping of the optic disc (*Plate VIII, Fig. V*). Central vision may remain quite good, even though the field of vision is extremely limited. The field of vision is, as a rule, most limited in *retinitis pigmentosa*, where the failure of sight will be found to be associated with night-blindness and characteristic ophthalmoscopic appearances, a small, ill-defined, waxy-looking disc, slender vessels, and diffuse superficial pigmentation of the periphery, the retina in patches resembling Haversian bone corpuscles. This condition often occurs in two or more members of the same family, and may exist where the parents have been first cousins. A limitation of the field similar to that of retinitis pigmentosa is often met with in cases of *disseminate choroido-retinitis* (*Plate VII, Fig. G*) and consequent optic atrophy; but may be distinguished from it by abundant evidence in the eye of deeper changes in the retina and choroid. Constriction of the field of vision may also occur in certain *functional states*, but may, as a rule, be recognized by its variable character and the absence of all evidence of organic ocular or general nervous disease.

2. *Indefinite*.—A defective visual acuity may exist with no evidence of any ocular or nervous disease (see AMEYLOPIA, p. 836). Defective vision may also be due to errors of refraction, to opacities of the cornea, aqueous, lens, or vitreous, to affections of the choroid and retina, and to lesions of the optic nerve. Opacities of the cornea can easily be recognized on illumination of the eye with a strong light concentrated by a lens, and intra-ocular causes of defective vision can be discovered by ophthalmoscopic examination. Detailed differential diagnosis of all the ocular causes of diminished vision requires a special knowledge of ophthalmology.

D.—COMPLETE BLINDNESS.

Total loss of vision, blindness, or amaurosis, may be (1) *Bilateral*, (2) *Unilateral*.

1. **Bilateral Blindness.**—Total blindness in both eyes may be congenital or acquired. Congenital blindness may be due either to absence of the eyes themselves, *congenital anophthalmos*, or to *congenital defects* in the development of the eyes themselves. Nearly 90 per cent of all cases of total blindness in the United Kingdom are due to the *ophthalmia of the new-born*. Such cases can be recognized by the history of profuse inflammation or discharge shortly after birth, by the diffuse opacity on the surface of the cornea, associated, in some cases, with thinning and protrusion of the anterior part of the eye, and more or less nystagmus.

Total blindness may also be caused by *bilateral inflammatory affections* of the eyes, such as iritis with blockage of the pupils and consequent glaucoma, or ultimate shrinking of the eyes, bilateral primary glaucoma, optic atrophy, or lesions of the optic chiasma. It is seldom due to lesions of the optic tracts, as this would only be caused by a bilateral lesion totally destroying the optic tract on both sides.

Total blindness of a *transient* nature may also occur in renal disease, and is termed *uræmic amaurosis*. This condition is recognized by its association with the symptoms of renal disease, whether in pregnancy or not, and by its sudden onset and short duration, the whole attack as a rule lasting not more than four or five days. In the majority of cases there is some evidence of renal retinitis, though in others the eyes are normal. The pupils usually react to light, though occasionally the light reflex is absent.

Another form of transient blindness occasionally met with, is apparently due to *spasm of the retinal arteries*. In these cases the loss of vision may last only a few hours, and during its continuance it will be found that the retinal arteries are of a very slender calibre. It is to be noted that no cataract ever causes total blindness. Provided that the rest of the eye is normal, a patient with the densest cataract can always perceive light, and also has the power of projection, or the recognition of the direction from which the ray of light is coming.

2. **Unilateral Blindness.**—It is evident that unilateral blindness must be due to some lesion in the eye itself, or between the eye and the optic chiasma. Lesions of the optic tract above the chiasma do not cause monocular blindness, but HEMIANOPSIA (*q.v.*). Monocular blindness may be either sudden or gradual.

Gradual blindness may be due to any of the inflammatory affections of the eye mentioned above, or to such progressive diseases as optic atrophy or glaucoma.

Sudden blindness in one eye may be due to one of the following causes:—

Detachment of the retina (*Plate VIII, Fig. t*)

Embolism of the central artery (*Plate VIII, Fig. s*)

Thrombosis of the central vein (*Plate VIII, Fig. o*)

Vitreous hæmorrhage

Acute glaucoma (*Plate VIII, Fig. v*)

Injury to the optic nerve due to an accident or fracture of the base of the skull

Compression of the optic nerve from hæmorrhage or dilatation of the nasal sinuses

Retrobulbar neuritis

Migraine.

The diagnosis of the majority of these causes is simple, owing to the characteristic ocular or ophthalmoscopic appearances. The only cases which present any obscurity are those in which there is sudden loss of vision without

any visible ocular changes. These cases are usually due to retrobulbar neuritis, an acute affection of the optic nerve of obscure origin, characterized by sudden loss of sight, with some pain and tenderness on movement of the eye. The loss of vision as a rule lasts for not more than twenty-four or thirty-six hours, and coincidentally with the return of vision, more or less definite neuritis appears at the optic disc (*Plate VII, Fig. K*). In the majority of cases vision entirely returns, but if there is a permanent defect, it usually takes the form of a central scotoma.

Blindness due to compression of the optic nerve by *dilatation of the accessory nasal sinuses* can only be recognized after a thorough examination of the nasal passages; sinus disease of any duration is always accompanied by certain well-defined appearances in the nose itself.

Monocular blindness may also occur in *migraine*, but in these cases it is of extremely short duration, seldom more than ten minutes or a quarter of an hour, and is followed by the characteristic headache and sickness.

E.—COLOUR BLINDNESS.

Defects in colour vision may be either congenital or acquired. In congenital colour blindness there is inability to recognize in the spectrum the six or seven definitely distinct colours which may be apparent to a normal eye. The commoner cases of colour blindness are those who can only see three colours in varying shades of black and white, or people who can only distinguish two colours, the spectrum being made up of yellow and blue, the one gradually passing into the other. Red, orange, yellow, and green are seen as one colour, blue and violet as the other. Scarlet and grass-green appear very similar to these persons.

Cases of congenital colour blindness can be recognized by examination with coloured wools, as in Holmgren's test, or with much more precision and certainty in a dark room by means of a lantern with properly coloured glasses.

Acquired loss of colour vision may also occur in tobacco blindness or in optic atrophy.

Colour Defects.

Rainbow Vision.—Objects, especially lights, may be seen surrounded by a ring containing the colours of the spectrum. The causes of this are, as a rule, either *conjunctivitis*—in which there is a thin film of mucus on the surface of the conjunctiva—or *glaucoma*. The diagnosis in the two cases should present no difficulty, because the rainbow vision of glaucoma will be associated with the other important symptoms of this disease, viz., steamiiness or lack of brilliancy in the cornea, a shallow anterior chamber, dilatation of the pupil, and some limitation of the field of vision, especially on the nasal side.

Erythropsia, or red vision, occurs after prolonged exposure to white or violet light in conditions such as electric or snow blindness. It is accompanied by much inflammation and redness of the eyes, conjunctival discharge, and intolerance of light. It may also occur in slight vitreous or retinal hæmorrhages, though in severe vitreous hæmorrhages vision is entirely abolished. Erythropsia, and in some cases blue vision, may occur after cataract extraction, and appears to be due to some fatigue of the retina.

Xanthopsia, or yellow vision, may occur in jaundice or in poisoning by *santonin*, *amyl nitrite*, *cannabis indica*, or *picric acid*.

F.—ABNORMAL SENSATIONS OF SIZE.

Objects may appear rapidly to increase or diminish in size in the preliminary stages of an attack of epilepsy; and this variation in size of objects is a fairly common symptom in the slight delirium of infantile febrile disorders. *Micropsia*,

or abnormal diminution in the size of objects, also occurs to many normal people during the act of reading. The book appears suddenly to recede to a great distance, and it and the type appear extremely minute, though absolutely clear. No satisfactory cause has yet been adduced for this phenomenon. It may be relieved by a momentary rest, and is of no pathological significance. A similar condition may be produced by the use of certain drugs, particularly cannabis indica and its products.

G.—DAY-BLINDNESS AND NIGHT-BLINDNESS.

Day-blindness, or *hemeralopia*, is caused most commonly by *tobacco poisoning*, it being probable that this condition is due to a direct poisoning of the retinal cones, which are endowed with the faculty of effective vision in lights of high brilliancy. In *snow blindness*, also, vision improves directly the light begins to fail, and defective vision in bright light is a common symptom of *albinism*. Except in the case of albinos, the retina may show no abnormal signs.

Night-blindness, or *nyctalopia*, occurs most frequently in *retinitis pigmentosa*, in which on ophthalmoscopic examination, the characteristic appearance of a small ill-defined optic disc, thin thready arteries and veins, and the characteristic spider-like pigment cells may be seen at the periphery of the fundus. It also occurs in cases of *disseminate choroido-retinitis*, and in *scurvy*. Patients suffering from *high myopia* may also suffer from defective vision in dim lights.

Herbert L. Eason.

VISION, DOUBLE.—(See DIPLOPIA.)

VOICE, ABNORMALITIES OF THE.—(See SPEECH, ABNORMALITIES OF.)

VOMITING.—Strictly speaking, the term vomiting implies the return and expulsion from the mouth of part or the whole of the stomach contents.

There are several conditions in which vomiting may be simulated closely, although the vomited matter has never reached the stomach. It will be convenient to deal with these before discussing the causes and differential diagnosis of true vomiting or gastric regurgitation.

In certain *diseases of the œsophagus*, food may be swallowed and, after a varying interval of time, brought up again. These conditions are :

Malignant disease	Pressure from without, as by
Fibrous stricture	aneurysm, new growth, etc.
Spasm	" Idiopathic " dilatation
	Diverticula—" pressure " pouches.

If the obstruction be of long standing, and near the lower end of the œsophagus, the interval between taking food and its regurgitation may be prolonged considerably, especially in cases in which the lumen has undergone much dilatation. This may occur with fibrous stricture, slow-growing carcinoma, or the very rare cases known as " idiopathic " dilatation of the œsophagus.

A " pressure " pouch produced by a hernia-like protrusion of the mucous membrane through the muscular coats of the upper part of the œsophagus, becomes filled gradually and, in addition to dysphagia caused by the pressure it exerts on the œsophagus below, may simulate vomiting when its contents are voided.

The differential diagnosis of these œsophageal causes of vomiting, or rather regurgitation, is usually easy. The returned matter is practically unaltered, and is undigested. It may be diluted freely with mucus. Blood may be present, and even portions of growth in cases of carcinoma. In œsophageal pouches,

food may be retained for long periods and returned unchanged. The most important point to recognize is, that in such œsophageal conditions the returned matter is alkaline or neutral in reaction. The diagnosis is confirmed by examination with a bougie, or by the x -rays after administration of bismuth emulsion.

Further, certain individuals may acquire the power of voluntarily causing a regurgitation of portions of the stomach contents into the mouth, which may be ejected or again swallowed, sometimes after further mastication. There is no accompanying nausea. This condition, known as "rumination" or "MERYCISM" (*q.v.*), must be distinguished from vomiting.

Mention must also be made of conditions in which the mechanism of deglutition is deranged, and in which swallowing is interfered with to such an extent that the food or drink is returned. This may occur in cases of bulbar paralysis, myasthenia gravis, etc. Again, in diphtheritic paralysis the return of fluids through the nose, owing to the paralysis of the soft palate, may be mistaken for vomiting. A similar mistake has been made in cases the writer has met with of bronchiectasis in which, during the act of coughing, large quantities of pus have gushed up, not only from the mouth but also through the nose.

The regurgitation of milk in healthy breast- or bottle-fed infants after a hearty meal is met with frequently, and is often wrongly regarded as vomiting. It is due to simple overfilling, or sometimes to too rapid feeding; air that has been swallowed is belched up, and drives out some of the milk with it.

A brief account of the *mechanism of vomiting* will facilitate a classification of its causes. The parts concerned are the muscular coats of the stomach; the sphincter at the cardiac orifice; the diaphragm, and the abdominal muscles; the vomiting centre situated in the medulla; the efferent nerve fibres in the vagus supplying the musculature of the stomach; the phrenics to the diaphragm; and the spinal nerves supplying the abdominal muscles.

In the act of vomiting, the walls of the stomach contract, the diaphragm is pushed violently downwards in full inspiratory position, while powerful contractions of the abdominal muscles take place. At the same time the cardiac sphincter is relaxed, and the gastric contents are expelled, chiefly as the result of the pressure thus exerted on the stomach by the diaphragm and the abdominal muscles, aided to some extent by reversed peristalsis. The pyloric sphincter is usually closed, but it may become relaxed, in which case bile and intestinal contents may enter the stomach and be found in the vomit. The vomiting centre may be excited to action by stimuli reaching it from the stomach itself, by afferent fibres in the vagus, or from other parts by many different afferent channels. The centre may also be thrown into action by toxic substances acting on it directly.

In *retching*, forcible contraction of the stomach wall, and of the diaphragm and abdominal muscles takes place as in vomiting, but there is no relaxation of the sphincter. In the condition known as *waterbrash* or *pyrosis*, in which a quantity of clear fluid is brought up into the mouth, usually on rising in the morning, the complete act of vomiting does not occur; relaxation of the cardiac sphincter takes place without obvious attendant muscular contraction of the stomach or of its auxiliaries, the diaphragm and the abdominal muscles.

It is obvious from the above that the causes of vomiting must fall into two great groups: (I) *Those acting directly on the vomiting centre*, such as certain poisons, e.g., apomorphine; (II) *Those acting reflexly on the centre*. The second group is a very large one, as it includes practically all the pathological states of the stomach, many visceral diseases, disturbances of special senses, etc., as will be seen later.

I.—CENTRAL CAUSES.

Certain drugs—	Addison's disease
Apomorphine]	Onset of acute infections, especially
Tobacco	in children
Anæsthetics	Pregnancy
Uræmia	Recurrent, periodic or cyclical vomit-
Diabetes	ing in children.
Acute yellow atrophy of the liver	

There may be some doubt as to whether Addison's disease, pregnancy, and recurrent vomiting should be included in this group, as their pathology is not fully known. The vomiting of pregnancy may be partly reflex; but there is strong evidence that a toxic element exists, and is probably the chief exciting cause. The differential diagnosis of these conditions presents little difficulty. The examination of the urine will give evidence of the existence of renal disease in uræmic vomiting, and the onset of drowsiness and coma in a diabetic patient may be attended by vomiting. Persistent vomiting occurring in a case of jaundice of apparently the common catarrhal variety should arouse suspicion of its proving acute yellow atrophy. The size of the liver should be determined carefully, and any diminution noted; the urine should be examined for leucin and tyrosin. Vomiting associated with asthenia, characteristic pigmentation of skin and buccal mucosa, and a persistent low blood-pressure would be diagnostic of Addison's disease. The form of vomiting met with in young children, termed "periodic," or "cyclical," is very severe, and is accompanied by great wasting. The symptoms pass off after a few days, but tend to recur at intervals of months. The urine during the attacks often contains acetone and diacetic acid, and the condition may be regarded as an autointoxication, probably an acidosis (see ACETONURIA). The vomiting so frequently met with as one of the earliest symptoms in specific fevers, especially in children, is chiefly due to the direct action of the specific toxin on the cerebral centre, though reflex action may also have a share in it. The diagnosis does not usually present difficulty; the acute onset, vomiting, general malaise, headache, pyrexia, sore throat, rash, etc., speedily give the clue to the cause of the vomiting. In older patients, scarlet fever is the commonest specific fever to begin with nausea and vomiting.

We must next consider the chief characteristics of the vomiting due to reflex causes.

II.—REFLEX VOMITING.

I. Gastric Causes.

Irritating articles of food (hard, indigestible substances)	Pyloric obstruction:
Emetics, such as zinc sulphate, mustard, etc.	Malignant disease
Poisons: Corrosives, irritants	Fibrous stricture
Gastritis:	"Hypertrophic stenosis" in infants
(a) Acute: (i) Simple,	Pressure on pylorus from without
(ii) Phlegmonous	Venous congestion, as in morbus cordis, portal obstruction, cirrhosis of liver
(b) Chronic	Ulcer
Dilatation and "hour-glass" contraction	Malignant disease.

2. Intestinal, Peritoneal, and General Visceral Causes.

Intestinal obstruction
 Appendicitis
 Intestinal worms
 Following administration of
 enemata
 Henoch's purpura
 Peritonitis
 Biliary colic
 Renal colic—movable kidney
 (" Dietl's crises ")
 Acute pancreatitis
 Certain conditions of the female
 genital organs :
 Pregnancy
 Retroversion of the uterus
 Ovarian disease
 Extra-uterine gestation

Phthisis—vomiting may be of central
 origin or due to irritation of the
 bronchi or fauces
 Irritation of the fauces or bronchi by
 direct stimulation, or by severe
 coughing :
 Pertussis
 Bronchiectasis
 Fibroid lung
 Shock — blows on the epigastrium,
 injury of a testicle, a kick upon
 the internal semilunar cartilage of
 the knee, etc.

3. Affections of the Central Nervous System.

Special Senses :—

Offensive smells, tastes, repulsive sights.

Brain :—

Concussion
 Cerebral tumour or abscess
 Meningitis
 Hydrocephaly
 Cerebral hæmorrhage
 Thrombosis of cerebral sinuses

Middle-ear disease ; Ménière's
 disease
 Migraine
 Epilepsy
 Sea-sickness
 Functional or hysterical vomiting.

Spinal Cord :—

Tabes dorsalis, gastric crises.

Certain general lines may be laid down of great importance in the accurate diagnosis of the cause of vomiting. Attention should be paid to its relation to food, if any, and at what interval after a meal it occurs ; whether preceded or not by pain ; whether attended or not by nausea. The absence of nausea is a point of great significance ; this is usually present in vomiting due to abnormal states of the alimentary tract and visceral organs, but is often absent in diseases of the brain.

The vomited matter should be inspected carefully, and its quantity and general character noted. Alcohol, and certain poisons such as carbolic acid and prussic acid, may be recognized by their *smell*, or a fæcal odour may be distinguished. *Blood* may be present, either dark or bright red, or dark brown, resembling coffee-grounds. Slight streaks of blood are common with severe vomiting, and are usually due to rupture of small vessels in the œsophagus or pharynx. In whooping-cough, blood is often mixed with mucus from the respiratory passages, and the contents of the stomach are ejected during the paroxysms. The *condition of the food remains* should be noted carefully ; the presence of substances, such as currants or seeds, taken it may be many hours or some days previously, would point to motor insufficiency of the stomach, either with or without pyloric obstruction ; shreds of meat returned unaltered some hours after a meal indicate deficient protein digestion.

The *reaction* should be ascertained : in corrosive poisoning this may be strongly acid or alkaline according to the toxic agent. It need hardly be said that in

any case of suspected poisoning the vomit should be kept for analysis. *Microscopical examination* may show sarcinæ (*Fig. 92, p. 267*), yeast cells, the Oppler-Boas bacillus, or cell elements from a malignant growth. Intestinal contents may be mixed with the vomit. *Bile* is often present in severe or protracted vomiting, and is readily recognized by its colour and the usual tests. Relaxation of the pyloric orifice in such cases allows of the return of the duodenal contents into the stomach. *Fæcal matter*, when present, is recognized by the characteristic odour and the brownish coloration it imparts to the vomit; it usually occurs as the result of intestinal obstruction. Gastro-colic fistula may give rise to fæcal vomiting.

1. Gastric Causes.—Most *corrosive* and *irritant poisons* cause vomiting immediately after swallowing, accompanied by intense burning pain in the epigastrium. The vomit contains food, blood, mucus, and may have the characteristic odour of the poison. With some irritant poisons, e.g., arsenic, or phosphorus, the vomiting may come on later and resemble that of an acute gastritis. The diagnosis will depend largely on the chemical analysis of the vomit, and the associated signs and symptoms.

In *acute gastritis* there is repeated vomiting, usually very severe, and attended by nausea and abdominal pain. Vomiting occurs shortly after taking food, and causes some relief of pain. The vomited matter consists at first of food ingested, later, of mucus and bile. There are often accompanying diarrhœa and febrile disturbances, especially in children. In the *phlegmonous* form the constitutional symptoms are exceedingly grave; pus is rarely found in the vomit, bile is often present.

In *chronic gastritis* the vomiting is associated with nausea and epigastric pain. There is usually much flatulence. The vomited matter consists of partially digested food, mucus, and a considerable quantity of sour-smelling fluid. Hydrochloric acid is usually reduced greatly in amount, or may be absent. When *dilatation* of the stomach is present, the quantity of fluid ejected is often very large; portions of food taken many hours previously may be returned. Fermentation takes place in the stagnant gastric contents, so that the vomit, when collected in a glass vessel, often shows an uppermost layer of brown froth, a middle greenish-grey layer of fluid containing streaks of mucus, and below this a semi-solid deposit containing food remains, sarcinæ (*Fig. 92, p. 267*), yeast cells, and bacteria; chemical tests show the presence of lactic acid and a diminution or absence of free or active hydrochloric acid.

"*Hour-glass*" contraction, due to transverse constriction of the stomach by fibrous tissue, may be a cause of vomiting which resembles in most respects that associated with dilatation.

The vomiting due to *pyloric obstruction* in adults presents no characteristics other than those associated with the dilatation of the stomach which usually results from it. The absence of free hydrochloric acid in the vomit would favour the diagnosis of carcinoma, the presence of free hydrochloric acid that of fibrous stricture; the presence of the Oppler-Boas bacillus is regarded by many as diagnostic of carcinoma. Persistent vomiting in young infants, especially if breast-fed, attended with wasting and constipation, should always arouse suspicions of the existence of "*hypertrophic stenosis of the pylorus*." The vomiting in these cases is very forcible, the milk being pumped up violently, often very shortly after a feed, and with little alteration. Visible gastric peristalsis and the presence of a small tumour in the epigastrium would complete the diagnosis.

Vomiting due to *gastric ulcer* (non-malignant) is very common. Pain occurs soon after taking food, and is relieved by vomiting, which usually occurs within an hour. The vomit consists of food, more or less digested, according to the

time which has elapsed after a meal. It almost always contains at least the normal quantity of free hydrochloric acid, and blood may be present in varying quantity.

With *malignant disease*—carcinoma of the stomach—though the general character of the vomit may be very similar to that in simple ulcer, there is usually a great diminution or complete absence of free hydrochloric acid, and lactic acid and the Oppler-Boas bacillus are often present. Sarcinæ may be present also when there is accompanying dilatation. Occasionally portions of the growth may be found in the vomited matter. In both simple and malignant ulcer, blood may be detected in the vomit microscopically or spectroscopically (see BLOOD PER ANUM) when it is not recognizable by the naked eye.

2. **Intestinal, Peritoneal, and General Visceral Causes.**—In *intestinal obstruction* vomiting sets in after an interval, the length of which may depend on the situation of the blocking. The vomiting is severe and persistent; the contents of the stomach are returned first, and later, mucus, bile, and intestinal contents. Fæcal vomiting should be recognized at once by its odour; obvious pieces of fæcal matter are rarely distinguishable, but the vomit may have a brownish colour. The vomiting is more severe the higher the obstruction is in the intestinal canal.

Vomiting is commonly present in *appendicitis*, but in slight cases does not persist after the onset. In the severe forms of the disease the vomiting may be a prominent symptom, and resemble that met with in intestinal obstruction; it is sometimes fæcal in character.

Intestinal worms are a cause of vomiting in children, probably owing to the reflex irritation they set up. Occasionally a round-worm is found in the vomit.

Enemata in certain individuals cause vomiting, and rare cases have been described in which the fluid injected per rectum has been returned by the mouth.

Vomiting is a common symptom in the condition known as *Henoch's purpura*, and may be due to either gastric or intestinal stimulation. The vomit may contain blood due to hæmorrhages from the mucous membrane of the stomach. It is usually accompanied by abdominal pain, sometimes of an acute and agonizing character closely simulating that occurring with intestinal obstruction, these symptoms being due to hæmorrhage into the intestinal wall or the mesentery, which occasionally simulate or even give rise to intussusception. Recurrent attacks of vomiting and abdominal pain associated with a purpuric eruption in a boy or girl would point to the existence of this not uncommon disease.

In *acute peritonitis*, vomiting is an early symptom, and causes great pain; rarely the vomit may have a fæcal odour. The history, together with the rigidity and immobility of the abdominal wall, generally indicates the need for early laparotomy.

In *biliary* and *renal colic*, the vomiting accompanying the attacks of agonizing pain presents no special features. The pain in the thorax and upper part of the abdomen, and the onset of jaundice, distinguish biliary colic from that due to renal calculus, in which the pain is in the loin or lower abdomen, shooting down towards the groin and testicle. Jaundice is absent if the stone is in the cystic duct.

Acute pancreatitis may simulate intestinal obstruction closely, in that it is attended by nausea and vomiting, constipation, and severe abdominal pain. The vomit is not fæcal in character; there is usually localized tenderness over the region of the pancreas. The diagnosis is seldom made, however, until laparotomy is performed on account of the urgency of the symptoms, when typical fat necrosis will be found in the omentum.

The other visceral causes of vomiting call for no special notice.

3. **Affections of the Central Nervous System.**—It has been pointed out that in most of the preceding conditions nausea accompanies vomiting, and this brings us to a most important distinction, namely, that in intracranial disease a special type of vomiting is met with, generally known as "cerebral vomiting." In this, nausea is absent, vomiting occurs suddenly and often without warning, and bears no relation to the ingestion of food. The whole or part of the stomach contents are returned. Vomiting of this type, especially if accompanied by headache or ocular changes, should arouse grave suspicion of the existence of organic cerebral disease, such as tumour, abscess, meningitis, or sinus thrombosis. "Cerebral vomiting" may also occur in hydrocephaly due to increased intracranial pressure.

Cerebral hæmorrhage may be attended by vomiting, more often when the cerebellum is the part affected than when other parts of the brain are involved.

In *Ménière's disease* vomiting may follow the attack of vertigo. Nausea and vomiting frequently accompany the severe headache associated with attacks of *migraine*.

Functional or hysterical vomiting is not attended by nausea or pain; portions of a meal are brought up, usually fluids; and although the vomiting may be a frequent occurrence, the general state of nutrition often remains good. Other hysterical manifestations are generally present in these patients. Cases have been recorded in which the vomit contained fæcal matter.

The *gastric crises* in tabes are attacks of vomiting accompanied by severe epigastric pain. The attacks usually last for several days, and tend to recur at intervals of weeks. Nausea may be absent. During the intervals digestion may be carried on normally. The diagnosis depends on the presence of the characteristic Argyll Robertson pupil and the loss of the knee-jerk.

The influence of anæmia upon vomiting, and the manner in which gastric ulcer may be simulated thereby, have been discussed in the article on ANÆMIA.

H. Morley Fletcher.

WALKING, PECULIARITY IN.—(See GAIT, ABNORMALITIES OF.)

WEIGHT, LOSS OF.—Loss of weight sooner or later accompanies all cases of cancer, phthisis, starvation from lack of food or from inability to swallow, and similar conditions; but in most such cases there are other definite symptoms pointing to the diagnosis. The present article is concerned chiefly with those cases in which, without any other very definite symptoms, the patient has recently been losing weight. In the case of children, the commonest causes are malnutrition from injudicious feeding, the eating of sweets between meals, gastro-intestinal infections, and latent tuberculosis (see MARASMUS).

If the patient is an adult and the loss of weight has been considerable, the first suspicion will almost certainly be that there is either *phthisis pulmonalis*, *deep-seated or latent carcinoma or sarcoma*, or *tuberculosis* other than pulmonary. All the systems, including the rectum, and, if need be, the vagina, will need careful routine examination. Any sputum that may be obtainable should be examined for tubercle bacilli; the physical signs at the apices of the lungs should be watched with extreme care, particularly if there is any difference in the amount of subcutaneous fat on the two sides in this region; the x-rays may be of value in detecting mottling (*Fig. 27*, p. 120) at one or other apex when the mischief is too far from the surface to give abnormal physical signs to percussion or auscultation. Von Pirquet's skin reaction, or, if it is thought advisable, Calmette's ophthalmic reaction to tuberculin may be tested. Von Pirquet's is nowadays preferred to Calmette's reaction on account of the occasional ill-effects of the latter upon the eye. Those who believe that the opsonic index to tubercle bacilli is of diagnostic significance would have it estimated before and after

inoculations with small or moderate doses of tuberculin; the family history might be of assistance in indicating the likelihood of a lung lesion, whilst the personal history as to the drinking of much unsterilized milk would indicate the possibility of infection by so-called surgical tuberculosis in the lymphatic glands, abdomen, a joint, or the spinal column.

Notwithstanding the most careful investigations, however, doubt as to the cause of the loss of weight in not a few cases remains until, in the course of time, the patient either recovers the lost ground and gets quite well, or else develops other signs or symptoms of growth, tuberculosis, or other definite disease.

Young persons may lose weight as the result of change of surroundings, for instance from active out-door school life to work in a city office. Care and anxiety; the undertaking of serious responsibilities; sorrow; love; too strenuous a life of pleasure; irregularity of meals; too long hours of work; these are amongst the everyday causes of what at the time may appear to be serious loss of weight.

Any affection of the alimentary tract sufficient in degree to interfere with the proper digestion and absorption of food may produce loss of weight, especially if there is cause for sapræmia at the same time; one may mention in this connection loss of appetite from too much smoking, excessive drinking, monotony of food or of existence, carious teeth, ill-fitting tooth plates, pyorrhœa alveolaris, dyspepsia, flatulence, the abuse of purgatives, and the constipation which results therefrom; gastric or duodenal ulcer; inflammatory or ulcerative affections of the bowel of the nature of colitis in its many forms. The wasting is seldom severe in any of these; but especially, for instance, in cases in which gastric symptoms are prominent, it may be very difficult, for the time being, to tell whether the mischief should be labelled merely dyspepsia, or actual carcinoma ventriculi. Analyses of the gastric juice were at one time thought to be valuable in deciding between simple and malignant affections of the stomach, but this is by no means always the case. If, under observation and treatment, the patient succeeds in gaining weight, or even ceases from losing more over a period of some weeks, the argument is against carcinoma; but if doubt remains, and it is desired, if possible, to adopt surgical measures before any carcinoma has passed the stage of radical curability, it will often be wise not to postpone laparotomy too long as a means of settling the diagnosis. It is too late if one waits until there is a tumour.

Any malady which produces sleeplessness or pain, or both, may lead to serious loss of weight, and thus to difficulty in the diagnosis. A thoracic aneurysm, for instance, may erode the vertebræ and produce severe intrathoracic pain, which in turn produces insomnia, and may thus cause so much loss of weight that neoplasm may be suspected.

Chronic microbial infections may not in themselves be obvious, and yet they may produce loss of weight by interfering with the general nutrition; one sees this in many persons who have returned from the tropics after infection there by dysentery, yellow fever, malaria, dengue, and so forth. At home, chronic infections of joints, of the skin, the alimentary tract, the uterus, and genital organs may produce loss of weight in a similar way. One would mention here in particular a malady that has only been recognized of recent years, though it is now known to be common, namely coli bacilluria (see BACTERIURIA), the diagnosis of which is only possible on bacteriological examination of the urine, though it may be suggested by the discovery in the latter of a trace of albumin and, on microscopical examination, of variable numbers of pus corpuscles.

Liver affections exert a prominent influence upon general nutrition, and the loss of weight exhibited by some sufferers from cirrhosis of the liver is familiar, though in the early stages the patient may be fat, and towards the end loss of

weight may be masked by a false increase due to ascites. Pernicious anæmia is only diagnosable with certainty by means of blood examination (see ANÆMIA), though it may be suggested by the lemon-yellow colour of the patient; but one marked feature of the malady is, that although the patient does not at first decrease much in bulk, the tissues, from conversion into or replacement by fat, become of less specific gravity than normal, so that the patient diminishes materially in weight.

The effect of alcohol upon body weight is variable, some persons becoming exceedingly stout, others not changing much, and others becoming extremely thin. Broadly speaking, it is spirit drinkers who decrease in weight, and in some cases serious doubts may arise as to whether the loss in such a patient is due to the alcoholic habits only, or whether there is not some new growth or tuberculous affection as well. When alcoholism leads to peripheral neuritis there is rapid and extreme loss of weight as the result of the muscular atrophy, and the same applies to other conditions of multiple peripheral neuritis (see ATROPHY, MUSCULAR).

Certain drugs have the power, especially in certain individuals, of reducing weight materially, even though the diet remain the same; the best known of these is *thyroid extract*, whilst a long way second comes *fucus vesiculosus*. It will seldom happen that either of these is being taken accidentally, so that the diagnosis of loss of weight due to them is generally obvious.

Old age is very apt to be associated with loss of weight; it is very difficult sometimes to be sure whether the loss of weight that may be complained of in a patient of sixty or seventy years of age is merely senile, or whether it is due to underlying growth.

Diabetes, especially diabetes mellitus in young subjects, may have loss of weight for its earliest and most prominent symptom; but the diagnosis is sufficiently easy when the urine has been examined.

Addison's disease is another affection in which, besides the progressive asthenia, loss of weight, though by no means essential, is sometimes a marked feature. There may or may not have been syncopal or gastric attacks; the diagnosis depends almost entirely upon the discovery of abnormal pigment deposits in the form of patches or spots, not only upon the skin of the neck, limbs, and trunk, but also beneath the mucous membranes, particularly of the mouth, where they are generally best seen inside the lips, or within the cheeks. The blood-pressure is sometimes very low in these cases, and if, on actual measurement, it is found to be 70 or 80 mm. Hg, this fact tends to confirm the diagnosis.

Just as the administration of thyroid extract diminishes weight, so may loss of weight be a prominent feature in cases of *Graves' disease*—exophthalmic goitre; sometimes, indeed, it may be the first symptom to attract attention, especially in those cases in which there is no exophthalmos. Tachycardia, nervousness, fine tremor of the outstretched fingers, and symmetrical but not extreme enlargement of the thyroid gland, would confirm the diagnosis.

Anorexia nervosa is a disease in which wasting from disinclination to eat any kind of food except in the smallest quantities is the most prominent symptom; the patient is nearly always a girl, or young woman, between the ages of fifteen and twenty-five; there may or may not be other evidence of functional nerve disorders. A patient who has been perfectly robust until puberty or shortly afterwards begins to lose all appetite, and the body wastes, until from being eight or nine stone the weight declines even to so little as four or three and a half stone, though the height may be 5 ft. 4 in. or more. One sometimes sees girls of 5 ft. 10 in. or more weighing less than five stone as the result, not of any organic disease, but of the simple functional absence of appetite

—anorexia nervosa. In arriving at the diagnosis it is important to exclude the possibility of some deep-seated tuberculous lesion, especially phthisis pulmonalis or tuberculous peritonitis (tabes mesenterica). One of the best means of excluding these is the thermometer, for in anorexia nervosa there should be little if any pyrexia. Very careful examination of all the systems, including von Pirquet's and perhaps Calmette's tuberculin reactions, will lead to negative findings, and the diagnosis will be confirmed by the rapid increase in weight that will accrue when measures for the treatment of the functional disease by the Weir-Mitchell method are adopted.

Herbert French.

WHEALS.—The characteristic lesion of *urticaria* may be defined as a flattish evanescent elevation of the skin, the result of an œdema of the derma. It may be regarded also as a special variety of the papule or the nodule. It is related to erythema, and is the expression of angioneurotic excitation, internal or external, which causes a dilatation of the vessels that permits an exudation of plasma. Reaction follows in the form of a spasmodic contraction of the capillaries. The fluid is not therefore immediately taken up by the vessels, but as soon as they return to their normal condition, the wheal disappears, as a rule without leaving any trace. In colour, wheals are usually pale in the centre, with a red periphery; but they may be uniformly rose-red, or may have a whitish periphery; or, as the result of hæmorrhage into them, they may be purplish. In size they vary from a pin-head upwards. The smaller ones may take the form of conical or acuminate papules, frequently surmounted by a tiny vesicle. As a rule, they are flat or very slightly raised; but the larger ones, when not the result of coalescence, are hemispherical. They may also be linear in shape, and several inches in length, and by running together, may form roughly circular plaques. They usually appear suddenly, and last only a few hours, but may be succeeded by others. They are always accompanied by itching or burning, which may be intense.

It is not necessary, in a work on diagnosis, to give a detailed description of the different forms of urticaria; the only other affection in which wheals appear is *urticaria papulosa* (strophulus), the differential diagnosis of which has been given under PAPULES. The sudden onset, the presence of the wheals, the usually fugitive character of the eruption, the irregular distribution, and the severe itching, make up a clinical picture which is generally unmistakable. In *bullous urticaria*, however, in which the wheal is crowned or is replaced by a bleb, the affection may be confused with pemphigus or with the erythematous stage of dermatitis herpetiformis; but its true nature is indicated by the history of the case, the course of the eruption, and the almost invariable presence at some points of typical lesions. In cases in which the constitutional symptoms are pronounced, the rash may be mistaken at first for that of scarlet fever, or even for erysipelas; but the course of the lesions will quickly correct the error.

When wheals are due to such local and accidental causes as the *bites of insects*, or contact with the *stinging-nettle*, the diagnosis is furnished by the history, and in insect bites by the central punctum.

- sometimes no leucocytosis with ..	644
- vertigo due to ..	828
- vomiting in ..	565, 651
- cerebral, aphasia in ..	685, 686
- bradycardia from ..	98
- from bronchiectasis ..	98, 547
- coma from ..	136, 137
- convulsions from ..	172
- from frontal sinus disease ..	547
- with fungating endocarditis ..	547
- giddiness in ..	341
- headache caused by ..	326, 327, 686, 847
- hemianopsia from ..	335
- hemiplegia from ..	82, 138, 340, 341
- hyperpyrexia in ..	344
- hypertension of cerebrospinal fluid in ..	338
- hypothermia in ..	346, 547
- increased intracranial pressure in ..	686
- leucocytosis in ..	400
- due to mastoid disease ..	547
- occasional latency of ..	341
- optic neuritis in ..	341, 547, 686
- otitis media causing ..	341
- paralysis from ..	547
- prolonged pyrexia in ..	609
- pupil changes with ..	594
- pyrexia in ..	341
- recurring rigors in ..	648
- septicæmia from ..	614
- signs of ..	173
- simulating superior longitudinal sinus thrombosis ..	651
- slow pulse-rate in ..	517, 771
- slow respiration in ..	547
- temperature in diagnosis from cerebral tumour ..	623
- temporoparietal, discharge through ear ..	470
- unilateral headache in ..	326
- vertigo due to ..	828
- vomiting in ..	341, 547, 651, 686, 844, 847
- of chest wall ..	194
- simulated by empyema ..	193
- cholecystic (see Gall-bladder, Empyema of)	
- femoral, femoral swelling due to ..	732
- gas-containing, from bacillus coli ..	578
- in subphrenic abscess ..	501, 578, 712, 720, 721
- in heart, from periostitis ..	650
- hepatic, amœba coli in wall ..	279, 704
- amœbic, absence of amœbæ in pus of ..	704
- dysentery with ..	279
- anaemia in ..	39
- "anchovy sauce" sputum from ..	176, 323, 704
- bursting through lung ..	323, 409, 704
- "chocolate and milk" appearance of pus in ..	279
- compression of lung caused by ..	667
- diagnosis from active congestion of liver ..	371, 407
- enlarged gall-bladder ..	278, 279
- hydatid disease ..	415
- dome-shaped dullness at right base of lung in ..	324
- empyema from ..	120
- enlargement of liver from ..	408, 651

Abscess, hepatic, contd.

- exercise, insufficient, in etiology of ..	371
- exploration in ..	279
- following dysentery ..	323, 651, 704
- fullness, sense of, from ..	371
- gumma, growth, or cyst preceding ..	279
- hæmoptysis from ..	317, 323
- history of residence in tropics in ..	704
- infection through hepatic artery causing ..	369
- jaundice in ..	362, 366, 371, 651
- with enlarged liver in ..	363
- large single ..	369
- age incidence of ..	408
- from extension from neighbouring suppurative ..	408
- injury to liver ..	408
- non-dysenteric intestinal ulceration ..	408
- race incidence of ..	408
- specific fevers a very rare cause of ..	408
- from suppuration round a gall-stone ..	408
- of a hydatid ..	408
- leucocytosis with ..	279, 369, 400, 402
- malaise from ..	651
- multiple ..	369, 372
- absence of enlarged liver in ..	408
- jaundice with ..	372
- patula of infection in ..	369
- suppurative cholangitis causing ..	369
- pyelephlebitis causing ..	369
- nausea in ..	371
- pain in axilla from ..	651
- chest from ..	779
- epigastrium in ..	486
- hypochochondrium from ..	499, 651
- shoulder from ..	651
- pleurisy from ..	123
- with effusion from ..	651
- peritonitis from ..	644
- pointing in chest-wall ..	478
- polymorphonuclear leucocytosis in ..	369
- from pyelephlebitis ..	649
- pyrexia from ..	324, 362, 651
- redness and swelling of hypochochondrium from ..	715
- relative leucocyte count in diagnosis from malaria ..	402
- residence in tropics in etiology of ..	371, 407
- rigors from ..	324, 362, 648, 651
- rupture through diaphragm, abundant sputum in ..	704
- into intestine ..	409
- lung, foul taste from ..	774
- sputum not usually foul in ..	704
- stomach ..	409
- simulated by phantom tumour ..	721
- by subphrenic abscess ..	723
- simulating axillary abscess ..	779
- empyema ..	119, 779
- large gall-bladder ..	278
- situation of ..	722
- skodaic resonance due to ..	667
- sterile pus in ..	323
- subphrenic abscess from ..	501
- sweating from ..	651
- swelling of chest wall from ..	194
- tenderness from ..	651
- in chest from ..	779

Abscess, hepatic, contd.

-- tropical ..	369
-- absence of bile in urine ..	369
-- in ..	369
-- albuminuria in ..	409
-- ameba dysenteriae in ..	369, 408
-- in lining wall of liver ..	408
-- pus from ..	408
-- anaemia in ..	408
-- "anchovy-paste" pus in ..	408
-- bacteria in pus from ..	408
-- bronchitis secondary to ..	409
-- bulging of ribs in ..	409
-- chest measurement ..	
-- increased on affected side in ..	409
-- common site of ..	408
-- diagnosis from malaria ..	369, 408
-- difficulty of diagnosis in chronic cases ..	409
-- dome-shaped area of dullness above liver in ..	409
-- emaciation in ..	369
-- empyema secondary to ..	409
-- extension upwards between layers of coronary ligament ..	409
-- fluctuating swelling in epigastrium in ..	369
-- fluctuation excessively rare in ..	409
-- gangrene of lung secondary to ..	409
-- history of dysentery in ..	369
-- icteroid tinge of conjunctivæ in ..	369
-- jaundice in ..	408
-- not common ..	369
-- leucocytosis absent in ..	408
-- liver enlarged in ..	408, 409
-- mistaken for recurrent attacks of influenza ..	408
-- obliteration of intercostal spaces in ..	409
-- occasional good health in spite of ..	408
-- leucocytosis in ..	369, 408
-- yellow colour of pus in ..	408
-- oedema and redness over ..	409
-- pain in right hypochondrium in ..	369
-- on jarring patient in ..	409
-- in left shoulder in ..	409
-- right shoulder in ..	369, 409
-- palpability ..	409
-- pleurisy secondary to ..	409
-- pneumonia secondary to ..	409
-- profuse sweats in ..	369, 408
-- pulse rapid in ..	369, 408
-- pus sterile in long-standing ..	408
-- pyrexia in ..	369, 408
-- rigidity of rectus over ..	409
-- rigors in ..	369, 408
-- rupture into lung ..	369
-- simulating empyema ..	369
-- enlarged gall-bladder ..	369
-- severe prostration in ..	369
-- tenderness in hepatic area in ..	409
-- thirst, anorexia in febrile stage of ..	409
-- tongue dry, furred in ..	369, 409
-- urine scanty and high-coloured in ..	409
-- variability of pain in ..	409
-- vomiting in ..	369
-- wasting in ..	408
-- x-rays in diagnosis of ..	409

Abscess, hepatic, contd.

-- upward enlargement of liver in ..	406
-- value of leucocyte count in diagnosis of malaria from ..	401
-- vomiting in ..	371
-- wasting with ..	69
-- iliac, diagnosis from psoas abscess ..	739
-- limping gait in ..	739
-- pyuria from ..	624, 632
-- rupture into bladder ..	631, 632
-- spinal caries with ..	632
-- swelling in iliac fossa in ..	632
-- inguinal, causes of ..	739
-- ischiorectal, felt per rectum ..	638
-- from foreign body ..	635
-- of kidney (see Abscess, Renal) ..	
-- lachrymal, epiphora from ..	250
-- of lung, embolic ..	649
-- foul breath in ..	99
-- leucocytosis in ..	400
-- pleurisy with ..	649
-- rapid breathing from ..	649
-- signs of bronchitis with ..	649
-- simulating empyema ..	119
-- stinking sputum in ..	176
-- mammary ..	744
-- purulent discharge from nipple in ..	202
-- tuberculous, absence of cocci in pus in ..	744
-- diagnosis from carcinoma ..	744
-- enlarged axillary gland in ..	744
-- fever in ..	744
-- long duration of ..	744
-- microscopic section of wall in diagnosis of ..	744
-- pain slight in ..	744
-- mastoid, discharge through auditory meatus ..	470
-- from otitis media ..	98
-- pain in the ear from ..	230
-- tachycardia in ..	98
-- mediastinal (see Mediastinitis, Acute) ..	
-- miliary in new-born ..	601
-- myocardial ..	241
-- omental, from perforative gastric ulcer ..	724
-- orbital, producing diplopia ..	200
-- ovarian, pyrexia due to ..	621
-- parametric, felt per rectum ..	638
-- femoral swelling from ..	734
-- pelvic, acute onset of ..	760
-- bearing-down pain in ..	474
-- bulging into posterior fornix ..	760
-- into rectum ..	760
-- diagnosis from cellulitis ..	760
-- fixation of uterus by ..	760
-- hæmaturia from ..	305, 613
-- in hip disease ..	739
-- intraperitoneal ..	760
-- mucus per rectum in ..	474
-- pelvic swelling due to ..	757, 760
-- from puerperal septic infections ..	760
-- pus in stools from ..	601
-- pyuria from ..	624, 632
-- rupture into bladder ..	624, 631, 632
-- into rectum ..	760
-- due to salpingo-oöphoritis ..	760
-- septicæmia from ..	611
-- signs of local peritonitis in ..	760
-- tenderness in the back from ..	785, 786
-- pericolic, swelling in right lumbar region from ..	727
-- perigastric, inflammation ..	
-- round umbilicus with ..	716

Abscess, perigastric, contd.

-- pus in the stools from ..	601
-- perinephric ..	499
-- abscess of liver from extension from ..	408
-- acute general symptoms in ..	392
-- diagnosis from renal tumour ..	391
-- fluctuation in ..	392
-- oedema of skin over ..	392
-- pain in ..	392
-- the left hypochondrium in ..	499
-- lumbar region in ..	500
-- right hypochondrium caused by ..	500
-- prominence in loin in ..	391, 392
-- pus in the stools from rupture of ..	601
-- recurring rigors in ..	648
-- renal tumour in ..	500
-- temperature in ..	392
-- tenderness in the back from ..	785, 786
-- thickening of skin over ..	392
-- periosteal (see Abscess of Bone) ..	
-- perirectal, acute peritonitis from ..	55
-- peri-urethral, oedema and fluctuation in ..	767
-- scrotal swelling due to ..	767
-- tenderness in ..	767
-- urinary fistula from ..	442
-- popliteal ..	
-- communicated pulsation in ..	762
-- flexion of knee in ..	762
-- from necrosis of femur ..	762
-- painful swelling due to ..	761, 762
-- raising of pulse and temperature in ..	732
-- suppurating lymph glands ..	762
-- from tuberculous knee ..	762
-- post-pharyngeal, age-incidence of ..	673, 707
-- digital diagnosis of ..	707
-- dysphagia from ..	225
-- obstruction to larynx by ..	710
-- orthopnea from ..	465
-- stertor from ..	707
-- stridor from ..	710
-- prostatic ..	510
-- acute peritonitis from ..	55
-- difficulty of micturition in ..	511, 631
-- felt per rectum ..	632, 638, 678
-- frequency of micturition in ..	511
-- gonorrhœal ..	631
-- hæmaturia due to ..	632
-- from instrumentation ..	631, 678
-- pain in penis ..	510, 511, 513, 515
-- perineum in ..	516
-- painful erections with ..	515
-- perineal sinus from ..	678
-- from posterior urethritis ..	678
-- prostate felt per rectum to be inflamed in ..	678
-- from prostatic calculus ..	632
-- pyrexia with ..	207, 511
-- pyuria caused by rupture of ..	624, 632
-- recent urethral infection in ..	678
-- retention of urine in ..	207, 631
-- rigors from ..	207, 631, 648
-- rupture into bladder ..	631, 632
-- rectum ..	631
-- urethra ..	631, 632
-- septic arthritis from ..	675
-- sequela of gonorrhœa ..	515
-- septic urethritis ..	515
-- soft area in enlarged inflamed gland on rectal examination in ..	511
-- fluctuating area with ..	207
-- tuberculous ..	632

Abscess, prostatic, contd.

-- urethral passage of faeces from ..	264
-- from urethritis ..	631, 678
-- venereal infection ..	631
-- psoas, anæmia in ..	39
-- causing swelling in iliac fossa ..	733
-- diagnosis from femoral hernia ..	739
-- iliac abscess ..	739
-- dullness on percussion over ..	739
-- extending under Poupert's ligament ..	733
-- in Scarpa's triangle ..	733
-- femoral swelling due to ..	733
-- fluctuation in ..	733, 739
-- impulse on coughing in ..	732, 733, 739
-- kyphosis with ..	733
-- lardaceous disease from ..	414
-- pointing over vertebrae ..	785
-- position external to femoral vessels ..	739
-- pus in the stools from rupture of ..	601
-- pyuria from rupture into bladder ..	624, 632
-- reducibility ..	739
-- rigidity of spine in ..	733, 739
-- rupture into bladder ..	631, 632
-- ureter ..	632
-- simulated by distended ilio-psoas bursa ..	734
-- femoral hernia ..	733
-- saphena varix ..	733
-- in spinal caries ..	564, 632, 739, 785
-- swelling of chest wall from ..	194
-- iliac fossa ..	632
-- inguinal region ..	632, 739
-- right iliac fossa from ..	730
-- tenderness of spine in ..	739, 785
-- tuberculous ..	564
-- rectal, characters of, as felt per rectum ..	635
-- foreign body causing ..	635
-- rectal tenderness from ..	635
-- renal, from infarct ..	625
-- infective peritonitis from ..	644
-- injury to kidney ..	625
-- leucocytosis with ..	400
-- palpable tumour due to ..	391
-- polyuria in ..	626
-- pyelonephritis ..	625
-- pyuria in ..	623, 625
-- from renal calculus ..	309
-- tuberculous ..	394
-- urine normal in localized cortical ..	626
-- retropharyngeal ..	673
-- cyanosis from ..	185
-- diagnosis of ..	465
-- by digital examination ..	466
-- in spinal caries ..	673
-- extreme dyspnoea from ..	642
-- laryngeal obstruction from ..	642
-- orthopnoea in ..	465
-- retraction of head from ..	642
-- simulating meningitis ..	642
-- sore throat from ..	670
-- tenderness in back from ..	786
-- the spine in ..	785
-- scrotal ..	767
-- fistula from ..	679
-- from peri-urethral abscess ..	679, 767
-- due to stricture ..	679
-- tuberculous epididymis ..	767
-- due to urethritis ..	679
-- spinal, tenderness in back from ..	786
-- splenic, exceedingly rare ..	692
-- peritonitis from ..	644

Abscess, contd.

-- subcutaneous, leucocytosis with ..	400
-- in pyæmia ..	649
-- subdiaphragmatic (see Abscess, Subphrenic)	
-- submammary, from tuberculosis of ribs ..	744
-- post-typoidal periostitis of ribs ..	744
-- submaxillary ..	419
-- sub-periosteal (see Abscess of Bone)	
-- subphrenic :	
-- abdominal swelling from ..	715
-- not moving with respiration in ..	501
-- affecting umbilicus ..	716
-- air in ..	712
-- apparent upward extension of liver dullness in ..	406
-- from appendicitis 119, 720, 721	
-- B. coli causing gas in ..	711
-- bulging of epigastrium from ..	720
-- hypochondrium from ..	720
-- from carcinoma of colon ..	578
-- of duodenum ..	578
-- of stomach ..	578
-- causing pleurisy ..	122
-- coin-sound on percussion over ..	501
-- commoner on left side ..	721
-- communicating with duodenal or gastric ulcer ..	712
-- with duodenum ..	711
-- with stomach ..	711
-- compressing lung 324, 667, 721	
-- constitutional disturbances 720	
-- diaphragm pushed up by ..	721
-- displacing heart upwards ..	712, 721
-- due to duodenal ulcer 578, 720, 721	
-- empyema from ..	120
-- complicating ..	720
-- exploring needle only to be used immediately before operation in ..	501
-- from Fallopian tube lesions 720	
-- fibroid lung and bronchiectasis from ..	324
-- foul taste from ..	774
-- gas-containing 501, 578, 720, 721	
-- from gastric ulcer 119, 721, 578, 720	
-- general account of 501, 720	
-- history of appendicitis in ..	501
-- duodenal ulcer in ..	501
-- gastric ulcer in ..	501
-- due to hydatid cyst ..	721
-- immobilizing diaphragm ..	721
-- from intestinal obstruction ..	721
-- from kidney lesions ..	720
-- laparotomy in diagnosis of ..	501
-- leucocytosis with 501, 720, 721	
-- liver not pushed down in ..	501
-- onset of pain in ..	501
-- opening into pericardium ..	711
-- pain in left hypochondrium in ..	499
-- right hypochondrium in ..	501
-- from pancreatic lesions ..	720
-- physical signs of ..	720, 721
-- pleurisy above ..	122, 501
-- secondary to ..	720, 721
-- pneumothorax from ..	577, 578
-- pyrexia with 501, 720, 721	
-- rapid pulse with ..	720, 721
-- rigors with ..	648, 721
-- rupture into lung ..	774
-- septic aspect with ..	720
-- sex incidence of ..	721
-- shifting of level of fluid in ..	721
-- shortness of breath with ..	721

Abscess, subphrenic, contd.

-- simulating empyema ..	119
-- hepatic abscess ..	723
-- hydropneumothorax ..	712
-- pneumothorax ..	721
-- skodaic resonance due to ..	667
-- from splenic lesions ..	720
-- succussion sounds in ..	711
-- from suppuration in liver ..	720
-- swelling of chest wall from ..	194
-- tenderness in back from ..	786
-- of epigastrium from ..	720
-- hypochondrium from ..	720
-- in the spine from ..	785
-- tympanitic note over ..	501
-- x-rays in diagnosing ..	501, 578, 712, 721
-- testicular	
-- acute pain in testicle from ..	380
-- affection of epididymis first in urethral cases ..	680
-- diagnosis from gumma ..	680
-- tuberculosis of testis ..	680
-- due to epididymo-orchitis ..	518
-- gonorrhoeal ..	680
-- hæmatogenous ..	680
-- from instrumentation ..	680
-- metastatic ..	680
-- in mumps ..	680
-- pyrexia and rigors in ..	680
-- in scarlet fever ..	680
-- scrotal sinus from ..	680
-- sores from ..	679, 680
-- swelling of testis in ..	518
-- from torsio testis ..	680
-- in typhoid fever ..	680
-- from urethritis ..	518, 679
-- thyroid, in pyæmia ..	792
-- urethral, pain in perineum in ..	516
Absinthe, coma due to ..	137
-- palpitation due to ..	525, 527
-- tremor from ..	795, 797
Academy headache ..	329
Acanthosis nigricans, sore fingers from ..	266
-- relation to prurigo ferox ..	531
Acarus, pruritus caused by ..	588
Accentuated heart sounds (see Heart Sounds, Accentuated)	
Accessorius, nerve supply of ..	542
Accessory rib (see Rib, Cervical)	
-- sinus dilatation, unilateral exophthalmos in ..	254, 255
-- inflammation, polyply with ..	255
-- suppuration, cavernous sinus thrombosis due to ..	253
-- earache from ..	230
Accommodation, paralysis of, after diphtheria ..	77
-- in disseminated sclerosis ..	838
ACCOUCHEUR'S HAND (Fig. 1) 3	
-- in tetany ..	178
Acetabulum, osteo-arthritis ..	734
Acetic acid in gastric juice ..	333
-- test for albuminuria ..	5
-- phosphaturia ..	208, 574
ACETONURIA, CAUSES OF ..	4
-- in cyclical vomiting of infants ..	426, 843
-- in diabetes ..	292, 583
Achillis-jerk (see Ankle-jerk)	
-- in locomotor ataxy ..	562
Aching in loin from vesical carcinoma (and see Pain in Loin)	
-- carcinoma coli ..	630
-- hypernephroma ..	393
-- kidney tumour ..	307, 395
-- polycystic kidneys ..	396
-- pyelitis ..	625
-- renal calculus ..	627
-- tuberculosis ..	626
-- in testis in tuberculous disease ..	519
Acholuric jaundice ..	361, 372

- Achondroplasia**, bowed legs in 212
 - bridge of nose depressed in 212
 - bulging forehead in 212
 - distinguished from rickets 214
 - dwarfism due to (*Fig. 64*) 212
 - enlargement of bones in 214
 - lordosis in 212
 - prominent joints in 212
 - shape of fingers in 212
 - short lower limbs characteristic in 212, 214
 - small contracted pelvis in 212
 - strong muscular power in 212
Achorion schönleini in favus 270
Achylia with diarrhoea 196
 - in functional dyspepsia 354
Acid dyspepsia (see *Dyspepsia*)
 - faeces in pancreatitis 117
Acidity of urine, effect of phosphates in 572
 - in general bacterial affections 83
Acidosis 4
 - in cyclical vomiting of children 426, 843
Acids, strong, gangrene from 282
 - oesophageal stenosis from 222
 - reduced total, in gastritis 352
 - sore throat from 671
 - of stomach contents, test for 355
 - stomatitis from 815
Acne rosacea in alcoholism 59, 368, 797
 - association of phlyctenular ulceration of cornea with 806
 - causes of 268
 - in cirrhosis of liver 368
 - diagnosis from *A. vulgaris* 268, 531
 - granulosus rubra nasi 714
 - lupus erythematosus 268
 - seborrhoeic eczema 268
 - tertiary syphilides 268
 - leprous nodules simulating 450
 - permanent flushing in 268
 - skin changes in 268
 - **vulgaris**, absence of cachexia with 604
 - age-incidence of 531, 603
 - in bromidism 112
 - chronic nature of eruption 604
 - comedones in 604, 609
 - convex shape of pustule in 601
 - diagnosis from acne rosacea 268, 531
 - from large acuminate syphilide 604
 - drug eruptions 603
 - pustular syphilides 603
 - small-pox 603, 609
 - syccosis vulgaris 603
 - distribution of 531, 604, 609
 - in iodism 112
 - the lesions of 530
 - papules of 528, 530
 - pustules in 603
 - septicaemia from 698
 - simulated by xanthoma diabeticorum 805
 - tenderness of scalp from 780, 781
 - spine from 784
Aconite, ptyalism due to 590
Acromegaly (*Fig. 88*) 753
 - abnormal growth of subcutaneous tissue in 262
 - amenorrhoea in 23
 - bony changes of 263
 - bulky tongue in 263
 - changes in face in (*Fig. 88*) 262, 263, 391, 749
 - diagnosis from leontiasis ossea 749
 - osteo-arthritis 391
 - enlarged bones of hands, feet, and head in 262, 391, 585, 749, 753
Acromegaly, contd.
 - enlarged fingers in 128
 - lower jaw in 263, 749, 752
 - pituitary body in 335, 585, 749
 - ridges of insertion of muscles and ligaments in 753
 - superciliary ridges in 749, 753
 - headache in 749
 - hemianopia in (*Fig. 102*) 335, 749
 - irritability in 360
 - muscular debility in 749
 - periosteal thickening in 753
 - polyuria in 583, 585
 - teeth in 263
 - x-rays in diagnosis of 585
Acroparesthesia:
 - age and sex incidence of 493
 - in alcoholism 493
 - becoming worse in bed 493
 - definition of 493
 - of hands and feet 493
 - occupation incidence of 493
 - in paroxysmal tachycardia 772
Actinomyces (*Plate XII, Fig. 8, p. 696*) 810
 - characters of pus due to 736
 - Gram-staining 736
 - microscopical recognition of 736
 - relation to barley 705
 - cotton 705
Actinomycosis, bleeding gums from 86, 88
 - of cæcum and appendix 736
 - distinction from mycetoma 810
 - hæmoptysis from 705
 - of jaw 88, 748, 810
 - with carious teeth 748
 - cellulitis of neck in 748
 - diagnosis from abscess 748
 - sinuses from 748
 - liver, rarity of 415
 - local enlargement from 415
 - ray fungus in pus in (*Plate XII, Fig. 8, p. 696*) 415
 - "sulphur granules" in 415, 748
 - trabeculate abscess from 415
 - of lung 322
 - hæmoptysis in 317, 705
 - mycelium in pus in 415, 748
 - simulating spinal caries 786
 - sites of election in 810
 - in tailors and seamstresses 705
 - "Acute abdomen" in acute pancreatitis 431
Acute nephritis (see *Bright's Disease, Acute; and Nephritis*)
 - poliomyelitis (see *Poliomyelitis, Acute*)
 - rheumatism (see *Rheumatism*)
 - yellow atrophy of liver (see *Liver, Acute Yellow Atrophy of*)
Adamson, re Jacquet's erythema 446
 - re pemphigus neonatorum 446
 - re seborrhoeic dermatitis of infants 446
Addison's anaemia (see *Pernicious Anaemia*)
 - disease, amenorrhoea in 23
 - arsenical poisoning simulating 38
 - asthenia in 38, 843, 849
 - bronzing of skin in 574
 - cancer of one capsule not causing 367
 - coma in 136
 - eosinophilia in 38, 248
 - gastric attacks in 849
 - headache in 329
 - hypothermia in 345
 - loss of weight in 849
 - low blood-pressure in 96, 329, 843, 849
Addison's disease, contd.
 - not produced by unilateral suprarenal disease 690
 - periodic acute diarrhoea in 196
 - pigmentation of skin and buccal mucosa in 843, 849
 - simulated by exophthalmic goitre 792
 - syncope in 38, 849
 - vomiting in 38, 843
Adductor brevis, nerve supply 542
 - femoris, spinal nerve root supplying 543
 - longus, nerve supply of 542
 - tendon, ossification of 763
 - magnus, nerve supply of 542
 - obliquus hallucis, nerve supply of 542
 - pollicis, nerve supply of 550
 - paralysis of 127
 - transversus hallucis, nerve supply of 542
 - pollicis, nerve supply of 550
Adenin bases, uric acid from 817
Adenitis, acute cervical (see *Lymphatic Glands, Cervical*)
Adenoids, anosmia from 668
 - a cause of deafness 190
 - cure of enuresis by removal of 248
 - with enlarged tonsils 670
 - epistaxis due to 250, 251, 252
 - headache from 327
 - insomnia from 357
 - loss of taste due to 774, 775
 - mouth-breathing causing 672
 - night terrors due to 357, 448
 - obstruction to nose by 668
 - otitis media from 230
 - removal of, palate paralysis after 604
 - rhinitis from 240
 - snoring due to 669
 - stertor from 707
Adenoma of liver (see *Liver, Adenoma of*)
 - of prostate (see *Prostate, Adenoma of*)
Adherent pericardium (see *Pericardium, Adherent*)
Adhesions, appendicular, pain in right iliac fossa from 501
 - intestinal, in peritonitis 56
 - perigastric, influence of movement on pains due to 486
 - peritoneal, causing constipation 147
 - from gall-stones 280
 - from hernia 152
 - intestinal obstruction from 151, 152
 - jaundice from 361
 - loculation of ascites by 717
 - pleural, pain and tenderness in the back from 789
 - pneumothorax rendered partial by 577
 - in shoulder joint simulating circumflex nerve paralysis 552
Adiposis dolorosa, age and sex incidence of 478
 - alcoholism causing 455
 - congenital syphilis causing 455
 - extreme fatness in 453, 454, 455
 - hyperaesthesia in 455
 - neuralgic pain in arm in 492
 - pain in the chest from 477
 - parts affected in 455
 - symmetrical painful deposits of fat in 478
 - thyroid treatment of no effect in 455
Adolescence, albuminuria of 19
 - erythema nodosum in 450
 - rounded spine of 183

Adrenal rests	395	<i>Age incidence of disease, contd.</i>	
-- causing nephroma	307	-- Henoch's purpura	90, 380, 600, 846
-- in kidney, hypernephroma ..	690	-- hereditary optic atrophy ..	838
-- in pathogenesis of malignant renal tumours ..	395	-- of high blood-pressure ..	96
Adrenalin in cystoscopy ..	680	-- Hirschsprung's disease ..	152, 718
-- irrigation of bladder with ..	307	-- Huntington's chorea ..	156
Ægophony in pleural effusion ..	193, 332	-- hysteria	710
Äerophagia	267	-- ichthyosis	530
Africa, bilharzia in	313	-- insomnia	356, 359
"After-pains" of labour ..	509	-- intermittent hydrarthrosis ..	387
Agar-agar in constipation ..	143	-- intussusception	636, 736
Age incidence of disease:		-- iodide and bromide eruptions	603
-- of acne	268, 531, 603	-- jaundice	362, 363, 365
-- acne rosacea	268	-- joint pains of acute rheumatism	507
-- acquired spastic paralysis ..	155	-- keratomalacia	807
-- acroparesthesia	493	-- kraurosis vulvæ	770
-- acute intestinal obstruction	151	-- leukoplakia of vulva ..	770
-- mastitis	743	-- lichen scrofulosorum ..	529
-- yellow atrophy	302	-- Little's disease	154
-- adiposis dolorosa	478	-- lupus erythematosus ..	449, 781
-- aneurysm	223, 786	-- vulgaris	449, 808, 812
-- angina pectoris	482	-- lymphangioma circumscriptum	833
-- anorexia nervosa	849	-- macular choroiditis ..	462

-- von Jaksch's disease ..	694
-- xeroderma pigmentosum ..	804
-- in diagnosis of systolic bruits ..	103
-- influence on heart sounds ..	1
-- on child-bearing	707
-- on size of pupil	594
Agustia (see Taste, Loss of) ..	774
Agglutination reaction (see Serum Reaction; and Widal's Test)	
Agaphia , definition of ..	685
-- hemiplegia with	685
-- lesions producing	685
Ague (see Malaria)	34, 371
"Ague-cake" spleen	693
Air-swallowing	267
-- borborygmi due to	97
Alar chest in phthisis	191
Albinism , diagnosis from leucoderma	575
-- hemeralopia in	841
-- nystagmus in	453
-- photophobia in	574
Albumin in serous discharge in chronic otitis media ..	468
ALBUMINURIA	5
-- from abdominal aneurysm ..	8
-- accidental	19
-- with albumosuria	20
-- from arteriosclerosis ..	1, 8
-- with bacilluria ..	83, 84, 576, 615, 848
-- boiling test for, nucleoprotein fallacy of	471, 472
-- phosphate fallacy of ..	574
-- from burns and scalds ..	16
-- in cerebral hæmorrhage ..	98, 138, 337, 563
-- cerebrospinal fluid in meningitis	643
-- chronic alcoholism	16
-- bronchitis and emphysema	246
-- laryngeal paralysis	539
-- peritonitis	56
-- pyuria	623
-- with chyluria	126
-- in cirrhosis of the liver ..	16
-- contracted granular kidney ..	14
-- after convulsions	169, 172
-- from corrosive poisoning ..	297
-- cystic kidneys	8, 396
-- in cystitis	628
-- diabetes mellitus	16
-- diphtheritic	13
-- disproportionate to the amount of pus in, in pyelitis and pyelonephritis ..	628
-- in eclampsia	647
-- from enlarged prostate ..	8, 16
-- with epistaxis	251
-- in exophthalmic goitre ..	16
-- febrile	17
-- and Fehling's test	290
-- in fungating endocarditis ..	237
-- gonorrhœa	16
-- gout	16
-- hæmaturia	306
-- with heart failure	61
-- high blood-pressure	252, 526
-- from invasion of kidney by malignant growth of colon ..	393

Albuminuria, contd.

- lardaceous disease	39, 197, 414, 696
- lead poisoning	16, 38, 77
- lymphadenoma	17
- medullary softening	343
- mercurialism	16
- mitral regurgitation	239
- morphinism	16
- from movable kidney	8
- in mumps	16
- myocardial affections	18
- nephritis (Bright's Disease)	1, 13, 63, 303, 331, 454, 466
- after nocturnal emission	19
- with oedema	457
- from ovarian cyst	8
- pelvic tumours	8
- physiological	19
- effect of calcium on	19
- polyuria in	584
- with pleural effusion	121, 122
- pneumonic	13
- polyuria with causes of	584
- in portal obstruction	300
- pregnancy	8
- prolonged, cachexia from	115
- in pyelitis	625
- pyelonephritis	626
- rareness in chlorosis	41
- from renal calculus	8, 16
- embolism	237
- enlargement	689
- tuberculosis	8, 16, 810, 626
- tumour	16, 367
- repeated pregnancies	16
- retinitis (see Retinitis)	
- with tube-casts	8
- -- and with pus	15
- -- without pus	8
- scarlatinal	13, 674
- in secondary syphilis	16, 371
- shortness of breath with	101
- slight with coli bacilluria	576
- in snake-bite	458
- from stricture of the urethra	8, 16
- suppurative nephritis	646
- syphilitic	13, 86
- in thrombosis of inferior vena cava	61, 825
- treatment by rosanilin	820
- with tropical abscess of liver	409
- without tube-casts	16
- with uræmia	329, 350, 464, 647
- from uterine fibromyomata	8
- prolapse	8
- in vasomotor neuroses	16
- vertigo with	829
- in yellow fever	301, 373
- Albuminuric retinitis (see Retinitis)	
- Albumoses, a source of fallacy in test for albumin	6
ALBUMOSURIA with albuminuria	20
- Pence-Jones	21
- in Bright's disease	12, 20
- hematogenous	20
- in malignant disease of bones	21
- pyrogenic	20
- tests for	20, 21
Alcoholism	
- acne rosacea from	268, 797
- acroparæsthesia from	493
- active congestion of liver from	371, 407
- acute, Babinski's sign in	82
- subnormal temperature in	344
- adiposis dolorosa from	455
- albuminuria in	16
- amenorrhœa from	23
- anorexia in	238, 243
- aortic aneurysm in	538, 564
- disease from	236, 237, 238
- arteriosclerosis from	238

Alcoholism, contd.

- ataxy from	66
- brachial neuralgia in	492
- in bronzed diabetes	575
- central scotoma from	836, 837
- cirrhosis of liver from	59, 309, 368, 409, 599
- colic from	136
- colour blindness from	836, 837
- coma due to	137, 344, 346
- convulsions in	169, 172
- cramps in	78, 179, 238
- delirium from	195
- Dercum's disease from	455
- diarrhœa in	197
- diminished appetite in	49
- disturbed pancreatic and hepatic functions in	292
- dwarfing of one lobe of liver in	404
- dyspepsia from	354
- dysphagia from	225
- effect on blood-pressure	238
- enlarged heart in	232, 238, 243, 245
- fatty heart from	238, 241
- liver from	414
- fibroid heart due to	238
- flushing in	268
- furred tremulous tongue in	136, 243
- and gangrene of the lung	287
- gastritis in	297, 352
- general symptoms of	300, 368
- hæmatemesis in	243, 295
- hæmorrhoidal bleeding in	243
- headache in	328
- hiccough in	342
- hippus in	595
- hypothermia from	341, 346
- infantile convulsions due to	170
- infantilism from	215
- insomnia in	358
- irritability in	360
- jaundice in	243
- Korsakow's syndrome in	25
- leucopenia in	401
- lipomatosis from	455
- and Little's disease	154
- loss of appetite in	238, 243
- weight due to	848, 849
- medullary degeneration in	225, 343
- moral deterioration from	797
- morning vomiting in	238, 243, 297, 797
- myocardial changes from	238
- nerve deafness from	191
- obesity due to	849
- optic disc changes from	836
- pachymeningitis from	563
- pains in the limbs in	78
- palpitation in	525, 527
- pancreatitis due to	116, 153
- paræsthesia from	797
- passive vacant aspect in	258
- peripheral neuritis from	66, 165, 285, 492, 505, 599
- pharyngitis in	136
- polyuria from	581, 583, 584
- priapism caused by	586
- in prognosis in pneumonia	194
- pupil reflex in	594
- purpura in	596, 599
- restlessness and insomnia in	797
- signs of	59, 797
- simulated by disseminated sclerosis	565
- by nervousness	797
- simulating new growth	849
- tuberculosis	849
- speech lost in	682
- tachycardia from	772, 773
- talipes due to	131
- temporary glycosuria in	292
- tinnitus increased by	793
- tremor in	136, 238, 258, 795, 797
- urethral stricture from	140

Alcoholism, contd.

- venous stigmata from	797
- vertigo from	827
- weakness of the limbs from	797
Alexia (Word Blindness)	684
Algidity in malaria	35
Alimentary albumosuria	20
- glycosuria, distinguished from diabetes mellitus	584
Alkali added to santonin, pink urine from	819
Alkalies , cachexia from	115
- in diabetic coma	137
- gangrene from	282
- cesophageal stenosis from	222
- sore throat from	671
- stomatitis from	815
Alkaline faeces in gall-stone obstruction	117
- urine with bacteriuria	83
- effect of phosphates in	572
Alkaptonuria , alkali test for	290, 822
- black urine from	820, 822
- due to congenital errors of metabolism	822
- dark colour of urine in	290
- darkening of urine on exposure	821, 822
- ferric chloride test for	822
- general account of	822
- homogenistic acid in	822
- hydroquinone-acetic acid in	822
- liquor potassæ test for	290, 822
- ochronosis with	575, 822
- optical inactivity in	822
- reactions with Nylander's reagent	822
- reduction of Fehling's solution in	290, 822
- relation to tyrosin and phenylalanin katabolism	822
- no safranin reaction in	822
- silver nitrate test for	822
- simulated by melanuria	822
ALLOCHEIRIA	21
- functional	22
- in tabes dorsalis	665
Alloxuric bases, uric acid derived from	817
ALOPECIA (and see Baldness)	
- areata	84
- diagnosis from favus	272
- ringworm of scalp	274
- tinea decalvans	274
- "exclamation - mark" hairs in	274
- relation to pseudopelade of Brocq	782
- cicatrizzata	85
- from head injury	80
- in syphilis	450
Altitudes, polycythæmia at high	579
Alum, extreme thirst due to	789
Alveolar abscess (see Abscess)	
- echinococcus disease (see also Hydatid Disease)	416
- sarcoma of kidney	395
Amaurosis from hæmorrhage	140
- pregnancy	839
- uræmic	836, 839
Amblyopia , causes of	836
- in disseminated sclerosis	800
- hysteria	800
AMENORRHEA , blood alterations and	24
- causes of	22
- in chlorosis	41, 303
- continued, in ectopic gestation	760
- with deficient ovarian activity	707
- double ovarian tumour	429, 691, 759
- hyperinvolution of uterine	706
- in myxœdema	429
- pregnancy	350, 437, 758, 759

America, yellow fever in ..	372
Amido-oxybutyric acid in urine ..	4
Ammonia , anæmia from ..	669
- co-efficient in urine in phosphorus poisoning ..	373
- coryza from ..	203
- olfactory neuritis from ..	669
- poisoning by ..	674
- sore throat from ..	671
- varying amounts of, in urine ..	574

- sciatica ..	487
- due to spinal hæmorrhage ..	787
- from transverse cord lesions ..	164
- in transverse myelitis ..	484
- trigeminal neuralgia ..	496
- ulnar paralysis ..	128
Anæsthetics , acetoneuria after ..	4
- coma due to ..	137, 346
- deaths from lymphatism under ..	423
- delirium from ..	195
- in determining cause of dystocia ..	228

Anæsthetics, contd.

- in diagnosis of abdominal aneurysm ..	786
- congenital abnormality of genital organs ..	705
- hysterical joint ..	389
- spasm ..	133
- pancreatic swellings ..	724
- phantom tumour ..	53, 721
- disappearance of phantom tumour under ..	761
- general, Babinski's sign in ..	82
- hypothermia from ..	346
- vomiting from ..	843
- Anal fissure (see Anus, Fissure of)	
- fistula (see Anus, Fistula of)	
- prolapse, hæmorrhoid in ..	93
- sphincter (see Sphincter Ani)	
- ulcer ..	636

Analgesia from cord lesions ..	662
- from cervical rib ..	128
- definition of superficial and deep ..	660
- from lesion of the medulla ..	666
- peripheral nerve lesions ..	662
- in syringomyelia (<i>Fig.</i> 182) ..	665
- tabes dorsalis (<i>Fig.</i> 183) ..	498, 507, 562, 662, 664, 665

Anangioplastia (<i>Fig.</i> 66) ..	215, 216
Anarthria ..	685

Anasarca (see Ascites, Oedema)	
"Anchovy-sauce" pus in tropical abscess of liver ..	408
- sputum ..	176, 323
Anconeus, nerve supply of ..	550

Aneurysm, abdominal aortic

- absence of pulsation in ..	764
- albuminuria from ..	8
- anæsthetic in diagnosis of ..	786
- blanching due to ..	692
- diagnosis from undue aortic pulsation 592, 728, 764 ..	
- erosion of vertebrae by ..	728
- expansile pulsation with ..	299, 486, 786
- from embolism ..	368
- hæmatemesis from ..	294, 299
- hæmatoma due to ..	692
- jaundice from ..	368
- leakage from ..	692, 728
- pain in abdomen from ..	299, 368, 692
- back from ..	299, 486, 728
- epigastrium from ..	486, 646
- rarity of ..	592, 728
- rupture into stomach ..	299
- sex incidence of ..	728
- simulating peritonitis ..	646
- indigestion ..	351
- syphilitic history in ..	300, 486, 728
- systolic bruit over ..	368
- x-rays in diagnosis of (and see X-rays) ..	486

Arterio-venous of orbit ..

- exophthalmos due to ..	254, 255
- loud murmur with ..	255
- pulsation of eye with ..	255
axillary, due to embolism ..	732
- due to injury ..	732
- unequal radial pulses from carotid, unequal pupils in ..	732, 595
- pulsation in exophthalmic goitre ..	244

cerebral, acute ..

- convulsions from ..	172
- diabetes insipidus in ..	585
- due to embolism ..	699
- headache from ..	327, 328
- sensations in head from ..	328
- of celiac axis artery ..	368
- abdominal pain from ..	368
- jaundice in ..	368
cirroid (<i>Plate XIV</i>) ..	764

Aneurysm, contd.

- external iliac, bruit over ..	741
- decreased by compressing common iliac ..	741
- delayed femoral pulse in ..	741
- diagnosis from psoas bursa ..	741
- sarcoma of pelvis in ..	741
- expansile pulsation in ..	741
- iliac swelling due to ..	735
- inguinal swelling due to ..	741
- x-rays in diagnosis of ..	741
femoral, femoral swelling due to ..	732
- gangrene from ..	282, 287
- of lung in ..	288
- of heart from syphilis ..	241
- systolic bruit in ..	102
- hepatic, ascites with ..	59
- from embolism ..	59, 368
- jaundice with ..	59, 362, 368
- innominate, x-rays in diagnosis of (<i>Fig.</i> 131) ..	483
- of internal carotid artery, erosion from chronic tympanic suppuration ..	468
- internal iliac, felt per rectum ..	638
popliteal (<i>Plate XIII</i>) ..	762
- bruit over ..	762
- compression of femoral artery in diagnosing ..	762
- delayed tibial pulse from ..	762
- diagnosis from sarcoma ..	762
- expansile pulsation in ..	762
- gangrene from ..	287
- oedema of leg from ..	456
- pain in leg from ..	762
- swelling due to ..	761
- varicose veins from ..	762
- x-rays in diagnosis of ..	762
- pulmonary, in phthisis ..	318, 319
- rarity of tuberculous focus in ..	786
subclavian, causing oedema of arm ..	456
- osteo-arthritis in ..	391
- simulating brachial neuritis ..	492
thoracic aortic :	
- absence of bruits over ..	476
- pain with ..	482
- age incidence of ..	223, 538, 786
- alcohol in etiology ..	538
- angina pectoris in ..	482, 778
- aortic regurgitation from ..	107, 235, 238
- apical râles from ..	322
- blood per anum from ..	90
- bronchiectasis from ..	324
- carotid pulses unequal with ..	236
- chest-wall bulged by ..	193, 235
- clubbed fingers from ..	128
- collapse from rupture of ..	482
- of lung due to ..	482
- coma from ..	137, 140
- compression of bronchi by ..	236, 322, 324, 482
- cord by ..	561
- heart by ..	482
- œsophagus by ..	222, 296, 474, 482, 841
- phrenic nerve by ..	482
- superior vena cava by ..	234, 236, 461, 746, 826
- of trachea by ..	465, 482, 710
- of vagus nerve by ..	482, 772
- confusion with phthisis ..	322
- cough due to ..	175, 176
- danger with bougie ..	222
- diagnosis from carcinoma of œsophagus ..	296
- dyspepsia ..	476
- enlarged bronchial glands ..	422
- mediastinal growth ..	296, 483

Aneurysm, thoracic aortic, contd.

- diagnosis from prominent subclavian artery ..	764
- dissecting, anginal pain on formation of ..	482
- dullness over ..	790
- dysphagia from ..	222, 482
- ear in detecting pulsation in ..	764
- embolism from ..	286
- erosion of rib cartilages by ..	482
- sternum by ..	194, 482
- vertebrae by ..	476, 482, 784, 848
- fusiform ..	238
- gangrene of fingers from ..	287
- girdle pain in ..	482
- hæmatemesis from ..	294, 296
- hæmoptysis from ..	176, 317, 318, 322
- hard work in etiology of ..	300, 538
- heart displaced by ..	330
- impaired resonance from ..	322
- insomnia due to ..	848
- loss of weight from ..	479, 848
- mistaken for asthma ..	582
- hysteria ..	777
- intercostal neuralgia ..	478, 777
- mode of production of pain in ..	482
- muscle atrophy in arm from ..	74
- neoplasm simulated by ..	185, 848
- oedema from ..	453
- of face, neck, and arms from ..	456, 458, 461
- orthopnea from ..	465, 467
- pain in abdomen from ..	646
- back from ..	222, 296, 322, 474, 475, 476, 482, 789
- chest due to ..	478, 482, 848
- intercostal due to ..	478, 479
- in left arm from ..	494
- from pleurisy over ..	482
- palpitation from ..	526
- paralysis of vocal cord from ..	538
- paraplegia from ..	561
- preponderance in men ..	483
- pressure signs with ..	235
- pulsatile tumour from ..	235, 476, 564, 763, 790
- pulsation in back from ..	296, 475
- pulses unequal with ..	593
- pupils unequal in ..	595
- rarity apart from syphilis ..	482
rupture into air-passages ..	483
- bronchus ..	318, 322
- heart ..	482
- lung ..	318
- œsophagus ..	482
- one of the great veins ..	482
- pericardium ..	482
- peritoneum ..	482
- pleura ..	482
- spinal canal ..	482
- trachea ..	318
- severe pain in chest from rupture of ..	482
- sex incidence of ..	538, 786
- signs of descending ..	222
- simulated by spinal caries ..	786
- sites of rupture of ..	140
- slight hæmoptysis of grave import in ..	322
- stridor from ..	710
- sudden death from ..	107
- syphilis in etiology of ..	223, 296, 322, 538, 786

Aneurysm, thoracic aortic, contd.

- systolic bruit over .. 105
- tachycardia from .. 772, 773
- tenderness of the spine
 - in .. 784, 789
- thrill due to .. 790
- thrombosis in .. 286
- transverse myelitis from .. 564
- varicose chest veins
 - from .. 236, 826
- Wassermann reaction in .. 786
- x-rays in diagnosis of
 - (Fig. 74), 223, 296, 322, 422, 465, 474, 476, 582, 593, 786, 790

Angina, abdominal, benefit of

- diuretin in .. 351, 486
- vasodilators in .. 351
- diagnosis from indigestion .. 351
- flatulence in .. 351, 486
- hæmatemesis in .. 351
- induced by exertion .. 486
- paroxysmal epigastric pain
 - in .. 486
- tenesmus in .. 486
- thick peripheral vessels in .. 351
- vomiting in .. 351
- **ludovici**, bacteriology of .. 459
- dysphagia due to .. 225
- oedema of face, neck, and arms from .. 459, 461
- pytalism due to .. 590
- stomatitis with .. 590
- trismus simulated by .. 801
- maligna .. 674
- **pectoris**, from acute aortitis .. 778
- age and sex incidence of .. 482
- aortic aneurysm .. 482, 778
- disease .. 233, 237, 582, 778
- atheroma and arterio-sclerosis with .. 482, 582
- brought on by emotion .. 482, 778
- exertion .. 350, 481, 482, 778
- touch .. 778
- from coronary artery
 - sclerosis .. 778
- diagnosis of .. 482
- from indigestion .. 350
- pseudo-angina .. 482
- faintness and collapse in .. 481
- false .. 482
- fatal .. 482
- due to fibroid heart .. 241
- flatulence with .. 267, 350, 481, 779
- high blood-pressure in .. 350, 582
- from hypertrophy and dilatation of the heart .. 778
- mental anguish in .. 481
- from myocardial affections .. 18
- pain in arm and neck in
 - 350, 481, 482
- chest in .. 478, 481, 582
- from pericarditis .. 480
- polyuria after .. 481, 581, 582
- precordial tenderness from .. 778
- with progeria .. 218
- sense of impending death in .. 481
- from syphilis .. 62, 237
- varying duration of attack .. 481
- vasomotor (see Pseudo-angina)
- Vincent's (see Vincent's Angina)

Angioma of larynx, hæmoptysis

- in .. 318
- liver .. 414
- nose, epistaxis due to .. 250
- vulva .. 768

Angioneurotic oedema (Fig.

- 128.) .. 457-8
- albuminuria in .. 17
- asymmetrical .. 455
- diagnosis from urticaria .. 746
- electrical reactions in .. 634
- of face (Fig. 128, p. 458) .. 746
- hæmoglobinuria in .. 315
- legs .. 459

Angioneurotic oedema, contd.

- relation to Milroy's disease .. 460
- self-induced oedema simul-
lating .. 457
- Angiokeratoma affecting fingers .. 266
- Angiosarcoma of kidney .. 395
- Angular curvature (see Ky-
phosis; Lordosis)
- gyrus, visual word centre in
(Fig. 185) .. 683
- word blindness from lesion of .. 684
- Anidrosis, causes of .. 714
- Aniline dye workers, bullæ in .. 110
- methæmoglobinæmia from .. 187
- Ankle, fractures near, causing
talipes .. 132
- hæmophilic arthritis of .. 388
- osteo-arthritis of .. 384
- synovitis of .. 486
- tuberculous disease of .. 385
- ulceration in yaws .. 449

ANKLE-CLOMUS

- in amyotrophic lateral sclero-
sis .. 73, 565
- birth palsies .. 558
- Brown-Séquard paralysis .. 510
- disseminated sclerosis .. 342
- with exaggerated knee-jerks
in hemiplegia .. 337
- method of obtaining .. 44
- in neurasthenia .. 787
- paraplegia from spinal caries .. 558
- positional, in normal person .. 160
- in primary lateral sclerosis .. 567
- spastic paralysis .. 547
- in paraplegia .. 494
- syringomyelia .. 554
- Tooth's peroneal atrophy .. 560
- transverse myelitis .. 71

Ankle-jerks, absent in multiple

- neuritis .. 488
- diminished in sciatica .. 487
- exaggerated in hysteria .. 541
- in spastic paralysis .. 539
- in hemiplegia .. 337
- locomotor ataxy .. 562
- Ankylosis**, after gonorrhœa .. 377
- from joint disease .. 167
- in rheumatoid arthritis .. 379
- after septic arthritis .. 375

Ankylostomiasis, albuminuria

- in .. 17
- blood-count in .. 33, 570
- cachexia in .. 115
- eosinophilia in .. 249
- melæna in .. 570
- occult hæmorrhage with .. 94
- oedema of legs in .. 459, 461, 570
- progressive asthenia in .. 570
- severe anæmia in .. 37, 94, 459, 570
- shortness of breath in .. 570
- skin eruptions in .. 570

Ankylostomum duodenale

- illustrated .. 94
- Anode, meaning of .. 633

Anophthalmos, congenital

- .. 839

Anorexia in acute polymyositis

- yellow atrophy of liver .. 370

alcoholism

- 238, 243, 368

with bacteriuria

- .. 84

in carcinoma of colon

- .. 147

-- stomach

- 299, 351

catarrhal jaundice

- .. 365

dyspepsia

- .. 49

gastritis

- .. 352

from intestinal parasites

- .. 568

nervosa

- 50, 819

-- absence of pyrexia in

- .. 850

-- age and sex incidence of

- .. 819

-- amenorrhœa with

- .. 23

-- severe loss of weight in

- 69, 819

-- simulating tuberculosis

- .. 850

-- carcinoma of stomach

- .. 508

-- tabes mesenterica

- .. 850

Anorexia nervosa, contd.

- Weir-Mitchell treatment
 - in diagnosis of .. 850
- Anosmia, various causes of .. 668, 669
- Anosteoplasia, dwarfism due to .. 212
- Ante-partum hæmorrhage .. 436
- Anterior chamber in glaucoma .. 840
- in differentiating conjuncti-
vitis, iritis, and glaucoma .. 257
- Anterior crural nerve, paralysis**
 - of .. 541
 - muscles supplied by .. 542
 - spinal roots supplying .. 542
 - **neuralgia**, with sciatica .. 488
 - diminished knee-jerk in .. 488
 - distribution of pain in .. 488
 - poliomyelitis (see Poliomyelitis)
- thoracic nerve, muscles sup-
plied by .. 550
- spinal roots derived from .. 550
- tibial nerve, distribution of .. 659
- Anteversion (see Uterus)
- Anthelmintics in diagnosis .. 249
- Anthraxosis .. 319
- Anthrax, bacteriology in diag-
nosing** .. 459, 603, 746
- constitutional symptoms in .. 603
- diagnosis of .. 603
- from carbuncle .. 603
- chancre .. 603
- gangrene from .. 282
- hæmoglobinuria from .. 315
- itching and burning in .. 603
- malignant pustule of .. 603, 746
- occupation incidence of .. 603, 746
- oedema of face, neck, and arms from .. 459, 461
- round lesion in .. 746
- rigors in .. 647
- septic fever in .. 603
- ulceration of the leg from .. 811
- Antimony, diarrhœa from .. 197
- hæmatemesis from .. 294, 297
- pytalism due to .. 590
- Antipyrim, purpura from .. 596
- tinnitus from .. 794
- Antitoxic serum rashes (see Serum)**
- Antrum of Highmore**
 - affections of, x-rays in
diagnosis of .. 502
 - pain in face from .. 749
 - due to carious tooth .. 502
 - discharge of pus from
nose in .. 204, 502, 749
 - foul taste from .. 774
 - headache from .. 327
 - tender swollen gums in .. 502
 - **empyema** of, illustrated .. 204
 - meningitis from .. 642
 - subjective smell sensa-
tions from .. 669
 - symptoms and diagnosis .. 204, 502
 - exploration of .. 502, 749
 - neoplasms of .. 205, 749
 - sarcoma of (see Sarcoma)
 - transillumination of (Fig. 62) .. 205, 502, 749
- ANURIA** .. 45
- distinction from retention .. 440
- non-obstructive .. 48
- obstructive .. 46
- from rapid emptying of dis-
tended bladder .. 440
- Anus, boil near, pain in perine-
um from** .. 516
- carcinoma of (see Carcinoma)
- condylomata round .. 769
- congenital absence of .. 637
- narrowness of, constipa-
tion from .. 150
- fissure of, dyspareunia from .. 221
- excruciating pains during
defecation from .. 636

Anus, fissure of, contd.

- pain in the penis from 513, 515
- perineum from .. 516
- fistula of, bleeding in .. 92
- irritation of, from thread-worm infection .. 569
- lymphatic drainage of .. 738
- pain in, from vesical carcinoma .. 442
- pigmented, in Addison's disease .. 574
- proctoscope examination in stricture of .. 150
- pruritus of .. 588
- syphilitic eruption round .. 416, 447
- ulcer of .. 636
- Anxiety, loss of weight due to 848
- professional cramps provoked by .. 177

Aorta, aneurysm of (see Aneurysm)

- atheroma of, pain in left arm from .. 494
- erosion of, by carcinoma of the oesophagus .. 295
- nerves corresponding to the .. 481
- site of bifurcation of .. 728
- tenderness in the chest from affections of .. 776

Aortic area, systolic bruits over

- disease, absence of bruit in 526
- albuminuria with .. 18
- anæmia in .. 38
- aneurysm with .. 223
- angina pectoris with 582, 778
- bruit often brought out on exertion in .. 526
- capillary pulsation in .. 106
- causes of .. 106, 236
- cerebral embolism from 138, 155
- collapsing pulse in 106, 247, 526
- congenital .. 236, 238
- diastolic bruit in .. 106
- displaced cardiac impulse in 332
- due to endocarditis .. 236
- enlarged left ventricle in 232
- right ventricle in .. 245
- essential signs of stenosis 105, 235

excessive pulsation in

- Flint's murmur with 108, 109, 231
- general account of .. 233
- hæmoptysis from .. 320
- heart failure from .. 464
- insomnia in .. 359
- liver congestion in .. 407
- with mitral disease .. 237
- mitral regurgitation from 239
- noises in the ear from .. 794
- orthopnea from .. 464
- pain down left arm in 481, 494
- palpitation in .. 233, 525, 526
- precordial pain in .. 481
- and pulmonary incompetence distinguished .. 247
- pulsating noises in head in 359

regurgitation, Corrigan's

- pulse in .. 106
- from endocarditis .. 106
- hypertrophy of the heart in 359
- rupture of valve from 236, 238
- signs of .. 240
- situation of bruit due to 790
- syphilitic .. 18, 62, 223
- systolic bruit over mitral area in .. 102, 103
- thrill due to .. 790
- water-hammer pulse in .. 106
- ring, dilatation from aneurysm 238

Aortitis, acute, angina pectoris

- due to .. 481, 778
- pain in the back from .. 789
- rheumatic .. 481
- due to syphilis .. 481

Ape's hand (see Claw-hand)

- Aperients, constipation due to 144
- in diagnosis of nature of constipation .. 142

Apex beat (see Heart Impulse)**Aphasia, from cerebral abscess**

- embolism .. 685, 686
- hæmorrhage .. 685
- syphilis .. 173
- thrombosis .. 685
- tumour .. 685, 686
- definitions of .. 682, 685
- diagnosis from loss of speech - due to mental defects .. 682
- difficulties of analysing .. 683
- with hemiplegia .. 336, 685
- impaired intelligence with .. 683
- internal and external speech in relation to .. 683, 685
- motor, anarthria distinct from 685
- Broca's area and .. 685
- consciousness of speech mistakes in .. 685
- intellectual processes intact 685
- sensory, intellect impaired in 683
- lesions producing .. 683
- temporary, in epilepsy .. 686
- in general paralysis of the insane .. 682
- health .. 686
- migraine .. 686

Aphonia, from laryngeal palsy**hysterical** 224, 342, 506, 538, 687, 710, 798

- cough normal with 538, 687
- painless .. 538
- recurrent .. 688
- sex and age incidence of 538
- sudden onset in .. 688
- recovery from .. 688
- voice reduced to a whisper 687

Aphrodisiac drugs, priapism**from** .. 586**Aphthous stomatitis, bleed-****ing gums in** (and see Stomatitis) .. 86, 88**Aplastic anæmia** .. 31

- ascites in .. 62, 64
- bleeding gums in .. 85
- blood changes in .. 64
- fatty heart from .. 62
- leucopenia in .. 401
- myelocytes in .. 29
- simulating pernicious .. 42

Apomorphine, vomiting from**Apoplexy** (see Hæmorrhage, Cerebral)**pulmonary** .. 320**Appendicitis**

- abdominal rigidity due to .. 736
- acute diarrhoea in .. 196
- adhesion to ovary and tube in 737
- bladder symptoms in 438, 632, 736
- in children .. 134
- constipation from .. 144, 729, 736
- cystitis from .. 313
- cystoscopic appearances when appendix adherent to bladder .. 632
- diagnosis from enlarged tender ovary .. 737
- gall-stones .. 500
- indigestion .. 350
- ovarian cyst with twisted pedicle .. 761
- pain due to retained testicle .. 523, 740
- from pyosalpinx .. 737
- renal colic .. 500
- renal tumour .. 393
- suppurating gall-bladder .. 737
- suppurative pyelphlebitis 614
- typhoid fever .. 401

Appendicitis, diagnosis, contd.

- from ureteric calculus 311, 627, 632
- vesical disease .. 632
- drawing up of right leg in .. 736
- dysmenorrhœa from .. 737
- empyema from .. 120
- feculent vomiting in .. 846
- furred tongue due to .. 736
- gangrenous, severe shock and collapse in .. 484
- gas-production in .. 231
- general peritonitis from 431, 644
- hæmaturia in 305, 313, 632
- hæmoptysis from .. 123
- indicanuria in .. 349, 500
- inguinal abscess due to .. 739
- intestinal obstruction from 151, 152
- jaundice from .. 362
- kinking of bowel after .. 147
- leucocyte count in diagnosis from typhoid fever .. 401
- leucocytosis with .. 736
- micturition frequent with 438, 632, 736
- multiple ulcers of stomach in 304
- pain in the back in .. 476
- epigastric, in .. 484
- hunger, in .. 350, 500
- in loin .. 393
- pelvis from .. 508, 632
- right hypochondrium in .. 500
- right iliac fossa in 313, 501, 729, 736, 780
- spasmodic, in .. 509
- pelvic abscess from .. 632
- swelling due to .. 757
- pleuritic effusion from .. 122
- pneumaturia from .. 576
- pregnancy with .. 761
- pulmonary emboli from .. 123
- pulse-rate in .. 632, 736
- pyelphlebitis after 59, 362, 370, 614, 649
- pyrexia from 133, 135, 313, 632, 729, 736
- pyuria in .. 313, 632
- rectal or vaginal examinations in .. 729, 736
- right-sided abdominal rigidity in .. 632
- rigors after .. 370
- rupture of abscess into bladder 632
- septicæmia from .. 614
- signs of .. 135
- simulated by dysmenorrhœa 220
- ovarian pains .. 729
- pyelitis .. 646
- salpingitis .. 729
- scybala .. 729
- spastic constipation .. 145
- tuberculous cæcum .. 736
- subphrenic abscess from 119, 129, 501, 720, 721
- swelling in right iliac fossa in 736
- tenderness in the right iliac fossa, due to .. 500, 736, 780
- undue abdominal aortic pulsation suggesting .. 592
- vomiting from 729, 736, 844, 846

Appendicular abscess (see Abscess, Appendicular)**colic, discussion of** .. 134**Appendix, actinomycosis of** .. 736**palpable per rectum** .. 638**in right inguinal hernia** .. 742**APPETITE, ABNORMAL** .. 49

- excessive, in diabetes 292, 507
- from intestinal parasites 568
- increased in pregnancy .. 293
- loss of, in cirrhosis of liver 59, 300
- gastritis .. 352
- lardaceous disease .. 48

Arthritis, gonorrhoeal, contd.

- gleet with	376
- gonococci in fluid from joint in	376
- ophthalmia from	376
- opsonic index in diagnosis	376
- pyrexia in	377
- rarity of suppuration in	377
- salicylates without effect in	377
- severe muscular atrophy in	376
- simulating gout	383
- progressive muscular atrophy	377
- tuberculous arthritis	377
- subcutaneous nodules in	375
- urethral discharge with	376
- vertebral	375
- gouty (see also Gout)	381, 383
- sodium urate in joints in (Fig. 112)	380
- tophi about joints in	507
- gummatous	386
- in hæmophilia	388
- hæmoptysis with	318, 319
- in Henoch's purpura	90
- hysterical , absence of muscular atrophy in	389
- bony outgrowths in	389
- grating in	389
- heat in	389
- swelling in	389
- symptoms of arthritis in	389
- coldness of joint in	389
- disappearance under anaesthesia	389
- tenderness of joint in	389
- of infants, acute	378
- infective , anaemia in	36
- in children, pneumococcal	375
- diagnosis from gout	382
- epitrochlear gland enlarged in	422
- in Malta fever	507
- mixed infection in	377
- from pyorrhoea alveolaris	87
- in intermittent hydrarthrosis	387
- localized in displacement of semilunar cartilage	388
- monarticular , of secondary syphilis	386
- character of Charcot's disease	387
- of osteo-arthritis	384
- swelling due to gout	382
- multiple, in children (see Still's Disease)	
- nervous mimicry in	389
- osteosynovial membrane thickened in	384, 390
- pain in the chest in	479
- in peliosis rheumatica	599
- pneumococcal , after injuries of joints	375
- general account of	375
- in otitis media	375
- pus in joints in	375
- great tenderness of joints in	375
- rheumatoid (see Rheumatoid Arthritis)	
- in scarlet fever	376
- septic	375
- of ankle, talipes from	132
- albumosuria in	20
- ankylosis from	375
- fixation from	375
- hue of skin over	375
- irregular temperature in	375
- leucocytosis in	375
- septicæmia from	698
- sources of infection of	375
- suppuration in	375
- simulating paralysis	545
- spinal, pain in back from	476
- suppurative in pyæmia	649

Arthritis, suppurative, contd.

- causing anaemia	39
- syphilitic , monarticular	386
- swelling and tenderness in	386
- synovitis in	386
- tertiary, enlargement of joint in	386
- gumma of end of bone in	386
- thickening of synovial membrane in	386
- in syringomyelia	388, 563
- tabes dorsalis	388
- disorganization of joint in	388
- monarticular	387
- talipes from	132
- transient impairment of movement in joints in early tuberculous	385, 386
- transparency of bones to x-rays (Fig. 110)	380
- traumatic, conversion into tuberculous	386
- diagnosis from acute rheumatic arthritis	375
- tuberculous	385, 386
- age incidence of	385
- anaemia in	36, 39, 386
- of ankle	385
- talipes from	132
- in association with tuberculous peritonitis	691
- contractures from	167
- diagnosis from acute rheumatism	375
- syphilitic synovitis	386
- disease of ilium secondary to	737
- of elbow	385
- foot simulated by tabetic arthritis	388
- frequent absence of general symptoms in	386
- pyrexia in	386
- of hip, relative frequency of	385
- history of injury in	386
- hysterical hip simulating	166
- knee simulating	166
- impaired movement a sign of	385, 386
- insidious onset of	385
- of knee, absence of bony outgrowth in	386
- pulpy sensation in	386
- relative frequency of	385
- lameness in	385
- muscular wasting in	386
- night startings in	385
- occasional absence of pain	385
- twinge of pain in early	385
- occurrence without impairment of movement	385
- pain in	385
- percentage distribution amongst various joints	385
- rarity of lardaceous disease from	386
- phthisis in	386
- tuberculosis elsewhere in	386
- relative frequency amongst the various joints	385
- sacro-iliac joint, difficulty of diagnosis of	386
- shoulder	385
- simulated by gonorrhoeal arthritis	377
- occupation neuroses	178
- slow progress of	385
- swelling in	385
- usually monarticular	386
- wrist	385
- with typhoid fever	375, 376
- Arthritism, pruritus in	588
- Artichokes, oxaluria from	471

Articular rheumatism (see

Rheumatism	
Articulation (see Speech, Abnormalities of)	
Arytenoid cartilage, perichondritis of, sore throat from	670
- joints, fixation of	537
Asafetida, foul taste from	774
Ascaris lumbricoides (Fig. 153)	569
- eosinophilia with	249
- in gastric contents	846
- gastro-intestinal and nervous disorders from	569
- impaction in bile-duct	364
- increased appetite with	49
- jaundice from	361
- length of	364
- no blood changes with	33
- ASCITES	50
- abdominal swelling from	467, 715
- simulating	717
- in acute peritonitis from Bright's disease	14, 63
- albuminuria with	9, 17
- from bronchitis and emphysema	246
- in cancerous peritonitis	57
- from carcinoma of colon	366
- of stomach	366
- in child, dystocia due to	227
- chlorotic anaemia	64
- chylous	58
- in subacute nephritis	126
- cirrhosis of the liver	301, 368, 410, 411, 693, 696, 826
- compression of lung by	324, 668
- constipation with	148
- diagnosis of	716
- from conditions simulating it	52
- hydramnios	759
- ovarian cyst	759, 761
- phantom tumour	433
- difficulty of estimating size of liver in	406
- "dipping" for liver in	410
- from distoma hepaticum	364
- dullness in flanks from	759
- encysted, account of	719
- diagnosis from ovarian cyst	761
- fibroid lung and bronchiectasis from	324
- fibroma of ovary with	759
- in Hanot's cirrhosis	411
- hæmorrhagic	718
- heart displaced by	330, 332
- due to hydatid disease	719
- in von Jaksch's disease	42
- jaundice with	58
- knee-elbow position in diagnosis of	717
- lineæ albicantes in	402
- localized	56, 717, 719
- mediastinitis	484
- in mitral regurgitation	238
- stenosis	764
- nephritis	14, 48
- oedema of legs from	461
- orthopnea from	465, 467
- with ovarian tumour	367, 393, 759
- cyst with twisted pedicle	759
- palpitation from	526
- pelvic swelling due to	759
- with peritonitis	56, 718
- in pernicious anaemia	62, 64
- physical signs of	50
- with pleural effusion	121
- from portal gland enlargement	366
- pressure on portal vein	301, 366, 696
- in pseudoleukæmia infantum	42
- pyelephlebitis	301
- resonance in umbilical area in	759

Ascites, contd.

- with secondary carcinoma
 - of liver .. 413
- in severe blood diseases .. 122
- simulated by distended bladder .. 717, 730
 - gall-bladder .. 717
 - intestines .. 717
 - gastrectasis .. 717
 - hemoperitoneum .. 717
 - mesenteric cyst .. 717
 - ovarian cyst .. 717
 - pregnancy .. 717
 - retroperitoneal lipoma .. 717
- skodaic resonance due to .. 668
- in splenic anæmia .. 64, 411
- splenomegalic cirrhosis .. 693
- subacute nephritis .. 126
- with telangiectases .. 59
- in thrombosis of portal vein .. 58
 - tuberculous peritonitis with .. 56, 152, 618, 691
- tumours of liver with .. 366
- varicose abdominal veins from .. 825
- vena cava obstructed by .. 459, 461, 825
- from vena cava thrombosis .. 825
- in venous congestion of liver .. 407
- Ascitic fluids**, analyses of .. 57
 - characters of .. 52, 59
 - endothelial cells in .. 718
 - mitotic figures in cells of .. 718
- Asexual ateleiosis** .. 218
- Aspergillosis**, hamomptysis in .. 317, 705
 - of lung .. 322
 - in mycetoma .. 809
- Aspergillus**, varieties of .. 705
- Asphyxia**, acute, from bilateral abductor paralysis .. 185
 - borborygmi in .. 97
 - causes of .. 288
 - convulsions in .. 169
 - local, in Raynaud's disease .. 490
 - raised blood-pressure in .. 61, 96
 - retraction of the head in .. 641
 - tetanus causing .. 162
- Assam**, kala-azar in .. 31
- Astereognosis** in brain lesions .. 68
 - in disseminated sclerosis .. 665
 - tabes dorsalis .. 665
- Asthma**
 - bronchitis and emphysema from .. 186, 582
 - simulating .. 180, 249, 467
 - cardiac, from fatty heart .. 241
 - Charcot-Leyden crystals in .. 117, 179
 - clubbed fingers in .. 128
 - constipation in .. 149
 - coryza with .. 203
 - Curschmann's spirals in .. 179
 - cyanosis in .. 186
 - differential diagnosis of .. 582
 - drugs relieving .. 582
 - dyspnoea the essential symptom of .. 582
 - eosinophilia in .. 179, 249, 582
 - insomnia in .. 356, 359
 - orthopnoea in .. 465
 - other diseases mistaken for .. 582
 - polycythæmia in .. 579, 580
 - polyuria after .. 581
 - shortness of breath from .. 579
 - spasmodic dyspnoea from .. 249
 - uræmia mistaken for .. 582
 - x-rays in diagnosis of .. 582
- Astigmatism**, headache due to .. 327, 498, 783
 - monocular diplopia in .. 198
 - neuralgia in .. 498
 - ophthalmoscopic appearance of (*Plate VII*) .. 463
 - pain in mid-orbital region in .. 498
 - tenderness of forehead from .. 783

Astigmatism, contd.

- tenderness in mid-orbital region in .. 498
- temporal region from .. 783
- vertex from .. 783
- Astley Cooper, re bladder in .. 742
- hernia .. 479
- irritable breast of .. 789
- Astringents, dryness of mouth due to .. 789
- extreme thirst due to .. 211
- vaginal casts due to .. 211
- Ataxic paraplegia (see Paraplegia, Ataxic) .. 64
- ATAXY** .. 64
 - cerebellar, intention tremor in .. 799, 800
 - in cerebellar lesions .. 69
 - from cerebellar tumour .. 643
 - combined sclerosis of cord .. 493, 667
 - choreiform movements with .. 799
 - distinguished from .. 156
 - contracture with .. 162
 - in disseminated sclerosis .. 341, 565
 - distinguished from paralysis .. 545
 - Friedreich's (see Friedreich's Ataxy) .. 66, 277
 - gait in .. 156
 - in Huntington's chorea .. 799
 - illustrated (*Fig. 206*) .. 68
 - from spinal new growth .. 285, 498, 562, 665
 - tabes .. 507
 - test for minor degrees of .. 65
 - from thrombosis of posterior inferior cerebellar artery .. 666
- Atelectasis, fibroid lung and bronchiectasis from .. 324
- Ateleiosis, asexual (*Fig. 69*) .. 217, 218
 - hypothyroidism in .. 216
 - sexual .. 218
 - how diagnosed .. 215
- Atheroma** (and see Arteriosclerosis) .. 1
 - abdominal angina from .. 351, 486
 - and angrina pectoris .. 582
 - aortic systolic bruit with .. 61, 105, 106, 235
 - ascites in .. 61
 - bruits in .. 105
 - cerebral, recurrent transient hemiplegia from .. 340
 - in diabetes mellitus .. 811
 - gangrene of the leg from .. 810
 - hæmatemesis in .. 299
 - headache from .. 326
 - pulmonary, in mitral stenosis .. 245, 317, 320, 323
 - hæmoptysis from .. 317, 323
 - Stokes-Adam's disease from .. 97
 - after syphilis .. 233, 238
 - thrill due to .. 790
 - thrombosis and embolism from .. 286
 - ulcer of leg from .. 810
 - unequal pulses from .. 593
 - vertigo due to .. 528
- Athetosis** (and see Contractions) .. 153
 - accoucheur's hand in .. 3
 - bilateral .. 154
 - in birth palsies .. 155
 - congenital diplegia .. 799, 800
 - from cortical lesions .. 336
 - facial paralysis with .. 536
 - hemiplegia with .. 155, 157, 336, 799
 - infantile hemiplegia with .. 68
 - primary or idiopathic .. 154
- Athletes, albuminuria in .. 19
- aortic disease in .. 237, 244
- cardiac impulse in .. 332
- enlarged left ventricle in .. 232
- semimembranosus bursa in .. 762
- Atmospheric conditions causing shortness of breath .. 101

Atmospheric conditions, contd.

- epistaxis due to .. 251
- Atony** of bladder wall, difficult micturition in .. 440
- bowel, illustrated .. 144
- constipation from .. 149
- gastric, dyspepsia from .. 354
- flatulence in .. 267
- post-dysenteric .. 144
- Atoxyl, optic atrophy from .. 836
- Atrophic brachial palsy, peripheral nerve distribution and (*Plate XI*, p. 663) .. 551
- Atrophic rhinitis (see Rhinitis, Atrophic)
- Atrophy**, acute yellow (see Liver, Acute Yellow Atrophy of)
 - of bone in tabetic arthritis .. 388
 - ears in lupus erythematosus .. 658
 - eyes from iritis .. 839
 - leg, with peroneal atrophy .. 128
 - in mycetoma .. 810
 - transverse myelitis at lumbar enlargement .. 563
- ATROPHY, MUSCULAR** .. 69
 - from acute poliomyelitis .. 555, 558
 - in alcoholism .. 77
 - of arm, various causes of .. 549
 - in brachial neuritis .. 492
 - from cervical rib .. 554
 - multiple neuritis .. 550
 - in arsenical peripheral neuritis .. 506
 - with arthritis .. 376, 379, 386, 634
 - associated with scars .. 132
 - in bulbar paralysis .. 224, 641, 686, 687
 - cachexia .. 634
 - callus causing .. 75
 - claw-hand with .. 127
 - from disuse .. 390, 634
 - facial paralysis with .. 536
 - in Friedreich's ataxy .. 70, 164
 - fibrillar contractions in .. 157, 158, 159
 - of hands in amyotrophic lateral sclerosis .. 131, 159, 565
 - bulbar paralysis .. 687
 - from cervical rib .. 554
 - peroneal atrophy .. 128
 - progressive muscular atrophy .. 127
 - ulnar paralysis .. 127
 - with herpes zoster .. 494

<i>Atrophy, Muscular, contd.</i>		<i>Babinski's sign, contd.</i>		<i>Bacillus influenzae, contd.</i>	
- of tongue in bulbar		- Brown-Sequard paralysis	540	- acute tonsillitis from	670
- paralysis	224, 641, 686	- children	557	- bronchopneumonia from	321
- from transverse myelitis	563	- with compression para-		- in the circulating blood	650
- with tuberculous hip	183, 386	- plegia	786	- importance of examining	
- in ulnar paralysis	127	- in disseminated sclerosis		- sputum for	702
- varieties of primary	158	- 174, 539, 542, 547, 800		- laryngitis from	670
- of progressive neuro-		- with exaggerated knee jerks	397	- pharyngitis	670
- muscular	158	- Friedreich's ataxy	82, 559	- small size of	702
- optic (see Optic Atrophy)		- hemiplegia	164, 337	- in sputum	321
- of the skin in sclero-dermia	781	- in paralysis of legs	82	- lactis aerogenes in bacilluria	616
ATROPHY, TESTICULAR	78	- paraplegia from spinal caries	553	- of leprosy	75
- from epididymitis	454	- primary lateral sclerosis	567	- mallei in bullae	112
- after gonorrhoea	454	- with pyramidal tract lesion	546	- in glands	603
- impotence from	347	- spastic paralysis of one		- sputum	704
- obesity in	453, 454	- leg	539	- paratyphosis A and B	697
- from orchitis	79, 454, 519	- - upper extremity	547	- pneumoniae (see Bacillus	
- Tooth's peroneal (see Tooth's)		- subacute combined de-		- Friedlander)	
Atropine harmful in glaucoma	257	- generation of the cord	493	- producing lactic acid in the	
- infantile convulsions from	170	- syringomyelia	554	- vagina	210
- in iritis	257	- in talipes	131	- proteus vulgaris in bacilluria	616
- relief of eye-strain by	498	- transverse myelitis	74	- pyocyaneus , pemphigus neo-	
Attic, tympanic, caries of		Bacillæmia , account of	650	- natorum from	111, 113
- ossicles from suppurative in	470	Bacilluria (see Bacteriuria)		- in the circulating blood	650
Auditive, definition of	685	Bacillus aerogenes capsulatus ,		- coloured sweat due to	714
Auditory aura of epilepsy	80	- emphysema due to	231	- in empyemata	119
- meatus, ivory exostosis in		- coli communis, bacteriuria		- green or blue sputum from	704
- (see also External Audi-		- due to	83, 615	- in impetigo	113
- tory Meatus)	754	- a cause of vaginal dis-		- nephritis due to	83
- nerve, deafness from injury		- charge	211	- tetani (Plate XII, p. 696)	
- of, in fractured base	468	- in cerebrospinal fluid	340	- 162, 463, 652, 802	
- from lesion of	190	- circulating blood	650	- tuberculosis (Plate XII, Fig.	
- degeneration in tabes	190	- cystitis due to	83, 264, 438	- K, p. 696)	814
- tumour of, vertigo due to	828	- in empyemata	119	- in ascitic fluid	57
- word centre	683	- feculent abscesses	264	- carbol-fuchsin stain for	700
AURA in epilepsy		- gas production by		- cerebrospinal fluid	340, 643
- 80, 81, 171, 268, 669, 774,	828	- 231, 576, 577, 578, 711,	713	- cystitis due to	83, 312, 442
- flushing as an	265	- in groin abscess	739	- in discharge from eye	808
- in intracranial new growth	80	- infection of pericar-		- examination for in hæmo-	
- Jacksonian epilepsy	174	- dium by	711	- ptysis	316, 317
- perverted taste as an	771	- meningitis due to	642	- in gum scrapings	87
- spasm of the glottis as an	828	- nephritis due to	83	- laryngitis from	226, 670
- vertigo as an	828	- in pleuritic effusion	123	- meningitis due to	172
Auricle, single cardiac	184	- pneumaturia caused by	576	- methods of concentrating	701
Auriculo-temporal nerve, skin		- pneumothorax from	577	- nephritis due to	83
- distribution of	659	- pyelitis due to	625	- pharyngitis from	670
Auriculo-ventricular bundle of		- pyelonephritis due to	83	- pyelonephritis due to	83
- His, lesions of	97, 98	- prostatitis due to	83	- in sputum in phthisis	
Australia, hydatid cysts in		- subcutaneous emphy-		- (Plate XII, Fig. K)	87, 185,
- 58, 323, 719, 720		- sema due to	231	- 319, 577, 578, 700, 701, 712	
Austria, impetigo herpeti-		- in subphrenic abscess	711	- in laryngitis	226, 670, 672
- forms in	112	- ureteritis due to	82, 83, 515	- tonsillitis from	670, 672
Autism, post-epileptic	25, 163	- diphtheria	181	- in ulcer of tongue	814
Autophonia	190	- associated with foul breath	99	- ureteritis due to	83
Axilla, abscess of (see Abscess,		- in cutaneous diphtheria	602	- in urine 136, 310, 394, 513, 623	
- Axillary)		- diagnosis	77, 203, 226, 469,	- Ziehl-Neelsen method of	
- bromidrosis of	714	- 602, 641, 672, 673, 807		- staining for	700
- eczema marginatum of	275	- diphtheria	641	- typhosus in bacilluria	616
- erythrasma of	276	- of ear	469	- bile passages	371
- glands enlarged in (see Lym-		- larynx	466	- blood	610, 650
- phatic Glands, Axillary)		- meningitis due to	642	- cerebrospinal fluid	340
- hairy, in infants, with		- in the throat	185, 224	- cystitis due to	83
- hypernephroma	690	- vaginal discharge due to	211	- in empyemata	119
- hyperoma of	732	- dysenteria	91	- meningitis due to	642
- lipoma of	732	- enteritis of Gaertner in		- in periosteal abscess	752
- simulating tubercle	732	- zymotic diarrhoea	426	- pure culture in periosteal	
- pediculosis of	447	- fetidus, cause of bromi-		- abscess after typhoid fever	752
- primary tumours of	732	- drosis	714	- pyelitis due to	625
- sebaceous in	832	- Friedlander's , bacteriuria from	83	- recognition in faeces	610
- seborrhæic dermatitis of	447	- nephritis due to	83	- vertebral periostitis from	787
- syccosis vulgaris of	602	- pyelonephritis due to	83	- xerosis in normal urethra	82
Axillary artery, aneurysm of		- ureteritis due to	83	Back , acne affecting	531, 604
- (see Aneurysm, Axillary)		- fusiformis , acute tonsillitis		- lichen scrofulosorum affecting	529
- swelling (see Swelling, Axillary)		- from	670	- lymphatic drainage of	738
Azoospermia, sterility due to	706	- laryngitis from	670	- multiple benign sarcoïd of	451
Asotic diabetes, polyuria in	583, 584	- pharyngitis from	670	- myoma cutis of	805
		- in Vincent's angina (Plate		- pain in (see Pain in Back)	
BABINSKI'S SIGN (and see		- XII, Fig. M, p. 696)	672	- papular syphilides of	532
- Plantar Reflexes)	81	- Vincent's	99	- pulsating tumour in	476
- absent in hysteria	82, 166, 800	- Gaertner's , in ptomaine		- sebaceous cyst of	804
- in alcoholic intoxication	82	- poisoning	597	- seborrhæic eczema affecting	533
- amyotrophic lateral sclerosis		- serum reaction with	597	- stiffness of (see Stiffness of	
- 73, 554, 565		- in zymotic diarrhoea	426	- Back)	
- birth palsies	558	- influenzae	203	- varicella affecting	833

Bones , abscess of (see Abscess of Bone)	
- in achondroplasia ..	214
- acromegaly ..	262, 585
- acute osteo-myelitis ..	751
- atrophy of, in general paralysis of the insane ..	269
- in tabetic arthritis ..	388
- carcinoma of ..	757
- caries of (see Caries of Bone)	
- in congenital syphilis (<i>Fig. 78</i>) ..	259
- cranial and facial, in leontiasis ossea ..	753
- hyperostoses of, in leontiasis ossea ..	749
- enchondroma of ..	754
- enlarged locally (see Swelling on a Bone)	
- fracture of (see Fracture)	
- gumma of (see Gumma of Bone)	
- hyperplasia of, in acromegaly ..	263
- in hypertrophic osteoarthropathy ..	390
- rickets ..	179, 214
- injury of, swelling due to ..	750
- innocent tumours of ..	754
- invaded by epithelioma ..	814
- malignant disease of ..	388
- albumosuria in ..	21
nerosis of ..	751
- abscess in heart from ..	650
- anæmia with ..	39
- anosmia from ..	668
- diagnosis from sarcoma ..	751, 763
- eacache from ..	230
- foul breath due to ..	99
- lichen scrofulosorum with ..	529
- obstruction to nose by ..	668
- pericarditis from ..	650
- from phosphorus ..	87
- popliteal abscess due to ..	762
- pytalism due to ..	590
- stomatitis due to ..	590
- from syphilis ..	237
- talipes from ..	132

Bones, contd.

- node on	750
- in osteitis deformans	753
- osteogenesis imperfecta	213
- osteomalacia	213, 214
- pain in, in syphilis (and see Pain in Bone)	503
- in rickety dwarfism	214
- sarcoma (see Sarcoma of Bone)	
- sinus in connection with	751
- spontaneous fracture of, in scurvy-rickets	753
- - - in new growth of	269, 757
- - - tuberculous disease of	269
- subperiosteal extravasation on, node after	750
- syringomyelia	285
- swelling on (see Swelling on a Bone)	
- syphilis of, diagnosis from tuberculous periostitis	752
- tenderness of, in scurvy and rickets	44, 115
- - in secondary syphilis	672
- thickening of, from chronic osteomyelitis	751
- - chronic periostitis (<i>Fig.</i> 192)	751
- - due to gumma	752
- - in osteitis deformans	753
- - x-rays in diagnosis of (<i>Figs.</i> 196, 198, 199)	751
- transparency to x-rays in rheumatoid arthritis (<i>Fig.</i> 110)	380
- tuberculous disease of	751
- - diagnosis from gumma	752
- - sites of commencement	751
- unaffected by lupus vulgaris	808
Bone-marrow affections, Bence-Jones' albumosuria in	21
- - eosinophilia in	248
- - splenomegalic polycythæmia a disease of	581
Bony out-growths in osteoarthritis and gout	383, 384
Boots , bullæ due to	110
- relation to Morton's disease	498
- tight, causing metatarsal neuralgia	488
- - talipes	132
- - whitlow	445
BORBORYGMI	96
- absent with general peritonitis	97, 431, 644, 645
- in intestinal colic	473, 645
- - obstruction	153, 431
Boring epithelioma of jaw	749
Bossing of skull in rickets	753
"Bossy" nodules in tuberculosis of testis	519
Bothriophthalmus infection, albuminuria in	17
- - anemia in	33, 37, 459, 568
- - cachexia in	115
- - eosinophilia in	249
- - œdema of legs in	459, 461
- (see also Tape-worm) (<i>Fig.</i> 151)	
Böttcher's test for glycosuria	290
Bottle-nose in cirrhosis of liver	300
Bougie in diagnosis of calculus in urethra	439
- - cesophageal pouch	842
- - urethral stricture	439
- danger of passing in dysplasia	222
- olive-pointed flexible, in urethral stricture	440
Bovine cough in laryngeal paralysis	538, 539
- heart	233
Bowed legs in achondroplasia	212
- - from rickets	212

Bowel, casts of, in membranous colitis	444
Boxing, enlarged heart from	241
Boys, excessive fatness of, in hypernephroma	454
Brachial artery, unequal pulses from atheroma of	593
- nerves, table of muscles innervated by	550, 556
- neuralgia (see Neuralgia, Brachial)	
- neuritis (see Neuritis, Brachial)	
- palsy (and see Paralysis of Extremity, Upper; see also Erb's, Duchenne's and Klumpke's Palsies)	545, 552
- - paralysis of, from pressure of cervical rib on	593
- plexus disease, diagnosis from progressive muscular atrophy	73
- - interference with by thyroid gland tumour	792
- - lesions, muscular atrophy in	74
- - table of innervation of muscles by	550
Brachialis anticus muscle, nerve supply of	550, 556
Brachycephaly in Mongolian idiocy	263
BRADYCARDIA	97
- in aortic stenosis	235
- cerebellar abscess	644
- fatty heart	241
- jaundice	98, 361, 365
- Stokes-Adams' disease	172
Brain , coma due to compression of	137
- concussion (see Concussion of Brain)	
- cystic, congenital	558
- fatigue in neurasthenia	506
- injury, testis atrophy after	79
- Cheyne-Stokes' respiration after	125
- - coma after	137
- - diagnostic importance of aura in localizing	80
- not coloured in jaundice	361
- syphilis of (see Syphilis, Cerebral)	341
- tuberculous nodule in	341
- tumour (see Cerebrum, Tumour of)	
Bramwell's test of pancreatic infantilism	216
Brassy cough in laryngeal paralysis	538, 539
Braun's sign in pregnancy	437
Brazil, ankylostomiasis in	570
Bread-crumbling movements in paralysis agitans	796
Breast , abscess of, (see Abscess, Mammary)	
- atrophy of, carcinomatous	745
- carcinoma of (see Carcinoma of Breast)	
- changes in, in lactation	743
- - the new-born	743
- - in pregnancy	743
- - of puberty	743
- cyst of (see Cysts of Breast)	
- cystic disease of	744
- enchondroma of	744
- fibro-adenoma of, absence of enlarged axillary glands in	744
- - age incidence of	741
- - characters of	743, 744, 745
- - cystic change in	744
- - diagnosis from carcinoma	744, 745
- - chronic mastitis	744
- - cyst	744
- - early sarcoma	746

Breast, fibro-adenoma of, contd.

- free mobility of	744
- the only common innocent tumour of breast	744
- fibroma, rarity of	744
- fullness and pigmentation of, in pregnancy	350
- hydatid cyst of	202
- hyperæsthetic patches in, in hysteria	667
- - lineæ albicantes on	402
- lipoma of, rarity of	744
- - male, milk in	202
- mode of examination of	742
- multiple cystic disease of	744
- myoma cutis of	805
- pain in (see Pain in the Breast)	
- redness of, in mastitis	743
- - in tuberculosis	744
- swelling and tenderness in mastodynia	479
- sarcoma of (see Sarcoma of Breast)	
- sinus of, tuberculous	744
Breast swellings , general discussion of	742, 743, 744, 745
- tuberculosis of	744
- unilateral hypertrophy of, from fibro-adenoma	743
- - - from putting children to the breast	743
- veins of, dilated in pregnancy and lactation	743
Breath, characteristic catch in gall-bladder affections	499
BREATH, FOULNESS OF	98
- with catarrhal jaundice	365
- - gangrene of lung	321
- - gastritis	297
- - pyorrhœa alveolaris	87
- - stomatitis	88
- - Vincent's angina	672
BREATH, SHORTNESS OF (and see Dyspnoea, Orthopnoea, etc.)	100
- - in ankylostomiasis	570
- - with bronchiectasis	579
- - bronchitis and emphysema	579
- - cachexia	115
- - fibroid lung	579
- - goitre	792
- - Graves' disease	792
- - mitral regurgitation	103
- - stenosis	579
- - pericarditis	480
- - polycythæmia in	100, 579
- - renal disease	13, 14, 579
- - spasmodic asthma	579
- - subphrenic abscess	721
- - smell of, in alcoholic coma	138
- - in uræmia	350
- - sounds (see Vesicular Murmur)	
Breathing, Cheyne-Stokes (see Cheyne-Stokes Respiration)	
- difficulty in (see Dyspnoea, etc.)	
- - laboured, in convulsions	169
- - painful, with gall-stones	486
- - in intercostal neuralgia	478
- - phrenic neuralgia	478
- - with pleurisy	479
- - pneumothorax	480
- - rapid shallow, in pneumothorax	577
- - stertorous, in convulsions	169
- - tubular (see Bronchial breathing)	
Breathlessness (see Breath, Shortness of)	
Bright eye in Bright's disease	256
Bright's disease , albuminuria in	11, 12, 466

Bright's disease, contd.

- albumosuria in ..	12
- amenorrhœa in ..	23
- œdema in ..	90
- anasarca with ..	48, 51
- aortic regurgitation in ..	107
- ascites in ..	63
- backward pressure in ..	48
- bacteriuria in ..	83
- bullæ in ..	110
- Cheyne-Stokes respiration in ..	124
- chlorides in ..	12
- conjunctival œdema of ..	256
- contracted granular kidney in ..	14
- convulsions in ..	160
- diminution of total solids in urine in ..	626
- distinguished from infarction of kidney ..	311
- physiological albuminuria ..	19
- epistaxis in ..	90, 251
- general œdema in ..	466
- hæmaturia rare in ..	299
- hæmaturia in ..	12, 304, 314
- hæmoglobinuria in ..	315
- hæmorrhage in ..	90, 598
- heart failure from ..	63, 461
- hypertrophy of heart in ..	90, 245
- infantile convulsions in ..	170
- mercury injurious in ..	590
- mitral regurgitation from ..	239, 240
- morning headache in ..	327
- multiple serositis in ..	124
- nerve deafness in ..	191
- nucleoprotein in ..	12
- obesity in ..	453, 454
- œdema in ..	12
- of legs in ..	459, 461
- pericarditis with ..	122
- phosphates in ..	12
- polyuria in ..	90
- puffiness and œdema of face in ..	746
- purpura in ..	596, 598
- renal tube-casts in ..	12, 90
- in scarlet fever ..	674
- simulated by Milroy's disease ..	460
- myxœdema ..	43
- œdema of convalescence ..	459
- stridor in ..	709
- syphilitic ..	86
- tube-casts in urine in ..	466
- uræmia with ..	48
- urea in ..	12
- urine changes in ..	12, 16 et seq.
- varieties of ascites with ..	54
- pleural effusion in ..	122
- various forms of ..	8
- weakness in ..	90
- acute, anuria in ..	48
- bacteriuria in ..	82
- cyanosis in ..	185
- diagnosis from Henoch's purpura ..	600
- mitral regurgitation in ..	239
- occasional absence of œdema in ..	311
- œdema in ..	311, 457
- of face and of labia in ..	458
- larynx in ..	185, 709
- legs in ..	458, 461
- lungs in ..	466
- penis in ..	458
- scalp in ..	458
- scrotum in ..	458
- peritonitis with ..	55
- polyuria in recovery from ..	582, 583
- scanty urine in ..	311

Bright's disease, acute, contd.

- after scarlet fever ..	671
- simulated by angioneurotic œdema (Fig. 128) ..	458
- by excessive drinking ..	458
- after infusion ..	458
- transfusion ..	458
- by vena cava thrombosis ..	825
- sudden onset in ..	311
- symptoms of ..	48
- universal œdema in ..	460
- urinary changes in ..	311
- chronic (and see Granular Kidneys) ..	
- albuminuria in ..	13, 16, 454
- albuminuric retinitis in ..	303, 454
- anæmia in ..	303
- big heart in ..	454
- cardiac hypertrophy with ..	303, 331
- chylous ascites in ..	58
- convulsions in ..	160
- cramps in ..	179
- eosinophilia in diagnosis ..	249
- epistaxis in ..	295
- general pains in limbs in ..	503
- hæmaturia in ..	294, 303
- high blood-pressure in ..	90, 102, 239, 240, 303, 454
- hypothermia in ..	335
- irritability in ..	360
- micturition frequent in ..	437
- noises in the ear in ..	794
- of old people ..	14
- parenchymatous, obesity in ..	453, 454
- anæmia due to ..	36
- polyuria in ..	48, 102, 303, 331, 437, 583
- prolonged first sound at impulse in ..	454
- renal tube-casts in ..	454
- retinal changes in ..	102, 103, 240
- ringing aortic second sound in ..	454
- systolic bruit over mitral area in ..	102, 103
- thick radial artery in ..	240
- tortuous arteries in ..	303
- trace of albumin in ..	331
- urinary changes in ..	240, 331
- vertigo due to ..	828
- of young people ..	13
- subacute, anæmia in ..	39
- cachexia in ..	115
- chylous ascites with ..	126
- chyluria in ..	126
- Brightness perception, normal ..	835
- Brittleness of bones ..	213, 285
- of nails, onychorrhæxis ..	445
- Broca's area, aphasia from ..	683
- lesion of ..	337, 683
- situation of ..	683
- motor speech centre in ..	683
- Brocq, re pseudo-pelade ..	85, 780, 782
- re vesicles of herpes ..	830
- Bromide eruption, characters of ..	603
- diagnosis from small-pox ..	609
- Bromides, coma due to ..	137
- loss of taste due to ..	774
- ptialism due to ..	590
- vesicles from ..	834
- Bromidrosis, account of ..	714
- Bromine test for melanuria ..	821
- Bronchial breathing with bronchiectasis ..	193, 324, 703
- fibroid lung ..	232
- growth of lung ..	322
- infarction of lung ..	321

Bronchial breathing, contd.

- lobar pneumonia ..	186, 701
- in lung compression ..	332
- phthisis ..	319
- pleuritic effusion ..	193
- glands (see Lymphatic Glands, Bronchial) ..	
- Bronchiectasis, albuminuria in ..	18
- albumosuria in ..	20
- anæmia in ..	39
- aneurysm causing ..	324
- causes of ..	324
- cerebellar abscess from ..	644
- cerebral abscess from ..	98, 547
- Charcot-Leyden crystals in ..	118
- clubbed fingers in ..	99, 129, 703
- cyanosis from ..	186
- diagnosis from gangrene of lung ..	321, 703
- from epithelioma of bronchus ..	324
- with fibroid lung, diagnosis of ..	324
- foul breath in ..	99, 703
- taste in ..	774
- gangrene of lung in ..	287
- hæmoptysis in ..	318, 324
- heart failure from ..	61, 186
- indicanuria in ..	349
- inspissated mucus in ..	324
- lardaceous disease in ..	10, 696
- leucocytosis in ..	400
- from mediastinal new growth ..	121
- monoplegia due to ..	547
- multiple rigors from ..	651
- no elastic fibres in sputum in ..	703
- orthopnoea in ..	464
- osteo-arthropathy in ..	390
- part affected by ..	703
- periodical return of symptoms in ..	703
- cyanosis from ..	579
- physical signs of ..	193, 703
- polycythæmia in ..	579, 580
- rigors in ..	648, 651
- septic arthritis from ..	375
- shortness of breath with ..	579
- simulating gangrene of lung ..	288
- sputum in ..	99, 176, 321, 651, 703, 842
- vomiting from ..	842, 844
- Bronchitis, Curschmann's spirals in ..	179
- Bronchitis, albuminuria in ..	18
- ascites in ..	61
- asthma developing into ..	186, 582
- mistaken for ..	582
- blood streaks in sputum of ..	176
- capillary ..	465
- extreme dyspnoea from ..	642
- cyanosis from ..	186
- retraction of the head from ..	642
- sticky sputum in ..	175
- Charcot-Leyden crystals in ..	118
- chronic, clubbed fingers in ..	128
- albuminuria in ..	246
- ascites in ..	246
- enlarged liver in ..	246
- right ventricle in ..	245, 246
- frænum linguæ abraded in ..	320
- heart failure in ..	61, 186, 464, 525
- œdema of legs in ..	246
- pains in limbs in ..	503, 505
- palpitation in ..	525
- polycythæmia in ..	579, 580
- systolic murmur in ..	246
- tricuspid regurgitation in ..	246
- complicating asthma ..	467
- cough from ..	175, 176
- cyanosis in severe ..	186
- distinction from asthma ..	180
- and emphysema (see Emphysema) ..	
- epistaxis in ..	251
- fibrous or plastic ..	704
- fibroid lung and bronchiectasis from ..	324

Bronchitis, contd.

- fetid	99, 703
- abundant foul sputum in ..	703
- foul breath in	99
- taste in	774
- frequently a mistaken diagnosis	703
- in diacutia in	349
- leucocytosis in	400
- simulating gangrene of lung	287, 288
- hæmoptysis in 317, 318, 320, 324 ..	324
- in influenza	505
- insomnia in	356, 359
- in Malta fever	507
- orthopnea in	186, 464, 465
- pain in the chest in	480
- periodic cyanosis from	579
- physical signs due to	192
- plastic, casts in sputum in ..	704
- secondary to abscess of liver ..	409
- abscess of the lungs	649
- shortness of breath from 101, 579 ..	703
- simulated by pertussis	249, 467
- simulating asthma	176, 700, 704
- sputum in	778
- tenderness in the chest from ..	697
- in typhoid fever	407
- venous congestion of liver in ..	703
Bronchophony in bronchiectasis ..	246
- in fibroid lung	324
- with fibroid lung and bronchiectasis	324
- in lobar pneumonia	186, 701
- in phthisis	319
Bronchopneumonia, albuminuria in	17
- apical, diagnosis from phthisis ..	321
- caseous, lividity in	185
- chief incidence in children ..	321
- cough from	176
- cyanosis from	186
- diagnosis from general pulmonary tuberculosis ..	615
- diminished knee-jerks in 398, 557 ..	39, 119, 186
- emphysema with	642
- extreme dyspnoea from	324
- fibroid lung and bronchiectasis from	287, 712
- gangrene of lung in	317, 321
- hæmoptysis in	343
- hyperpyrexia in	321, 505
- influenza	321
- asthenia in	321
- relatively low fever in	321
- sticky rales at bases in	186
- and laryngeal obstruction ..	321
- after mouth operations	465
- orthopnea in	321
- with otitis media	122
- pleurisy with	615
- pneumococcal	609, 615
- prolonged pyrexia in	641
- retraction of the head in	321
- septic, diagnosis of	578
- gangrene of lung from	321, 578
- from lateral sinus thrombosis	578, 712
- pneumothorax from	321, 578
- from tongue carcinoma	101
- shortness of breath in	615
- streptococcal	318, 324
Bronchorrhœa, hæmoptysis in	324
- identity with bronchitis	140, 318, 322, 482
Bronchus, aneurysm of aorta rupturing into ..	578
- carcinoma of (see Carcinoma of Bronchus)	578
- emphysema rupturing into, causing pneumothorax ..	466
- foreign body in	324
- fibroid lung and bronchiectasis from	324

Bronchus, contd.

- irruption of caseous gland into	466
- parasitic infection of	318, 325
- pressure of mediastinal growth on	483
- stenosis of by aneurysm	236, 296, 322, 324, 474, 482
- bronchiectasis from	324
- carcinoma	324
- fibroid lung from	324
- foreign body	324
- gangrene of lung from 288, 712 ..	321
- Hodgkin's disease	321
- inspissated mucus	324
- list of causes of	324
- mediastinal new growth 324, 343 ..	324
- with mitral stenosis	118, 185, 322
- new growth	465
- orthopnea from	712
- pyopneumothorax from	288, 582
- in syphilis	325
- syphilitic disease, diagnosed from phthisis	324, 422, 773
- tuberculous bronchial glands	325
- ulceration of, hæmoptysis in ..	582
Bronzed diabetes (see Diabetes, Bronzed)	68
Broom tops, polyuria from	540
Brown-Séquard paralysis	664
- character of	361, 598
- crossed anæsthesia in (Fig. 181)	597
- diagram of physical signs of, (Fig. 142)	597
Brows, prominence in acromegaly	368
Bruising of skin in jaundice ..	597
- multiple in epilepsy, simulating purpura	597
- in some normal people	368
Bruit in aneurysm of celiac axis	193, 577
- d'airain with pneumothorax	711
- simulated by drips in thorax	105, 106
- de diable	41, 107, 333
- associated with congenital systolic bruit 101, 105, 106 ..	333
- in chlorosis	689
- over enlarged spleen	244
- exophthalmic goitre	108, 109, 234
- Flint's, in dilatation of left ventricle	41, 102, 101, 105, 106
- functional	333
- systolic pulmonary, in chlorosis	9, 10, 38, 240, 598, 649
- in fungating endocarditis ..	41
- hæmic, in chlorosis	252
- with high blood-pressure	107
- mid-diastolic	107, 245, 320, 580
- in mitral stenosis	333
- myocardial degeneration ..	255
- over eye with orbital aneurysm	181
- with patent ductus arteriosus ..	184, 579
- septum ventriculorum	107, 320, 580
- presystolic	110
- in tricuspid stenosis	247
- pulmonary incompetence ..	129, 184, 247
- stenosis	105
- systolic, in chlorosis	579
- rumbling systolic, in congenital pulmonary stenosis ..	236
- sometimes absent in congenital heart disease	38
- of stenosed superior vena cava ..	38
- sudden changes in, in fungating endocarditis	38

Bruit, contd.

- of tricuspid regurgitation ..	239
- in undue abdominal aortic pulsation	592
BRUIITS, CARDIAC	101, 613
- with acute cardiac dilatation	243
- endocarditis	76, 102, 103, 239, 613, 671
- in adherent pericardium ..	243
- with albuminuria	18
- aortic disease	138, 233, 234, 235, 236, 237, 240
- aortic and mitral distinguished	234
- in arterio-sclerosis	102, 103
- cerebral embolism	138, 563
- chronic bronchitis and emphysema	246
- nephritis	14, 102, 103
- chlorosis	41, 333
- congenital heart disease ..	129, 184, 244, 247, 579

-- simulated by diverticulitis ..	146, 152
-- -- local inflammatory lesions ..	727
-- -- omental tumour of ..	472
-- -- chronic peritonitis ..	472
-- -- spastic constipation ..	145
-- -- tuberculous peritonitis ..	724
-- -- simulating enlarged liver ..	406
-- -- spleen	729
-- -- movable kidney	727
-- -- tuberculous infiltration ..	146
-- -- spastic constipation with ..	145
-- -- splenic flexure affected by ..	499, 690
-- stricture due to (<i>Fig. 38</i>) ..	146
-- subcostal position of	393
-- subphrenic abscess from ..	578
-- swelling in umbilical region in	524
-- -- tenesmus due to	731
-- -- transverse colon affected by	406
-- tumour with	91, 146, 147, 394, 499
-- vesico-colic fistula from ..	146
-- visible peristalsis with ..	91, 147
-- vomiting with	153, 367
-- weakness and wasting with ..	91
- en cuirasse, secondary to breast cancer	802
- of duodenum	421
-- anaemia from	725
-- ascites with	59

Carcinoma of duodenum, contd.

-- bile-duct obstruction from ..	366
-- copious vomiting from ..	725
-- diagnosis from carcinoma of pancreas	266, 725
-- distended gall-bladder from	725
-- enlarged supraclavicular gland in	421
-- fatty stools in	265
-- gastrectasis from	725
-- hamatemesis from	725
-- jaundice from	362, 366, 725
-- loss of weight from	725
-- secondary in liver	279
-- simulating bile-duct carcinoma	725
-- -- enlarged gall-bladder ..	280
-- -- gastric carcinoma ..	725
-- -- portal fissure carcinoma ..	725
-- -- subphrenic abscess from ..	578
-- -- suppurative cholangitis from	725
-- swelling in epigastric and umbilical areas from ..	725
-- visible gastric peristalsis from	725
- of external auditory meatus ..	469
-- -- similarity to rodent ulcer	469
- of face, affection of lymphatic glands from	808
-- diagnosis from lupus vulgaris	449
-- -- syphilitic ulcer	449
-- -- pain from	808
- of fauces	420, 670, 673
-- enlarged submaxillary lymphatic glands in	420
- of eyelids	419
- of fingers	266
- of gall-bladder	421
-- biliary colic in	278
-- catch in breath on deep inspiration during pressure over gall-bladder in ..	499
-- cholangitis in	369
-- diagnosis from enlargement of gall-bladder ..	278
-- enlarged supraclavicular glands in	278, 421
-- gall-stones in	278
-- jaundice in	278
-- nodular outline in	278
-- pain in the right hychochondrium in	499
-- pyrexia in	278
-- rapid enlargement in ..	278
-- rectal shelf in	639
-- secondary deposits in left supraclavicular gland ..	278
-- -- in liver	278
-- tenderness over gall-bladder in	499
- of gum	419
-- bleeding gums in	86, 88
- of jaw, connection with decayed tooth	749
-- microscopic examination in diagnosis of	749
-- -- origin as an ulcer on gum ..	749
- of kidney	395
-- aching pain in loin in ..	395
-- Cheyne-Stokes respiration in	124
-- diagnosis from renal calculus ..	395
-- -- tuberculosis	395
-- early metastases in ..	395
-- enlarged supraclavicular glands in	421
-- extreme malignancy of ..	395
-- hæmaturia in	304, 307, 395
-- increased hæmaturia after movement in	305

Carcinoma of kidney, contd.

-- inferior vena cava obstruction from ..	826
-- liability to spread into renal veins and inferior vena cava ..	825
-- nodular enlargement of kidney in ..	395
-- origin from adrenal rests ..	395
-- polypus of heart due to ..	826
-- rarity of ..	395
-- renal colic in ..	395
-- enlargement in 391, 394, 395	395
-- symptoms of ..	307
of large intestine (see Carcinoma of Colon)	
of labium majus ..	423
of larynx ..	420
-- cyanosis from ..	185
-- diagnosis from syphilitic laryngitis ..	674
-- tuberculous laryngitis ..	673
-- dysphagia from ..	226
-- ulceration unilateral in ..	325
-- hæmoptysis in ..	318, 325
-- microscopic examination in diagnosis of ..	674
-- oedema of larynx in ..	466
-- sore throat from ..	670
-- stridor from ..	710
-- ulceration of, described ..	226
-- unilateral occurrence of ..	325, 674
of leg ..	812
of lip ..	403, 419
of liver ..	58, 60
-- absence of symptoms in 50 per cent of cases ..	412
-- age incidence of ..	412
-- ascites in ..	55, 60, 279, 413
-- albumosuria in ..	20
-- angioma simulating ..	414
-- from carcinoma of breast ..	743
-- colon ..	690
-- gall-bladder ..	278
-- œsophagus ..	223
-- rectum ..	636
-- stomach ..	351, 691
-- common sites of primary growth ..	279
-- commonest liver tumour ..	412
-- compression of lung by ..	667
-- death in coma in ..	413
-- diagnosis from cirrhosis ..	409, 410, 413, 722
-- gumma ..	370
-- hydatid disease ..	413, 415
-- impacted gall-stone ..	413
-- syphilis of liver ..	411, 413
-- enlargement of the liver often great and rapid in ..	412
-- extreme wasting in ..	413
-- frequent absence of symptoms of primary disease ..	412
-- impalpability of nodules ..	412
-- general account of ..	368
-- gradual exhaustion in ..	413
-- great enlargement of liver in ..	279
-- green jaundice characteristic of ..	368, 413
-- hard irregular edge of liver ..	412
-- nodules on liver in ..	412
-- hardness of liver in ..	279
-- jaundice in ..	60, 279, 362, 366, 368, 412, 413
-- leucocytosis in ..	413
-- liver enlarged in ..	60, 363, 368
-- movement with respiration ..	412
-- nocturnal rise of temperature in ..	362
-- occasional semi-fluctuant feeling from softening in ..	412
-- pain in the epigastrium in ..	486
-- hepatic region in about half the cases ..	412

Carcinoma of liver, contd.

-- pain in right hypochondrium in ..	499
-- shoulder in ..	412
-- primary, extreme rarity of ..	413
-- difficulty of diagnosis from secondary ..	413
-- growth in portal area in 90 per cent ..	412
-- rapid course of ..	413
-- symptoms similar to those of secondary ..	413
-- progressive wasting and weakness in ..	368
-- pyrexia in ..	362, 618, 623
-- rub from peritonitis over hypochondrium ..	412
-- simulating large gall-bladder ..	278
-- skin dry and shrivelled in ..	413
-- skodaic resonance due to sudden enlargement from hæmorrhage into ..	409, 412
-- umbilication of nodules in ..	279, 368, 409, 412
-- urinary changes in ..	413
-- mamme (see Carcinoma of Breast)	
-- melanotic ..	802
of nose ..	204, 420
-- epistaxis from ..	250
of œsophagus affecting lung ..	322
-- diagnosis from aortic aneurysm ..	296
-- dysphagia from ..	222, 484
-- enlarged cervical glands in ..	223, 296
-- the first sign in ..	421
-- erosion of aorta by ..	295
-- gangrene of lung in ..	288
-- hæmatemesis in ..	294, 295
-- hæmoptysis from ..	318
-- invasion of bronchus by ..	318
-- laryngeal paralysis in ..	296, 538
-- obstruction to trachea by ..	710
-- opening into pericardium ..	711
-- pain in ..	296
-- paralysis of vocal cord from ..	538
-- pneumothorax from ..	577
-- progressive dysphagia in ..	295
-- emaciation in ..	484
-- rapid wasting in ..	295
-- right supraclavicular gland enlarged in ..	421
-- secondary in liver ..	223
-- simulated by gastric carcinoma ..	299
-- stridor from ..	710
-- x-rays in diagnosis of ..	296
of ovary enlarged supraclavicular glands in ..	421
-- peritonitis with ..	57
-- secondary deposits in ribs ..	776
-- simulating sciatica ..	74
of palate ..	420, 640
-- palpable in inguinal region ..	731
of pancreas ..	421
-- absence of cholangitis with ..	725
-- sterobilin in faeces with ..	116
-- Cammidge's reaction with ..	59, 60, 116, 690
-- diagnosis from duodenal carcinoma ..	266, 725
-- pancreatitis ..	265
-- epigastric pain with ..	486
-- tumour from ..	366, 500, 724
-- fecal fat in ..	116
-- fatty stools with ..	59, 364, 366
-- gall-bladder enlargement with ..	59, 265, 280, 363, 366, 500, 690
-- glycosuria with ..	59, 366

Carcinoma of pancreas, contd.

-- inflammation of stomach in ..	59, 366
-- jaundice due to ..	280, 362, 363, 366, 500, 690, 724, 725
-- occult blood in faeces in ..	117
-- pain in right hypochondrium in ..	500
-- in left hypochondrium ..	726
-- pancreatitis secondary to ..	116
-- peritonitis with ..	57
-- portal glands affected in ..	366
-- position and characters of ..	366
-- secondary in liver ..	60, 279
-- supraclavicular glands enlarged in ..	421
-- transmitted pulsation in ..	59
-- wasting, anaemia and jaundice with ..	724
of penis ..	423, 677, 803
-- age incidence of ..	676, 677
-- deposits in femoral glands ..	734
-- description of ..	676
-- diagnosis from chancre ..	676, 677
-- gumma ..	677
-- inguinal glands enlarged in ..	423, 676, 677
-- liability to bleed ..	677
-- microscopic diagnosis of ..	676, 677
-- obscured by phimosis, slitting up of prepuce in diagnosis of ..	676
-- occurrence on site of previous ulceration ..	677
-- pain due to ..	516
-- site of origin of ..	676
-- sore due to ..	674
of perineum ..	423, 677, 678
-- development from scar ..	678
-- direct extension from anal or vulval growth ..	678
-- inguinal glands enlarged from ..	423, 678
-- hæmorrhage from ..	678
-- microscopic diagnosis of ..	678
-- ulcerated ..	678
of peritoneum , ascites in ..	57
-- colloid ..	57
of pharynx , enlarged submaxillary lymphatic glands in ..	420
-- enlargement of cervical glands in ..	420
-- sore throat in ..	670
of pleura , bloody effusion in ..	118
of prepuce ..	423
of prostate ..	307
-- characters of ..	441, 512
-- enlarged pelvic glands in ..	307
-- hæmaturia in ..	304, 311
-- infiltration of urethral mucous membrane in ..	512
-- micturition frequent with ..	440
-- nodulation and fixity of ..	307
-- pain in penis during micturition in ..	511, 512
-- perineum in ..	516
-- primary ..	307
-- rectal examination in diagnosis of ..	512, 638
-- relative frequency of ..	512
-- secondary deposits in cranial bones from ..	782
-- ribs ..	776
-- vertebrae ..	786
-- similar in many ways to adenoma ..	512
of rectum ..	473
-- absence of satisfaction after stool in ..	636
-- age incidence of ..	93, 636
-- bearing-down pain in ..	473

Carcinoma of rectum, contd.

- bladder infiltrated by 313, 624, 632
- cachexia from .. 93
- characters of .. 636
- constipation due to 147, 636
- diagnosis from polypus 635, 636
- diarrhoea in .. 636
- dyschezia from .. 150
- enlarged supraclavicular glands in .. 421
- explosive diarrhoea in .. 636
- faecal urethral discharge in 264, 313, 633
- hæmaturia in .. 305, 313
- hæmorrhage in .. 92, 636
- incontinence of feces in .. 347
- infection of inguinal, pelvic, or lumbar glands in 636
- with internal piles .. 635
- jaundice first symptom in 363
- malignant portal glands in 366
- microscope in diagnosis of 636
- micturition frequent in .. 438
- mucus in the stools in .. 636
- pain in penis after micturition in .. 513
- rectum and bottom of back in .. 636
- peritonitis with .. 57
- pyuria from .. 624, 632
- rapid emaciation in .. 636
- rectal examination in .. 636
- sciatica simulated by .. 74
- secondary deposits in liver from .. 60, 279, 636
- simulating acute Bright's disease .. 9
- situation of .. 636
- stricture of rectum from 636
- symptoms of .. 93
- talipes from .. 131, 132
- ulceration of rectum due to 635
- vesical irritability in .. 313
- villous, hæmorrhage in .. 93
- of ribs .. 776
- of scrotum .. 423, 679
- absence of testicular enlargement with .. 681
- characters of ulcer 679, 681
- in coal miners .. 679
- commencement as small nodule or wart .. 679
- diagnosis from hernia testis 681
- enlarged glands in groin in 423, 679, 765
- extension to testicles .. 679
- gas-workers .. 679
- occupation incidence of 679, 765
- simulated by suppurating sebaceous cyst .. 681
- in sweeps 679, 765, 803
- of sigmoid colon (and see Carcinoma of Colon) blood per anum in .. 731
- cachexia from .. 731
- intestinal obstruction from .. 501, 731, 735
- involvement of bladder 632
- sigmoidoscopy in diagnosis of .. 501, 735
- urethral passage of feces from .. 261
- of the skin, characters of (Fig. 210) .. 803, 811
- description of .. 449
- distinction from syphilide 803
- hæmorrhage from .. 803
- of spine, atrophic palsy of one leg from .. 543
- pain in arm in 491, 492, 493, 494
- mistaken for malingering 508
- simulating brachial neuritis 492

Carcinoma, contd.

- of splenic flexure (and see Carcinoma of Colon) absence of definite tumour in many cases of .. 690
- alternating constipation and diarrhoea in .. 690
- blood and mucus per rectum in .. 690
- diagnosis of enlarged spleen from .. 690
- intestinal obstruction from .. 690
- local perforation of .. 690
- growth usually annular 690
- resonance of tumour in .. 690
- secondary deposits in left supraclavicular glands in .. 690
- in liver in .. 690
- tumour in left hypochondrium in .. 690
- of stomach, abdominal tumour from 299, 351, 485, 713, 723
- acetouria in .. 4
- age incidence of .. 299, 713
- anaemia in 27, 37, 351, 691
- anorexia in .. 299, 351
- nervosa confused with 508
- appetite in diminished .. 50
- ascites with .. 59, 366
- band of resonance between liver and tumour .. 406
- bile-duct obstruction from .. 366
- blood count in .. 351
- in vomit in .. 691
- cachexia in .. 299
- cardiac end, interscapular pain in .. 474
- tenderness of lower dorsal spines in .. 474
- chemical analysis in .. 299
- "coffee-grounds" vomit in 299
- copious vomiting in .. 737
- diagnosis from cirrhosis of liver .. 301
- enlarged gall-bladder .. 280
- spleen 690, 726, 729
- gastric ulcer .. 816
- from dyspepsia .. 848
- pernicious anaemia .. 351
- spleno-medullary leukaemia .. 691
- diffuse type 123, 270, 299
- dilatation of stomach in 299, 351, 712, 846
- distaste for meat in .. 50
- dysphagia from .. 222, 351
- epigastric tumour from 723
- gastroscope in .. 299
- glands above left clavicle enlarged in 351, 421, 691
- hæmatemesis in 294, 298, 351
- HCl absent from vomit in .. 485
- diminished in 253, 351, 485, 691, 845, 846
- hysterical vomiting confused with .. 508
- "indigestion" in .. 351
- jaundice from .. 362, 366
- lactic acid in gastric contents in 351, 353, 846
- laparotomy in diagnosis of 352, 713, 848
- leaking .. 577
- leucocytosis in .. 691
- loss of weight in .. 351
- malignant portal gland in 366
- melæna in .. 351
- mesenteric glands enlarged in .. 422

Carcinoma of stomach, contd.

- movement with respiration 406
- multiple serositis in .. 123
- nausea, vomiting, and pain in .. 351
- early symptoms in 299
- obstructing œsophagus 223
- portal vein .. 692
- occult blood in vomit in 846
- Origin from simple ulcer 351, 713
- Oppier-Boas bacilli in stomach in 351, 353, 355, 845, 846
- pain aggravated by food in 485, 691
- in epigastrium in 484, 485
- an early symptom in 299
- left hypochondrium in 499
- and tenderness in the back from .. 789
- umbilical region in .. 524
- palpable in left hypochondrium .. 726
- peritonitis with .. 57
- physical signs of .. 690
- pneumothorax from 577, 578
- ptyalism in .. 591
- pyloric obstruction from 712
- pyrexia with .. 299
- rectal shelf in .. 638
- retroperitoneal glands enlarged in .. 422
- sarcinae in vomit in (Fig. 92, p. 267) .. 691, 846
- secondary deposits in cervical gland from .. 223
- at umbilicus from 351, 526, 716, 718
- growths in bone in .. 269
- in liver 279, 351, 691
- lung .. 322
- simulated by duodenal carcinoma .. 725
- dyspepsia .. 299
- enlarged spleen .. 690
- epithelioma of œsophagus .. 299
- gastritis .. 299
- phantom tumour .. 721
- simulating enlarged liver 406
- omental tumour of chronic peritonitis .. 472
- subphrenic abscess from 577, 578
- swelling in right iliac fossa due to .. 737
- umbilical region in .. 524
- vomiting in 351, 485, 691, 737, 843
- nature and time of .. 299
- wasting in .. 299, 737
- of suprarenal, ascites with .. 59
- diagnosis from enlarged gall-bladder .. 280
- of testis .. 421, 520
- age incidence of .. 766
- commoner than sarcoma 766
- dissemination via lymphatics .. 766
- duration of .. 766
- lumbar glands infected in 766
- malignant peritonitis from .. 718
- mesenteric and retroperitoneal glands, enlarged, in .. 422
- secondary deposits in cranial bones from .. 782
- vertebrae from .. 786
- supraclavicular glands enlarged in .. 421
- thickening of cord in 520
- of thyroid gland, age incidence of .. 791

Carcinoma of thyroid gland, contd.

- - - cervical glands enlarged from ..	792
- - - paralysis of vocal cords from ..	538, 792
- - - secondary deposits in cranial bones from ..	782
- - - - in ribs from ..	776
- - - - vertebrae from ..	786
- - - sex incidence of ..	791
- - - ulceration of trachea from ..	792
- of tongue ..	419, 812
- - age incidence of ..	812
- - from leucoplakia (Plate XI) ..	814
- - broncho-pneumonia in ..	321, 578
- - cervical glands enlarged in ..	420
- - diagnosis from gumma, therapeutic test in ..	420
- - - Wassermann's reaction in ..	420
- - distinction from syphilis ..	813
- - dysphagia due to ..	225
- - earache from ..	230
- - foul breath from ..	99
- - taste from ..	774
- - limited protrusion with ..	812
- - origin from superficial glossitis ..	812
- - position usually not median ..	420
- - positive Wassermann's reaction with ..	813
- - relation to chronic glossitis ..	812
- - sex incidence of ..	812
- - simulated by tuberculous ulcer ..	814
- - situation of ..	812
- - submaxillary lymphatic glands enlarged in ..	419
- - trismus simulated by ..	801
- of tonsil ..	420
- - not common ..	672
- - squamous-celled ..	670
- - submaxillary lymphatic glands enlarged in ..	420
- - ulceration of ..	672
- - unilateral ..	672
- of trachea, stridor from ..	710
- of urethra ..	209
- - great pain due to ..	767
- - painful micturition from ..	209
- - urethral obstruction resulting from ..	767
- of uterus, affecting body of, pregnancy almost impossible with ..	436
- - size of uterus with ..	434
- - vaginal discharge from ..	211
- - anuria in ..	15, 47
- - arising from fibromyoma ..	434
- - bladder infiltrated by ..	313, 624, 632
- - diagnosis from sloughing fibroid ..	759
- - dystocia from ..	229
- - foul discharge in ..	211, 435
- - frequent micturition with ..	435
- - friable hardness of ..	438
- - hæmaturia in ..	305, 313
- - histological diagnosis ..	431
- - metrorrhagia from ..	433, 435
- - metrorrhagia from ..	436
- - micturition frequent from ..	438
- - pain in inguinal regions in ..	510
- - ovarian regions in ..	510
- - radiating down legs in ..	510
- - pelvic swelling due to ..	757
- - pressure on rectum of, causing dyschezia ..	150
- - pyelitis from ..	625
- - pyonephrosis from ..	626
- - pyuria from ..	624, 632
- - sacralgia in ..	510
- - sciatica simulated by ..	74

Carcinoma of uterus, contd.

- - - simulating prolapse ..	587
- - - simulating renal tumour ..	393
- - - sterility due to ..	705, 706
- - - ureter involved in ..	625, 626
- - - urethral passage of faeces from ..	264
- - - urinous vaginal discharge in ..	313
- - - vesical irritability in ..	313
- - - vesico-vaginal fistula in ..	632
- of vagina ..	423
- - hæmaturia in ..	305, 313
- - infiltration of bladder in ..	313
- - inguinal lymphatic glands enlarged in ..	423
- - pain in perineum in ..	516
- - urine per vaginam in ..	313
- - vesical irritability in ..	313
- of vertebrae, paralysis of upper extremity from ..	555
- - lumbar, pain in testicle in ..	524
- of vulva ..	768, 771
- - difficulty of micturition ..	440
- - leukoplakia preceding ..	770
- - swelling due to ..	768
Cardiac asthma from fatty heart ..	241
- - branches of vagus, relation to cough ..	175
- - bruits (see Bruits, Cardiac) ..	
- - disease (see Heart) ..	
- - displacement (see Heart Impulse, Displaced) ..	
- - dullness (see Heart Dullness) ..	
- - dyspnoea, asthma mistaken for ..	582
- - failure (see Heart failure) ..	
- - hypertrophy (see Heart Enlarged) ..	
- - impulse (see Heart Impulse) ..	
- - irregularity (see Heart, Irregular) ..	
- - malformation (see Heart, Disease, Congenital) ..	
- - thrills (see Thrills, Precordial) ..	
Caries of bone, spontaneous fracture in ..	269
- - tuberculous ..	751
- - cervical (see Caries of Spine, Cervical) ..	
- dental (and see Neuralgia Minor) ..	419, 496, 497
- - abscess of antrum of Highmore from ..	502
- - alveolar abscess from ..	747
- - bleeding gums from ..	86, 87
- - canine, pain and tenderness in naso-labial area in (Fig. 132) ..	497
- - earache caused by ..	230
- - emphysema of antrum of Highmore from ..	204, 205
- - enlarged glands from ..	419, 708
- - submaxillary lymphatic glands from ..	419
- - fibrous epulis in association with ..	748
- - foul breath due to ..	99
- - taste due to ..	774
- - headache from ..	327
- - loss of weight due to ..	848
- - mercurialism from ..	86
- - neuralgia from ..	330, 496
- - trigeminal from ..	495

- - tooth in ..	496
- - the upper jaw from ..	502
- - pyalism due to ..	591
- - referred pain in ..	496
- - segmental areas in face in ..	497
- - relation to carcinoma of jaw ..	749
- - retracted gums from ..	641
- - stiff neck from ..	708

Caries, dental, contd.

- - stomatitis from ..	815
- - swelling of the face from ..	746
- - ulceration of the tongue from ..	813, 814
- - sicca ..	786
- of spine ..	474
- - age incidence of ..	785
- - atrophic palsy of one leg from ..	543
- - atrophy of one leg from ..	543
- - cervical ..	477
- - age incidence of ..	708
- - characteristic attitude in ..	708
- - diagnosis from post-pharyngeal abscess ..	673
- - occipital pain in ..	477
- - pain increased on movement ..	477, 494, 673
- - radicular pain in arm in ..	493
- - scoliosis from ..	708
- - severe pain in cervical spine in ..	673
- - sore throat in ..	673
- - stiff neck from ..	708
- - x-rays in diagnosis of ..	477, 708
- - colicky pains in ..	134
- - compression of cord by ..	561
- - without deformity ..	564
- - diagnosis of pachymeningitis from ..	563
- - occipital headache ..	477
- - from scoliosis ..	477
- - dwarfism from ..	214
- - gait in ..	181, 785
- - hyperaesthesia from ..	667
- - iliac abscess from ..	632
- - intercostal nerve pain in ..	478
- - interscapular pain from ..	474
- - knee-jerk exaggerated in ..	558
- - kyphosis from ..	181
- - larval disease in ..	10, 696
- - lordosis from ..	183
- - loss of sphincter control in ..	558
- - mistaken for hysteria ..	777
- - intercostal neuralgia ..	777
- - new growth simulating ..	564
- - pain in back from ..	476, 785
- - with prominence of spines in ..	475
- - epigastrium from ..	485
- - umbilical region in ..	525
- - paralysis of bowel and tympanites from compression in ..	432
- - upper extremity from ..	555
- - paraplegia due to ..	121, 181, 557, 561
- - Pott's curvature in ..	564
- - psoas abscess from ..	632, 733, 785
- - reflexes in ..	558
- - relative frequency of ..	385
- - rigidity over painful area in ..	477
- - of the spine from ..	474, 785
- - sacralgia in ..	510
- - signs of tuberculosis in ..	564
- - simulated by aneurysm ..	786
- - indigestion ..	351
- - malignant disease of vertebrae ..	786
- - phrenic neuralgia ..	479
- - rickets ..	785
- - simulating torticollis ..	167
- - spontaneous fracture in ..	270
- - stooping gait in ..	181
- - sudden, paraplegia in ..	270
- - swelling in right iliac fossa due to ..	737
- - over spine from ..	194, 474
- - tenderness in spine in ..	181, 474, 784, 785
- - transverse myelitis from ..	564

Caries of spine, conld.

- tuberculous, relative frequency of .. 385
- - x-rays in diagnosis of .. 181, 474
- spontaneous fracture from .. 269
- swelling of the face from .. 746
- of temporal bone, earache from .. 230
- Carnin bases, uric acid from .. 817
- Carotid aneurysm (see Aneurysm, Carotid)
- artery, internal, erosion from chronic tympanic suppuration .. 468
- pulsation in exophthalmic goitre .. 244
- pulses, unequal, with aortic aneurysm .. 236
- Carpal joints, hypertrophic osteo-arthropathy in .. 390
- Carplo-pedal spasm (see Spasm, Carpo-pedal)
- Carriers, typhoid, infected bile in .. 281
- Cartilage**, blackening in ochronosis .. 575, 822
- in embryoma of kidney .. 395
- erosion of (see Erosion of Cartilage)
- Caruncle, urethral, dyspareunia from .. 221
- vulval swelling due to .. 768
- Caruncule myrtiformes, red and swollen in gonorrhoea .. 769
- Castellani, re dhobie's itch .. 275
- Castor oil, taste in mouth from .. 774
- Castration, obesity after, 453, 454
- Casts**, intestinal, simulating tapeworm (*Fig. 123*) .. 444, 568
- renal, in acute nephritis .. 12, 311
- - albuminuria with .. 8
- - without .. 15, 16
- in arteriosclerosis .. 15
- bacilluria .. 615
- and cells, test for in oedema .. 457
- with chyluria .. 126
- haemoglobinuria .. 314
- high blood-pressure conditions .. 526
- importance in diagnosis of cause of albuminuria .. 61
- with infarction of kidney .. 314
- in kidney lesions causing haematuria .. 306
- lardaceous .. 10
- mitral regurgitation due to Bright's disease .. 240
- nephritis .. 466, 646
- - chronic .. 303
- - of old people .. 14
- - parenchymatous .. 454
- with pleuritic effusion .. 122
- in polyuria with albuminuria .. 584
- pyelitis and pyelonephritis .. 628
- uremia .. 329, 464
- in urine from inferior vena cava thrombosis .. 825
- - simulated by mucus .. 444
- varieties of (*Plate I*) .. 7
- in sputum .. 704
- vaginal .. 211, 220
- Catalepsy** .. 140
- dementia with .. 651
- melancholia with .. 651
- pupils in .. 594
- retraction of the head in .. 641
- risus sardonius in .. 651
- trismus in .. 801
- Cataract**, anterior polar from corneal ulceration .. 806
- - from opthalmia neonatorum .. 836
- blindness never total from .. 839
- congenital, nystagmus in .. 453

Cataract, conld.

- extraction, blue vision from .. 840
- - erythroptia from .. 840
- - monocular diplopia in .. 198
- Catarrh** of bile-ducts (see Bile-ducts)
- buccal and pharyngeal, cheilitis glandularis from .. 403
- duodenal, jaundice from .. 361
- - pancreatitis secondary to gastric (see Gastritis) .. 116
- nasal, epistaxis in .. 251
- epiphora in .. 250
- of pancreas (see Pancreatitis)
- small bowel, chronic diarrhoea from .. 197
- swelling of eyes and face caused by .. 459
- Catarrhal jaundice (see Jaundice, Catarrhal)
- laryngitis .. 465
- Catastrophe, abdominal, causes .. 472
- Catching cold, liability to in rickets .. 171
- Catheter** broken off in urethra .. 210
- coude, in prostatic enlargement .. 440, 441
- in diagnosing cause of pyuria .. 624
- distended bladder .. 730
- neuroses of bladder .. 443
- urethral stricture .. 439
- retained .. 206
- Catheterization**, acute epididymo-orchitis after .. 517, 518
- anuria from .. 49
- in distention, care needed in .. 440
- rigors after .. 647
- Cattle, anthrax from .. 603
- Cauda equina**, affections of, diagnosis from sciatica .. 487
- incontinence of faeces from .. 318
- talipes in .. 131
- tumour on, mode of onset .. 563
- of symptoms .. 563
- muscular atrophy in .. 74
- paraplegia from .. 561
- Caustic soda test for elastic fibres .. 701
- Cauterization in hypopyon ulcer .. 807
- Cautley's anosteoplasia .. 213
- Cavernitis**, gouty .. 516
- due to hematoma .. 516
- pain in the penis in .. 516
- syphilitic .. 516
- Cavernous sinus**, carotid aneurysm communicating with .. 764
- thrombosis (see Thrombosis of Cavernous Sinus)
- Cayenne pepper deposit in the urine .. 816
- Cattle's cramp .. 177
- Cellulitis**, acutely inflamed lymphatics in .. 455
- asymmetrical oedema from .. 455
- bacteriology in diagnosis .. 459
- of calf muscles, talipes from .. 132
- diagnosis from carbuncle .. 603
- gout simulating .. 455
- local infection causing .. 455
- lymphatic obstruction from .. 456
- of neck from actinomycosis .. 748
- oedema of face, neck, and arms from .. 459, 461
- orbital, cavernous sinus thrombosis due to .. 253, 254
- of pelvis (see Pelvis Cellulitis of)
- Central necrosis of bone (see Bones, Necrosis of)
- retinal artery, embolism of, ophthalmoscopic appearance of (*Plate VIII*) .. 463
- vein, thrombosis of, ophthalmoscopic appearance of (*Plate VIII*) .. 462, 839

Cephalalgia (see Headache)

- Cerebellar** artery thrombosis, ataxy in .. 68
- articulation .. 69
- ataxia of children, acute .. 68, 69
- - intention tremor in .. 800
- haemorrhage, vomiting with .. 847
- lesions, ataxy in .. 68
- deviation of eyes in .. 69
- nystagmus with .. 69
- occipital headache in .. 326
- reeling gait in .. 69, 277
- tremor in .. 795
- vertigo with .. 69, 827
- peduncle, superior, intention tremor from lesion of .. 800
- Cerebellum**, abscess of (see Abscess, Cerebellar)
- tumour of, ataxy from .. 68, 643
- Babinski's sign in .. 82
- bladder and rectal troubles .. 565
- exaggeration of tendon reflexes from .. 643
- gait in .. 565, 643
- headache with .. 565, 651
- head retraction from .. 641, 643
- hypothermia in .. 346
- knee-jerks increased in .. 565
- nystagmus with .. 453, 643
- optic atrophy and neuritis from .. 643
- paraplegia from .. 562
- pseudo-nystagmus in .. 452
- rectal trouble in .. 565
- vertigo due to .. 828
- vomiting with .. 565, 651
- Cerebral** abscess (see Abscess, Cerebral)
- anaemia, arteriosclerosis preventing .. 359
- aneurysm (see Aneurysm, Cerebral)
- congestion, epistaxis in .. 251
- cysts, headache in .. 327
- diplegia .. 154, 535, 686
- diseases, hyperpyrexia in .. 622
- vomiting in .. 328
- embolism (see Embolism, Cerebral)
- gumma, headache in .. 327
- haemorrhage (see Haemorrhage, Cerebral)
- hemisphere, left, with speech centres, diagram of (*Fig. 185*) .. 683
- inflammation, spastic paralysis of upper extremity from .. 547
- injuries, ataxy in .. 68
- - grave significance of hyperpyrexia in .. 622
- glycosuria after .. 292
- hemiplegia from .. 337, 338
- hiccough in .. 343
- monoplegia, talipes in .. 131
- softening, laryngeal paralysis with .. 539
- bilateral, apoplexy with hemiplegia from .. 563
- sensory disorders in .. 563
- or haemorrhage, paraplegia from .. 562
- hyperpyrexia in .. 344
- increase of deep reflexes with .. 796
- paralysis agitans simulated by .. 796
- progressive mental failure with .. 796
- sphincter trouble with .. 796
- syphilis (see Syphilis, Cerebral)
- thrombosis (see Thrombosis, Cerebral)
- vomiting (see Vomiting, Cerebral)

- Cerebritis, convulsions in .. 172
- Cerebrospinal fluid** .. 338
- in acute meningitis .. 563, 643
- albumin in, in intracranial inflammatory conditions .. 339
- in intraspinal inflammatory conditions .. 339
- bacteriological examination of .. 339, 340
- in cerebrospinal fever .. 598
- not coloured in jaundice .. 361
- cytological examination of .. 339
- from ear .. 468
- in encephalitis, and superior longitudinal thrombosis of meningitis .. 558
- general paralysis of insane .. 139, 269
- lymphocytosis in .. 339
- globulin, albumin, and nucleo-protein in .. 643
- hypertension of, in meningitis .. 338, 643
- lymphocytes in (see Lymphocytes) .. 338, 643
- meningococci in .. 310, 643
- normal and abnormal characters of .. 338, 643
- from nose .. 138, 203
- palsy of leg from syphilitic meningitis .. 544
- polymorphonuclear cells in acute meningitis .. 643
- pyrocatechin in .. 203
- reducing substances in .. 203, 613
- sugar, urea, proteins, choline in .. 339
- trace of globulin in normal .. 643
- trypanosomes in, in sleeping sickness .. 34
- tubercle bacilli in .. 643
- turbid in meningitis .. 338
- yellow in meningitis .. 338
- meningitis (see Meningitis, Cerebrospinal)
- Cerebrum**, abscess of (see Abscess, Cerebral)
- contracture from lesions of cortex .. 162
- paraplegia from congenital defect of cortex .. 558
- tumour of, anosmia from .. 669
- aphasia in .. 685, 686
- aura in .. 80
- bradycardia from .. 98
- Cheyne-Stokes respiration from .. 125
- coma in .. 136, 137
- convulsions in .. 160, 172
- not common in .. 173
- diabetes insipidus from .. 585
- diagnosis from abscess .. 623
- saturnine encephalopathy .. 139
- "ebb and flow" of knee-jerk in .. 399
- epileptic aura from .. 80
- frontal, alteration in character due to .. 798
- inattention due to .. 798
- incoherence due to .. 798
- loss of memory due to .. 798
- unilateral tremor due to .. 798
- hæmianopsia from .. 81, 235
- hæmorrhage into .. 341
- headache in 292, 327, 350, 477, 686, 847
- hemiplegia from 138, 310, 341
- hippus in .. 595
- hyperpyrexia in .. 344
- hypertension of cerebrospinal fluid in .. 338
- hypothermia in .. 346
- Cerebrum, tumour of, contd.**
- increased intracranial pressure in .. 686
- insomnia in .. 356, 358
- loss of knee-jerk in .. 398
- taste due to .. 774
- lymphocytosis in cerebrospinal fluid in .. 339
- nerve-deafness from .. 190
- occasional latency of .. 341
- optic neuritis in 98, 292, 341, 350, 477, 547, 565, 686, 782
- paralyses in .. 340, 341, 350, 547, 782
- pyrexia in .. 341
- signs of .. 173, 547
- simulated by arteriosclerosis .. 328
- simulating hysteria .. 798
- slow pulse in .. 782
- small pupil with retention of reflexes in .. 594
- subjective small sensations from .. 669
- temporary glycosuria from .. 292
- tender scalp in .. 781, 782
- tinitus from .. 794
- tremor in .. 795
- trigeminal neuralgia in .. 496
- of uncinate gyrus, anosmia from .. 669
- unilateral convulsions in .. 170
- exophthalmos due to tubercle in .. 254, 255
- vertigo from .. 341, 828
- vomiting in, 292, 336, 341, 350, 477, 686, 782, 844, 847
- unilateral headache in .. 326
- Cerumen** .. 467
- creaking noises in ear from .. 793
- deafness from .. 188, 190
- earache from .. 230
- Cervical adenitis** (see Lymphatic Glands, Cervical)
- caries (see Caries of Spine, Cervical)
- glands, enlarged (see Lymphatic Glands, Cervical)
- plexus, interference with by thyroid gland tumour .. 792
- rib (see Rib, Cervical)
- sympathetic, interference with by aneurysm .. 222
- paralysis (see Paralysis of Cervical Sympathetic)
- Cervico-brachial plexus and its branches (Fig. 145) .. 553
- Cervix uteri**, carcinoma of (see Carcinoma of Uterus)
- closure of, sterility due to .. 706
- congenital elongation of .. 586
- erosion of, metrorrhagia from .. 433, 435
- metrorrhagia from .. 436
- sacralgia from .. 509
- gonococci in .. 211, 769
- herpes of .. 830
- inflammation of .. 210
- long conical, causing dysmenorrhœa .. 219
- normal secretion of .. 210
- polypus of, simulating prolapse of uterus .. 587
- simulating prolapse while fundus is in normal position .. 587
- rigidity of, dystocia from .. 227
- Ceylon, odium tropicale in .. 705
- Champagne, explosive eructation of gas from .. 639
- priapism caused by .. 586
- Chance**, appearance of secondaries 4 to 6 weeks after .. 676
- balanitis with .. 676
- Chancre, contd.**
- characters of .. 675, 676
- common site .. 675
- development from soft sore .. 676, 738
- diagnosis from anthrax .. 693
- digital .. 268, 422
- enlargement of neighbouring glands 417, 419, 675, 676, 747
- of eyelid .. 419
- on face, less indurated than on penis .. 746
- marked surrounding œdema .. 747
- incubation period .. 675, 676
- of lip (Fig. 10) .. 86, 403, 746
- obscured by phimosis, diagnosis of .. 675, 676
- œdema of labium minus from .. 770
- penile sore due to .. 674
- on perineum .. 678
- scrotum .. 681, 765
- simulated by molluscum contagiosum .. 805
- epithelioma of vulva .. 769
- penis .. 676, 677
- gumma .. 677
- herpes genitalis .. 830
- soft sore .. 675, 676
- spirochæta pallida in (Plate XII, Fig. J, p. 696) .. 675, 678, 747, 769

- coma in ..	368, 410
- congenital syphilis and ..	365
- contraction of fibrous tissue in ..	409
- cramps in legs at night in ..	59, 300, 368
- delirium in ..	359, 368, 410
- diagnosis from carcinoma ..	409, 410, 413
- of stomach ..	301
- from enlarged liver due to obstruction of common duct ..	410
- splenic anæmia ..	42, 64, 411, 694, 696
- syphilis of liver ..	410, 411
- diazo-reaction in ..	198

Cirrhosis of liver, contd.

- diarrhoea in ..	197
- dilated venules on cheeks in ..	300, 410
- diminished appetite in ..	49
- distended abdominal veins in 59, 301, 409, 410, 826	
- drowsiness in ..	368
- dry, harsh skin in ..	410
- dyspepsia in ..	410
- enlargement of liver from ..	
- - spleen in 301, 368, 409	
- - enteritis in 301, 369, 409	
- - enteritis in ..	410
- - epistaxis in 251, 295, 300, 368, 696	
- - firm irregular edge in 368, 409	
- - frequent total absence of symptoms in ..	410
- - furred and tremulous tongue in ..	59, 368, 410
- - gall-bladder in ..	410
- - gastritis in ..	352, 410
- - general account of ..	300
- - pains in the limbs in ..	503
- - generally painless ..	409
- - Hanot's ..	410
- - absence of symptoms in ..	411
- - age incidence of ..	410
- - ascites rare and of evil omen in ..	411
- - chronic course of ..	410
- - clubbing of fingers in ..	411
- - diagnosis from spleno-megalic cirrhosis ..	369
- - enlargement of liver in ..	410
- - familial character of ..	369
- - firm, smooth liver in ..	410
- - hemorrhages in ..	411
- - jaundice in ..	369
- - liver firm and smooth in ..	410
- - long-standing jaundice in ..	410
- - periods of illness with pyrexia in ..	411
- - prominence of abdomen in ..	411
- - sex incidence of ..	410
- - smoothness of liver in ..	410
- - splenic enlargement in ..	410
- - stunting of growth in children with ..	410
- - hæmatemesis due to, 40, 60, 294, 296, 300, 302, 368, 410, 696	
- - hæmorrhages in ..	694
- - hæmorrhoids in ..	368
- - hobnail irregularities in ..	409
- - hypertrophic biliary (see Cirrhosis of Liver, Hanot's)	
- - icteric conjunctiva in ..	59
- - impairment of strength in ..	410
- - infantilism from ..	215
- - insomnia in ..	359
- - jaundice in, 40, 60, 301, 362, 363, 368, 410, 696	
- - liver changes in ..	59
- - loss of appetite in ..	59, 300
- - weight from ..	848
- - in malaria ..	371, 410
- - melæna in 300, 368, 410, 696	
- - menorrhagia in ..	428
- - meteorism in ..	432
- - morning sickness in 300, 368, 410	
- - motions in ..	409
- - muscular atrophy in ..	76
- - nervous symptoms in ..	410
- - oedema of ankles in ..	410
- - œsophageal varix in ..	296
- - pain from perihepatitis in ..	409
- - pancreatitis from ..	116
- - passive hyperæmia of uterus from ..	430
- - perihepatitis in ..	409
- - peripheral neuritis in ..	76
- - phthisis complicating ..	295
- - pigmentation in ..	40, 59

Cirrhosis of liver, contd.

- polyuria in ..	582
- prolonged pyrexia due to ..	609
- purpura in 596, 599, 696	
- pyrexia due to ..	40, 362, 368, 410, 609, 623
- rapid death after onset of ascites in ..	413
- red nose in ..	410
- roughness and hardness of liver in 301, 368, 409	
- sallow complexion in ..	410
- sex incidence of ..	410
- simulating malignant disease ..	722
- simulation by tuberculous peritonitis ..	719
- slow diminishing of liver dullness in late stages ..	404
- smoothness in early stages ..	409
- splenic enlargement in 59, 302, 692, 695, 696	
- - splenomegalic ..	369
- - age incidence of ..	693
- - anæmia in 369, 693, 694	
- - ascites in ..	693
- - clubbed fingers in 369, 694	
- - diagnosis from Hanot's cirrhosis ..	369
- - early age incidence of ..	369
- - enlargement of liver in ..	369
- - familial character of ..	693
- - hæmatemesis in 369, 694	
- - hæmorrhages in ..	694
- - jaundice in ..	369, 693
- - lack of development in ..	693
- - long course of ..	691
- - relation to Banti's disease ..	694
- - - splenic anæmia 411, 691	
- - - spleen enlarged 302, 692, 693, 696	
- - stunted growth in ..	369
- - telangiectases in ..	59
- - in terminal stage of splenic anæmia ..	411
- - tremulous tongue in 368, 410	
- - tympanites in ..	410
- - urinary changes in ..	410
- - urobilinuria in ..	818
- - uroerythrin in urine in ..	819
- - varicose abdominal veins 826	
- - vomiting in 300, 368, 410, 843	
- - wasting in ..	69, 410, 848
- - weight of liver in ..	409
- of lung, clubbed fingers in ..	129
- - fibroid lung and bronchiectasis from ..	324
- - hæmoptysis in ..	317, 319
- - occupations tending to ..	319
- - tubercle bacilli in sputum ..	319
- of pancreas, Cammidge's reaction in ..	116
- - fat globules in fæces in ..	117
- - Cirsoid aneurysm (<i>Plate XIV</i>) ..	764
- - Citrates, transient polyuria ..	581
- - Clark, Andrew, re hæmoptysis in arthritic subjects ..	318

Claudication, intermittent,

- age incidence of ..	489
- - arterial pulsation in legs absent in ..	489
- - cerebral atheroma ..	340
- - diagnosis from erythromelalgia and Raynaud's disease ..	490
- - excessive smoking in ..	489
- - gangrene in ..	489
- - hemiplegia from ..	340
- - local temporary insufficient blood supply in ..	489
- - myokymia in ..	490
- - pain in legs after walking ..	489
- - - relief by rest ..	489
- - pallor of foot in ..	489

Clavicle , affection in yaws ..	449
- myeloid sarcoma of ..	756
- prominence of one in phthisis ..	319
- rudimentary ..	213
- swelling on, syphilitic ..	752
Clavus hystericus 166, 329, 506, 798	
CLAW-FOOT (<i>Fig. 29</i>) ..	126
- paralysis of internal popliteal nerve causing ..	543
CLAW-HAND (<i>Fig. 30</i>) ..	127
- from cervical rib ..	493
- chronic poliomyelitis ..	165
- neuropathic muscular atrophy ..	159
- progressive muscular atrophy ..	73, 127, 165
- - syringomyelia ..	285, 554
- - in transverse myelitis ..	74
Cleft palate , dysphagia due to ..	225
- - harelip associated with ..	640
- - regurgitation of food through the nose in 202, 640	
Cleido-cranial dysostosis, dwarfism with ..	213
Clergymen, chronic pharyngitis in ..	670, 673
Climacteric, flushing at the ..	268
Climbing-up-himself posture of pseudo-hypertrophic paralysis ..	560
Clitoris , elongation of in pseudo-hermaphroditism ..	706
- epithelioma of, enlargement of inguinal glands in ..	423
- hypertrophied in hypernephroma ..	455
- leukoplakia of ..	770
- priapism of ..	585
Clonic contractions in Bright's disease ..	160
- - myoclonus and paramyoclonus multiplex ..	161
- - pregnancy ..	160
- - torticollis ..	161
- - convulsions in Jacksonian epilepsy ..	161
- - spasms, mild, in cases of major epilepsy ..	160
Clonus, account of ..	160
- - ankle (see Ankle-clonus)	
- - influence of parathyroid glands on ..	161
- - patellar (see Patellar Clonus)	
Clots in urine ..	305
CLUBBED FINGERS (<i>Fig. 31</i>) ..	128
- - accompanying cyanosis ..	184
- - in bronchiectasis ..	18, 99, 324, 703
- - cirrhosis ..	369
- - congenital heart disease ..	129, 579, 790
- - empyema ..	99
- - fibroid lung 18, 193, 246, 324	
- - Hanot's cirrhosis ..	411
- - hypertrophic osteoarthropathy ..	390
- - with patent interventricular septum ..	129
- - pulmonary stenosis 104, 129	
- - seldom present in persistent ductus arteriosus ..	579
- - splenomegalic cirrhosis ..	369, 694
- - and toes in congenital heart disease ..	244, 247
CLUB-FOOT (see Talipes)	
Coachman, Dupuytren's contracture in ..	167
Coagulation time of blood, effect of calcium salts on ..	430
- of urine, spontaneous ..	126
Coal gas poisoning, coma in ..	138
- - miners, anthracosis in ..	319
- - epithelioma of scrotum in ..	679

Cocaine, palpitation from	525, 527	<i>Coli-bacilluria, contd.</i>		<i>Colic, contd.</i>	
- in diagnosis of asthma	582	- rigidity of the abdomen in	646	- laparotomy may be required	
- spray in laryngoscopy	226	- trace of albumin with	576, 848	- in diagnosis of	645
- tremor from	795, 797	COLIC	133	- pancreatic	365
Cocainism, palpitations worse		- abdominal pain over colon in	136	- signs and associated	
when drug is not being		- referred to as	133	- symptoms of	135
taken	527	- rigidity with	645	- in plumbism	58, 77,
- multiple prick marks on body	527	- wall in	133, 134, 645	144, 473, 500, 507, 798	
Cocci in pustules	601	- absence of leucocytosis in	645	- pulse in	472, 645
Cocosa, oxaluria from	471	- in alcoholism	136	- pyrexia in	645
- polyuria from	581	- appendicular	134	- renal	47
Coccydynia, movements of		- in arsenical poisoning	75	- causes and associated	
coccyx painful in	638	- atonic constipation	143	- symptoms of	135
Coccyx, bed sore over	283	- biliary	135, 509	- characteristic tendency to	
- fracture of, felt per rectum	638	- absence of jaundice with	846	pass down into groin	500
- rectal examination of	635	- in acute pancreatitis	153	- constipation in	153
Cod-liver oil, taste in mouth		- areas of tenderness in	779	- diagnosis from appen-	
- from	774	- constipation in	153	dicitis	500
Coeliac axis, aneurysm of (see		- with gall-bladder tumours	392	- lead colic	500
Aneurysm of Coeliac Axis)		- from gall-stones	152, 278, 363	- distribution of pain in	308
Coffee-drinking, pseudo-angina		- jaundice with	153, 846	- due to passage of blood	
from	482	- pain in the chest with	846	clots down ureter	305, 395
- gastritis from	297	- in the right hypochon-		- gravel in urine in	500
- insomnia from	356, 358	drium in	500	- hæmaturia with	
- oxaluria from	471	- upper part of abdomen		153, 306, 395, 500	
- palpitation from	525, 527	- with	846	- in hypernephroma	395
- transient polyuria from	581	- patient rolling about in	644	- kidney tumours	307
Coffee-ground vomit in gastric		- radiation of pain to back		- malignant kidney tumour	395
carcinoma	299	and right shoulder in	500	- micturition frequency of	
- ulcer	298	- shivering in	135	in	488, 516
- (and see Hæmatemesis)	293	- simulation by renal colic	500	- mode of production in	
Coffin-lid crystals of triple		- urates after	500	renal calculus	627
phosphate (Fig. 155)	573	- vomiting with	846	- from movable kidney	310
Cohnheim, re end-arteries	286	- from carcinoma of bowel	91, 147	- pain in the groin from	846
Coin œsophagus obstructed by	222	- in colitis	501	- loin from	846
- sound on percussion over		- collapse from	645	- penis in	516
subperitoneal abscess	501	- diagnosis of cause of	136	- right hypochondrium in	500
- in pneumothorax	577	- organic disease from	133	- testicle from	846
Coitus, causes of hæmorrhage in	434	- from peritonitis	644	- patient rolling about in	644
- excessive, menorrhagia from	428	- in dysentery	501	- pyrexia in	500
- fracture of penis during	123	- facies of	133	- in renal calculus	308, 627
- painful (see Dyspareunia)	221	- intense abdominal pain in	645	- tuberculosis	309, 626
Colcott Fox, re vacciniiform		- intestinal	472	- simulating biliary colic	500
ecthyma of infants	446	- abdominal distention in	473	- simulation by abdominal	
Cold bath, amenorrhœa due to	23	- in children, drawing up		neuralgia	473
- menorrhagia from	428	of legs in	473	- biliary colic	500
- chilblains from	810	- cold sweating in	472	- twisting of pedicle of	
- common (and see Coryza;		- contraction in	134	ovarian cyst	392
and Discharge, Nasal)		- all degrees of pain in	472	- spasmodic pelvic pain in	509
- acute nasal catarrh in	668	- diagnosis from pain due to		- vomiting with	500, 844, 846
- anosmia in	668	retained testis	740	- in spastic constipation	144
- inflammation of soft palate,		- from faecal accumulations	393	- sudden onset of	615
uvula, and fauces in	672	- due to flatulence	267	- use of term by patients	133
- loss of taste due to	774	- in Henoch's purpura	90, 690	Colic-like pains in dysmenor-	
- micrococci catarrhalis		- due to indigestible food	136, 473	rhea	219
causing	203	- infantile	357	Colitis, abdominal tenderness in	134
- œdema about face, neck,		- intestinal obstruction	473, 571	- acute, diarrhœa in	196
and arms from	459, 461	- in chronic intussusception	148	- symptoms of	196
- simulated by measles	203	- nausea, eructations and		- tenesmus in	196
- excessive, coma from	137, 159	borborygmi in	473	- blood and mucus in stools	
- exposure to, hæmoglobinuria		- in organic stricture of		from	197, 501
arising from	315	intestine	146	- catarrhal, constipation as-	
- stiff neck from	708	- pain spreading from		sociated with	144
- extreme, gangrene from	282	- umbilicus in	473	- characteristics of faeces in	134
- febrile, spoken of as influ-		- palpable contracted bowel		- chronic, anæmia in	39
enzal	203	with	134	- colicky pains in abdomen in	501
- rigors in	647	- paroxysmal recurrent pain		- diarrhœa in	134, 501
- and heat, effect on mictu-		in	472	- indicanuria in	349
rition of	581	- patient rolling about in	611	- loss of weight due to	848
- influence on myoma cutis	805	- persistence of borborygmi		- membranous, indicanuria in	319
- muscular twitchings from	157	with	615	- mucus casts in (Fig. 123)	441
- nephritis from	13	- pulse in	472	- muco-membranous, blood	
- sense of, in syringomyelia	664	- due to purgatives	114	per rectum in	727
- sheets at bedtime causing		- relief of pain by pressure	473	- casts of bowel in (Fig. 123)	441
cough	175	- restlessness in	473	- constipation in (Fig. 37)	
- stage of malaria	35	- rigidity of abdomen in	473	- enterospasm in	145, 727
- tremor from	794, 795	- shrieking from	472	- mucous colic and	486
- ulceration of the leg from	810	- simulating cramps	177	- mucus in the stools from	727
Coli-bacilluria	16	- dysmenorrhœa	220	- sex incidence of	727
- etiology and symptoms	82, 83	- perforative peritonitis	615	- simulated by plumbism	486
- little obvious pus with	576	- spasmodic pelvic pain in	509	- simulating tape-worm	567
- loss of weight in	848	- temperature in	472	- tenderness in right lum-	
- pus corpuscles in the urine		- visible peristalsis in	473	bar region from	727
from	848	- vomiting in	645		

Colitis, contd.

- mucous, characteristics of	
- faeces in	134
- - intestinal sand in	652
- mucus in stools with	144
- pain in left iliac fossa in	501
- - right iliac fossa in	134, 135
- - and tenderness in the back from	789
- pus in the stools in	601
- sigmoidoscope in 91, 92, 196, 501	
- simple, of infants, blood per anum and other symptoms in	92
- tenesmus in	501
- tetany in	3
- ulcerative, abdominal pain and tenderness in	92
- - albumosuria in	20
- - blood per anum in 91, 92, 727	
- - death from	727
- - enlarged mesenteric glands in	422
- - indicanuria in	349
- - leucopenia in	401
- - mucus in the stools from	727
- - painful diarrhoea with	727
- - palpable sigmoid flexure in	735
- - pneumothorax from	578
- - pyrexia with	92, 727
- - subperitoneal abscess from	578
- - tenderness in the right lumbar region from	727
- - tenesmus in	91
- - ulceration of rectum in	635
- - vomiting in	727
- - wasting from	69, 727
Collapse from abdominal injury	645
- acute intestinal obstruction	153
- - pancreatitis	292, 724
- - angina pectoris	481
- - anuria with	45, 49
- - in arsenical poisoning	92
- - colic	133, 135, 645
- - corrosive poisoning	297
- - gall-stone colic	363
- - gangrenous appendicitis	484
- - hypothermia in	346
- - in intestinal obstruction	346
- - intussusception	92
- - from loss of fluid	580
- - in pancreatic hæmorrhage	292
- - from perforated duodenal ulcer	484
- - gastric ulcer	484, 721
- - in peritonitis	346
- - phosphorus poisoning	373
- - from rupture of aortic aneurysm	482
- - extra-uterine gestation	436, 760
- - after severe diarrhoea	346
- - hæmorrhage	346
- - vomiting	346
- - and shock in acute intestinal obstruction	153
- - sudden, in myocarditis	241
- Colliers, verruca necrogenica in	266
Colloid carcinoma of peritoneum	57
- - of colon	735
- - miliary, account of	805
Coloboma of the choroid, ophthalmoscopic appearance of (<i>Plate VII</i>)	461
- - iris	462
- - lens	462
- - macular, nystagmus with	836
- - of the optic disc	462
Colon , affection by bullous eruptions	88
- - ascending, palpable	726
- - atony of	149

Colon, continued.

- bacillus (see <i>Bacillus Coli</i>)	
- carcinoma of (see <i>Carcinoma of Colon</i>)	
- - congenital idiopathic dilatation of (see <i>Hirschsprung's Disease</i>)	
- - dilated, gastrectasis simulated by	714
- - in acute obstruction of	152
- - diverticula of (see <i>Diverticula of Colon</i>)	
- - faecal accumulations in (see <i>Faecal Accumulation</i>)	
- - greedy, as cause of constipation	143
- - inflammatory attacks of, constipation due to	727
- - - local pain and tenderness due to	727
- - - vomiting due to	727
- - kink of, causing constipation	147
- - malignant disease of (see <i>Carcinoma of Colon</i>)	
- - normal, situation of	722
- - obstruction, character of	571
- - visible peristalsis in	114
- - pemphigus, etc., of	114
- - post-dysenteric ataxy and paresis of, diagram of	144
- - pressure on, causing dyschezia	150
- - resonance in tumour of kidney	367
- - scybala in transverse	724
- - sigmoid, cachexia from tuberculosis of	731
- - carcinoma of (see <i>Carcinoma of Colon</i>)	
- - dilatation of, in congenital dilatation of colon	735
- - - succussion sounds in	711
- - faecal accumulations in	393
- - normal situation of	722
- - pain in left iliac fossa from kinking of	501
- - palpable in left inguinal region	731
- - - normally	731
- - - sigmoid flexure in congenital dilatation of	735
- - - in ulcerative colitis	735
- - spasm of, constipation due to	145
- - spasmodic contraction of transverse (see <i>Enterospasm</i>)	
- - stricture of, due to cicatrization	146
- - transverse, normal situation of	724
- - rarity of tumours in	724
- - tuberculosis of, cause of swelling in right lumbar region	727
- - - stricture from	146
- - - tumour from	723, 724
- - tumour of (see <i>Carcinoma of Colon</i>)	
- - ulceration of (see <i>Colitis, Ulcerative</i>)	
Colour blindness	840
- - due to alcohol	837
- - congenital	840
- - nystagmus in	453
- - from optic atrophy	840
- - tobacco	836, 837, 840
- - index of blood, varieties of	26
- - ankylostomiasis	570
- - aplastic anæmia	42, 64
- - in carcinoma of stomach	352
- - chlorosis	41
- - congenital heart disease	579
- - leukæmia	32
- - pernicious anæmia	64, 302, 352, 616
- - polycythæmia	580

Colour, contd.

- vision, normal characters of	835
COMA	136
- - absent in Jacksonian epilepsy	161
- - in acute diabetes	292
- - - encephalitis	643
- - - yencephalitis	370
- - from alcohol poisoning	346
- - - difficulties in diagnosing	138
- - - anæsthetics	346
- - anuria	46, 48
- - with apoplexy	173
- - Babinski's sign in	82
- - from carbolic acid	346
- - carcinoma of liver	413
- - in cerebral conditions, diagnosis from diabetic coma	292
- - - hæmorrhage	138, 337
- - - from chloral poisoning	346
- - in cholæmia	361
- - cirrhosis of liver	368, 410
- - - diabetic	4, 292
- - - preceded by vomiting	843
- - from embolism	237, 699
- - encephalitis	558
- - in epilepsy	160, 646
- - excess of urea in cerebro-spinal fluid in uræmic	339
- - in fatty heart	241
- - from fractured spine	286
- - in general paralysis of the insane	340
- - hysterical trance	137, 140
- - incontinence of faeces in	347
- - in malaria	35
- - Ménière's disease	828
- - meningitis	642
- - at onset of acute fevers	646
- - in opium poisoning	345, 346
- - from oxalic acid	346
- - in phosphorus poisoning	373
- - from pontine hæmorrhage	344, 345
- - post-epileptic	171
- - stertor in	707
- - in Stokes-Adams' disease	97, 527
- - superior longitudinal sinus thrombosis	643
- - in tuberculous meningitis	174
- - uræmic	48, 172, 339, 464
- - after urinary operations	49
Combined degeneration of the cord, subacute	493
- - sclerosis of the cord, effects of	164, 667
- - - paraplegia from	561, 667
- - - (and see <i>Paraplegia, Ataxic</i>)	
Comedones in acne	530, 604, 609
Competitions, physical and mental, transient polyuria caused by preparation for	581
Complexion , florid and mottled, in Mongolian idiocy	263, 264
- - sallow in cirrhosis of liver	410
- - congenital syphilis	259
- - general congestion of liver	407
- - myxœdema	259
- - - tabes	262
- - tropical abscess of liver	369
Compositor's cramp	177
Compressed-air illness (see <i>Caisson Disease</i>)	
Compression of brain, coma due to	137
- - of cord, causes of	561
- - - partial, simulating primary lateral sclerosis	565
- - - transverse myelitis from	564
- - of lung (see <i>Lung, Compression of</i>)

- insensitiveness of, from paralysis of fifth nerve... 807

- opacities of, in congenital syphilis... 259

- from interstitial keratitis... 806

- in keratomalacia... 807

- from ophthalmia neonatorum... 836, 839

- paralysis of fifth nerve... 807

- from ulceration... 806

- perforation of, in diphtheria infection... 807

- gonococcal infection... 807

- from ophthalmia neonatorum... 836

- by ulceration... 806

- rodent ulcer of (see Mooren's Ulcer)

- steamy in glaucoma... 840

- insensitive in glaucoma... 838

- tuberculous ulceration of... 808

- ulceration of (see Ulceration of Cornea)

Corneal affections, photophobia in... 574

- reflex in facial paralysis... 535

Cornet player's cramp... 177

Cornwall, ankylostomiasis in... 570

Corona veneris... 532

Coronary arteries, angina pectoris due to sclerosis of 778

- atheroma of, violent thumpings of heart with... 527

- mistaken for rheumatism of the shoulder... 778

- pain and tenderness in the back from... 789

- Stokes-Adams' syndrome from... 97

Corpora quadrigemina, intention tremor from lesion of... 800

- tumour of, loss of convergent accommodation with retention of light reflex in... 594

Corpus cavernosum, inflammation of... 125

- luteum, hæmorrhage from, pelvic hæmatocele from... 757

- hæmorrhagic cyst of, pelvic pain from... 508

- striatum, hyperpyrexia from lesions of... 346

Corpuscles, red, increase of (see Polycythæmia)

- nucleated (*Plate II, Fig. F*)... 28

- variation in shapes and sizes of (*Plate II*)... 28

- white (see Leucocytes)

Corrigan's pulse... 106

Corrosive poisoning, œsophageal stenosis from... 222

- hæmatemesis in... 294, 297

- loss of taste from... 774

- sore throat from... 671, 674

- symptoms of... 297, 845

- vomiting from... 843

- sublimate test for bile in stools... 197

Coryza, acute, pains in the limbs in (and see Discharge, Nasal; and Cold, Common) 503, 505

- in arsenical poisoning... 75

- congenital syphilis... 446

- e feno, or hay fever, loss of smell in... 668, 774

- impairment of taste from... 775

- in influenza... 505

- from iodides... 87

- in measles... 426

- various causes of... 203

Costermongers, chronic pharyngitis in... 670, 673

Cotton, relation to actinomycetes... 88, 705

- sporotrichosis from... 322

- wool in ears, otorrhœa from... 465

- eczema from... 469

Coudé catheter... 440, 441

COUGH... 174

- in asthma not the essential symptom... 582

- Charcot-Leyden crystals in... 118

- due to chronic pleurisy... 480

- dry, due to growths... 175

- early in phthisis... 101, 620

- epistaxis from... 250

- in fibroid lung... 246

- hæmoptysis from violent... 317

- incessant, in phthisis... 194

- in influenza... 505

- interference with, by laryngeal paralysis... 538, 539

- in mediastinal growth... 483

- micrococcus catarrhalis in, in influenza... 505

- mitral regurgitation... 238

- morning, in bronchial catarrh 176

- oedema of face, neck and arms from... 459, 461

- onset of pneumothorax during... 480

Cough, contd.

- pain in the chest due to ..	480
- painful, in phrenic neuralgia ..	473
- paroxysmal, in whooping cough ..	467
- in phthisis ..	
101, 176, 185, 319, 577, 620	
- pneumonia ..	175, 176, 372
- relation to gastric branches of vagus ..	175
- severe epigastric pain from ..	485
- tenderness in the epigastrium from ..	779
- vomiting from ..	467, 844
- Coughing in diagnosis of inguinal swellings ..	740
- Cousins, marriage of, retinitis pigmentosa from ..	838
- Cracked nipples, mastitis from ..	743
- Cracked-pot sound in fibroid lung ..	246
CRACKLING, EGG-SHELL ..	177
- over myeloid sarcoma ..	756
CRAMPS ..	177
- abdominal (see Colic) ..	
- in alcoholism 59, 78, 238, 300, 368	
- differentiation of contractions from ..	153
- from contractures ..	163
- peripheral neuritis ..	78, 505
- dull, aching pain after cessation of spasm in ..	494
- painful spasm in ..	494
- professional, ill-health a cause of ..	177
- from local injury ..	177
- in syringomyelia ..	664
- typist's (see Occupation Neuroses) ..	
- writer's, (see Occupation Neuroses) ..	
- Cranial nerve paralyses, muscular atrophy in ..	75
- - - ptosis in ..	590
- - - syphilitic, multiple asymmetrical ..	640
- Craniotabes in congenital syphilis ..	782
- crepitus with ..	179
- egg-shell cracking in ..	177
- Cranium (see Skull) ..	
Creatinine ..	4
- darkening with picric acid ..	290
- oxalates derived from ..	471
- in urine, reduction by ..	290
- Cremaster muscle, spinal nerve root supplying ..	543
- Crenated red corpuscles (<i>Plate II, Fig. D</i>) ..	28
- Creosote, foul taste from ..	774
Crepitations in pneumonia ..	186, 701, 702
- mediastinal, in acute mediastinitis ..	483
- in endosteal sarcoma ..	756
- fractured rib ..	776
- subcutaneous (see Emphysema, Surgical) ..	
- Crescents, congenital myopic pigmented, ophthalmoscopic appearances of (<i>Plate VII</i>) ..	461, 462
Cretinism, amenorrhœa in ..	23
- delayed walking from ..	557
- facies of ..	258
- fatty pads on shoulders in ..	259
- hair and skin in ..	259
- hypothermia in ..	259, 345
- illustrated (<i>Fig. 67</i>) ..	216
- lack of mental development in ..	259
- paraplegia due to ..	556, 557
- pendulous belly in ..	259

Cretinism, contd.

- relative largeness of head in ..	258
- slow pulse in ..	259
- stunted growth in ..	258
- thyroid extract in ..	216, 557
- Crick in the neck ..	477
Crises, gastric ..	184, 847
- - periodicity of ..	847
- - in tabes dorsalis 134, 350, 473, 489, 562, 664, 665, 844, 847	
- - diagnosis from indigestion ..	350
- intestinal ..	134
- laryngeal ..	466
- in lobar pneumonia ..	186
- pyrexial in meningococcal meningitis ..	642
- in typhus fever ..	371
- Crossed hemiplegia ..	336
- paralysis (and see Hemiplegia) ..	536
- pyramidal tracts, Babinski's sign in lesions of ..	82
- Cross-legged gait ..	164
- - in Little's disease ..	154
- Croton oil causing bullæ ..	110
- - used by malingerers ..	112
- Crural lesions causing ataxy ..	68
- - monoplegia (see Paralysis of one extremity (lower)) ..	
- nerve (anterior), isolated paralysis of (see Anterior Crural Nerve) ..	
- Crus penis (see Penis) ..	
Crusts (and see Scabs) ..	
- in atrophic rhinitis ..	204
- cheilopompholyx ..	654, 832
- eczema ..	602, 829, 831
- in favus ..	270, 653
- herpes ..	829
- impetigo ..	113, 602, 831
- keratosis follicularis ..	806
- lupus vulgaris ..	448, 808
- mycosis fungoides ..	802
- Paget's disease ..	802, 803
- pemphigus vulgaris ..	654
- pustular eczema ..	602
- from pustules ..	601
- in scrofuloderma ..	603
- syphilides ..	604
- from vesicles ..	829
- in xeroderma pigmentosum ..	804
- Crutch, musculospiral paralysis from ..	549
- Crying, œdema of face, neck, and arms from ..	459, 461
- Cryoscopy of cerebrospinal fluid ..	338
- Cryptomenorrhœa ..	22
- Cryptorchism in infantilism ..	218
CRYSTALS , Charcot-Leyden, illustrated ..	117
- - in asthma ..	179
- in acid urine in renal calculus ..	306
- cholesterolin, in gall-bladder (<i>Fig. 94</i>) ..	281
- - in spermatocoele ..	765
- choline platino-chloride ..	339
- cystin, illustrated ..	187
- dumbbell, in oxaluria ..	470
- of uric acid ..	816
- of fats and fatty acids in stools ..	197
- fatty acid in pancreatitis ..	117
- "hedgehog," of urates ..	815
- leucin ..	302, 843
- osazone ..	115, 290
- oxalic acid (<i>Fig. 130</i>) ..	470
- rosettes, of uric acid ..	816
- "thorn-apple," of urates ..	815
- triple phosphate (<i>Fig. 155</i>) ..	573
- tyrosin ..	302, 843
- of uric acid (<i>Fig. 212</i> ; and see Uric Acid Crystals) ..	816
- Cud-chewing (see Merycism) ..	

- Cup, glaucomatous (<i>Plate VIII</i> , p. 463) ..	257, 461
- physiological, ophthalmoscopic appearance of (<i>Plate VII</i>) ..	461
Curetage in diagnosis of cause of dysmenorrhœa ..	220
- - metrorrhagia ..	433
- - metrostaxis ..	436
- in endometritis ..	220, 429
- relief of dysmenorrhœa ..	220
- sterility ..	706
CURSCHMANN'S SPIRALS , significance of (<i>Fig. 46</i>) ..	179
- - in spasmodic asthma ..	118
CURVATURE, SPINAL (see also Kyphosis; Lordosis; Scoliosis; and Spinal Curvature) ..	180
- Cutaneous reaction (von Pirquet's) for tuberculosis ..	612
- sensibility, loss of, mistaken for paralysis ..	545
- Cut throat, hæmoptysis from ..	318
- - stenosis of trachea after ..	710
- - stridor in ..	710
CYANOSIS, EXTREME ..	184
- - blood alterations causing ..	184
- - clubbed fingers in ..	128, 184
- - borborygmi with ..	97
- in chronic mediastinitis ..	484
- congenital ..	184
- in congenital heart disease ..	129, 244, 579, 790
- - during convulsions ..	169
- of face and neck with aortic aneurysm (<i>Fig. 72</i>) ..	234
- hands in some cases of ..	493
- cervical ribs ..	493
- in laryngismus stridulus ..	466
- local, symmetrical, of the extremities, in Raynaud's disease ..	490
- from malignant ulceration of larynx ..	185
- mediastinal growth ..	296
- in mitral stenosis ..	764
- myxœdema ..	259
- passive congestion of liver ..	370
- periodic, from bronchitis and emphysema ..	579
- - from fibroid lung and bronchiectasis ..	579
- - in mitral stenosis ..	579
- - from renal disease ..	579
- pneumonia ..	645
- from pneumothorax 480, 577, 712	
- polycythæmia with ..	187, 579
- from pulmonary embolism ..	620
- stenosis ..	104, 247
- during rigors ..	647
- in splenomegalic polycythæmia ..	187, 581, 693
- in Stokes-Adams' disease ..	97
- from sudden irruption of caseous bronchial glands into bronchus ..	466
- in sulphhæmoglobinæmia ..	187
- syphilitic ulceration of larynx ..	185
- Cyclical albuminuria ..	19
- vomiting of children ..	426, 843
- Cyclitis, causes of ..	256
- conjunctivitis distinguished from ..	256
- severe pain in the eye from ..	256
- Cytometric tracings of various forms of chest, illustrated ..	192
- Cystalgia, frequent micturition in ..	443
- Cystic degeneration of fibromyomata ..	434
- disease of breast (see Breast, Cystic Disease of) ..	
- - epididymis (see Epididymis) ..	

Cystic disease, contd.

-- of kidneys ..	8, 396
-- age incidence of ..	310
-- albuminuria in ..	15
-- anuria in ..	45, 48
-- bilateral tumours in ..	310
-- bulging of lower thoracic wall by ..	393
-- Cheyne-Stokes respiration in ..	124
-- continued polyuria in ..	583
-- diagnosis from hydro-nephrosis ..	310, 396
-- hæmaturia in ..	304, 310
-- ilio-costal space lengthened in ..	393
-- occupation of whole abdomen by ..	393
-- pain in ..	310
-- palpability on vaginal examination ..	393
-- renal enlargement from ..	310
-- similarity to ovarian cyst ..	393
-- symptoms of ..	48
-- duct stenosis, distention of gall-bladder without jaundice in ..	365
-- calculus in, colic without jaundice from ..	846
-- ovary, congestive dysmenorrhœa from ..	220
Cysticercid, eosinophilia with ..	452
Cystin crystals (<i>Fig. 51</i>) ..	187
-- formula of ..	187
CYSTINURIA ..	187
Cystitis, abscesses in mucosa in ..	627
-- albuminuria in; ascending nephritis from ..	16
-- bacteriuria in ..	83
-- from calculus ..	312, 513, 629
-- congestion of bladder a predisposing cause of ..	627
-- cystoscope in diagnosing ..	442, 628
-- diagnosis from posterior urethritis ..	628
-- prostatitis ..	627
-- pyelitis or pyelonephritis ..	628
-- urethritis ..	207, 628, 631
-- due to dysenteric or tuberculous intestinal ulceration ..	633
-- dyspareunia from ..	221
-- frequent micturition in ..	221, 438, 512, 627, 628, 817
-- hæmaturia in ..	304, 312, 441, 512, 627, 628, 629, 631
-- due to instrumentation ..	627
-- from malignant ulceration of the bladder ..	627
-- mucous membrane changes in ..	627
-- mucus in urine from ..	221
-- from non-gonococcal urethritis ..	206
-- pain after micturition in ..	441, 627
-- in bladder from ..	629
-- penis from ..	441, 512, 513, 514, 628
-- perineum in ..	516, 627
-- vulva on micturition in ..	442
-- from papilloma of bladder ..	630
-- prostatic obstruction ..	627
-- much pus in alkaline urine in ..	623
-- pyelitis from ..	625
-- crystals in urine in ..	629
-- pyonephrosis from ..	626
-- pyrexia in ..	312, 512, 620, 627
-- pyuria due to ..	221, 312, 512, 623, 627
-- recurring rigors in ..	648
-- with retention of urine ..	627, 628
-- in retroversion of gravid uterus ..	628
-- septic arthritis from ..	375

Cystitis, contd.

-- simulating passage of feces per urethram ..	264
-- suprapubic pain in ..	306, 312, 512, 627, 631
-- in tabes ..	628
-- transverse myelitis ..	628
-- triple phosphate crystals in urine in ..	574
-- tuberculous, general account of ..	513, 628, 629
-- age incidence of ..	513
-- associated with tuberculous of vesiculae seminales ..	312, 513, 629
-- ureteral tuberculosis ..	513
-- cystoscopic appearances in (<i>Plate V, Fig. E, p. 308</i>) ..	312, 513, 626, 629
-- diagnosis from renal tuberculosis ..	312, 513, 629
-- ureteral calculus impacted near bladder ..	627
-- vesical calculus ..	628
-- examination for tuberculous focus elsewhere in ..	513
-- frequency of micturition in ..	306, 312, 513, 581
-- uninfluenced by rest in ..	513
-- hæmaturia from ..	304, 312, 441, 628, 629
-- lesions in testes, prostate, or vesicles with ..	629
-- other genito-urinary tuberculosis in ..	312, 513
-- pain after micturition in ..	441
-- in penis ..	441, 513
-- perineum in ..	516
-- persistent slight pyuria in ..	312
-- primary, diagnosis from primary renal tuberculosis ..	629
-- prostatic tuberculosis with ..	513, 678
-- pyuria due to ..	441, 513, 623, 628
-- rarely a primary affection ..	513
-- slight hæmaturia at end of micturition in ..	513
-- tubercle bacilli in urine in ..	312, 513
-- tuberculous testis with ..	513, 518
-- vesiculae seminales with ..	513
-- ulceration of bladder with ..	627, 629, 630
-- from urethral stricture ..	627
-- urethritis ..	627, 631
-- urinary changes in ..	628
-- incontinence with ..	628
-- obstruction with ..	628
-- urine acid in ..	512, 627
-- alkaline in ..	628
-- vesical tenesmus in ..	312
Cystocele simulating prolapse of uterus ..	587
-- dystocia due to ..	227
-- pain in perineum in ..	516
-- vulval swelling due to ..	768
Cystoscopy, adrenalin as an aid to	630
-- appearances in adhesion of appendix to bladder in appendicitis ..	632
-- in bilharzia hæmatobia infection (<i>Plate VI, Fig. K, p. 310</i>) ..	313, 514, 630
-- in descending ureteritis (<i>Plate V, Figs. C, D, p. 308</i>) ..	515
-- dilatation of ureter ..	625
-- impacted ureteral calculus ..	514, 627
-- in thickening of ureter (<i>Plate V, Fig. D, p. 308</i>) ..	625

Cystoscopy, appearances, contd.

-- in ureteral tuberculosis (<i>Plate V, Fig. D, p. 308</i>) ..	625
-- vesical tumours (<i>Plate VI, Figs. F, G, p. 310</i>) ..	311
-- bladder infected from tuberculous bowel ..	313
-- in calculus anuria ..	47
-- carcinoma of bladder (<i>Plate VI, Figs. F, G, p. 310</i>) ..	442, 512, 514, 630
-- detecting vesical fistula ..	442
-- cause of bearing-down pain ..	474
-- pyuria (<i>Plate V, p. 308</i>) ..	624
-- cystitis ..	442, 624, 628
-- papilloma of bladder ..	441, 514, 630
-- pelvic tumour ..	758
-- pyelitis (<i>Plate V, Fig. C, p. 308</i>) ..	625, 628
-- single simple ulcer of bladder ..	630
-- vesical calculus (<i>Plates V, VI, pp. 308, 310</i>) ..	312, 439, 442, 512, 513, 629
-- villous tumour of bladder ..	512, 514
-- in differential diagnosis of ulceration of bladder ..	630
-- hæmaturia (<i>Plates V, VI, pp. 308, 310</i>) ..	9, 307
-- in pneumaturia ..	576
-- silver nitrate as an aid to ..	630
-- in suspected growth of kidney ..	395
-- renal tuberculosis (<i>Plate V, p. 308</i>) ..	626, 629
-- vesical tuberculosis (<i>Plate V, Fig. E, p. 308</i>) ..	312, 513, 626, 629
Cysts, abdominal swelling from	715
-- of Bartholin's gland ..	770
- breast, blood-stained discharge from nipple in	745
-- with chronic mastitis ..	202, 743
-- diagnosis from carcinoma ..	744
-- fibro-adenoma ..	744
-- mastitis ..	202, 744
-- with fibro-adenoma ..	744
-- fluctuation rarely felt in ..	743
-- milk retention in lactation (see Galactocoele) ..	744
-- possibly precancerous ..	744
-- simple serous ..	744
-- causing albuminuria ..	17
-- of corpus luteum ..	508
-- dentigerous ..	757
-- derived from Wolffian body ..	725
-- dermoid (see Dermoid Cyst) ..	52
-- diagnosis of ascites from ..	52
-- of epididymis (see Epididymis, Cystic Disease of) ..	724
-- hydatid (see Hydatid Cysts) ..	724
-- of kidney, serous ..	396
-- lesser peritoneal sac ..	725
-- liver simulating ascites ..	717
-- mesentery, simulating ascites ..	717
-- in mucous uterine polypi ..	435
-- omental ..	724
-- ovarian (see Ovary, Cysts of) ..	724
-- of pancreas (see Pancreas, Cysts of) ..	724
-- pneumaturia caused by ..	576
-- retroperitoneal, laparotomy in diagnosis of ..	725
-- palpable in left hypochondrium ..	726
-- pyloric obstruction from ..	713
-- in sarcoma ..	757
-- sebaceous of scrotum ..	681, 765
-- of testis (see Testis, Cyst of) ..	791
-- thyroid gland ..	791
-- urachal (see Urachal Cyst) ..	791
-- vulval ..	768, 770

Cytology of ascitic fluids ..	57	<i>Defecation, contd.</i>		<i>Dengue, contd.</i>	
- cerebrospinal fluid ..	339	- peremptory desire for, as		- loss of weight in ..	848
- in general paralysis of the		epileptic aura ..	80	- meteorism in ..	432
insane ..	269	- precipitate ..	348	- pains in ..	503, 506
- spinal meningitis ..	464	- reflex, primary weakness of	149	- worse on movement in ..	506
- urine in acute nephritis ..	12	- time after meals of ..	140	- pus in the stools in ..	601
		- unfavourable posture in, a		- rapid pulse in ..	506
		cause of constipation ..	149	- relapse after two or three	
DACHSHUND type of dwarf	212	- weakness of voluntary mus-		days' improvement in ..	506
Dactylitis, tuberculous (<i>Fig. 193</i>)	751	cles of ..	148	- roseolar rash, beginning on	
Diabetic acid in cyclical vomit-		Deformities in acute polio-		hands and wrists, in the	
ing of children ..	843	myelitis ..	555	relapse of ..	506
Dalrymple's sign in exoph-		- dwarfism due to ..	212	- slow convalescence in ..	506
thalmic goitre ..	792	- with paraplegia in Fried-		- sore throat in ..	506
Damiana, priapism caused by	586	reich's ataxy ..	559	- sudden onset of ..	506
Damp, nephritis from ..	13	- in syringomyelia ..	563	Dental caries (see Caries, Dental)	
Dancers, cramp in ..	177	DEFORMITY OF THE CHEST		Dentigerous cysts ..	757
Dancing, hæmaturia after, due		(see also Chest, Deformities of)	191	Dentition causing infantile	
to movable kidney ..	310	Degeneration of muscles, fibril-		convulsions ..	170
- menorrhagia from ..	428	lar contractions in ..	157	- Depression due to arsenic ..	297
Darier, re prurigo ferox ..	551	- reaction of (see Reaction of		- with fatty heart ..	241
- re vesicles ..	829	Degeneration) ..		- in gastritis ..	297
Day-blindness or hemeralopia	841	Deglutition difficult, in bulbar		- general congestion of liver	407
Dead fingers, association with		paralysis ..	159	- influenza ..	505
menorrhagia at puberty ..	430	- effects on muscles of, in		- irritability in ..	360
- in peripheral neuritis ..	505	hydrophobia ..	162	Dercum's disease (see Adiposis	
DEAFNESS (and see Word-		Dejerine, re olivoponto-cere-		Dolorosa)	
deafness) ..	187	bellar atrophy ..	799	Dermatitis exfoliativa , affect-

Emissions, nocturnal, with impotence ..	347
Emotion , acute yellow atrophy of liver preceded by ..	370
- - angina pectoris from ..	482, 778
- - convulsions from ..	170
- - diarrhæa from ..	197
- - disproportionate exuberance in paralysis agitans ..	262
- - in double hemiplegia ..	253
- - dyspepsia from ..	355, 374
- - expression of, diminished in tabes ..	262
- - in hysteria ..	173, 798
- - jaundice from ..	362, 374
- - loss of control of expression of, in pseudo-bulbar palsy ..	686
- - menorrhagia from ..	428
- - motor tic increased by ..	160
- - movements of, uncontrolled in facial paralysis ..	536
- - myoclonus increased by ..	160
- - palpitation from ..	525, 527
- - ptalorrhæa caused by ..	592
- - tremor from ..	795
Emphysema , albuminuria in ..	18
- - ascites in ..	61
- - asthma developing into ..	180, 186, 582
- - barrel-shaped chest in ..	191, 404
- - and bronchitis (and see Bronchitis) ..	246
- - cardiac dullness in ..	331
- - clubbed fingers in ..	128
- - compensatory, in fibroid lung ..	246
- - constipation in ..	149
- - cyanosis in ..	186, 579
- - dilatation of heart in 246, 485, 526	
- - diminished liver dullness in ..	404
- - displaced cardiac impulse in ..	232, 330, 331
- - dyspeptic symptoms in ..	526

Emphysema, contd.

- enlarged right ventricle in ..	245, 246
- epistaxis in ..	251
- eversion of lower ribs in ..	404
- flatulence in ..	267
- general pains in the limbs in ..	503
- hæmoptysis in ..	317, 320
- heart failure from ..	61, 186, 464, 525
- - inelasticity of skin with ..	186
- - insomnia in ..	356, 359
- - liver dullness lost from ..	406
- - local bulging of chest-wall from ..	193
- - orthopnoea in ..	186, 464
- - pain in the chest in ..	480
- - epigastrium from ..	485
- - palpitation in ..	525, 526
- - periodic cyanosis from ..	579
- - physical signs of 101, 186, 192	
- - pneumothorax from ..	577, 578
- - polycthaemia in ..	579, 580
- - shortness of breath in ..	101, 526, 579
- - subcutaneous (see Emphysema, Surgical)	
EMPHYSEMA, SURGICAL ..	231
- - abdominal distention from ..	716
- - - swelling from ..	715
- - - crepitus with ..	179, 716
- - egg-shell crackling in ..	177
- - due to gas-producing microbes ..	231, 716
- - from injury to chest ..	578
- - wounds producing ..	716
- - tenderness in the chest from ..	778
- - thoracic telangiectases in ..	826
- - uterine, hyperæmia from ..	430
- - - menorrhagia in ..	428
- - wheezing in ..	526
Empurthotonus in tetanus ..	162
Emphyema , without abnormal physical signs ..	99, 323, 703
- in abnormal situations ..	703
- - albuminuria in ..	17
- - albumosuria in ..	20
- - anæmia in ..	39
- - with bronchopneumonia ..	186
- - bulging of chest-wall with 192, 193	
- - clubbed fingers in ..	99, 128
- - compression of lung from ..	324
- - diagnosed by needling chest ..	186
- - from gangrene of lung ..	288, 321, 703
- - diaphragm immobilized by ..	721
- - difficulties in locating ..	119
- - displaced cardiac impulse in ..	330
- - fibroid lung and bronchiectasis from ..	324
- - foetid sputum in ..	321, 703
- - foul breath in ..	99
- - hæmoptysis in ..	317, 323
- - indicianuria due to ..	349, 821
- - lardaceous disease from ..	10, 696
- - latent ..	119, 650
- - leucocytosis in ..	400, 401
- - after measles ..	650
- - mistaken for abscess of chest-wall ..	193
- - osteo-arthropathy in ..	390
- - pain in the chest in ..	478, 480
- - peristitis in ..	776
- - physical signs of ..	119, 192
- - after pleurisy ..	650
- - pneumococcal ..	122
- - after pneumonia ..	323, 650
- - slight value of leucocyte count in diagnosis of ..	401
- - pointing on chest-wall in 193, 178	
- - post-critical intermittent fever in pneumonia due to ..	622
- - retraction of chest-wall after ..	194
- - rigors with ..	648, 650

Empyema, contd.

- rupture into bronchus ..	578
- causing pneumothorax ..	577
- into lung ..	99, 323, 703
- diagnosis of ..	703
- previous history of pneumonia in ..	703
- no elastic fibres in sputum in ..	703
- foul taste from ..	774
- sputum in ..	99, 321, 703
- scarlet fever ..	650
- scoliosis from ..	180
- secondary to abscess of liver ..	409
- to otitis media ..	123
- septicæmia from ..	614, 698
- prolonged pyrexia in ..	609
- shrinkage of chest after ..	193
- simulating hepatic abscess ..	779
- simulation by tropical liver abscess ..	369
- suggested by anaemia in bronchopneumonia of children ..	39
- subdiaphragmatic inflammation causing ..	122
- from subpleuric abscess ..	720
- tenderness of the spine in ..	785
- undiscovered, difficulty of exploration with needle in ..	703
- varieties of cause and position of ..	119
- x-rays in diagnosis of ..	721
- of antrum of Highmore (see Antrum of Highmore)	
- of frontal sinus (see Frontal Sinus)	
- of gall-bladder (see Gall-bladder, Empyema of)	
Encephalitis, acquired paralysis of childhood due to ..	155
- acute constitutional symptoms in ..	547
- hemiplegia from ..	337, 338
- optic neuritis in ..	139
- pupils in ..	594
- retraction of the head in ..	641
- simulating meningitis ..	558, 643
- symptoms of ..	139
- vomiting in ..	139
- ataxy from ..	69
- athetosis after ..	155
- coma due to ..	136, 558, 643
- convulsions in ..	139, 547, 558
- diagnosis of sup. longitudinal sinus thrombosis from ..	558
- general head symptoms in ..	558
- headache in ..	139, 547
- infantile diplegia due to ..	556
- monoplegia from ..	547
- paraplegia due to ..	556
- pyrexia in ..	547, 558
- vomiting in ..	547, 558
Encephalocele, diagnosis from dermoid cyst ..	254
- unilateral exophthalmos from ..	254
Encephalopathy, saturnine (see Saturnine Encephalopathy)	
Enchondroma of breast ..	744
- simulating sarcoma (<i>Fig. 195</i>) ..	754
Encysted hydrocele (see Hydrocele)	
Endarteritis, gangrene from ..	282
- preceding paraplegia, history of syphilis in ..	563
- syphilitic ..	327, 337, 563
- cerebral, headache in ..	327
- cutaneous ulcers in ..	338
- hemiplegia from ..	337, 338
- premonitory symptoms ..	337
- without loss of consciousness in ..	338
- Wassermann's serum reaction in ..	338

Endocarditis, acute, changes following ..	240
- in acute rheumatism ..	103, 121, 504, 671
- aortic disease due to ..	106, 236, 237
- bruits in ..	102, 103, 105, 110, 671
- cerebral embolism from ..	173
- changes in heart sounds with ..	239
- in chorea ..	103, 156
- common causes of ..	236
- diastolic bruits in ..	106
- embolism from ..	173, 286
- in erysipelas ..	103
- fungating (see Fungating Endocarditis)	
- hæmaturia from ..	305
- impulse displaced with ..	239
- not indicated by temperature chart ..	103, 239, 622
- infarct of lung from ..	322
- infected or infective (see Fungating Endocarditis)	
- malignant (see Fungating Endocarditis)	
- mid-diastolic bruit of ..	110
- mitral regurgitation from ..	239
- stenosis from ..	240
- monoplegia due to ..	547
- palpitation from ..	239
- in pneumonia ..	103
- precordial pain from ..	239
- in puerperal fever ..	103
- pulmonary regurgitation from ..	107
- pulse-rate in ..	239
- pyrexia absent with ..	103, 622
- due to ..	622
- in septicæmia ..	103
- systolic aortic bruit in ..	105
- bruit over mitral area in acute ..	102, 103
- ulcerative (see Fungating Endocarditis)	
Endolymph, rise in pressure of, causing deafness ..	190
Endometritis, acute, in zymotic diseases ..	429
- blood-stained watery discharge from ..	435
- cachexia in ..	114
- chronic, anaemia in ..	39
- backache from ..	220
- diagnosis from uterine scrapings ..	429
- dysmenorrhœa from ..	219, 220
- enlargement of uterus from ..	220
- infective peritonitis from ..	644
- leucorrhœa from ..	220
- menorrhagia from ..	210, 220, 428
- metrorrhagia from ..	433, 435
- pelvic pain from ..	508
- Pozzi's syndrome in ..	429
- sacralgia in ..	509
- senile, metrostaxis from ..	436
- foul vaginal discharge from ..	211
- sterility due to ..	706
- vaginal discharge due to ..	210
- in virgins ..	429
Endometrium abnormal in dysmenorrhœa ..	219
Endoscope ..	208
- in diagnosing impacted calculus in urethra ..	511
- urethral stricture ..	439, 440, 511, 678
- fistula ..	678
- herpe of urethra seen with ..	209
- and soft sores in urethra ..	209
- and urethral affections ..	208
- calculus ..	210
- papillomata ..	209

Endothelioma of antrum of Highmore, purulent rhinitis from ..	205
- kidney ..	395
- lung ..	287
- nose ..	204
- palate ..	640
- testis ..	766
- vulva ..	768
Endothrix in ringworm ..	273
Endotriches, Sabouraud's classification of ..	273
Enemata in diagnosis of carcinoma of sigmoid colon ..	735
- of cause of swelling in right iliac fossa ..	736
- faecal tumours ..	393, 499, 501, 691
- intestinal obstruction ..	151
- nature of constipation ..	142
- relief of pain by, in faecal accumulations ..	499
- vomiting caused by ..	844, 846
Enlargement of a bone (see Bones)	
- of gall-bladder (see Gall-bladder, Enlarged)	
- heart (see Heart, Enlarged)	
- joints (see Arthritis)	
- kidney (see Kidney, Enlarged)	
- lachrymal gland (see Lachrymal Gland, Enlarged)	
- liver (see Liver, Enlarged)	
- lymphatic glands (see Lymphatic Glands)	
- prostate (see Prostate, Enlarged)	
- salivary glands (see Salivary Glands, Enlarged)	
- spleen (see Spleen, Enlarged)	
- testis (see Testis, Enlarged)	
- thyroid (see Thyroid Gland, Enlarged)	
- tonsils (see Tonsils, Enlarged)	
- uterus (see Uterus, Enlarged)	
ENOPHTHALMOS ..	247
- in paralysis of cervical sympathetic ..	590, 594
Entasement in spinal cord lesions causing paralysis ..	543
Enteric fever (see Typhoid Fever)	
Enteritis, in cirrhosis of liver ..	409
- indicanuria in ..	349
- mucus and blood in stools in ..	444
- simulating ascites ..	717
Enterocolitis of infants, blood per anum in ..	92
Enterogenous cyanosis ..	187
Enterolith in the rectum ..	635
Enteroptosis, abdominal swelling from ..	715
- illustrated ..	147, 149, 721
- jaundice in ..	367
- undue abdominal aortic pulsation associated with ..	592
Enterospasm in abdominal neuralgias ..	473
- constipation from ..	144
- distinction from tumour or intussusception ..	134
- induced by taking food ..	486
- mucus and membrane in motions in ..	486
- obstinate constipation in ..	486
- pain in the epigastrium in ..	486
- relieved by passage of flatus ..	486
- pressure ..	486
ENURESIS ..	247
- in children, nocturnal ..	471
Envelope crystals in urine (see Oxaluria)	
Eosin, fluorescence due to ..	820
- pink urine from ..	819, 820
- staining of mucus by ..	444

- EOSINOPHILIA** (*Plate II*,
Fig. L, p. 28) .. 248
- in Addison's disease .. 38
 - ankylostomiasis .. 570
 - associated with parasites 33, 249
 - in asthma .. 118, 179, 180, 582
 - bloody effusion due to new growths of pleura .. 118
 - - - bullous dermatoses .. 114
 - exceptional in round-worm infection .. 569
 - in filariasis .. 126
 - with hydatid cyst of liver 58, 279, 413, 415, 719, 720

- (see Carcinoma)		- 647, 648, 698, 746		- - measles ..	253
- causing perineal sores ..	678	- sharply defined border of ..	252	- - pityriasis rubra ..	253
- histology in diagnosis of (and see Histology in Diagnosis) 420, 769, 803, 812		- simulated by lupus erythematosus ..	781	- - strawberry tongue in ..	253
Epithelium in hæmaturia of acute nephritis ..	311	- - urticaria ..	850	- - simplex ..	252
Epitrochlear gland enlarged (see Lymphatic Gland)		- sloughing in ..	746	- - diagnosis from macular stage of leprosy ..	424
Epulis , bleeding gums due to ..	86, 88	- splenic enlargement in ..	692, 698	- - solare ..	252
- fibrous ..	748	- streptococci in ..	113	- vesicular, perlèche with ..	404
- association with decayed tooth ..	748	- tendency to spread in ..	746	- vesiculosum, vesicles in ..	832
- displacement of teeth by ..	748	- tenderness of scalp from ..	780, 781	Erythemato-papular lesions, description of ..	528
- distortion of jaw by ..	748	ERYTHEMA ..	252	Erythremia (see Splenomegalic Polycythæmia)	
- microscopic examination in diagnosis of ..	748	- in acute rheumatism ..	671	Erythrasma in bathing-drawers area ..	447
- origin of sarcoma as ..	748	- bullosum, bleeding gums in ..	86, 88	- description of ..	276
- softness of swelling due to malignant ..	756	- - of the buccal cavity, dysphagia in ..	225	- diagnosis from eczema marginatum ..	276
Equilibrium, neuro-muscular mechanism of maintenance of ..	827	- - eulæ in ..	110, 113	- - eczema seborrhœicum ..	276
Erb's muscular dystrophy ..	70	- - eosinophilia in ..	249	- - pityriasis rosea ..	276
- - fibrillary contractions rare in ..	158	- in cerebrospinal meningitis ..	643	- - tineæ vesicolor ..	276
- palsy, extent and causes of ..	552	- congenital syphilis ..	446	- low contagiousness of ..	276
- sign in tetany ..	178	- at onset of dengue ..	506	- microsporon minutissimum in ..	276, 277
Erections, Penile , absence of (see Impotence)		- dermatitis herpetiformis ..	831	- reddish-brown lesions of ..	276
- - Painful (see Chordee)		- eczema ..	831	Erythroblasts ..	28
- - in acute prostatitis or prostatic abscess ..	515	- of fingers ..	266	Erythrocythæmia (see Splenomegalic Polycythæmia)	
- - age incidence of ..	585	- fugax ..	252	Erythromelalgia ..	490
- - in cavernitis ..	516	- gestationis, bullæ in ..	111	- diagnosis from intermittent claudication ..	490
- - gonorrhœa ..	207	- with herpes zoster ..	830	- - Raynaud's disease ..	284, 490
- - persistent (Priapism) ..	585	- at onset of impetigo vulgaris ..	602	- in disseminated sclerosis ..	490
Ergotism, gangrene from (see Gangrene, Epidemic)		- in duratum, scrofulosorum (see Bazin's Disease)		- an early sign of organic nervous disease ..	490
- purpura from ..	596	- from inflammation ..	478	- elevation and cold relieve pain in ..	490
- simulating Raynaud's disease or erythromelalgia ..	287	- intertrigo ..	252	- flushing of extremities in ..	284, 490
- tetany following ..	178	- - area of distribution of ..	447	- gangrene in ..	282, 284
Erosion of cartilages in hypertrophic osteo-arthritis ..	390	- from iodides or bromides ..	112	- in some healthy persons ..	490
- - in joints in hæmophilic arthritis ..	388	- iris, bullæ in ..	110, 113	- heat and pulsation in ..	284, 490
- - lupus vulgaris ..	448, 808	- - eosinophilia in ..	249	- local patches of rose-pink to purplish flushing in ..	490
- - in osteo-arthritis ..	384	- relation to pemphigus ..	113	- oedema in ..	490
- cervix (see Cervix, Erosion of)		- rings of vesicles in ..	832	- pain aggravated by dependent position and by warmth ..	490
Eruccatio nervosa ..	267	- keratodes, nodules of ..	451	- simulated by ergotism ..	287
- diagnosis from indigestion ..	351	- - oedema and tenderness of palms and soles in ..	451	- in tabes dorsalis ..	490
Eruccations in gastritis ..	297	- of the legs, from excessive standing ..	450	- tenderness of foot in ..	490
- relief of pain by ..	484	- macular ..	423	Erythrospira (and see Vision, defects of)	
- in intestinal colic ..	473	- multiforme, diagnosis from small-pox ..	607	- from cataract extraction ..	840
Eruptions, bullous, vesicular, etc. (see Bullæ, Vesicles, etc.)		- - herpes zoster ..	830	- in electric blindness ..	840
Erysipelas , acute dilatation of heart from ..	243	- distribution of ..	531	- with retinal hæmorrhage ..	840
- albuminuria in ..	17	- - mainly on limbs ..	607	- in snow blindness ..	840
- bacteriology in diagnosis ..	459	- papular and other lesions of ..	531	Eschar, black, gangrenous, in anthrax ..	603
- baldness from ..	84	- pityriasis rubra after ..	658	- from injury to mouth, pytalism due to ..	591
- in bathing-drawers area ..	447	- scabs from ..	653	- on lips or mouth in irritant or corrosive poisoning ..	674
- bullæ in ..	110, 113, 746	- simulation by prurigo ..	531	Essential albuminuria ..	19
- diazo-reaction in ..	198	- - strophulus ..	531	Esthimène, syphilitic nature of ..	769
- differentiation of erythema simplex from ..	252	- - urticaria ..	531	- vulval swelling due to ..	768
- endocarditis in ..	103	- slightness of itching in ..	531	Ether, headache from ..	328
- gangrene in ..	282	- vesicles in ..	832	- poisoning, leucopenia in ..	401
- hyperpyrexia in ..	343	- in napkin region ..	446	Ethereal sulphates in urine, indicanuria indicating ..	349
- leucocytosis in ..	401	- nodosum, absence of ulcers in ..	450	Ethmoidal air cells, infection of, meningitis from ..	642
- oedema of face and arms from ..	461	- - in acute rheumatism ..	121, 671	- dilatation, exophthalmos in ..	255
- - or neck in ..	459	- affection of legs and feet in ..	450	- sinusitis, diagnosis from abscess of antrum ..	502
- skin in ..	746	- bilateral ..	751	- - headache in ..	327
- prolonged pyrexia in (<i>Fig.</i> 166) ..	614	- - colours of ..	450	- - nasal discharge from ..	204, 206
- pyrexia in ..	614, 638, 746	- diagnosis from acute osteomyelitis ..	751	Eucalyptus leaves, sore fingers from ..	266
- rash of ..	698, 746	- - nodular leprosy ..	450	Eunuchs, obesity in ..	453, 454
		- - syphilis ..	450	Europe, Malta fever in ..	506
		- multiple red swellings on shins in ..	751	- Southern, dengue in ..	506
		- pain and swelling of joints ..	450		
		- pyrexia in ..	450		
		- simulated by varicose veins ..	450		
		- papulatum, staining of skin after ..	531		
		- in peliosis rheumatica ..	600		
		- pruritis in ..	588		
		- rheumatic, albuminuria with ..	18		
		- scabs in ..	832		
		- scales in ..	655, 656		
		- scarlatiniform ..	253		
		- desquamation after ..	656		

- Eustachian tube, deafness
 from catarrh of the .. 190
 -- infection of ears through .. 230
 -- obstruction from syphilis .. 190, 828
- Exanthemata, menorrhagia in .. 429
- Excitability** in exophthalmic goitre .. 244
 -- effect on alcoholic tremor .. 797
 -- choreic movements .. 797
 -- mercurial tremor .. 156
 -- tremor in Graves' disease .. 797
 -- after epileptic convulsions .. 169
 -- producing diarrhoea .. 197
 -- religious, pandemic chorea caused by .. 157
 -- tachycardia from .. 772
 -- transient polyuria due to .. 582
- Exclamation-mark hairs in alopecia areata .. 274
- Exercise**, decreased passage of urine after .. 581
 -- deficient, effect on uric acid .. 817
 -- in etiology of dyspepsia .. 354
 -- effect in increasing hæmaturia in vesical calculus .. 629
 -- micturition in vesical calculus .. 438
 -- on rheumatic pains .. 507
 -- hæmoglobinuria from .. 315
 -- in health, shortness of breath in .. 100
 -- want of, causing obesity .. 453
- Exertion**, effect on muscle pains .. 478
 -- pulse-rate in myocardial affections .. 526
 -- in raising temperature of body in health .. 619
 -- on sciatic pain .. 487
 -- symptoms of cervical rib .. 554
 -- in etiology of aneurysm .. 538
 -- hernia produced by .. 740
 -- increase of alcoholic tremor by .. 797
 -- influence upon pain due to heart failure .. 485
 -- in intermittent claudication .. 489
 -- on tremor .. 796
 -- in Graves' disease .. 792, 797
 -- palpitations due to .. 528
 -- relation to angina abdominalis .. 486
 -- pectoris .. 481, 482, 778
 -- tachycardia from .. 772
- Exhaustion** .. 619
 -- on exertion in hepatoptosis .. 407
 -- in obstructed labour, symptoms of .. 229
 -- subnormal temperature in .. 619, 621
- Exophthalmic goitre**, age incidence of .. 772, 792
 -- albuminuria in .. 16
 -- amenorrhoea in .. 23
 -- breathlessness in .. 792
 -- cachexia in .. 115
 -- chloasma in .. 574
 -- Dairymple's sign in .. 792
 -- defective winking power in .. 261
 -- diagnosis of .. 772
 -- distinction from paroxysmal tachycardia .. 772
 -- enlarged heart in .. 232, 244
 -- epiphora in .. 250
 -- excitability in .. 244
 -- exophthalmos in .. 527, 772, 792, 797
 -- occasionally absent in .. 527
 -- extreme nervousness in .. 253, 772, 792, 849
 -- eyelids retracted in .. 792
 -- facies of (*Fig. 85*) .. 261
 -- flushing in .. 261
- Exophthalmic goitre**, *contd.*
 -- glistening conjunctiva in .. 261
 -- glycosuria in .. 292
 -- irritability in .. 360
 -- loss of weight in .. 244, 797, 849
 -- marked pulsation in neck in .. 764
 -- menorrhagia in .. 430
 -- mental changes in .. 797
 -- Möbius's sign in .. 253
 -- ocular symptoms of .. 253
 -- oedema of eyelids in .. 261
 -- palpitation in .. 525, 527, 792, 797
 -- pigmentation of eyelids in .. 244, 261
 -- of skin in .. 792
 -- proptosis in .. 253, 261
 -- pulse-rate in .. 772
 -- pupillary changes in .. 261
 -- relation to parenchymatous goitre .. 792
 -- sex incidence of .. 772, 792
 -- shortness of breath in .. 100
 -- signs of .. 244
 -- simulation of Addison's disease by .. 792
 -- skin changes in .. 261, 792
 -- spasmodic contractions in .. 159
 -- staring eyes in .. 261, 772
 -- Stellwag's sign in .. 253, 792
 -- sweating in .. 797
 -- systolic bruit in .. 244
 -- tachycardia in .. 244, 253, 771, 772, 792, 797, 849
 -- thyroid gland enlargement in .. 244, 253, 527, 772, 792, 797, 849
 -- occasionally absent .. 527
 -- tremor in .. 244, 253, 772, 792, 795, 797, 849
 -- ulceration of the cornea in .. 807
 -- undue abdominal aortic pulsation in .. 592
 -- von Graefe's sign in .. 253
- EXOPHTHALMOS** .. 253
 -- some causes of .. 200
 -- epiphora from .. 250
 -- in exophthalmic goitre .. 527, 772, 792, 797
 -- intermittent, in arterial aneurysm .. 255
 -- in myopathy .. 260
 -- from thrombosis of cavernous sinus .. 651
 -- ulceration of the cornea in .. 807
 -- unilateral .. 254, 754
- Exostosis**, ankylosis of joints from .. 167
 -- bursa covering .. 754
 -- composition of .. 754
 -- heredity in .. 754
 -- ivory, in the auditory meatus .. 754
 -- of bones of the skull .. 754

 -- multiple .. 754
 -- pedunculated tumour in .. 754
 -- popliteal .. 763
 -- age incidence of .. 763
 -- association with exostoses elsewhere .. 763
 -- common situation .. 763
 -- diagnosis from ossification of a tendon or muscle .. 763
 -- presence of exostoses in other members of family .. 763
 -- slow growth of .. 763
 -- tumour well-defined in .. 763
 -- without symptoms .. 763
 -- spurious .. 754
 -- tumour capped with cartilage .. 754
 -- ungual phalanx of great toe a common site for .. 754
 -- unilateral exophthalmos due to .. 254, 255
- Exostosis**, *contd.*
 -- usual situation near epiphyseal line of long bone (*Fig. 194*) .. 754, 763
 -- x-rays in diagnosis (*Fig. 194*) .. 754
 -- Expectoration (see Sputa, and Hemoptysis)
 -- Expiration sound prolonged at apex in phthisis .. 319
 -- in emphysema .. 192
 -- Exposure, hypothermia in .. 346, 619
 -- pinguecula due to .. 256
 -- Expression (see Facies)
 -- lack of in paralysis agitans .. 548
 -- **Extensor** brevis digitorum, nerve supply of .. 542
 -- pollicis, nerve supply of .. 550
 -- carpi radialis brevis, nerve supply of .. 550
 -- longior, nerve supply of .. 550
 -- ulnaris, nerve supply of .. 550
 -- communis digitorum, spinal nerve-root supplying .. 543
 -- nerve supply of .. 550
 -- indicis, nerve supply of .. 550
 -- longus digitorum, nerve supply of .. 542
 -- hallucis, hypertrophy of .. 164
 -- nerve supply of .. 542
 -- spinal nerve-root supplying .. 543
 -- pollicis, nerve supply .. 550
 -- minimi digiti, nerve supply .. 550
 -- ossis metacarpi pollicis, escape in lead palsy .. 77
 -- nerve supply of .. 550
 -- plantar reflex (see Babinski's Sign) .. 81
 -- Extensors of wrist, spinal nerve-root supplying .. 556
- External auditory meatus**, caries of .. 469
 -- cerebrospinal fluid from .. 468
 -- condylomata of .. 469
 -- diphtheria of .. 469
 -- eczema of .. 468
 -- epithelioma of .. 469
 -- foreign body forgotten in .. 469
 -- in ruptured tympanum from .. 468
 -- furunculosis of .. 469
 -- herpes in facial paralysis .. 536
 -- injury of .. 467
 -- otorrhoea from .. 469
 -- polyp of .. 469
 -- rodent ulcer of (see Rodent ulcer)
 -- suppurating sebaceous cyst of .. 469
 -- syphilitic ulceration of .. 469
 -- cutaneous nerve, skin distribution of .. 659
 -- neuralgia of .. 488
 -- iliac artery (see Aneurysm of External Iliac)
 -- plantar nerve, muscles supplied by .. 542
 -- spinal roots derived from .. 542
 -- popliteal nerve, muscles supplied by .. 542
 -- skin distribution of .. 659
 -- spinal roots derived from .. 542
 -- rectus muscle paralysis with peripheral facial paralysis .. 536
 -- Extra-uterine gestation (see Gestation, Ectopic)
 -- Extravasation of urine (see Urine, Extravasation of)
 -- Extroversion of bladder .. 587
- EYE, ACUTE INFLAMMATION OF** .. 255
 -- atrophy of, from iritis .. 839

Eye, contd.

- burning, pricking, or watering of, from error of refraction ..	328
- conjugate deviation of, in hemiplegia ..	137
- - - in cerebellar lesions ..	69
- dilatation of blood-vessels of, in arterial aneurysm ..	255
- diseases, headache from ..	328
- - epiphora in ..	250
- - neuralgia from ..	781
- - photophobia in ..	573
- tenderness of scalp ..	781
- vertigo due to ..	827
- displacement of, cause of ..	200
- - by dermoid cyst ..	254
- - ivory exostosis ..	754
- epiphora in inflammation of ..	250
- herpes zoster of ..	831
- inability to close, from facial paralysis ..	534, 536
- - - in hemiplegia ..	337
- light flashes before, relieved by epistaxis ..	252
- limited movement in cavernous sinus thrombosis ..	254
- melanotic sarcoma of ..	419
- murmur from aneurysm ..	255
- muscles of, abnormalities in congenital enophthalmos ..	247
- - in myasthenia gravis (<i>Fig.</i> 83, p. 261) ..	225, 260
- - myopathy ..	260
- - edema of, in trichinosis ..	501
EYE, OPHTHALMOSCOPIC APPEARANCES OF (<i>Plates VII, VIII</i>) ..	461
EYE, PAIN IN ..	494
- paresis of muscles of, in diphtheria ..	77, 640
- protrusion of (see Exophthalmos)	
- puffiness of, in Bright's disease and edema simulating ..	458
- pulsation from aneurysm ..	255
- retraction of (see Enophthalmos)	
- sarcoma of ..	279, 419
- shifty, of drug-takers ..	258
- signs of jaundice in ..	360
- staring (see Exophthalmos)	
- sunken in zymotic diarrhoea of infants ..	426
- tension of, in conjunctivitis, iritis, and glaucoma ..	257
- - in paralysis of cervical sympathetic ..	594
- tremor of (see Nystagmus)	
- tuberculosis of ..	808
Eyebrows, seborrhœic eczema of ..	533
- falling out of, in myxœdema ..	454
- sycosis vulgaris of ..	602
Eyelashes, pediculosis of ..	447
- sycosis vulgaris of ..	602
Eyelids, affected, in nuclear ..	
- facial paralysis ..	536
- chancre of ..	419
- coloured sweat of ..	714
- drooping of (see Ptosis)	
- epithelioma of ..	419
- eversion of, in chronic marginal blepharitis ..	250
- edema of (see Edema of Eyelids)	
- pigmentation in exophthalmic goitre ..	244, 261
- puffiness in myxœdema ..	259
- quivering of in hysteria and malingering ..	160
- red and engorged in cavernous sinus thrombosis ..	253
- retraction in Graves' disease ..	261

Eyelids, contd.

- retraction in paralysis agitans ..	262
- stitching of, in perforation of corneal ulcer ..	807
- thickening in cretinism ..	258
- tuberculosis of ..	445
- xanthelasma of, in jaundice ..	360
- xanthoma planum of ..	805
Eyestrain, headache in 327, 329, 498 ..	
- migraine from ..	495
- pain behind eyes in ..	495, 498
- supra-orbital pain from ..	495
FACE, acne affecting ..	531, 604
- actinomycosis of ..	810
- acute swelling of, by gas ..	231
- alcoholic tremor of ..	797
- anaesthesia of, in syringomyelia ..	661
- asymmetry of, in myasthenia ..	261
- - with spastic paralysis ..	540
- atrophic contractions of ..	154
- atrophy of ..	75
- bloody sweat of ..	715
- colloid milium of ..	805
- coloured sweat of ..	714
- congestion of, in mitral regurgitation ..	238
- dusky or livid in splenomegalic polycythæmia ..	581
- enlargement of all the bones of, in acromegaly ..	749
- epithelioma adenoides cysticum of ..	805
- erythema papulatum of ..	531
- flushing in diabetes ..	292
- healed gumma of (<i>Figs.</i> 156, 157) ..	589
- hemiatrophy of (<i>Fig.</i> 141, p. 537) ..	167, 537
- herpes simplex of ..	829
- hyperostoses of bones of, in leontiasis ossea ..	749
- lichen scrofulosorum of ..	529
- lupus erythematosus of ..	656
- - vulgaris of ..	808
- meningocœle of (<i>Fig.</i> 75) ..	251
- mercurial tremor of ..	797
- motor tics affecting ..	160
- movements in chorea ..	156
- multiple benign sarcoid of ..	461
- muscular twitches of, in petit mal ..	160
- œdema of (see Edema of Face)	
FACE, PAIN IN ..	495
- - in antral empyema ..	205
- papular syphilides of ..	532
- pemphigus neonatorum of ..	446
- pigmented in xeroderma ..	804
- pityriasis rosea of ..	658
- preference of impetigo for ..	604
- - small-pox for ..	605
- pustular syphilides of ..	604
- rarity of scabies on ..	609, 832
- roseolar rash on, in syphilis ..	676
- scrofulous ulceration of ..	808
- sebaceous cyst of ..	804
- seborrhœa of ..	656, 657
- seborrhœic dermatitis of infancy affecting ..	447
- segmental areas of (<i>Figs.</i> 132-135) ..	497
- spasm of, in hysteria ..	537
- - major trigeminal neuralgia ..	495
- - tetanus ..	162
FACE, SWELLING OF (see Swelling of Face)	
- surgical emphysema of ..	231
- sycosis vulgaris of ..	602
- tremor of ..	795, 797
- - in general paralysis of the insane ..	172, 796
- twitching of, during rigors ..	646

Face, contd.

- type carrée in acromegaly ..	263
- ulceration of (see Ulceration)	
- unusual breadth in cretinism ..	258
- varicella affecting ..	833
Facial changes in 7th nerve ..	
- paralysis ..	533
- neuralgia, varieties of (see Neuralgia)	
- paralysis (see Paralysis, Facial)	
- tic, chorea simulating ..	156
FACIES, ABNORMALITIES OF ..	258
- of acromegaly (<i>Fig.</i> 88) ..	262, 749
- bulbar paralysis ..	159
- in catalepsy ..	651
- cirrhosis ..	59
- congenital syphilis (<i>Figs.</i> 78, 79) ..	259, 446
- cretin (<i>Fig.</i> 67) ..	216, 258
- of exophthalmic goitre ..	253, 261
- expressionless in paralysis agitans ..	259, 262, 796
- - from scleroderma ..	652
- ferret-like, in microcephaly ..	214
- Hippocratica in peritonitis ..	133, 431
- hysterical, contortion of ..	652
- in lardaceous disease ..	39
- mitral stenosis ..	61, 773
- Mongolian idiocy (<i>Figs.</i> 68, 89, 90, 91, p. 264) ..	216, 217, 263, 264
- myasthenia gravis (<i>Figs.</i> 83, 84) ..	260
- myopathy (<i>Figs.</i> 81, 82) ..	260
- myxœdema (<i>Figs.</i> 3, 4, 76, 77, p. 258) ..	43, 259, 451, 585
- paralysis agitans (<i>Fig.</i> 86) ..	259, 261, 541, 796
- pericarditis ..	480
- pernicious anæmia ..	76
- rat-like, in microcephaly ..	214
- simple colic ..	133
- spastic, in pseudo-bulbar palsy ..	686
- starchy, in pseudo-bulbar paralysis ..	686
- in tabes (<i>Fig.</i> 87) ..	262
Facio-scapulo-humeral myopathy, fibrillary contractions rare in ..	158
Fæcal accumulation in cæcum ..	
- in malignant growth of colon ..	394
- - colicky pain in loin from ..	393
- - in colon ..	393, 691
- - age incidence of ..	692
- - characters of mass in ..	692
- - constipation with ..	145, 692
- - diagnosis from renal tumour ..	393
- - - splenic tumour ..	691
- - movement of tumour with respiration ..	406
- - pain in left hypochondrium from ..	499
- - simulating enlargement of liver ..	406
- - nemata in diagnosis of ..	393, 499, 501, 691
- - flatulence with ..	393
- - obstruction due to ..	145, 692
- - occurrence in spite of daily action of bowels ..	393
- - pain in iliac fossæ from ..	501
- - tumour in loin from ..	393
- fistula of umbilicus in tuberculous peritonitis ..	51, 57
- odour in vomit (see Vomiting, Fæcalient)	
Fæces, acid, in pancreatitis ..	117
- alkaline, in gall-stone obstruction ..	117
- ankylostomum ova in ..	94

Fæces, contd.

- ascaris lumbricoides and ova in	361
- black	89
- blood in (see Blood per Anum, and Melæna)	
- characteristics in case of "greedy colon" ..	143
- colic	134
- colitis	134
- infantile colitis ..	92
- pancreatic cyst ..	724
- in pancreatitis ..	116, 117, 135, 364, 724
- Charcot-Leyden crystals in ..	117, 118
- clay-coloured from chronic pancreatitis ..	724
- - in obstruction of common bile-duct ..	362
- coloration in jaundice ..	361, 365
- congenital obliteration of bile-ducts ..	365
- rectal hæmorrhage ..	89
- suppurative pyelophlebitis ..	619
- condition of fat in, in pancreatic lesions ..	116
- delayed passage of, in intestinal constipation ..	141
- distoma eggs in ..	364
- discharge per urethram in rectal carcinoma ..	313, 633
- dry and hard in diabetes ..	141
- eggs of parasites in ..	94, 364, 569, 621
- enormous accumulations of ..	718
- examination in tropical dysentery ..	91
- fat in (see Fatty Stools)	
- gall-stones in ..	135, 300, 363, 621
- with gas passed per urethram ..	576
- hard and bulky, dyschezia due to ..	150
- heat loss in ..	619
- incontinence of (see Incontinence)	
- insufficiency of quantity of ..	140
- microscopical characters in pancreatitis ..	117
- examination in detecting cause of flatulence ..	268
FÆCES, MUCUS IN ..	443
- from anal fistula ..	92
- in arsenical poisoning ..	92
- bilharziasis ..	93
- in carcinoma of bowel ..	150, 152, 393, 636, 690, 736
- from colitis ..	134, 144, 197, 727
- dysentery ..	90, 727
- in enterospasm ..	486
- Henoch's purpura ..	600
- from intussusception ..	148, 152, 196, 636, 727, 736
- invagination of rectum ..	150
- oxyuris vermicularis ..	93
- from pelvic abscess ..	474
- in rickets ..	171
- simple colitis of infants ..	92
- spastic constipation ..	145
- in stomach, estimation of excess of ..	355
- ulcerative colitis ..	92, 727
- occult blood in, in carcinoma of colon ..	145
FÆCES, PASSED PER URETHRAM, commoner causes ..	261
- - in carcinoma of rectum or colon ..	313, 633
- - simulation by cystitis ..	261
- pus in (see Pus in Stools)	
- reactions of ..	117, 197
- ribbon-like, in rectal cancer ..	93
- sand in ..	652
- shreds and casts in ..	134

Fæces, contd.

- simulating enlarged liver ..	406
- tape-worm ova in ..	569
- tarry	89
- test for bile in ..	197
- tubercle bacilli in ..	427
- typhoid bacilli in ..	610
- worms in (see Worms, Intestinal)	
- Fæculent vomiting (see Vomiting, fæcal)	
- Fainting, associated with flushing (and see Coma) ..	268
- Faintness in angina pectoris ..	481
- due to arsenic ..	297
- on change of position due to aortic disease ..	233
- in fatty heart ..	241
- hepatoptosis ..	407
- paroxysmal tachycardia ..	772
- preceding hæmatemesis ..	316
- from rupture of extra-uterine gestation ..	436
- Fallopian canal, effects of lesion of facial nerve in ..	537
- tubes, absence of, sterility due to ..	706
- affection of, simulating movable kidney ..	727
- inflammation of, subphrenic abscess from ..	720
- new growth of, pelvic swelling due to ..	757
- tumour of, swelling in hypogastrium from ..	730
- Falls a cause of deafness ..	191
Familial character of acute rheumatism ..	121, 671
- - anæsthetic oedema ..	457
- congenital diplegia ..	800
- Friedreich's ataxy ..	559, 560
- gout	381, 383
- hæmophilia ..	599

- hereditary optic atrophy ..	838
- jaundice	362
- Miroy's disease ..	456
- mycicism	431
- myopathy	555, 559, 560
- pavor nocturnus ..	357
- phthisis	848
- primary muscular dystrophies ..	555, 559, 560
- pseudo-hypertrophic muscular paralysis ..	560
- retinitis pigmentosa ..	838
- splenomegalic cirrhosis ..	693
- Tooth's peroneal atrophy ..	132, 559, 560
Famine and filth in causation of relapsing fever ..	373, 698
Faradism in reaction of degeneration ..	633
Fascia, gonococcal inflammation of ..	376
- palmar, Dupuytren's contracture of ..	167
- rheumatic nodules in ..	452
- Fascicular muscular twitches ..	157
- Fastigium during rigors ..	646
Fat, emulsified, in urine (and see Chyluria) ..	126
- in fæces in pancreatitis ..	116
- jaundice	361
- necrosis in acute hæmorrhagic pancreatitis ..	153, 151, 646, 846
Fatigability in neurasthenia ..	788
- in disseminated sclerosis ..	171
- myasthenia gravis (Fig. 83, p. 261) ..	687
Fatigue, cause of convulsions ..	169
- alcoholic tremor increased by ..	797
- in etiology of dyspepsia ..	354
- hæmoglobinuria in ..	315

Fatigue, contd.

- in malingersers ..	464
- muscular twitchings from ..	157
- pains in limbs due to ..	508
- spasmodic contractions from ..	159
- tremor from ..	795, 797, 798
Fatness, excessive (and see Obesity) ..	453
- due to hypernephroma ..	454
- with thymic infantilism ..	215
Fatty acid crystals in fæces in pancreatitis ..	117, 135
- formed during putrefaction ..	283
- casts, renal ..	7
- heart (see Heart, Fatty)	
- infiltration, cardiac ..	62, 241
- liver (see Liver, Fatty)	
FATTY STOOLS ..	265
- in pancreatic disease ..	59, 135, 197, 292, 364, 366
- - infantilism ..	216
- superposition of heart ..	62, 241
Fauces, carcinoma of ..	420, 670, 673
- gumma of ..	670, 673
- inflammation of ..	673
- mucous patch on, in secondary syphilis ..	676
- reddening of, in scarlet fever and erythema scarlatiniforme ..	253
- simple ulceration of ..	670
- tuberculosis of ..	670, 673
Favus, affecting nails ..	271, 275, 445
- baldness from ..	84
- body and scalp (Fig. 93) ..	271
- crusts in ..	270, 653
- description of lesions of ..	270
- diagnosis from alopecia ..	272
- eczema and seborrhœa ..	272
- lupus erythematosus ..	272
- psoriasis of the scalp ..	271
- ringworm of scalp ..	274
- distribution of ..	270
- loss of lustre of hair in ..	270
- "mousey" smell in ..	270, 271, 272
- mycelium in ..	270
- scarring in ..	270, 272
- spores in ..	270
- sulphur yellow discs in ..	270
- tenderness of scalp from ..	780, 781
- transmission from animals ..	270
Fibrilla in children ..	621
- diagnosis from influenza ..	505
- pains in the limbs in ..	503, 505
- prostration with ..	505
- real nature of ..	505
Febrile albuminuria ..	17
- albumosuria ..	20
Feet, anæsthesia of, vertigo from ..	827
- in acromegaly ..	585, 749, 753
- atrophic contractions of ..	154
- bloody sweat of ..	715
- broad in myxœdema ..	454, 455, 585
- bromidrosis of ..	714
- bullæ of, in congenital syphilis ..	111
- cheiropompholyx of ..	111, 654, 832
- cold and blue, in paralytic talipes ..	130, 131
- erythema nodosum affecting ..	450
- keratodes of ..	451
- papulatum of ..	531
- in erythromelalgia ..	490
- œdema of (see Edema)	
- pruritus of ..	588
- scabies affecting ..	609
- sweating of, in rheumatoid arthritis ..	378
- swelling of, in angi-neurotic œdema ..	459
- tremor from alcohol ..	797
- (and see Soles of Feet)	

- Fehling's solution** in estimation of sugar .. 291
 -- reduction in alkaptonuria .. 822
 -- -- carboloria .. 823

 -- dyschezia from .. 150
 -- dysmenorrhoea from .. 219
 -- dystocia due to .. 227
 -- extrusion of .. 434, 759
 -- after labour, inversion of uterus mistaken for .. 587
 -- fluctuation in softening of .. 758
 -- fluid thrill in, from cystic degeneration .. 429
 -- frequency of micturition in .. 438
 -- hardness of tumour in .. 429
 -- histological diagnosis .. 434
 -- infection of extruded .. 759
 -- irregular outline of tumour .. 429
 -- length of uterine cavity increased in .. 429
 -- median position of .. 392
 -- menorrhagia in 428, 758, 759
 -- metrorrhagia from .. 433, 435
 -- necrobiosis in .. 759
 -- nephritis from .. 8
 -- obstructing labour .. 228
 -- obvious pelvic origin of .. 392
 -- often multiple .. 434
 -- passage of uterine sound in .. 429
 -- pelvic swelling due to 757, 758
 -- rapid growth of tumour indicative of degeneration of .. 759
 -- relation to metrorrhagia .. 434
 -- of round ligament 741, 768
 -- sarcomatous degeneration of .. 434, 759
 -- simulated by inversion of uterus .. 587
 -- simulating sciatica .. 74
 -- -- sarcoma .. 434
 -- sloughing of .. 759
 -- diagnosis from malignant disease .. 759
 -- foul vaginal discharge due to .. 211
 -- softening from degenerative changes .. 429
 -- in pregnancy .. 759
 -- spasmodic pelvic pain from expulsion of .. 509
 -- sterility due to .. 706
 -- strangulation of .. 434
 -- subperitoneal, absence of elongation of uterine cavity in .. 429
 -- swelling in iliac fossa from .. 737
 -- tumour and cervix move together in .. 429

Fibromyoma, contd.

- of vagina ..	768
Fibro-lipomata of abdominal wall ..	716
Fibro-sarcoma, nasal ..	204
- of naso-pharynx, snoring due to ..	669
Fibrosis of mediastinum (see Mediastinum, Fibrosis of)	
Fibrous tissue inflammation, in rheumatism in children ..	504
Fidziness, excessive ..	156
Fifth nerve affected in bulbar paralysis ..	159
- - anesthesia of, from tumour of mid-brain ..	798
- - herpes of ..	781
- - lesions, pytorrhoea from ..	591, 592
- - motor paresis of ..	496
- - pain in, from iritis ..	495
- - paralysis, anomia from ..	668
- - causing impaired taste ..	775
- - undue dryness of nose from ..	668
Figs, oxaluria from ..	471
Fiji, filariasis in ..	33
Filaria sanguinis hominis, oedema from ..	455
- - elephantiasis due to ..	126, 456, 763, 810
- - - of vulva due to ..	770
- - - embryo (<i>Plate XII, Fig. F</i>) ..	696, 770
- - - lymphatic obstruction from ..	810
- - - ulceration of the leg in ..	810
Filariasis , blood changes in ..	33
- - chylous ascites in ..	58
- - chyluria in ..	126
- - eosinophilia in ..	126, 249
Filth and famine in causation of relapsing fever ..	698
Fingers affected by acute rheumatism ..	374
- - atrophic contractions of ..	154
- - bedsores on ..	266
- - broad, in myxodema ..	454, 585
- - burning pain in, in acroparæsthesia ..	493
- - burrows of scabies on ..	832
- - chancre of ..	266
- - clubbed (and see Clubbed Fingers) ..	128, 390, 411, 266
- - dissection wounds of ..	266
- - eczema of ..	533
- - enlarged in acromegaly ..	128
- - pulmonary osteo-artro-pathy ..	128
- - epidermolysis bullosa affecting ..	266
- - examination of, in obscure pyrexia ..	620
- - flexed in brachial monoplegia ..	516
- - fusiform enlargement in tuberculous dactylitis ..	751
- - - rheumatoid arthritis ..	378
- - gangrene of, due to carcinoma of breast ..	287
- - - diabetes ..	266
- - - intrathoracic aneurysm ..	287
- - - in Raynaud's disease ..	284
- - - syringomyelia ..	285
- - gonococcal arthritis of ..	376
- - Heberden's nodes in ..	384, 452
- - pads on dorsal aspect of first interphalangeal joints (<i>Figs. 114, 115</i>) ..	385
- - pityriasis rubra pilaris papules on ..	530
- - pruritus of, due to scabies ..	588
- - scabies affecting ..	588, 609, 832
- - septic infection, epitrochlear gland enlarged in ..	422
- - shape of, in achondroplasia ..	212

FINGERS, SORE .. 266

- test for movements of, in hysterical and cerebral paralysis ..	548
- tremor of, in Graves' disease ..	244, 253, 772, 849
- tingling and numbness in, in acroparæsthesia ..	493
- tuberculous disease of skin of ..	266
- ulnar flexion of (<i>Fig. 108</i>) ..	379, 380
Firemen, enlarged left ventricle in ..	232
First lumbrical, nerve supply of ..	512
- sound abnormal in hypertrophy of ventricles ..	331
Fish, fried, colic due to ..	136
- urticaria from ..	746
Fishbone in œsophagus, hæmatemesis from ..	297
- in the rectum ..	635
Fissure, anal (see Anus, Fissure of)	
- palpebral (see Palpebral Fissure)	
Fistula , anal, bleeding in ..	92
- causing pneumaturia ..	576
- cervical with tuberculous glands ..	420
- - duodeno-pancreatic ..	294
- - gastro-colic, faecal vomiting in ..	845
- - genital, sterility due to ..	706
- - lumbar, from kidney after operation ..	442
- - micturition through ..	442
- - recto-urethral, illustrated (<i>Fig. 170</i>) ..	637
- - recto-vaginal, illustrated (<i>Fig. 172</i>) ..	637
- - recto-vesical from growth ..	264, 633
- - reno-colic, from carcinoma ..	577
- - scrotal, general account of ..	679
- - - from tuberculous testis ..	518, 672
- - suprapubic, after operation ..	442
- - umbilical faecal, in tuberculous peritonitis ..	691, 716
- - urethral, acute ..	677
- - - chronic ..	678
- - - endoscopic examination in ..	678
- - - from gummata ..	209
- - - perineal excoriation in ..	678
- - - pain in ..	516
- - - sore from ..	677
- - - due to stricture ..	677
- - - urinary, after childbirth ..	442
- - - from peri-urethral abscess ..	442
- - - traumatic ..	442
- - - urethral stricture ..	442
- - uro-biliary, choluria without jaundice in ..	819
- - vesical, cystoscope in detecting ..	442
- - vesico-colic, due to carcinoma ..	146
- - - due to diverticulitis ..	146
- - vesico-intestinal, faeces passed per urethram in ..	264
- - vesico-vaginal, in carcinoma of uterus ..	632
- - - methylene blue in tracing ..	442
Fits (see Convulsions)	
Flaccidity in birth palsies ..	558
- in hysterical paralysis ..	541
Flail-like joint in osteo-arthritis ..	384
- - tabetic arthritis ..	388
Flanks, shifting dullness in ..	335
Flat chest in phthisis ..	191
Flat-foot from gonorrhœa ..	376
- - metatarsal neuralgia in ..	488
- - in neuralgia paræsthetica ..	488
- - pain in the foot from ..	486
FLATULENCE ..	267
- in abdominal angina ..	351, 186
- - angina pectoris ..	350, 181, 779
- - asthenic dyspepsia ..	351

Flatulence, contd.

- atonic constipation ..	143
- borborygmi with ..	97
- with chronic gastritis ..	845
- diagnosis from merycism ..	431
- in dyspepsia ..	354
- from faecal accumulation ..	393
- foul breath with ..	99
- in functional stomach disorders ..	267
- - with gall-stones ..	350
- - in gastric atony ..	267
- - dilatation ..	267
- - fermentation in ..	267
- - offensive eructations in ..	267
- - interscapular pain from ..	474
- - intestinal ..	267
- - colicky pains in ..	267
- - spasmotic pelvic pain in ..	509
- - loss of weight due to ..	848
- - may simulate dysmenorrhœa ..	220
- - pain in the chest from ..	484, 779
- - epigastrum in ..	485
- - left hypochondrium from ..	499
- - - iliac fossa from ..	501
- - - precordial, from ..	481
- - palpitation in ..	484
- - simulating heart disease ..	779
- - tenderness in the chest from ..	779
- - visible peristalsis with ..	724
Flatus, passage of, in acute pancreatitis ..	153
- - intestinal obstruction ..	151
- - per urethram in carcinoma of rectum or colon ..	633
Flea-bites, purpura from ..	596, 597
Flexor brevis digitorum, nerve supply of ..	542
- - hallucis, nerve supply of ..	542
- - minimi digiti, nerve supply of ..	542, 550
- - pollicis, nerve supply of ..	550
- - carpi radialis, nerve supply ..	550
- - ulnaris, nerve supply of ..	550
- - - paralysis of ..	128
- - - spinal nerve root supplying ..	556
- - longus digitorum, nerve supply of ..	542
- - hallucis, nerve supply of ..	542
- - pollicis, nerve supply of ..	550
- - profundus digitorum (inner half) nerve supply of ..	550
- - sublimis digitorum, nerve supply of ..	550
- - of wrist and long flexors of fingers, spinal nerve root supplying ..	556
Flint's bruit ..	108, 109, 234
Fluid in abdomen in bladder injury (and see Ascites) ..	308
- - deficiency in tissues, polycythæmia due to ..	579, 580
- - with gas in pleural cavity ..	577
- - rapid loss of, as cause of marasmus ..	426
Fluorescence in urine due to eosin ..	820
Fluorescein, in detection of corneal ulceration ..	806
Flush, malar, of myxodema ..	43
FLUSHING ..	268
- associated symptoms ..	268
- chronic ..	268

- - loss of weight due to ..	848
- - melæna in ..	298, 428
- - multiple, in appendicitis ..	304
- - normal HCl with ..	713, 846
- - ordema of legs after ..	459
- - pain in the back in ..	298, 476, 485
- - chest from ..	779
- - epigastrium in ..	484
- - after food with ..	89, 815
- - relieved by vomiting ..	352, 845
- - in left hypochondrium ..	499
- - interscapular in ..	474
- - spasmodic pelvic in ..	509
- - and tenderness in the back from ..	789

Gastric ulcer, contd.

- - pancreatitis caused by ..	116
- - perforated, abdominal pain and collapse from ..	484, 721
- - causing acute peritonitis ..	55, 780
- - diagnosis from acute pancreatitis ..	431
- - latent symptoms with ..	721
- - omental abscess from ..	724
- - pneumoperitoneum from ..	711
- - resembling dysmenorrhœa ..	220
- - shock and collapse in ..	484
- - sudden severe pain in the epigastrium in ..	484
- - tenderness in the hypogastrium from ..	780
- - right iliac fossa from ..	780
- - peritonitis in ..	55, 431, 484, 644, 721, 780
- - pleuritic effusion from ..	123
- - pneumothorax caused by ..	577
- - predisposed to by chlorosis ..	303
- - ptialism in ..	591
- - pyloric obstruction from ..	712
- - stenosis from ..	352
- - relation of pain to food in ..	485
- - results of profuse hæmorrhage in ..	298
- - sex incidence of ..	40, 90
- - simulated by anæmic vomiting ..	847
- - cardiac dilatation ..	485
- - heart disease ..	779
- - tabes dorsalis ..	350
- - subphrenic abscess from ..	119, 501, 577, 578, 720, 721
- - sudden collapse from hæmatemesis in ..	298
- - pallor in ..	298
- - surgical emphysema from ..	231
- - without symptoms ..	780
- - tenderness of abdomen in ..	184
- - epigastrium in ..	89, 298
- - lower dorsal spines in ..	474
- - tetany in ..	3
- - thickening round, diagnosis from enlarged gall-bladder ..	406
- - time of pain in ..	298
- - vomiting in ..	298
- - undue abdominal aortic pulsation suggesting ..	592
- - urobilinuria with ..	116
- - vomiting in ..	89, 298, 485, 843
- - Gastritis, analysis of gastric contents in ..	352
- - from antimony ..	297
- - arsenical, diarrhoea in ..	297
- - epigastric burning pain in ..	297
- - faintness in ..	297
- - nature of vomit in ..	297
- - red, inflamed mucous membrane in ..	297
- - rice-water stools in ..	297
- - violent incessant sickness in ..	297
- - bile in vomit in acute ..	845
- - causes of ..	297, 352
- - in cirrhosis of liver ..	410
- - diarrhoea in ..	297, 845
- - diminished appetite in ..	49
- - total acidity in ..	352
- - dull boring pain behind sternum and in epigastrium in ..	484
- - epigastric discomfort and tenderness in ..	297
- - excess of mucus in stomach contents in ..	352
- - flatulence with ..	845
- - furred tongue in ..	49
- - hæmatemesis in ..	294, 297
- - hæmorrhage and erosion in ..	297

<i>Gastritis, contd.</i>		<i>General paralysis of insane, contd.</i>		<i>Gestation, ectopic, contd.</i>	
- heartburn in	481	- - - convulsions in	169, 172, 269, 340	- - - diagnosis from small ovarian dermoid ..	760
- loss of appetite in ..	352	- - - cyto-diagnosis in ..	269	- - - pedunculated fibroid ..	760
- mistaken for rheumatism of the shoulder ..	778	- - - diagnosis of	269	- - - difficulty of identification of uterus in ..	760
- nausea, eructations, and vomiting in	297, 352	- - - of saturnine encephalopathy from ..	139	- - - felt per rectum ..	638
- pain in the chest and palpitation in	484	- - - dysarthria in	686	- - - importance of early diagnosis in ..	760
- in limbs in	503	- - - dysphagia in	225	- - - internal hæmorrhage from ..	780
- radiating to left breast and interscapular region in ..	484	- - - grinding of the teeth in ..	796	- - - pain preceding rupture or abortion in ..	509
- directly related to the taking of food	484	- - - headache in	327	- - - pelvic hæmatocele due to ..	638, 757
- and tenderness in the back from	789	- - - hemiplegia in	340, 682	- - - pain in	508, 760
- phlegmonous, severe constitutional symptoms with ..	845	- - - impotence in	346	- - - swelling from	757, 760
- from phosphorus	297	- - - insomnia in	358	- - - progressive	760
- ptyalism in	591	- - - irritability in	360	- - - rupture of, pain in right side of abdomen in ..	500
- pyrexia in	297, 815	- - - laryngeal paralysis with ..	589	- - - gestation sac in ..	760
- relief of pain on eructation ..	484	- - - lumbar puncture in ..	760	- - - signs of pregnancy in ..	760
- - - vomiting	484	- - - diagnosis of	269	- - - simulated by threatened abortion	436
- results of test meal in ..	50	- - - mental changes in ..	139, 269	- - - swelling in tube felt on bimanual examination ..	509
- sense of fullness with ..	352	- - - osseous atrophy in ..	269	- - - tenderness in the right iliac fossa from ..	780
- simulated by arsenical poisoning	845	- - - paraplegia in	562, 567	- - - unruptured	760
- - - carcinoma	299	- - - perforating ulcer from ..	809	- - - uterine hæmorrhage in ..	436, 646, 760, 780
- - - phosphorus poisoning ..	845	- - - physical changes in ..	139	- - - vaginal examination in ..	500
- - - symptoms of	845	- - - pupils in	195, 594, 595	- - - Giant cells in tuberculosis ..	450
- - - in children	297	- - - simulated by plumbism ..	797	- - - Giemsa's method of staining ..	769
- toxic, collapse in	297	- - - slow blurred speech in ..	796	- - - Gigantism and infantilism associated ..	214
- - - hæmatemesis in	294, 297	- - - spasmodic contractions in ..	159	- - - Giantotoblasts (<i>Plate II, Fig. F</i>) ..	28
- - - intense pain in	297	- - - spontaneous fracture in ..	269	- - - Gin-drinking, polyuria from ..	581
- - - vomiting from	297, 843	- - - stammering in	688	- - - Gingerbeer, explosive eructation of gas from ..	639
Gastrocnemius bursa, popliteal swelling due to	762	- - - symptoms of	139	- - - Gingivitis, bleeding gums in ..	87
- nerve supply of	542	- - - syphilis a precursor of ..	269	- - - purpura from	600
- pseudo-hypertrophy of ..	560	- - - temporary aphasia in ..	682	- - - in syphilis	86
- spinal nerve root supplying ..	543	- - - tottering in	796	- - - tuberculous	85, 87
Gastroduodenum	724	- - - tremor in	795, 796, 798	- - - Girdles, organ of, cyst of ..	521
Gastro-enterostomy, performance of, in tubes, from mistaken diagnosis	525	- - - unequal knee-jerks in ..	398	- - - GIRDLE PAIN	289
Gastro-intestinal disorders, carpalpedal spasm in ..	3	- - - pupils in	195, 595	- - - from aortic aneurysm ..	482
- headache in	328	- - - various signs of	172	- - - due to bilateral pressure on intercostal nerves ..	479
- from hepatic abscess	651	- - - Wassermann's reaction ..	269, 340, 360	- - - in disseminated sclerosis ..	665
- insomnia in	356	- - - peritonitis (see Peritonitis, Acute General) ..	832	- - - fracture of dorsal spine ..	484
- in movable kidney	310	- - - tuberculosis of lungs (see Lungs; Phthisis; and Tuberculosis, General) ..	832	- - - in spinal caries	667
- pain in limbs in	505	- - - coli bacilluria after operation on	83	- - - hæmorrhage	787
- prolonged pyrexia in children due to	618	- - - congenital syphilis of ..	446	- - - tables	484, 664
- rigors in	647	- - - herpes simplex of	829	- - - with transverse cord lesions ..	164
- from round-worm infection	569	- - - lymphatics	738	- - - in transverse myelitis ..	484
- tetany from	178	- - - melanotic carcinoma of ..	802	- - - from compression ..	564, 786
Gastropnoxis, dyspepsia in ..	351	- - - myoma cutis of	805	- - - meninges	667
- diagnosis from gastrectasis ..	353	- - - precocious development of with hypernephroma (<i>Figs. 125, 126, pp. 453-4</i>) ..	690	- - - Glands, arthritis in ..	376
- flatulence in	267	- - - pustular syphilides of ..	604	- - - B. mallei in	603
- mobility of right kidney in ..	353	- - - Genito-crural nerve, skin distribution of	659	- - - bullæ in	110, 112, 603
- x-rays in diagnosis of (<i>Fig. 105</i>)	353	- - - region, erythrasma in ..	276	- - - constitutional disturbance in ..	603
Gastroscope in diagnosing gastric carcinoma	299	- - - Geophagy	115	- - - discharge from nostrils in ..	603
Gastrostaxis	295, 298	- - - German measles, albuminuria in ..	17	- - - mallein in diagnosis of ..	603
- causing anæmia	40	- - - conjunctivitis ("pink-eye") in	256	- - - papules, vesicles, and pustules in	603
- blood per anum in	90	- - - diagnosis from erythema scarlatiniforme ..	253	- - - purulent rhinitis in ..	203, 204
- discussion of	303	- - - measles	418	- - - rigors in	617
- hæmatemesis from	294, 298	- - - scarlet fever	418	- - - ulceration of the leg from ..	811
Gellé's test for hearing	189	- - - small-pox	607	- - - widespread ulceration in ..	603
Gemellus superior, nerve supply ..	512	- - - generalized lymphatic gland enlargement in ..	416, 418, 607	- - - Glands, heat production from activity of	619
General paralysis of the insane, amnesia in	25	- - - rigors in	617	- - - lymphatic, enlargement of (see Lymphatic Glands) ..	619
- - - anæmia from	669	- - - scaly eruption with ..	655	- - - salivary (see Salivary Glands) ..	619
- - - aural hæmatoma in	269	- - - sore throat in	670	- - - thymus (see Thymus Gland) ..	619
- - - bedriddenness from ..	69	Gestation, ectopic (and see Abortion, Tubal) ..	500, 759	- - - thyroid (see Thyroid Gland) ..	619
- - - bleeding gums in	85	- - - abortion of	760	- - - Glaucoma, acute (<i>Plate VIII, Fig. c, p. 463</i>)	839
- - - cerebrospinal fluid in ..	338, 339, 340	- - - coma from rupture of ..	137, 140	- - - age incidence of	257
- - - Cheyne-Stokes respiration in	125	- - - no definite sign of pregnancy in	760		
- - - coma in	136, 139, 310	- - - diagnosis from chronic salpingo oophoritis ..	760		
- - - congestive attacks in ..	682	- - - small cystic ovary ..	760		

Glaucoma, contd.

- anterior chamber shallow in	840
- atropine and mydriatics	
contraindicated in	257
- circumcorneal injection in	838
- differentiation from conjunc-	
tivitis and iritis	257
- effects of diet on	257
- haloes and rainbows in	257
- lazy vitreous in	838
- headache in	257, 327, 328,
	494, 783, 838
- lachrymation in	255
- loss of vision in	257
- oedema of eyelids and conj-	
unctiva in	257
- optic disc in (<i>Plate VIII,</i>	
<i>Fig. v, p. 463</i>)	257, 463, 838
- pain in eye in	255, 494, 498
- ears and teeth from	257
- maxillary region from	498
- temporal region from	498
- peripheral constriction of	
vision in	838
- photophobia in	255
- pupil dilated, in	595, 838, 840
- fixed, in	838
- unequal, in	595
- rainbow vision from	257, 840
- secondary to iritis	839
- steaminess of cornea in	838, 840
- sudden blindness from	839
- tenderness of forehead from	783
- temporal region from	783
- vertex from	783
- tension of eye in	257
- trigeminal neuralgia in	838
- vomiting in	494, 838
- Glaziers, plumbism in	136
- Gleet, arthritis from	376
- defined	207
- epididymitis due to	766
- Glénard's disease, displace-	
ment of viscera in (<i>Figs.</i>	
<i>39, 41, pp. 147, 149</i>)	721
- Glioma of cauda equina, mus-	
cular atrophy in	74
- cerebral, diabetes insipidus	
in	585
- Gliosis, spinal	492
- Globus hystericus	166, 224, 225,
	342, 506, 538, 710, 798
- associated with functional	
paralysis of vocal cords	538
- major, nodules in	767
- minor, nodules in	767

of trypanosomiasis	34
- Glossitis, chronic, relation to	
carcinoma	812, 813
- smoking	812
- syphilis	812, 813
- dysphagia from	225
- Glossio-pharyngeal nerve,	
paresis of	774, 775
- Glossy skin	423
- with syringomyelia	128
- Glottis, spasm of, vertigo	
associated with	828
- Glove-and-stocking anaesthesia	
(see <i>Anaesthesia</i>)	
- Glutei, nerve supply of	542
- pseudo-hypertrophy of	560
- spinal roots supplying	544
- treadler's cramp of	177
- wasting in tuberculous lip	72
- Glycogen	5
- GLYCOSURIA	289
- acetonuria with	4
- alimentary, distinguished	
from diabetes mellitus	584
- Böttger's test in	290
- in bronzed diabetes	411, 575
- with carcinoma of pancreas	59

Glycosuria, contd.

- chronic, absence of abnormal	
thirst or appetite in	292
- acetoneuria in	292
- wasting in	292
- advancing age in	292
- good effect of diet in	292
- gouty tendency in	292
- moderate amount of urine	292
- from chronic pancreatitis	
	135, 292, 724
- in diabetes	291, 507
- diagnostic importance of	291
- errors in tests for	290
- Fehling's test in	289
- fermentation test in	291
- of urine as quantitative	
test in	291
- gouty	817
- laryngeal paralysis with	539
- Moore's test in	290
- multiple neuritis from	551
- need for confirmation by	
fermentation test	818
- by phenylhydrazine test	818
- neuritis with	75
- Nylander's test in	290
- obesity preceding	292, 453
- with pancreatic cyst	724
- in pancreatic disease	
	59, 292, 366, 486, 724
- Pavy's test for	289
- phenyl-hydrazine test for	290
- picric acid test for	290
- pneumaturia with	576
- in pregnancy	293
- quantitative tests in	291
- Fehling's solution in	291
- Pavy's solution in	291
- polarimeter in	291
- safranin test for	291
- temporary, in chronic alco-	
holism	292
- conditions associated with	292
- due to cerebral conditions	292
- tests for	289
- transitory as forerunner of	
true diabetes	293
- Trommer's test for	289
- in tumour of pancreas	59, 366
- uric acid crystals with	817
- yeast in testing for	290
- Glycuronic acid, osazone crys-	
tals from	115, 290
- precipitate with phenyl-	
hydrazine	291
- in urine, reduction by	290
- Gmelin's reaction in acute	
yellow atrophy of liver	370
- detecting bile in the urine	819
- Gnats, lumpy swellings from	747
- vesicles from	834
- Goats, Malta fever from	507, 612
- Goitre (see <i>Thyroid Gland</i>)	
- Enlarged, and Exophthal-	
mic Goitre)	
- Gonococci in arthritic fluid	376
- ascitic fluid	57
- bacteriuria with	83
- causing chordee	125
- in the circulating blood	650
- difficult to detect in chronic	
urethritis	209
- epididymitis from	454
- in gleet	209
- mode of examining films for	768
- female genital organs	211
- staining	211
- of Neisser described (<i>Plate</i>	
<i>XII, Fig. R, p. 696</i>)	206, 769
- occurrence within leucocytes	211, 643, 769
- ophthalmia from	255
- neonatorum due to	255

Gonococci, contd.

- orchitis due to	454
- panophthalmitis from	807
- peritonitis, acute from	55
- prostatitis due to	83
- purulent rhinitis, from	203
- not stained by Gram's method	769
- and streptococci associated	377
- ulceration of the cornea from	807
- in urethral discharge	79, 206, 675
- urethritis due to	83, 675
- in vaginal discharges	211
- vertebral arthritis due to	785
- in vulvitis	768
- Gonorrhœa, acute, acute	
gonorrhœal arthritis in	376
- method of investigating	
	206, 207
- prostatitis and prostatic	
abscess from	515
- urethritis in	510
- albuminuria in ascending	
nephritis from	16
- balanitis in	674
- chordee in	125
- chronic defined	207
- filaments found in urine in	207
- joint lesions from	278
- dyspareunia from	221
- enlarged inguinal glands from	422
- epididymo-orchitis from	518, 766
- eosinophilia in	248
- flat-foot from	376
- gangrene in	282
- infection of ejaculatory ducts	518
- prostatic urethra in third	
week in	518
- iritis and cyclitis in	256
- mode of examining dis-	
charge for gonococcus	768
- nature of vaginal discharge	211
- nodules in globus minor in	767
- orchitis from	79
- pain in the penis during	
micturition in	510
- sole of foot from	376
- papilloma urethrae from	209
- vulva from	769
- perineal sores from	677
- persistent pyuria in	626
- priapism from	586
- prostatic abscess from	631
- threads after	444
- purulent urethral discharge in	511
- pyrexia in	620
- pyuria due to	623, 631
- redness of Bartholin's gland	
ducts in	769
- and swelling of carunculae	
myrtiformes	769
- residual prostatic catarrh of	444
- rigors from	650
- scalding on micturition in	769
- simulated by gouty urethritis	818
- soft chancre of	769
- spondylitis deformans after	786
- testicular abscess from	680
- atrophy after	79
- thread-worm infection mis-	
taken for	569
- time of onset of urethral	
symptoms	510
- urethral	518
- epididymo-orchitis in	517
- gonococcus in smear of	
the discharge in (<i>Plate</i>	
<i>XII, Fig. R, p. 696</i>)	675
- pyuria due to	623, 631
- staphylococcus simulat-	
ing	631
- vesiculitis in	638
- vulvitis in	768, 769
- Gonorrhœal arthritis (see <i>Ar-</i>	
thritis)	

Gonorrhœal Bartholinitis ..	221	Gowers' varieties of hemiplegic rigidity	163, 164	Gualiacum test for blood ..	89
- epididymitis (see Epididymitis, Gonorrhœal)		Graafian follicle, hæmorrhage into, spasmodic pelvic pain from	509	- - iodides	112
- rheumatism (see Arthritis, Gonorrhœal)		Gracilis, nerve supply of ..	542	Guanin bases, uric acid from Guinea-pig, inoculation of, in diagnosing tuberculosis ..	817
Gooseberries, oxaluria from 311, 471		Grain, sporotrichosis from ..	322	57, 121, 626, 719	
Goose-skin, severe ..	528, 530	Grandeur, ideas of, in general paralysis of insane 139, 269		Gum-boil	747
Gout	380	Grandeur, re hæmophilia ..	302	- foul taste from	774
- acute attack of	382, 383	Granddier, (see Epilepsy)		- grinding of teeth due to ..	293
- - arthritis in	383, 507	Grand mal (see Epilepsy)		- pain in the face from ..	495
- - in other joints than the toe ..	382	Granular casts, renal, ..	7	- ptyalism due to	591
- age incidence of	381	- kidneys (and see Bright's disease)	13	Gumma of bone	386
- albuminuria in	16	- - accentuation of heart sounds in	1, 2, 639	- - diagnosis from .. chronic pyogenic infection ..	752
- bony out-growths in	383	- - albuminuria in	14, 18	- - - sarcoma	752
- brachial neuralgia in	491	- - and cerebral hæmorrhage ..	138	- - - tuberculous disease ..	752
- cavernitis from	516	- - Cheyne-Stokes respiration with	124, 125	- - general thickening of bone in	752
- cellulitis simulating	455	- - cyanosis from	186	- - localized swelling due to ..	356, 752
- chronic (Figs. 112, 113) ..	383	- - enlarged left ventricle in 232, 639		- - osteomyelitis due to ..	752
- condition of nails in	275	- - epistaxis in	251	- - of bundle of His	98
- confusion with syphilitic pains	386	- - in gout	507	- - cauda equina, simulating peripheral neuritis ..	74, 563
- cramp in	179	- - hæmoptysis in	318	- - cerebral, diabetes insipidus in ..	585
- diagnosis from infective arthritis	382	- - heart failure in	464	- - headache, vomiting and giddiness from ..	336
- distribution amongst joints in ..	383	- - high blood-pressure in ..	18, 64, 96, 186, 251, 464, 639	- of cranium, tenderness of scalp from	782
- Dupuytren's contracture in ..	167	- - in orthopnea in	464	- diagnosis from abscess ..	449
- dyspepsia in	354	- - pale, albuminuria in contracted	17	- - Bazin's disease	451
- effect of diet in	381	- - or red	63	- - epithelioma	420
- epididymo-orchitis from 517, 818		- - palpitation in	525	- - lupus	449
- epistaxis in	251	- - pleuritic effusion in ..	122	- - enlarged liver from ..	615
- no essential relationship to uric acid precipitates 816, 817		- - in plumbism	38, 144	- of face, healed (Figs. 156-7) ..	589
- granular kidney in	507	- - polycythæmia in	579	- of fauces, palate, or uvula ..	673
- glycosuria in	292, 817	- - polyuria from	579, 582, 583, 584	- of joints (see Arthritis, Tertiary Syphilitic)	
- headache in	328	- - reduplicated heart sound in	639	- - of liver	411, 615
- heredity in	381, 383	- - signs of	122	- - action of mercury and iodide in	279
- high blood-pressure from ..	251	- - due to ureteral obstruction ..	11	- - ascites with	60
- importance of history in 381, 383		Granulosis rubra nasi ..	714	- - causing pleuritic effusion ..	123
- intercostal neuralgia in ..	478	Grating in osteo-arthritis ..	384	- - secondary carcinoma ..	370
- involvement of tendon sheaths in	382	Gravel, uric acid	816	- - local enlargement of liver in	370
- in lead poisoning	77	- - in urine in renal colic ..	500	- - pyrexia in	370, 615
- monarticular character of ..	382	Graves' disease (see Exophthalmic Goitre)		- - simulated by phantom tumours	721
- neuralgia in	491	Gravid uterus (see Pregnancy)		- - simulating enlarged gall-bladder	278, 279
- orchitis from	79	Great auricular nerve, skin distribution of	659	- - new growth	279
- oxaluria in	471	- occipital nerve, skin distribution of	659	- - situation of	722
- pain in the big toe from 381, 382, 486		Great-toe joint, favourite site for gout	381	- - therapeutic test for ..	279, 370
- - soles of feet in	382	Greedy colon, constipation due to	143	- - Wassermann's reaction in ..	279, 371
- peripheral neuritis in ..	75, 507	Green cancer (see Chloroma)		- mediastinal (see Mediastinum, Gumma of)	
- plumbism causing	38, 507	Green-stick fracture	750	- meninges	687
- priapism in	585, 586	- - in rickets	269	- paralysis of vocal cord from ..	538
- pyrexia in	382, 455	Grimacing, mild choreiform movements causing ..	156	- pelvic, simulating sciatica ..	74
- rarity of suppuration in ..	382	GRINDING OF TEETH DURING SLEEP	293	- of penis	677
- recurrence of attacks of 381, 382		- - in general paralysis of the insane	796	- pyrexia with	615
- rigors in	647, 650	Groin, affected by eczema marginatum	275	- of skin	279
- scleritis and episcleritis in ..	256	- coloured sweat of	714	- spinal cord, spastic paralysis of one leg from ..	540
- senile gangrene and	286	- glands (see Lymphatic Glands, Inguinal)		- - allocheiria from	22
- sex incidence of	381	- - hernia in	716	- spleen, exceedingly rare ..	692
- shiny skin over joint in ..	383	- - oedema of in Milroy's disease ..	460	- spontaneous healing of ..	812
- simulated by tabes	484	- pain in, from renal calculus ..	308	- of testis (see Testis, Gumma of)	
- simulating gonorrhœal arthritis	382	- swelling in (see Inguinal Swelling)		- therapeutic test in diagnosing ..	254, 279, 420, 672, 677, 752
- - pyæmia	383	- - due to lipoma of spermatic cord	741	- thyroid gland	792
- sodium urate crystals in joint, bursa, or ear in (Figs. 112, 113) ..	380	Growing-pains	18	- tongue	279, 420, 814
- - in tophi in	380	- in children, relation to acute rheumatism	504, 507	- - simulated by tuberculous ulcer	814
- swelling of bones in	754	Gualacol, foul breath from ..	98	- - tonsil simulating carcinoma ..	672
- tenderness in the spine in 784, 785		- - taste from	774	- - sore throat from	670
- testicular atrophy after ..	79	- - poisoning, diazo-reaction in ..	198	- ulcerating, description of 811, 813	
- tinnitus with	794			- unilateral exophthalmos due to	254
- tophi about joints or in ears in	380, 507			- urethral	209
- - in (Figs. 112, 113) ..	381, 383			- Wassermann's reaction in ..	420, 752
- urethritis in 206, 585, 586, 818					
- vertigo due to	829				
- violent thumpings of heart in elderly people liable to ..	527				
- x-rays in (Fig. 113) ..	383				
Gow on reaction of vaginal secretion	210				
Gowers' distal myopathy, fibrillary contractions rare in ..	158				

Gums , actinomycosis of .. 88	Hæmatin , absorption bands of .. 95	Hæmaturia , <i>contd.</i>
- bleeding (see Bleeding Gums, and Gingivitis)	Hæmatocele , absence of translucency in .. 522	- Bright's disease .. 12
- blue line on, in lead poisoning 136, 153, 473, 507, 525	- clinically like hydrocele except for translucency .. 522	- brown urine from .. 820
- epithelioma of .. 419, 749	- coma from occurrence of .. 140	- colic in .. 306, 395
- examination of, in obscure pyrexia .. 620	- diagnosis from tumour of testis .. 521, 523	- colour of urine in .. 305, 819, 820
- lacerated, in fracture of jaw .. 747	- - scrotal hernia .. 523	- from corrosive poisoning .. 297
- retraction of (see Retraction of Gums)	- echymosis of scrotum from fluctuation in .. 521, 522	- with cystic kidneys .. 15, 396
- septic, foul breath due to .. 99	- gradual onset in some cases .. 522	- cystoscopy in (<i>Plate V</i> , p. 308) .. 9, 307
- spongy , in infantile scurvy .. 295, 599	- history of injury in .. 522	- diagnosis of .. 313
- - and foetid, in scurvy .. 44, 302	- operation in diagnosis of .. 706	- diagnosis from hæmoglobinuria .. 315
- - from mercury .. 295	- pelvic .. 473	- disproportionate albuminuria in .. 306
- - in scurvy-rickets .. 753	- - albumosuria in .. 20	- distribution of blood in the urine during micturition .. 305
- - (see Bleeding Gums)	- - bearing-down pain in .. 473	- examination of clots in .. 305
- suppurating (see Pyorrhæa Alveolaris)	- - bulging into rectum .. 760	- - testis in cases of .. 307
- swelling of, in abscess of antrum of Highmore .. 502	- - into vagina .. 760	- frequent micturition with .. 306
- - in alveolar abscess .. 747	- coma from hæmorrhage of .. 140	- in fungating endocarditis .. 9, 237
Gun headache .. 329	- due to ectopic gestation .. 757	- Henoch's purpura .. 90, 380, 600
Gunpowder type of actinomycosis .. 756	- hæmorrhage from corpus luteum .. 757	- from hypernephroma .. 395
Gunshot wounds, pneumothorax after .. 577, 578	- - pelvic swelling due to .. 757, 760	- increased after exercise with calculus .. 395, 629
Gurgling, abdominal (see Borborygmi)	- - from tubal abortion .. 760	- influence of movement on .. 305
Gymnastics, menorrhagia from .. 428	- due to tapping a hydrocele .. 522	- intermittent, from movable kidney .. 310
HABITS , change of, causing amenorrhœa .. 23	- testicular atrophy from .. 78	- kidney enlarged with .. 395
- dirty in idioey .. 682	Hæmatocolpos .. 761	- penile pain with, in vesical disease .. 306
- effect on constipation of .. 143	- with amenorrhœa .. 22, 23	- phosphates coloured by .. 12
Habit-spasm a cause of convulsions .. 169	- imperforate hymen in .. 761	- due to prostatic abscess .. 632
- mild chorea simulating .. 156	- pelvic swelling due to .. 757, 761	- in purpura hæmorrhagica .. 600
- muscle twitching in .. 159	- uterus like a cork on the upper extremity of .. 761	- quantity of blood in urine in .. 305
- tetanus mistaken for .. 162	Hæmatoma , abdominal, diagnosis from splenic tumour .. 692	- reaction of urine in .. 306
Hæmameba malaria .. 35	- albumosuria from .. 20	- rectal examination in .. 306
HÆMATEMESIS .. 293	- aural, in general paralysis .. 269	- renal enlargement with .. 689
- in abdominal angina .. 351	- leaking abdominal aneurysm causing .. 692	- from renal calculus .. 16, 46, 155, 308, 627, 818
- after abdominal operations, no obvious lesion in .. 304	- - pelvic .. 757	- - carcinoma .. 9, 395, 826
- acid reaction of blood in .. 293	- - dystocia due to .. 227	- - colic .. 153, 500
- in acute yellow atrophy .. 370	- penile, causes of .. 516	- - embolism .. 237
- admixed food particles in .. 293	- perinephritic .. 308	- - sarcoma .. 395
- in alcoholism .. 243	- of vulva .. 770	- - tuberculosis .. 16, 394, 626, 629
- anemia after .. 36, 459	- - swelling due to .. 768	- - tumour with .. 16, 367
- in carcinoma of stomach .. 351, 691, 846	Hæmatometra with amenorrhœa .. 22, 23	- - unilateral uterine bleeding in (<i>Plate V</i> , <i>Fig. 1</i> , p. 308) .. 307
- cirrhosis of liver .. 60, 368, 409, 694, 696	- - pelvic swelling due to .. 757	- in scarlatina maligna .. 301
- coffee-grounds appearance of blood in .. 293	Hæmatomyelia , anæsthesia in .. 664	- simple ulcer of bladder .. 630
- coma from .. 137, 140	- common situation of .. 555	- simulated by aniline dyes .. 820
- from corrosive poisons .. 674, 845	- history of injury in .. 563	- - uroerythrin .. 818
- diagnosis from hæmoptysis .. 293, 316	- paralysis of arm from .. 555	- - spectroscopic in diagnosis of .. 821
- differential diagnosis of .. 295	- paraplegia due to .. 561	- in suppurative nephritis .. 646
- in duodenal carcinoma .. 725	- sensory disorders in .. 563	- with suprarenal tumour .. 690
- duodeno-pancreatic fistula .. 294, 300	- thermo-anæsthesia in .. 664	- thrombosis of inferior vena cava .. 9, 61, 825
- from epistaxis .. 294	Hæmatoporphyria (see <i>Urine</i> , Abnormal Coloration of)	- unilateral lumbar pain in .. 306
- gastric ulcer .. 40, 352, 485, 846	- absence of albuminuria with .. 820	- in uræmia .. 329
- - or duodenal ulcer .. 89	- black urine from .. 819, 820, 821	- ureteral calculus .. 135, 514, 627
- hæmoptysis .. 317	- brown urine from .. 820	- urethritis .. 631
- Henoch's purpura .. 90, 380, 846	- detection by spectroscope .. 819	- variola maligna .. 301
- irritant poisoning .. 674, 845	- high colour of urine due to .. 818	- vesical calculus .. 512
- leucocytosis after .. 400	- in hydroa æstivale .. 820	- - growth .. 47, 512, 514, 628, 630
- list of causes of .. 294	- method of precipitation .. 820	- - tuberculosis .. 441, 513, 628, 629
- from mediastinal sarcoma .. 296	- pink urine from .. 819	Hæmochromatosis , argyria simulating .. 575
- in mesenteric embolism .. 153	- red urine from .. 819, 820	- in digestive diseases .. 575
- phosphorus poisoning .. 373	- sex incidence of .. 820	- slate-coloured skin in .. 575
- preceded by nausea and faintness .. 316	- simulating hæmoglobinuria .. 819	Hæmocytometer .. 27
- in relapsing fever .. 373	- sodium bicarbonate in .. 820	Hæmoglobin , increase of in congenital heart disease .. 579
- splenic anemia .. 411	- due to sulphonal .. 820	- spectral absorption band .. 95
- splenomegalic cirrhosis .. 369, 694	- in tuberculosis .. 820	Hæmoglobinometer .. 27
- tarry stools after .. 316	Hæmato-rachis , talipes from Hæmatospinx with amenorrhœa .. 22	HÆMOGLOBINURIA .. 314
- variable colour of blood in .. 293	HÆMATURIA .. 304	- colour of urine in .. 304, 314, 819, 820, 821
Hæmatidrosis , account of .. 715	- in acute cystitis .. 512, 627	- diagnosis from hæmaturia .. 315
	- age of patient in .. 306	- importance of fresh urine in examination for .. 314
	- anemia after .. 36	- methæmoglobin in urine in .. 304, 314
	- in appendicitis .. 632	- mucus, casts, and debris in urine in .. 314
	- with bacteriuria .. 83	
	- billiarzia infection .. 513, 630	
	- blood-clot in bladder from .. 439	

Hæmoglobinuria, contd.

- oxyhæmoglobin in urine in .. 314
- paroxysmal 821
- simulation by hæmatopor-
phyria 819
- spectroscopic in diagnosis of .. 821

Hæmoperitoneum, blanching

- with 717
- rapid small pulse with .. 717
- from rupture of liver .. 717
- spleen 717
- sighing respiration with .. 717
- simulating ascites .. 717

Hæmophilia, acute hæmor-

- rhagic otitis in 468
- anæmia in 37
- bleeding gums in 85
- from mouth in 302
- blood in joints in .. 302, 388
- epistaxis in .. 251, 302
- familial character of .. 86, 599
- hæmatemesis in .. 294, 302
- hæmaturia in 305
- hæmoptysis in 318
- menorrhagia in .. 428, 430
- metrorrhagia due to .. 433, 435
- persistent oozing from slight
cuts and scratches in .. 599
- pyralism due to 590
- purpura in 596, 599
- sex incidence of 599
- stomatitis in 590

Hæmophilic arthritis .. 388**Hæmopneumothorax** .. 577

- needing of chest in diagnosis
of 711
- succussion sounds with .. 711

HÆMOPTYSIS .. 315

- after abdominal operation .. 123
- admixture of sputum in .. 316
- alkalinity of blood in .. 293, 316
- amount of blood in .. 293
- anæmia after 36
- bright colour of blood in .. 293
- bronchial casts after .. 704
- casts in sputum after .. 704
- causes of 317, 318, 319
- coma from 137, 140
- diagnosis from hæmatemesis .. 293, 316
- between true and spurious .. 316
- elastic fibres in sputum .. 316, 317
- in embolism of the lung .. 186
- caused by epistaxis .. 251
- fatal from aneurysm of aorta .. 322
- in fibroid lung 246
- frequency of occurrence in
night 317
- frothiness of blood in .. 293, 316
- in gangrene of lung .. 288
- due to growths 176
- hæmatemesis from swallowed
blood in .. 294, 295, 317
- in healthy subjects 318
- from infarction of lung .. 186, 210
- malingering of 317
- in mediastinal growth .. 483
- mitral regurgitation .. 238, 210
- in parasitic infection of
bronchus 318, 325
- phthisis 185
- from pneumothorax .. 577
- profuse, due to aneurysm .. 176
- new growth 176, 322
- phthisis 176
- rapidly fatal 293
- severe anæmia after .. 459
- spurious, causes of .. 316
- from stonemason's lung .. 317
- the only symptom of throm-
botic infarct of lung .. 320
- tickling in throat in .. 316
- tubercle bacilli in .. 316, 317
- x-rays in 318

Hæmorrhage, anæmia after .. 36, 459

- ante- and post-partum .. 436
- per anum (see Blood per Anum)
- arachnoid, convulsions in .. 172
- in Bright's disease 598
- into calf muscles in scurvy .. 599
- capillary, in jaundice .. 361
- cerebral 173, 685
- acquired paralysis of .. 155
- childhood due to .. 155
- albuminuria in .. 98, 138, 337
- aphasia from 685
- the apoplectic fit described .. 173
- arteriosclerosis with .. 337
- atetosis after 155
- bilateral 563
- brachial monoplegia from .. 516
- bradycardia in 98
- Cheyne-Stokes respiration .. 125
- choreiform movements
before 157
- coma in 137, 138, 292
- convulsions in 169
- cortical, birth palsies due to .. 155
- defective arteries in .. 138
- diabetes insipidus from .. 585
- diabetes of general para-
lysis of insane from .. 139
- enlarged heart in .. 138, 337
- granular kidney with .. 138
- headache in .. 173, 327, 328
- hemianæsthesia from .. 336, 666
- hemianopsia from .. 335
- hemiplegia due to .. 82, 138, 285, 336, 337
- high blood-pressure in .. 96, 98, 138, 337
- in Hodgkin's disease .. 302
- hyperpyrexia from .. 98, 344
- hypertension of cerebro-
spinal fluid in .. 338
- hypothermia in 346
- Jacksonian epilepsy from .. 161
- optic neuritis in 98
- prodromal symptoms of .. 173
- ringing aortic second
sound in 337
- from rupture of an acute
aneurysm 700
- simulated by saturnine
encephalopathy .. 139
- tumour 341
- a first symptom of chronic
nephritis 15
- temporary glycosuria in .. 292
- tendon reflexes after .. 337
- thick neck in those pre-
disposed to 191
- unilateral convulsions in .. 170
- epilepsy mistaken for .. 174
- from uterine prolapse .. 10
- vomiting from .. 844, 847
- into cord from bullet wound .. 563
- from ears or nose in fractured
skull 138
- functional bruits after .. 106
- in fungating endocarditis .. 9, 10, 38, 593
- gastric (see Hæmatemesis)
- into Graafian follicle resem-
bling dysmenorrhæa .. 220
- from gums (see Bleeding
Gums)
- in Hanot's cirrhosis .. 411
- hard fæces after 150
- internal from ruptured tubal
gestation 780
- signs of 646
- intermenstrual (see Metror-
rhagia)
- intestinal (see Blood per
Anum, and Melæna)
- coma from 137, 139

Hæmorrhage, contd.

- into intestinal wall in
Henoch's purpura .. 600, 846
- intra-abdominal, hæmo-
globinuria from 315
- in jaundice, from trivial
causes 598
- into joints in hæmophilia (see
Hæmophilic Arthritis)
- in Henoch's purpura .. 90
- in labyrinth, nerve deafness
from 190
- from lung (see Hæmoptysis)
- in lymphatic leukaemia .. 599
- medulla oblongata, laryn-
geal paralysis due to .. 539
- meningeal, acute onset of .. 562
- birth palsies due to .. 155
- coma in 137
- convulsions in 172
- talipes from 181
- and thrombosis, acquired
paralysis of childhood
due to 155
- into mesentery in Henoch's
purpura 846
- middle lobe of cerebellum,
priapism from 586
- from mucous membranes
in Hodgkin's disease .. 649
- leukaemia 649
- pernicious anæmia .. 649
- pseudo-leukaemia .. 42
- scurvy 44
- scurvy-rickets 753
- in von Jaksch's disease .. 42
- nasal (see Epistaxis)
- occult (and see Occult Blood) .. 94
- in pancreatitis 117
- edema of legs due to .. 459, 461
- into optic thalamus, hyper-
pyrexia from 344
- pancreatic, collapse in .. 292
- constipation in 292
- glycosuria in 292
- severe abdominal pain in .. 292
- simulating acute intestinal
obstruction 292
- vomiting in 292
- in phosphorus poisoning .. 373
- pontine 138
- absence of unilateral para-
lysis in 138
- bilateral loss of move-
ment in 345
- coma in 344, 345
- hyperpyrexia in .. 138, 341, 344, 345
- pin-point pupils with .. 138, 345
- simulating opium poison-
ing 345
- post-partum 27
- coma due to 137
- from hourglass uterus .. 229
- leucocytosis after .. 400
- secondary 436
- severe anæmia after .. 459
- producing diplopia .. 200
- rectal (see Blood per Anum)
- in retina 598, 613
- in albuminuric retinitis .. 462
- chronic Bright's disease .. 240
- erythropsia with .. 840
- in fungating endocarditis .. 38, 76, 237, 338, 598, 613
- macular, preceding choroid-
itis 462
- scotoma from 837
- round optic nerve, sudden
blindness from 839
- in scurvy 44, 85
- into semicircular canals,
Ménière's disease due to .. 828
- severe, collapse from .. 346

Hæmorrhage, severe, *contd.*

- coma due to	137, 139, 140
- effects of	298
- extreme thirst from	789
- fall of temperature from	780
- hypothermia after	346
- leucocytosis after	400
- œdema of legs after	461
- pallor from	780
- rapid pulse from	646, 780
- shortness of breath due to	100
- spinal, anesthesia due to	787
- girdle pain due to	787
- history of injury in	563
- paralysis of upper extremity from	555
- paraplegia due to	561, 787
- priapism from	585
- sensory disorders in	563
- in splenic anemia	411
- splenomegalic cirrhosis	694
- spontaneous, in congenital obliteration of bile-ducts	365
- subconjunctival, in acute conjunctivitis	255
- distinguished from conjunctivitis	256
- in fractured skull	138
- subcutaneous (see Purpura)	
- in fungating embocarditis	76
- subdural, convulsions in	152
- subperiosteal in scurvy	14, 85, 374
- into thyroid cyst simulating malignant disease	791
- uncinate gyrus, anosmia from	669
- urinary (see Hæmaturia)	
- uterine (see Menorrhagia, Metrorrhagia, Metrostaxis; Uterus, Hæmorrhage from)	
- intermenstrual (see Metrorrhagia)	
- vaginal (see Menorrhagia, Metrorrhagia, Metrostaxis)	
- in extrusion of uterine fibroid	587
- inversion of uterus	587
- new-born infants	435, 436
- with ruptured tubal gestation	646
- various, in leukæmia	31
- into vitreous, blindness from	840
- erythropsia from	840
- sudden blindness from	839
Hæmorrhagic erosions	298
- small-pox	605
Hæmorrhoids , in alcoholism	243
- bleeding	92
- bearing-down pain from	473
- in cirrhosis	368
- diagnosis from rectal polypus	635
- dyspareunia from	221
- excessive blood loss from	100
- increased by pyelitis	59
- inflamed, pain in the penis after micurition in	513, 515
- internal, carcinoma of rectum with	635
- difficulty of palpation unless inflamed or thrombosed	635
- pain in perineum in	516
- priapism in elderly men from	586
- and prolapse, association	93
- retention of urine after operation from	49
- sacralgia from	510
- spasm of sphincter ani from	150
- thrombosis or gangrene of	635
Hæmosiderin in macules	424
HÆMOTHORAX	118
Hair , analysis for arsenic poisoning	38, 78, 87, 576
- axillary and pubic, early development with hyper-nephroma	690

Hair, *contd.*

- brittleness in cretinism	259
- broken in ringworm of scalp	274
- changes in myxœdema	43
- distribution of ringworm spores on	273
- falling out, in myxœdema	454
- follicles, affection in papular syphilis	532
- pityriasis rubra pilaris	530
- xeroderma	530
- loosening of, in sycosis vulgaris	602
- loss of (see Baldness)	
- lustre due to favus	270
- mode of affection in ringworm	272
- "mousey" colour in Mongolian idiocy	263
- scantiness in cretinism	259
- Mongolian idiocy	263
- and receding in myxœdema	259
- shape in alopecia areata	84, 85, 274
- stumps in ringworm of scalp	273
- suppuration round, in sycosis vulgaris	602
- thinness at back from head rolling	171
- trophic changes in major trigeminal neuralgia	495
Hair-ball, palpation per rectum	635
Hair-cutter's cramp	494
Hair-wash, lead poisoning from	77
Haldane-Gowers' hemoglobinometer	27
Haller, vas aberrans of, cyst arising from	521
Hallucinations of hearing in mental cases	793
Hallux erectus in Friedreich's ataxy	71, 131, 559
Haloes, appearance of in glaucoma and conjunctivitis	257
Halting (see Gait)	
Hamstrings, atrophy of	560
- elongation in contortionists	183
- spinal nerve-roots supplying	543
- treadler's cramp of	177
HAND, ACCOUCHEUR'S	3
- affected by acute rheumatism	374
- erythema papulatum	531
- angioneurotic œdema of	457, 459
- atrophic of (Fig. 42)	154
- atrophy of palsy of, in amyotrophic lateral sclerosis	131, 159
- bloody sweat of	715
- bulle of in congenital syphilis	111
- in syringomyelia	112
- cheiropompholyx of	654, 832
- chondromata of	755
- deformity in spastic hemiplegia	164
- syringomyelia	554
- tetany	178
- enlarged in acromegaly	391, 585, 749, 753
- gangrene of	287
- gonococcal arthritis of	376
- lupus erythematosus of	656
- mercurial tremor of	797
- muscular atrophy of (see Atrophy, Muscular, of Hand)	
- in myxœdema	451, 455, 585
- œdema of in heart failure	458
- and tenderness of, in erythema keratodes	451
- pain in, due to chondromata	755
- paralysis of, in Tooth's peroneal atrophy	71, 128
- preference of Impetigo for	604
- small-pox for	605

Hand, *contd.*

- professional cramp of	177
- pruritus of	588
- Raynaud's disease affecting	450, 490
- redness or pallor in acroparesthesia	493
- scabies of	447, 609
- sensation of heat and swelling in, in acroparesthesia	493
- sweating of, in rheumatoid arthritis	378
- tremor of	795
- from alcohol	136, 238, 797
- general paralysis of the insane	796
- in exophthalmic goitre	792, 797
- wasting of, in amyotrophic lateral sclerosis	73, 554
- bulbar palsy	687
- from cervical rib	493
- in peroneal atrophy	128
- progressive muscular atrophy	73, 127
- syringomyelia	285
- ulnar paralysis	127
Hanot's cirrhosis (see Cirrhosis of Liver, Hanot's)	
Harelip with cleft palate	640
Harrison's sulcus	170, 191, 212, 695
Hat-makers, mercury poisoning in	38, 77
- neuritis in	77
Hay fever, acute nasal catarrh in loss of smell in	203, 668
- taste due to	774
- sporotrichosis from	322
Head , choreiform movements of, in spinocerebellar ataxy	799
- enlarged in acromegaly	585
- cretinism	258
- hydrocephalus	557
- osteitis deformans	183
- rickets	170
- fixed in cervical caries	477
- forward droop in acromegaly	263
- fullness of, epistaxis relieving	252
- injuries, alopecia from	80
- cerebrospinal fluid from nose after	203
- chronic headache after	329
- coma due to	137
- effects of	137
- hemiplegia from	138
- Jacksonian epilepsy after	174
- quadrate, in rickets	695
- retraction of (see Retraction of Head)	
- tremor of	795, 796
- in disseminated sclerosis	800
- Friedrich's ataxy	799
- paralysis agitans	796
- segmental areas of (Figs. 132-135)	497
Head, H., re alterations in sensibility	600
- re Brown-Séquard paralysis	664
- re nerves of heart and aorta	481
- re pain in the face	495
- re referred pain from prostatitis	491
- re segmental areas of scalp (Figs. 202, 203)	783
- re sensation changes from lesions in the cord	662
- re spinal areas of referred pain	788
- re trigeminal neuralgia	495
Head's areas of referred pain in pelvic disease	509
- segmental areas for referred pain	496

HEADACHE	326
- in acute encephalitis	139
- meningitis	139, 563
- poliomyelitis	128
- yellow atrophy	370
- aortic disease	233
- arsenical poisoning	76
- from astigmatism	498, 783
- in cerebellar abscess or tumour ..	565
- cerebral abscess 341, 547, 686, 817	
- syphilis	173
- tumour	173, 292, 336, 341, 350, 477, 547, 686, 847
- from concussion	782
- and cryptomenorrhoea	22
- with cystic kidneys	48
- digestive	326
- in encephalitis	547
- epidemic jaundice	372
- after epileptic convulsions ..	169
- in errors of refraction	498
- frontal in diseases of eyes ..	528
- at onset of typhoid fever ..	610
- in fronto-nasal and mid-orbital areas, in frontal sinusitis	498
- - - - nasal inflammation ..	498
- in gastritis	297
- general tuberculosis	699
- glaucoma	257, 494, 783, 838
- hysteria	345, 784
- due to hypermetropia	783
- increased intracranial pressure	686
- in influenza	505, 610
- iritis	783
- with lardaceous disease	48
- in late stages of acromegaly ..	749
- lesions of central nervous system	585
- Malta fever	507
- meningitis 350, 359, 622, 612, 817	
- in mid-orbital region in errors of refraction	498
- migraine	837, 840, 847
- mode of production of	326
- neurasthenia 494, 506, 782, 788	
- occipital , in affections of tongue	498
- cerebellar disease	326
- cerebral tumour	477
- diagnosis from cervical caries ..	477
- meningitis	327
- simulated by myalgia	326
- at onset of dengue	506
- paroxysmal, due to eyestrain ..	498
- phosphorus poisoning	373
- plumbism	38, 77, 173
- in pneumonia	622
- preceding apoplexy	173
- with puerperal eclampsia	172
- pyelonephritis	48
- referred pain in severe ear disease	498
- relief by digitalis	329
- iron	329
- with renal tuberculosis	48
- in scarlatina	301
- segmental areas of	498
- with sinus thrombosis 139, 651, 817	
- temporal, from ear disease ..	498
- from the douloureux	782
- toxic causes of	328
- in tuberculous meningitis ..	612
- typhoid fever 90, 610, 620, 697, 699	
- unilateral, causes of	326
- uræmic	45, 48, 172
- in variola	301
- various character of	326
- vertical, from ear disease ..	498
- in hysteria	798
- in yellow fever	301
Head-retraction (see Retraction)	
Head-rolling in rickets	171, 782

Hearing , defects of, delay in acquiring speech due to ..	682
- impaired in otitis media ..	229
- with facial paralysis	536
- tests for	188
Heart , abscess of (see Abscess of Heart)	
- affection common in Monogolism	216
- by post-diphtheritic peripharyngeal neuritis	640
- alcoholic, ascites with	62
- blood	97
- bruits (see Bruits, Cardiac)	
- cloudy swelling of, palpitation in	525, 526
- compression in aortic aneurysm	482
- dilatation of , acute, epigastric pulsation in	243
- - - general account of	243
- - - from specific fevers ..	243
- - - canter rhythm in	639
- - - in chronic bronchitis and emphysema	246
- - - fibroid degeneration ..	241
- - - Flint's murmur in	108
- - - of left auricle from mitral stenosis	245
- - - mitral regurgitation from	239, 240, 243
- - - in myocarditis	241
- - - perniciuous anæmia	639
- - - right ventricle, pain in epigastrium in	485
- - - sharp short first sound in ..	331
- - - simulation of gall-stones by	485
- - - gastric ulcer by	485
- - - systolic bruit in	102, 106
- disease , albuminuria in	18
- - - amenorrhœa in	23
- - - anæmia in	38
- - - anal hæmorrhage from mesenteric embolism in ..	90
- - - ascites in	61
- - - blood-pressure high from ..	251
- - - low in	329
- - - brachial monoplegia in ..	546
- - - cerebral embolism in	138
- - - in children, splenic enlargement in	693
- - - congenital , aortic	238
- - - - bruits in	102, 104, 129, 244, 579, 790
- - - - cardiac dullness in ..	790
- - - - clubbing of fingers in ..	129, 244, 579, 790
- - - - colour index in	579
- - - - convulsions due to ..	169, 170
- - - - cyanosis in	129, 184, 244, 579, 790
- - - - dyspnoea in	244, 790
- - - - enlarged left ventricle in ..	232
- - - - enlargement from	244
- - - - epigastric pulsation in ..	244
- - - - hæmoptysis in	320
- - - - liability to phthisis in ..	320
- - - - polycythæmia in 244, 579, 790	
- - - - precordial thrill in	244
- - - - pulmonary regurgitation ..	107
- - - - stenosis, enlarged right ventricle in	245
- - - - - rumbling systolic bruit in	579
- - - - site of apex beat in	790
- - - - thrill due to	790
- - - - without bruit	129, 184
- - - - cyanosis	129
- - - - conjunctival œdema of ..	256
- - - - convulsions in	169, 172
- - - - cyanosis from	186
- - - - diagnosis of	526
- - - - displaced impulse	330

Heart disease , <i>contd.</i>	
- - - dry cough due to	175
- - - eosinophilia in diagnosing ..	249
- - - asthma from	251
- - - epistaxis in	267
- - - flatulence in	352
- - - gastritis in	503
- - - general pains in limbs in ..	299
- - - hæmatemesis in	314
- - - hæmaturia in	329
- - - headache in	461
- - - heart failure from	526
- - - history of chorea in	526
- - - scarlet fever in	526
- - - syphilis in	430
- - - hyperæmia of uterus from ..	345
- - - hypothermia in	819
- - - increase of uroerythrin in urine in	155
- - - infantile paralysis from ..	216
- - - infantilism	314
- - - insidious onset of fungating endocarditis in ..	356, 358
- - - insomnia in	428
- - - menorrhagia in	153
- - - mesenteric thrombosis in ..	461
- - - œdema of legs from	359
- - - orthopnoea in	478
- - - pain in the chest in	783
- - - temporal region from ..	783
- - - and tenderness in back from (Fig. 201)	788, 789
- - - palpitation in	481
- - - pancreatitis from	116
- - - polyuria in clearing up of effusion in	582
- - - precordial pain in	481
- - - puffiness and œdema of face in	746
- - - referred pain in arm in ..	494
- - - rheumatic history in ..	121, 526
- - - shortness of breath in ..	100
- - - splenic enlargement in, suggesting fungating endocarditis	699
- - - subcutaneous nodules in ..	452
- - - tenderness in chest from ..	776
- - - epigastrium from	779, 783
- - - precordial region from ..	778
- - - temporal region from ..	783
- - - uric acid in	817
- - - vomiting in	843
- - - dullness diminished in emphysema	246
- - - with hypertrophied heart ..	331
- - - increased in acute dilatation of heart	243
- - - aortic disease	233
- - - enlarged heart	231, 232
- - - congenital heart disease ..	244, 579
- - - fatty heart	241
- - - mitral regurgitation	238
- - - stenosis	245
- - - pericarditis	242
HEART, ENLARGED	
- - - 1, 13, 102, 231, 232	
- - - absence or presence of murmurs in	331
- - - in adherent pericardium ..	63
- - - alcoholism in	238, 243, 333
- - - angina pectoris due to ..	778
- - - in aortic disease	103, 105, 107, 359
- - - apoplexy	173
- - - apparent health	332
- - - arteriosclerosis	639
- - - beer drinkers'	333
- - - in Bright's disease	63, 90
- - - cardiac impulse displaced down and to left in ..	332
- - - cerebral hæmorrhage ..	138, 337
- - - chronic nephritis	48, 122, 126, 172, 303, 331, 639

Heart, enlarged, contd.

-- chronic parenchymatous nephritis ..	454
-- compression of lung by 324, 667	
-- diagnosis from displacement of ..	331
-- epistaxis in ..	252
-- in exophthalmic goitre ..	244
-- heart sounds in ..	331
-- high blood-pressure conditions 252, 331, 359, 526	
-- incompetence in ..	247
-- insomnia in ..	359
-- laryngeal paralysis with ..	539
-- due to long-continued over-exertion ..	243, 244
-- medullary degeneration with 343	
-- in mitral regurgitation ..	102
-- from mitral stenosis ..	245
-- in morbus cereleus ..	579
-- orthopnoea due to 465, 467	
-- with patent interventricular septum ..	244
-- prolonged first sound in ..	331
-- right ventricle, cardiac impulse placed to left in ..	332
-- causes of .. 244, 245	
-- diseases of lungs causing ..	246
-- in pulmonary incompetence ..	247
-- skodaic resonance due to 667	
-- swelling of chest wall from ..	194
-- without symptoms ..	332
-- failure, acute, in tetanus ..	162
-- albuminuria in ..	18
-- from alcoholism ..	243
-- ascites in .. 61, 62	
-- blood-pressure high in 64, 96	
-- borborygmi in ..	97
-- from Bright's disease 14, 63	
-- bullæ in ..	110
-- causes of, classified 54, 61, 464	
-- Cheyne-Stokes respiration in ..	125
-- congestion of liver in ..	370
-- cyanosis in ..	184, 186
-- enlarged liver from 55, 61	
-- influence of exertion on pains of ..	485
-- jaundice in ..	382
-- lung conditions causing 525	
-- main groups of causes ..	457
-- types of ..	461
-- nutmeg liver with ..	55
-- oedema of limbs in 61, 457, 458, 459, 461	
-- orthopnoea from ..	464, 465
-- pain in epigastrium from ..	485
-- polyuria in clearing up of effusion in ..	582
-- pulsation of liver due to ..	764
-- splenic enlargement rare in ..	693, 699
-- universal oedema from 458, 460	
-- urate deposit in ..	815
-- fatty, albuminuria in ..	18
-- alcohol causing ..	238, 241
-- anaemia in ..	241
-- ascites in ..	62
-- canter rhythm in ..	639
-- cardiac asthma in ..	241
-- causes of ..	62, 241
-- causing mitral regurgitation ..	239, 241
-- Cheyne-Stokes breathing in ..	125, 241
-- degeneration of ..	464
-- from phosphorus ..	87
-- diagnosis from dyspepsia 526	
-- dyspnoea in ..	241
-- faintness and coma in ..	241
-- feeble cardiac impulse in ..	241
-- general account of ..	241

Heart, fatty, contd.

-- heart failure in ..	464
-- in obesity ..	103, 241
-- orthopnoea in ..	464
-- palpitation in ..	525, 526
-- in pernicious anæmia ..	639
-- shortness of breath with ..	101
-- after specific fevers ..	241
-- systolic apical bruit with ..	102
-- wasting diseases causing 241	
-- fibroid, albuminuria in ..	18
-- due to alcohol ..	238
-- ascites in ..	62
-- Cheyne-Stokes' respiration in ..	125
-- degeneration of ..	464
-- dyspnoea in ..	242
-- heart failure in ..	464
-- mitral regurgitation in 239, 241	
-- palpitation in 242, 525, 526	
-- precordial pain in ..	242
-- shortness of breath with ..	101
-- sudden death from ..	241
-- after syphilis 62, 241, 242	
-- systolic apical bruit with ..	102
-- Hypertrophy of (see Heart, Enlarged)	
HEART IMPULSE, DIS- PLACED ..	330
-- in acute dilatation of heart ..	243
-- endocarditis ..	239
-- adherent pericardium 242	
-- alterations in resonance in ..	331
-- aortic disease ..	233, 332
-- regurgitation ..	107
-- in ascites ..	51
-- asymmetry of chest in ..	331
-- in athletes ..	332
-- bronchiectasis ..	703
-- chlorosis ..	333
-- congenital heart disease 244	
-- diagnosis from enlarged ..	331
-- enlargement of right ventricle 231, 232, 332	
-- exophthalmic goitre ..	244
-- by fibroid lung 129, 193, 232, 246, 324	
-- with Flint's murmur ..	193
-- fluid in chest ..	103
-- huge hydatid cyst of liver ..	415
-- hydrothorax ..	467
-- in hypertrophy of heart 332	
-- meteorism ..	716
-- mitral regurgitation 232, 332	
-- stenosis ..	245, 580
-- valve disease ..	102
-- orthopnoea from ..	467
-- pericarditis ..	242
-- by pleural effusion 232, 764	
-- pneumothorax 193, 232, 480, 577, 721	
-- subphrenic abscess 712, 721	
-- x-rays in diagnosis of ..	332
-- feeble in fatty heart ..	241
-- normal position of 231, 330	
-- position in hypertrophy of heart ..	332
-- raised in pericardial effusion ..	332
-- senile myocardial degeneration ..	333
-- irregular in enlarged heart from over-exertion ..	244
-- mitral stenosis ..	61
-- in organic cerebral disease 328	
-- tobacco poisoning ..	527
-- malformation (see Heart Disease, Congenital)	
-- malignant polypus of ..	826
-- nerves corresponding to the ..	481, 778

Heart, contd.

-- new growths of ..	98
-- patent septum ventriculorum 579	
-- senile, palpitation from 525, 527	
-- slow action of (see Bradycardia)	
-- sounds, abnormal (see Bruits, Cardiac, and Heart Sounds, Accentuation of, and Reduplication) ..	101
HEART SOUNDS, ACCENTU- ATION OF ..	1
-- in albuminuria ..	14
-- arteriosclerosis ..	639
-- cerebral hæmorrhage 138, 337	
-- chronic nephritis 14, 122, 454, 639	
-- parenchymatous nephritis ..	454
-- emphysema ..	192
-- with high blood-pressure ..	96, 252
-- loud sharp slapping 1st sound at apex in mitral stenosis 108, 320	
-- in mitral stenosis ..	320
-- regurgitation ..	239
-- (see Reduplication of Heart Sounds)	
-- relation to reduplication ..	639
-- second sound in hypertrophy of the left ventricle ..	331
-- altered in cerebral hæmorrhage ..	138
-- enlargement of heart ..	331
-- estimation of blood-pressure ..	96
-- reduplicated ..	2
-- strain, albuminuria due to 18	
-- symptoms of arteriosclerosis and sclerosis of kidney ..	14
-- in chorea ..	548
-- thumpings of, with coronary atheroma ..	527
-- in elderly gouty men ..	527
-- from excessive smoking ..	527
-- at night in epilepsy ..	527
-- transposition of ..	330
-- weakness suggested by cough on exertion ..	176
HEARTBURN ..	333, 484
-- definition of ..	842
-- diagnosis from merycism ..	431
-- in dyspepsia ..	354
-- regurgitation of acrid fluid into mouth in ..	431, 484
Heat, distribution of, influence of blood, lymph, and tissue juices on ..	619
-- of nerve centres on ..	619
-- extreme, gangrene from ..	282
-- and flushing in the extremities in erythromelalgia ..	284
-- from inflammation ..	478
-- loss, modes of ..	619
-- production, modes of ..	619
-- stroke, coma from 137, 139	
-- hyperpyrexia in ..	344
Heberden's nodes (<i>Fig.</i> 109) 380, 384, 452	
Hebra, prurigo ferox of ..	531
Hedgehog crystals of urates ..	815
Heel, bed sore over ..	285
-- conical ..	130
-- Jacquet's erythema of ..	446
Hegar's sign in pregnancy ..	437
Heller's test for albumosuria 6, 20	
Hemeralopia, albinism causing 841	
-- in snow-blindness ..	841
-- tobacco poisoning ..	841
Hemianæsthesia from apoplexy 666	
-- from cervical cord injury ..	341
-- disseminated sclerosis ..	665

Hemianæsthesia, contd.

- dissociative from thrombosis of left posterior inferior cerebral artery (<i>Fig. 184</i>)	666
- with hemianopsia ..	336, 666
- hemiplegia ..	336
- hysteria ..	69, 166, 506, 666, 798
- with hysterical chorea ..	157
- loss of taste, smell, hearing, and sight, with ..	666
- hemianopic pupillary reflex ..	595
HEMIANOPSIA ..	333
- bilateral homonymous, illustrated (<i>Figs. 103, 104</i>) ..	335
- - temporal, in acromegaly (<i>Fig. 102, p. 334</i>) ..	749
- - from tumour near optic chiasma ..	335
- in cerebral tumour ..	81
- with hemianæsthesia ..	336, 666
- hemiplegia ..	336
- light reflex in ..	595
- migraine ..	836
- with normal light reflex in optic fibre lesions above corpora quadrigemina ..	595
- from occipital cortex lesions ..	595, 837
- optic tract lesion ..	595
- perimeter in demarcating ..	333
- pupil tests for site of lesion in ..	336
- quadrant variety in migraine ..	837
- with word blindness ..	684
Hemiataxia ..	68, 69
Hemiatheiosis ..	338
Hemiatrophy of face with torticollis ..	167
- - simulating facial paralysis (<i>Fig. 141</i>) ..	537
- - or trunk ..	72
Hemichorea ..	156, 341
- paralysis of arm in ..	548
- simulating hemiplegia ..	340, 341
Hemicranial from eye-strain ..	495
- in migraine ..	838
Hemipopia (see Hemianopsia)	
HEMIPLEGIA ..	336
- abnormal gait in ..	277
- from abscess ..	138
- acute bedsores in ..	285
- agraphia with ..	685
- altered reflexes in ..	137
- ankle-clonus in ..	44
- aphasia in ..	336, 685
- articulation in ..	686
- ataxia in ..	68
- atetosis from ..	155
- Babinski's sign in ..	82
- bedsores in ..	811
- from bilateral cerebral softening ..	563
- causes of ..	82
- from cerebral embolism ..	285, 699
- - syphilis ..	173
- - thrombosis ..	285
- chorea simulating ..	340, 341
- choreiform movements before and after ..	157
- - tremor in ..	799
- with coma ..	137
- without coma in thrombosis ..	138
- condition of muscles in ..	336
- conjugate deviation of eyes in ..	137
- contractures with ..	162, 163
- crossed ..	336
- double, dysarthria in ..	336, 686
- - without aphasia in ..	686
- - emotionalism in ..	258
- facial paralysis with ..	533, 536
- with fungating endocarditis ..	237
- gangrene in ..	282
- hemianæsthesia with ..	336, 666
- hemianopsia with ..	336
- hysterical ..	69

Hemiplegia, contd.

- inequality of knee-jerks in ..	397
- infantile ..	155
- - ataxia in ..	68
- - atetosis in ..	68
- - hemi-atetosis in ..	338
- - talipes in ..	131
- from porencephalus ..	164
- puffing out of one cheek in ..	137
- rigidity with ..	164
- site of lesion in ..	336
- spastic, characters of hand, arm, and leg in ..	161
- - in general paralysis of the insane ..	682
- tremor in ..	795, 798
- ulceration of the leg in ..	811
- unequal pupils in ..	137
Hemiatrophy of face or trunk ..	72
Hemoch's chorea electrica ..	157
- - convulsions in ..	161, 169
- purpura (<i>Fig. 111</i>) ..	90, 380, 382, 600
- - acute abdominal symptoms in ..	380, 600, 846
- - age incidence of (<i>Fig. 111</i>) ..	380, 600, 846
- - arthritic symptoms in ..	90, 380
- - blood per anum in ..	90, 600
- - colic in ..	90, 380, 600
- - constipation in ..	90
- - diagnosis of ..	600
- - - from acute nephritis ..	600
- - - rheumatism ..	380
- - - rheumatic purpura ..	380
- - diarrhoea in ..	380
- - epistaxis in ..	90
- - hamatemesis in ..	380, 846
- - hæmaturia in ..	90, 380, 600
- - hæmoglobinuria in ..	315
- - hæmorrhage from kidney in ..	600
- - intestine in ..	600, 846
- - joint pains in ..	600
- - melæna in ..	380
- - mesenteric hæmorrhage in ..	846
- - purpura in ..	596, 600
- - pyrexia in ..	380
- - recurrence of attacks of ..	600
- - severe prostration in ..	600
- - simulating intestinal obstruction ..	90, 846
- - - intussusception ..	90, 600, 846
- - stomach-ache in ..	600
- - urine in ..	600
- - vomiting in ..	90, 380, 600, 844, 846
Hepatic abscess (see Abscess, Hepatic)	
- artery, aneurysm of (see Aneurysm, Hepatic)	
- colic (see Colic, Biliary)	
- reflex, pytalism from ..	501
- tumour (see Liver Enlarged)	
Hepatitis, pain in the right hypochondrium in ..	499
Hepatogenous albumosuria ..	20
Hepatoptosis , blood-stagnation in abdominal vessels on ..	407
- dragging pain in ..	407
- dyspnoea on exertion in ..	407
- faintness in ..	407
- floating kidney with ..	407
- gallstones with ..	407
- heaviness of liver region in ..	407
- influence of posture on ..	406
- kinking of bile-duct in ..	407
- occurrence usually in neurotic dyspeptic valetudinarians ..	407
- palpitation in ..	407
- physical signs of ..	401, 406, 407
- rarity of ..	406
- sudden attacks of pain in right of abdomen in ..	407

Hepatoptosis, contd.

- from venous congestion ..	407
- without symptoms ..	407
Hereditary ataxia (see Friedreich's Ataxia)	
- chorea ..	156
- optic atrophy ..	837
- trophædema (see Milroy's disease)	
Heredity and anosteoplasia ..	213
- baldness due to ..	84
- and bradycardia ..	97
- cystinuria ..	187
- exostoses ..	754
- Friedrich's ataxy ..	164
- gout ..	381
- hæmophilia ..	86
- Milroy's disease ..	460
- myopathies ..	70
- obesity ..	453
- paroxysmal hæmoglobinuria ..	315
Hernia , bands and adhesions from ..	152
- bladder in ..	742
- - passage of more water after reduction of hernia in cases with ..	742
- cerebri, movement with respiration ..	764
- congenital, first descent in adult life ..	742
- epigastric, pain in the epigastrium in ..	485
- in the groin ..	716
- gurgling on reduction ..	741
- hydrocele of sac of ..	740
- identification of contents of ..	742
- importance of examination both in upright and recumbent position ..	742
- impulse on coughing in ..	739, 741
- internal, obstruction due to ..	153
- labial, simulating Bartholin's cyst ..	768, 770
- of the lung ..	194, 764
- palpation of appendix in ..	742
- perineal ..	768
- reducibility of ..	739
- resonant on percussion unless omentum only in ..	739, 741
- retention of urine after operation for ..	49
diaphragmatic, congenital ..	712
- - rarity of ..	712
- - succussion sounds in thorax with ..	711
- femoral, age incidence of ..	733, 740
- - causes of irreducibility of ..	733
- - diagnosis from femoral gland ..	734, 738, 740
- - - from hydrocele of a hernial sac ..	740
- - - inguinal hernia ..	739
- - - mal-descended testis ..	740
- - - obturator hernia ..	740
- - - psoas abscess ..	739
- - - saphæna varix ..	739
- - disappearance on lying down ..	732
- - femoral swelling due to ..	733
- - general account of ..	733
- - gurgling on reduction of ..	733
- - impulse on coughing in ..	732
- - position and relationship ..	739, 740
- - reducible on pressure ..	732, 740
- - resonance of ..	733
- - sex incidence of ..	733, 740
- - simulated by lipoma ..	716
- - - psoas abscess ..	733
- - - saphæna varix ..	733
- - strangulation of ..	733
- inguinal, age incidence of ..	740, 742

Hernia, inguinal, contd.

-- bowel and testicle in same or different sacs ..	742
-- commoner than femoral at all ages and in both sexes ..	740
-- descent almost always into a congenital sac ..	742
-- diagnosis of adherent omentum from encysted hydrocele ..	741, 742
--- between direct and indirect ..	740
--- from encysted hydrocele of the cord ..	740
--- femoral hernia ..	739
--- lymphangioma of cord ..	741
-- extension into labium ..	739
-- scrotum ..	739
-- frequent association with undescended testis ..	523
-- gradual development of ..	742
-- history of hernia in infancy ..	742
-- hydrocele of the sac of an, diagnosis from new growth of retained testis ..	742
-- mode of reduction ..	740
-- position and relationship ..	739, 740
-- relation to straining ..	740, 742
-- simulated by lipoma ..	716
-- strangulated, diagnosis from inflamed hydrocele ..	741
-- suppurative ..	739
-- testicular atrophy from ..	78
-- varicocele with ..	742
-- vulval swelling due to ..	768
-- direct, ease of reduction and suddenness of return in ..	740
-- globular shape of ..	740
-- rarity of ..	740
-- relation of spermatic cord to ..	740, 742
-- scrotum rarely reached ..	740, 742
- obturator, diagnosis from femoral hernia ..	740
-- neuralgia from ..	488
-- pain shooting along inner side of thigh in ..	740
-- rectal or vaginal examination in detecting ..	740
-- strangulation of ..	740
-- swelling vague in ..	740
- omental, diagnosis from hydrocele of hernial sac ..	741
-- lipoma of cord or round ligament ..	741
-- new growth of retained testis ..	742
-- granular feel in ..	741
-- strangulated, diagnosis from torsion of testis ..	742
- scrotal, absence of limitation above in ..	522
-- diagnosis from hæmatocele ..	523
-- hydrocele ..	522
-- varicocele ..	767
-- impulse on coughing in ..	522
-- nearly always oblique inguinal ..	742
-- reducible with gurgle ..	522
-- resonance in ..	522
-- testis distinguishable in ..	522
-- translucency in infants ..	522
-- variations in size with position of patient ..	522
- strangulated, absolute constipation in ..	151, 431, 741
-- diagnosis from inflamed hydrocele of the sac ..	740
-- undescended testis ..	523
-- difficulty of detecting ..	733
-- possibly obturator ..	740

Hernia, strangulated, contd.

-- resonant ..	741
-- severe vomiting in ..	741
-- shock and collapse in ..	153
- testis, characters of ..	681
-- diagnosis from epithelioma of scrotum ..	681
-- sloughing papilloma ..	681
-- due to syphilis ..	680, 681, 766
-- tuberculous ..	680, 681, 766
- umbilical ..	716
-- age incidence of ..	524
-- diagnosis from sebaceous cyst of umbilicus ..	524
-- frequently irreducible ..	524
-- globular shape of ..	524
-- impulse on coughing ..	524
-- pain in ..	524
-- presence of omentum in ..	524
-- sex incidence of ..	524
Hernie along linea alba ..	716
-- quite small, intestinal obstruction from ..	716
-- vulval ..	771
Herpes, on the ear ..	536
-- facial paralysis with ..	536
-- febrilis, involving lips ..	403
- frontalis, corneal ulceration from ..	807
-- insensitiveness of cornea in ..	807
-- itching in ..	781
-- opacity of cornea from ..	807
-- raised ocular tension in ..	807
-- tenderness of the scalp in ..	781
-- vesicles in ..	807
- genitalis, bubo rare with ..	675
-- diagnosis of ..	675
-- soft sores from suppuration stage of ..	675
-- distinction from herpes zoster ..	830
-- enlarged inguinal glands from ..	830
-- irritation during micturition in ..	209
-- itching and burning in ..	830
-- occurrence in herpes zoster ..	675
-- parts affected by ..	830
-- penile sores in ..	515, 674
-- of prepuce ..	209
-- recurrent nature of ..	675
-- simulation of chancre by ..	830
-- chancroids by ..	830
-- simultaneous occurrence of syphilis and ..	675
-- vaginal discharge from ..	830
-- vesicles, pustules, and ulcers in ..	675
- gestationis, bullæ in ..	110, 111
-- eosinophilia in ..	249
- iris, bullæ in ..	832
-- eosinophilia in ..	249
-- relation to pemphigus ..	113
- labialis in lobar pneumonia ..	186, 372
- simplex, distinction from herpes zoster ..	830
-- face and genital organs affected by ..	829
-- vesicles in ..	829
-- simulating impetigo ..	830
-- urethral ..	209
- zoster, affection of 3rd, 4th, and 5th intercostals most often in ..	479
-- from central nervous lesion ..	675
-- crusts in ..	829
-- diagnosis from dermatitis herpetiformis ..	830
-- eczema ..	831
-- erythema multiforme ..	830
-- herpes simplex and herpes genitalis ..	830
-- perleche ..	404

Herpes zoster, contd.

-- distribution of ..	830
-- enlarged lymph glands in ..	479
-- erythema and vesicles with ..	830
-- of eyes, mouth and tongue ..	831
-- flaccid vesicles in ..	829
-- from Gasserian ganglion disease ..	496
-- herpes genitalis and ..	675
-- hyperæsthesia from ..	667
-- of painful area in post-herpetic pain ..	494
-- influence of age on pains due to ..	479, 496
-- intercostal neuralgia after ..	478
-- involvement of lips in ..	403
-- lymphocytosis in cerebrospinal fluid in ..	339
-- macules in ..	424
-- malaise and pyrexia with ..	496
-- neuralgic pain with ..	830
-- origin as vesicular eruption ..	404
-- pain in arm in ..	494
-- back from ..	475, 476
-- chest from ..	477, 777
-- left hypochondrium in ..	499
-- right hypochondrium in ..	501
-- papules in ..	830
-- persistence of pain after disappearance of eruption ..	499
-- rarely bilateral ..	830
-- not recurrent ..	830
-- scabs from ..	653
-- scars after ..	479, 653
-- simulating pleurisy ..	830
-- tenderness with ..	830
-- in chest from ..	776, 777
-- of scalp from ..	780
-- spine in ..	784, 785
-- trigeminal neuralgia in ..	496
-- ulceration from ..	830
-- vesicles, on an inflamed base in ..	479, 829
-- most marked at exits of branches of intercostal nerves ..	479
Herpetic eruption on auricle in peripheral facial paralysis ..	536
- urethritis described ..	209
Herpetiform eruptions in arsenical poisoning ..	76
Herter, views of intestinal infantilism ..	215
Heteroxanthin bases, uric acid derived from ..	817
HICCUGH ..	342
Hides, anthrax from ..	603, 746
Hidrocystoma ..	714, 829
- relation to miliaria ..	831
High altitudes, polycythæmia caused by residence at ..	579
High-stepping gait in paralysis of external popliteal nerve ..	543
Hill, re pyrexia in health ..	619
Hip, congenital dislocation, signs and symptoms of ..	183
-- lordosis in ..	183, 277
-- skiagraphy for ..	183
-- waddling gait in ..	277
- disease in caries of spine ..	564
-- chronic inguinal abscess from ..	739
-- insomnia from night starting in ..	357
-- lordosis with ..	183
-- pelvic abscess in ..	739
-- perforation of acetabulum in ..	739
-- wasting of thigh with ..	183
- hysterical ..	166
- injury of, causing sciatic nerve paralysis ..	542

Hip, contd.

- osteo-arthritis of ..	383, 384
- with spondylitis deformans ..	787
- rarity of gout in ..	383
- stiff after typhoid fever ..	376
- tuberculous ..	564
- femoral swelling from ..	734
- lardaceous disease from ..	10
- muscular wasting in ..	72, 386
- obturator neuralgia and ..	488
- pain referred to knee in ..	278
- relative frequency of ..	385
- secondary affection of ilium in ..	737
- simulated by ilio-psoas bursa ..	734
- swelling in right iliac fossa from ..	730
Hippocratic facies ..	431, 644
- succussion ..	193
Hippuric acid in urine, reduction by ..	290
Hippus, association with central scotoma ..	595
- nystagmus ..	595
- in cerebular tumour ..	595
- chronic alcoholism ..	595
- definition of ..	595
- in disseminated sclerosis ..	595
Hirschsprung's disease 147, 432, 718	
- abdominal distention in ..	148, 151, 152, 713
- ballooning of colon in ..	433
- bismuth in diagnosis of ..	433
- constipation 147, 151, 433, 713	
- diagnosis of ..	433
- illustrated (Figs. 40, 122), ..	148, 432
- intestinal obstruction in ..	151, 433
- tympanites in ..	148, 152
- visible peristalsis with ..	148, 724
- x-rays in diagnosis of ..	433
His' bundle, lesions of ..	97
Histology in diagnosis of affections of breast 744, 745, 746	
- larynx ..	226, 674
- orbit ..	255
- tonsil ..	672
- uterus 434, 435, 706, 759	
- carcinoma of jaw ..	749
- uterus ..	435
- cause of perforate palate ..	640
- cysticerci ..	452
- epithelioma 420, 769, 803, 812	
- of peritis ..	676, 677
- perineum ..	678
- epulis ..	748
- erosion of uterus ..	435
- faeces in pancreatitis ..	117
- gastric ulcer and carcinoma ..	713
- growths ..	421
- of testis ..	520
- haemoglobinuria ..	821
- melanotic carcinoma or sarcoma ..	802
- in metrorrhagia ..	433
- molluscum contagiosum ..	805
- multiple benign sarcoïd ..	452
- nature of ovarian tumour ..	759
- new growth of epididymis ..	767
- Paget's disease ..	803
- polyuria with albuminuria ..	584
- ptyalism ..	591
- rectal carcinoma ..	636
- sarcoma ..	803
- bone ..	756, 763
- jaw ..	748
- sebaceous cyst ..	681
- spinal growths ..	564
- stomach contents ..	355
- syphilis and cancer 672, 769, 813	
- for tapeworm ova ..	569

Histology in diagnosis, contd.

- for torsio testis ..	521
- trichinosis ..	504
- tubercle of uterus ..	435
- tuberculosis 253, 435, 744, 814	
- ulcer of tongue ..	814
- uric acid crystals ..	816
- xanthoma multiplex ..	805
Hoarseness from pharyngitis ..	673
- and dysphagia in laryngitis ..	226
Hob-nail liver, with ascites ..	60
Hock, polyuria from ..	581
Hockey, cramp during ..	177
Hodgen's splint, extension apparatus, talipes from ..	132
Hodgkin's disease (see Lymphadenoma)	
Hofmann's bacilli, acute tonsillitis, laryngitis, and pharyngitis from ..	670
Hofmeister's test for albumosuria ..	20
Hollow-back (see Lordosis)	
Holmgren's test for colour blindness ..	840
Homogentistic acid in alkaptonuria ..	822
- Fehling's solution reduced by ..	822
- quantitative estimation ..	822
Hooklets, hydatid 57, 58, 415, 720	
- in urine ..	396
Hook-worm (see also Ankylostomiasis) (Figs. 14, 15, 16, p. 94) ..	570
Horse-hair, anthrax from ..	746
Horse-riding, torsio testis from ..	521, 766
Horses, actinomycosis in workers amongst ..	705
Hospital gangrene, surgical emphysema in ..	231
- sore throats ..	419, 673
Hot-cross-bun skull in congenital syphilis ..	752, 782
- in rickets ..	212
Hot eye, Hutchinson's ..	256
- stage of malaria ..	35
- water-bottles, bedsores from ..	285
- weather, urate deposit with ..	815
Hour-glass contraction of uterus, dystocia due to ..	227
- placenta retained in ..	229
- stomach (see Stomach, Hour-glass)	
Humerus, fracture of (see Fracture)	
- myeloid sarcoma of ..	756
- tuberculous periostitis of ..	752
Hump-back (see Kyphosis)	
Hunger, infantile insomnia from ..	356
Hunger-pain in appendicitis 350, 500	
- in chronic cholecystitis ..	500
- duodenal ulcer ..	40, 500
Hunter, re toxicæmic catarrh of bile-ducts ..	370
Hunting, hamaturia after, due to movable kidney ..	310
Huntington's chorea, description of ..	156
Huppart's test for bile pigment ..	819
Huskiness (see Speech, Abnormalities of)	
Hutchinson's hot eye ..	256
- teeth described (Figs. 79, 80) ..	259
Hyaline corpuscles ..	28
- renal tube-casts ..	7
Hyaloid artery persistent, amblyopia with nystagmus ..	836
Hydatid cysts, abdominal tumours from ..	720
- in bile-ducts, jaundice from ..	361

Hydatid cysts, contd.

- of bone ..	757
- spontaneous fracture in ..	757
- causing discharge at the nipple ..	202
- diagnosis of ascites from ..	53
- from ovarian cyst ..	761
- eosinophilia with ..	58, 323, 415, 719, 720
- felt per rectum ..	58
- geographical distribution ..	323, 719, 720
- of kidney ..	396
- simulating hydronephrosis ..	396
- of liver ..	58
- abscess from ..	408, 415
- ascites in ..	60
- breath sounds on right side impaired from ..	415
- bulging right side of chest ..	415
- causing pleural effusion ..	123
- compression of lung by ..	667
- confusion with pleuritic effusion ..	415
- diagnosis from abscess ..	415
- adenoma of liver ..	414
- carcinoma ..	413, 415
- syphilitic liver ..	415
- dome-shaped upward extension of liver ..	415
- dullness in ..	415
- eosinophilia in ..	279, 413
- extension upwards of ..	415
- general account of ..	719, 720
- giving rise to hydatid of lung ..	323
- great enlargement of liver in ..	415, 416
- heart displaced by ..	415
- jaundice in ..	364, 366, 415
- latency of ..	279
- occasionally multiple ..	415
- pressure symptoms in ..	415
- previous hydatid history ..	279
- rareness of fluctuation in ..	415
- serum reaction in ..	279
- simulating enlarged gall-bladder 278, 279, 415	
- situation of ..	722
- stocadic resonance above ..	667
- suppurating ..	415
- tenseness of ..	415
- thrill in ..	413, 415
- urticaria from ..	415
- of lung ..	323
- absence of symptoms in ..	323
- hæmoptysis in ..	317, 323
- secondary to hydatid of liver ..	323
- mediastinal ..	826
- varicose thoracic veins from ..	826
- pelvic ..	757, 761
- in peritoneum ..	58
- ribs affected by ..	776
- simulating movable kidney ..	727
- phthisis ..	323
- spherical x-ray shadows in (Fig. 100) ..	323
- of spleen ..	692
- subphrenic abscess from ..	721
- of thyroid gland ..	792
- with tumour of liver ..	58
- varicose thoracic veins from ..	826
- disease, death from exhaustion in ..	416
- description of ..	720
- extreme rarity of ..	416
- gastro-intestinal symptoms in ..	416
- of joints ..	388
- liable to suppurate ..	388
- kyphosis from ..	182
- laparotomy in diagnosis of ..	720

Hydatid disease, contd.

- physical signs of	415, 720
- pyrexia in	416
- relation to tænia echinococcus	719
- serum reaction in	58, 279, 415, 719, 720
- site of development of	720
- peritoneum, account of	719
- of vertebrae	181, 785, 786
- fluid, characters of	415
- in ascitic fluid (Fig. 6)	57, 58
- hooklets	57, 58, 415
- illustration of	57
Hydatidiform mole, chorion-epithelioma following	434
- vaginal discharge from	211
Hydræmia	26
Hydræmiosis, diagnosis of	228
- from ascites	759
- dystocia due to	227, 228
Hydrarthrosis, intermittent	387
Hydroa	114
- æstivale, hæmatoporphyrinuria in	820
- eosinophilia in	249
- gestationis, bullæ in	111
Hydrocele , translucency in not always apparent	765
- acute, accompanying acute epididymo-orchitis	522
- in mumps	522
- polyorchytenitis	522
- rheumatism	522
- from scrotal injuries	522
- in small-pox	522
- bleeding into	765
- bloodstained fluid in, in malignant disease of testis	520
- of canal of Nuck, diagnosis from fibromyoma of round ligament	741
- disappearance on lying down	771
- simulating hernia	771
- vulval swelling from	768
- cholesterol crystals in fluid of	765
- chronic, aching in testicle in	522
- dragging sensation in loin in	522
- of the cord	740, 741
- diagnosis from inguinal hernia	740, 741
- vaginal hydrocele	765
- extension upwards along cord	765
- impulse on coughing in	741
- not reducible	740
- size and shape	765
- translucency in	741
- development in sac of hernia	740
- diagnosis from cyst of testis	521
- encysted hydrocele of cord	765
- testis	522
- femoral hernia	740
- growth of testis	520, 521, 522, 742
- hæmatocele	522, 523, 765
- scrotal hernia	522
- of femoral hernial sac	733, 734
- flabby consistency of	765
- fluctuation in	522, 765
- formation of hæmatocele after tapping	522
- frequent association with hernia	742
- great thickening of tunica vaginalis in some cases of	521
- of a hernial sac	740
- inflamed, diagnosis from strangulated hernia	741
- loculated	765
- milky fluid in	765
- physical signs of	521, 522

Hydrocele, contd.

- relation of testis to	522, 765
- with syphilitic orchitis	519
- scrotal swelling due to	522, 765
- size of	765
- straw-coloured fluid in	521
- testicle enveloped by	765
- atrophy from	78
- translucency in	765
- vaginal	765
- with tuberculous testis	765
Hydrocephalus , anosmia from	669
- antenatal recognition of	228
- Cheyne-Stokes respiration in	125
- convulsions in	170, 172
- crepitus with	179
- dwarfism with	214
- dystocia due to	227
- egg-shell crackling in	177
- headache in	327
- infantile diplegia due to	556
- meningitis with	557
- paraplegia due to	556, 557
- vomiting from	844, 847
Hydrochloric acid in gastric juice, absence of	37, 845
- deficiency in carcinoma of stomach	353, 845, 846
- gastric contents	299
- in chronic gastritis	845
- gastrocæsis	815
- test for	355
- in benign pyloric obstruction	353
Hydronephrosis , absence of hæmaturia in	396
- pain in	396
- bilateral, from obstruction to outflow of urine from bladder	395
- in pelvic carcinoma	311
- prostatic disease	310
- urethral stricture causing	310
- in vesical disease	311
- conversion into pyonephrosis	396
- diagnosis of ascites from	53
- from cystic disease of the kidney	310
- enlarged gall-bladder	279
- direction of growth from above downwards and inwards	393
- fluctuation in	395
- hæmaturia in	304, 310
- intermittency in	310
- due to movable kidney	500, 581, 583, 729
- papilloma of kidney	308
- renal calculus	309, 581, 583
- uterine carcinoma	48
- pelvic swelling due to	757
- peridic polyuria in	500, 581, 583
- renal enlargement from	391, 394, 396, 500, 583
- round smooth outline of	395
- sense of tenseness and elasticity in	395
- simulation by cyst of kidney	396
- in ureteral obstruction	135, 395, 627
- variations in quantity of urine passed in	396
- in size of	396
- from vesical growth	47
Hydrophobia , convulsions in	169, 801
- diagnosis of tetanus from	162
- due to dog or wolf bite	162, 801
- dysphagia in	225, 801
- long latency of	802
- mental symptoms in	162
- priapism in	586
- pyralism in	591
- retraction of the head in	641
- rigors in	647

Hydrophobia, contd.

- spasms in	162
- trismus rare in	162, 801
Hydropneumopericardium , churning sounds in	711
Hydro-pneumothorax	577
- acute cyanosis from	712
- dyspnoea from	712
- pain in the chest from	712
- from injury	712
- needling of chest in diagnosing	711
- from paracentesis thoracis	712
- due to phthisis	712
- simulated by subphrenic abscess	712
- succussion sounds in	710
- sudden onset of	712
- tubercle bacilli in sputum in	712
Hydrops amnii , diagnosis of ascites from	52
- physical signs of	52
Hydroquinone-acetic acid in alkaptonuria	822
Hydrosalpinx , pelvic swelling due to	757
Hydrothorax in mitral regurgitation	239, 240
- orthopnoea from	465, 467
Hygroma , cystic, in axilla	732
Hymen , closure of, sterility due to	705, 706
- imperforate, with ameorrhoea	22, 23
- hæmatocolpos from	761
- unruptured, dyspareunia from	221
Hyoid area , referred pain in, in affections of lateral part of tongue	498
- with hyperæsthesia in ear disease	498
Hyoseyamus , delirium from	195
Hyperacidity of gastric juice with ulcer	89
- of urine, frequency of micturition from	438
Hyperacusis from nuclear facial paralysis	536
- paralysis of stapedius	537
- in fevers, etc.	190
- migraine	190
Hyperæsthesia in adiposis dolorosa	455
- of arms, from visceral disease	494
- band type in tabes dorsalis	665
- in brachial neuralgia	491
- from combined sclerosis of the cord	667
- compression of cord	786
- in Dercum's disease	455
- herpes zoster	494, 667
- hyoid region from ear disease	498
- hysteria	509
- leprosy nodules	450
- from lesion of the optic thalamus	666
- in lipomatosis, diffuse	455
- peripheral neuritis	505, 506, 666
- pernicious anæmia	667
- predisposing to pruritus	588
- referred pains	475
- spinal caries	667
- from spinal tumour	667
- in tabes dorsalis	665, 666
- vesica, frequent micturition in	443
Hyperæsthesia spots in neuræsthesia and hysteria	667
Hyperalgesia during regeneration of peripheral nerve	661
- of muscles in peripheral neuritis	660, 661
- thoracic	778
Hyperchlorhydria , absence of local tenderness in	485
- in functional dyspepsia	354

- Hyperchlorhydria, contd.*
 - heartburn with .. 333
 - increased appetite in .. 49
 - pain in the epigastrium in .. 485
 - - - relieved by taking food .. 485
- Hyperidrosis** (see Sweating, Abnormalities of)
- Hyperkeratosis** in arsenical poisoning .. 76, 87
- Hyperlactation**, anaemia from .. 40
- Hypermetropia**, congenital crescents associated with .. 461
 - convergent squint due to .. 709
 - headache from .. 327, 783
 - increasing in tumour of optic nerve .. 255
 - small size of pupil in .. 594
 - tenderness of forehead from .. 783
 - - temporal region from .. 783
 - - vertex from .. 783
- Hypermetropic astigmatism**, ophthalmoscopic appearance of (*Plate VIII*) .. 463
- Hypermesia** .. 25
- Hypernephroma**, aching in loin - causing premature development of external genitalia (*Figs. 125-6*) .. 454, 690
 - demarcation from renal tissue .. 395
 - enlargement of the kidney in .. 395
 - haematuria in .. 395
 - microscopically similar to adrenal tissue .. 395
 - obesity in .. 453
 - origin from adrenal rests .. 395, 690
 - - upper pole of kidney .. 395
 - premature puberty with .. 690
 - renal colic in .. 395
 - secondary deposits in lungs .. 455
 - simulating enlarged spleen .. 726
 - slow growth of .. 395
 - yellow colour of .. 395
- Hyperpiesis** (see Blood-pressure, high)
- HYPERPYREXIA** .. 343
 - in acute rheumatism .. 194, 622
 - cerebral diseases .. 98, 138, 345, 346, 622
 - - haemorrhage .. 98
 - - injuries .. 622
 - - heat-stroke .. 139
 - - hysterical .. 618
 - - from lesions of corpus striatum .. 346
 - - of subthalamic region .. 346
 - - pontine haemorrhage .. 138, 345
 - - lesions .. 346
 - - septic conditions .. 622
 - - typhoid fever .. 622
 - - uraemia .. 622
- Hyper-resonance** to percussion in pneumothorax .. 577
- Hypersecretion** in functional dyspepsia .. 354
 - - stomach-tube test for .. 355
- Hypertrophic pulmonary osteoarthropathy** (see Osteoarthropathy)
- pyloric stenosis, congenital .. 426, 845
 - - rhinitis (see Rhinitis, Hypertrophic)
- Hypertrophy** of cervix uteri simulating prolapse of uterus .. 586
 - - extensor longus hallucis .. 164
 - - of heart (see Heart, Enlarged)
 - - oesophagus, idiopathic .. 225
 - - prostate (see Prostate, Enlarged)
- Hypnotics**, delirium due to .. 195
- Hypocholelhydria** in gastric carcinoma .. 37, 351
 - - in functional dyspepsia .. 354
 - - gastritis .. 352
- Hypochondriasis**, constipation in .. 144
 - - insomnia in .. 358
 - - oesophagismus type .. 484
 - - in oxaluria .. 471
 - - pruritus in .. 588
 - - with undue abdominal aortic pulsation .. 592
- Hypochondrium**, definition of .. 722
 - - enlarged spleen felt in .. 726
- HYPOCHONDRIUM, LEFT, PAIN IN** (see Pain in Hypochondrium)
 - - bulging of, by enlarged spleen .. 688
 - - liver palpable in .. 725
 - - retroperitoneal cyst in .. 726
 - - swelling in, due to tuberculous peritonitis .. 691
 - - subphrenic abscess .. 720
 - - suprarenal tumour .. 393
 - - tumour in, due to carcinoma of splenic flexure .. 690
 - - - of pancreas .. 726
 - - - pancreatic cysts .. 724
 - - various tumours felt in .. 725
- HYPOCHONDRIUM, RIGHT, PAIN IN** (see Pain in Hypochondrium)
 - - discomfort in, in catarrhal jaundice .. 365
 - - organs normally contained in .. 722
 - - redness and swelling of due to hepatic abscess .. 715
 - - tenderness in (see Tenderness in Hypochondrium)
 - - various tumours felt in .. 722
- Hypocythæmia** .. 26
- Hypogastric region**, definition .. 722
 - - organs normally contained in .. 722
- Hypogastrium**, bladder forming swelling in (*Fig. 191*) .. 730
 - - Fallopian tube tumour in .. 730
 - - intussusception felt in .. 730
 - - ovarian tumour in .. 730
 - - pain in (see Pain in Hypogastrium)
 - - uterine tumour in .. 730
 - - various tumours felt in .. 730
- Hypoglossal nerve**, bulbar paralysis affecting .. 159
 - - paralysis, ptialism in .. 591
- Hypomnesia** .. 25
- Hypopyon**, cauterization in .. 807
 - - galvanic-cautery in .. 807
 - - from paralysis of fifth nerve .. 807
 - - pneumococcus in .. 807
 - - pure carbolic acid in .. 807
 - - from ulceration of the cornea .. 806
- Hypospadias**, changes in stream of urine in .. 438
- Hypothermic muscles**, atrophy of .. 73
- HYPOthermia** .. 345, 621
 - - in alcoholism .. 344
 - - children, from exhaustion .. 621
 - - in marasmus .. 621
 - - cerebral abscess .. 547, 623
 - - conditions associated with much pain .. 621
 - - after convulsions .. 621
 - - in cretinism .. 259
 - - heart disease .. 345
 - - from internal hæmorrhage .. 780
 - - with lardaceous disease .. 48
 - - in myxedema .. 259
 - - neurasthenia .. 506
 - - opium poisoning .. 138, 344
 - - pyelonephritis .. 48
 - - renal tuberculosis .. 48
 - - starvation .. 621
 - - summer diarrhoea .. 621
 - - tuberculous peritonitis .. 57
 - - uraemia .. 45
- Hypothyroidism**, in ateleiosis .. 216
 - - nervous symptoms with .. 454
 - - obesity in .. 453, 454
 - - tetany from .. 178
- Hypotonia** of muscles in tabes .. 262
- Hypoxanthin bases**, uric acid derived from .. 817
- Hysteria**:
 - - abdominal aortic pulsation in .. 592
 - - absence of fatigue in .. 464
 - - acute pains in limbs in .. 503
 - - age incidence of .. 710
 - - amblyopia with .. 800, 836
 - - amnesia from .. 26
 - - anaesthesia in (see Anaesthesia, Hysterical)
 - - anorexia in .. 50
 - - anuria in .. 45, 49
 - - aortic aneurysm mistaken for .. 777
 - - aphonia in (see Aphonia) .. 69
 - - ataxy in .. 82, 800
 - - Babinski's sign absent .. 82, 800
 - - bilateral adductor paralysis in .. 798
 - - blindness in .. 666
 - - borborygmi in .. 97
 - - brisk knee-jerk in .. 509
 - - bullæ in .. 111
 - - change of signs and symptoms in .. 506
 - - choreic movements in .. 156, 157
 - - clonus hystericus in .. 506, 798
 - - clonic spasms in .. 652
 - - club-foot in .. 132
 - - coma in .. 137, 140
 - - constipation in .. 150
 - - constriction of field of vision in .. 666, 837, 838
 - - convulsures in .. 163, 165, 166
 - - convulsions in .. 160, 169, 173, 845, 464, 798, 801
 - - - impaired consciousness in .. 160
 - - - polymorphous character of .. 464
 - - - simulating tetanus .. 464
 - - - sphincter unrelaxed in .. 160
 - - cough due to .. 175
 - - danger of diagnosing .. 798
 - - deafness in .. 191, 666
 - - delirium in .. 345
 - - diagnosis from disseminated sclerosis .. 665, 798, 800
 - - - by effect of suggestion .. 150
 - - - from malingering .. 389
 - - - neurosis .. 527
 - - - strychnine poisoning .. 801
 - - - tetanus .. 162, 801
 - - distention in .. 465
 - - dysphagia due to .. 224
 - - emotional outbursts in .. 798
 - - exaggeration of deep reflexes in .. 166, 342, 343, 800
 - - excessive appetite in .. 49
 - - - thirst with .. 789
 - - facial spasm .. 537
 - - faecal vomiting in .. 847
 - - fits described .. 173
 - - flexor plantar reflex in .. 342, 343
 - - flushing in .. 345
 - - globus hystericus in .. 224, 342, 506, 710, 798
 - - "glove" anaesthesia in .. 342, 506
 - - headache in .. 329, 345, 784, 798
 - - hemianæsthesia in .. 69, 506, 666, 798
 - - hemiplegia in .. 69, 340, 342
 - - hicough in .. 342
 - - hyperæsthesia in .. 509, 667
 - - hyperpyrexia in .. 344, 345
 - - impaired consciousness in .. 160
 - - increase of symptoms from anaemia in .. 784
 - - insomnia in .. 356
 - - intention tremor in .. 800

Hysteria, contd.

- joint symptoms in	166, 389
- diagnosis of	389
- disappearance under anæsthesia	389
- disproportionate pain in	389
- muscular atrophy in	390
- sleep unaffected by the pain and tenderness of	389
- stiffness often extreme	389
- leg-raising test of	342
- lock-jaw in	464
- loss of smell in	666, 669
- taste in	666, 774
- mediastinal new growth mistaken for	777
- meteorism in	433
- mistaken for asthma	582
- myoclonus in	160
- and neurasthenia, difficulty of distinguishing	788
- nystagmus absent in	800
- opisthotonos in	162, 463, 464
- optic discs not affected in	800
- pains in the limbs in	506
- in ovarian region in	509
- and tenderness in back in	788
- scalp from	784
- palate reflex in	509
- palpitation in	525, 527
- paralysis agitans mistaken for	548
- paralysis in	157, 163, 389, 506, 798, 800
- absence of associated movements in	549
- muscular wasting in	541
- anæsthesia in	549
- of arm in	548
- general atrophy in	548
- characteristic attitudes of	166
- with chorea	157
- electrical reactions in	541
- flaccidity in	511
- gait in	511
- with hysterical chorea	157
- joint	389
- of one leg due to	541
- typical attitude	541
- reflexes in	541
- rigidity in	398, 541, 548
- of arm in	548
- of limbs in	398
- simulating pregnancy	166
- paraplegia in	69, 562, 567
- perverted taste in	774
- phantom tumours in	433, 721
- phosphorus excretion in	572
- pleurisy mistaken for	777
- pneumonia mistaken for	777
- polyuria with	581, 582, 789
- professions of insomnia in	359
- pruritus in	588
- pseudo-neuralgia in	498
- pyralorrhœa from	590
- pupillary reaction in	160
- pyrexia from	618
- quivering of eyelids in	160
- retention of urine in	441
- retraction of the head in	641
- rigidity of limbs in	398
- rigor-like attacks in	646, 647
- risus sardonius in	651, 652
- scoliosis in	180
- screaming in	160
- "seizures" in	506
- sex incidence of	506, 641, 710
- simulating cerebral tumour	798
- epilepsy	160
- strychnine poisoning	461, 652
- tuberculous hip or knee	166
- spasm of bladder in	443
- spasmodic contractions in	159, 166, 537
- sphincters not paralyzed in	800

Hysteria, contd.

- spinal caries mistaken for	777
- spine symptoms in	788
- "stocking" anæsthesia in	506
- stridor from	710
- subjective small sensations in	669
- sudden recovery from	506
- suggestion treatment in	150, 343, 527
- some symptoms of	157
- tenderness in the chest from	776, 777
- of the scalp from	781
- tests for motor types of	548, 567
- tetanic spasms in	162, 464, 802
- tetany simulated in	178
- trance in	137, 140
- tremor in	795, 798
- trismus in	162, 801
- typhoid spine simulating	787
- variable paralyses in	506
- vomiting in	844, 847
- simulating indigestion	350
- writer's cramp simulated in	178
Hystero-epilepsy	161
- retraction of the head in	641

ICELAND, hydatid disease in

in	719, 720
Ichthyosis, age incidence of	530
- anidrosis with	714
- diagnosis from tinea imbricata	276
- hystrix, papules of	530
- onychogryphosis in	445
- scales in	655
- sore fingers from	266

Icterus (see Jaundice)

Ideas of grandeur in general	
- paralysis	139, 172, 269
Idiocy, absence of speech due to	682
- convulsions of children in	169
- delayed walking from	557
- destructiveness in	682
- dirty habits in	682
- irritability in	682
- kyphosis with	182
- and microcephaly	214
- Mongolian, facies of	263
- paraplegia in	556, 557
- ptialism in	591

Idiogliosis, description of (see Hirschsprung's Disease)

- œsophagus	225
- muscular atrophy and hypertrophy, fibrillary contractions in	158
Ileum, congenital malformation	151

Iliac abscess (see Abscess, Iliac)

- crest, bedsores over	285
- fossa, swelling in (see Swelling in Iliac Fossa)	
- pain in (see Pain in the Iliac Fossa)	
- glands, enlarged (see Lymphatic Glands, Iliac)	
- vein, thrombosis in	186, 456
Iliacus, nerve supply of	542
Ilio-costal space, bulged out by renal tumour	391, 393
- perinephric abscess	392
Ilio-hypogastric nerve, skin distribution of	659
Ilio-inguinal nerve, skin distribution of	659
Ilio-psoas muscle, spinal nerve-root supplying	543
Ilium, disease of, swelling in	
- iliac fossa from	730, 737
- osteomyelitis of	737
- tuberculous disease of	737

Illusions in chronic alcoholism	172
Imbecility, amenorrhœa in	23
- dwarfism with	214
- prominent in Mongolism	216
- ptialism in	591
Impacted wisdom tooth, diagnosis of tetanus from	162
Impending death, delirium in	195
Imperforate hymen, vagina, or cervix	23
Impetigo, bullæ in	110, 113, 446, 602, 608
- crusts in	602, 831
- cutaneous diphtheria with	602
- diagnosis from mild modified smallpox (Fig. 161)	607
- pustular syphilide	604
- ringworm	274
- distinction from eczema	831
- enlarged occipital glands in	419
- flat and irregular pustules in	601
- no leucocytosis with	400
- lips rarely affected by	830
- papules in	831
- perleche with	404
- preference for face and hands	604, 609
- pustules in	601, 602, 654
- pyrexia slight in	602, 608
- relation to pemphigus neonatorum	446
- scabs in	653, 654
- simulated by herpes facialis	830
- small erythematous spots in	602
- sore fingers from	266
- streptococcal infection in	601
- tenderness of the scalp from	781
- vesicles in	608, 831
- bullosa, description of	113, 602
- circinata	602
- follicular, diagnosis from pemphigus	602
- pustular eczema	602
- distribution of eruption in	602
- pustules pierced by hairs	602
- staphylococcal infection in	601
- yellow crusts in	602
- gyrata	602
- herpetiformis	113
Implantation cyst of vulva	768
IMPOTENCE	346
- in cachexia	347
- in distinction from sterility	346
- senile, priapism preceding	585
Impulse on coughing in rare cases in hydrocele	522
- displaced cardiac (see Heart)	
Incompatibility, sterility due to	706, 707
INCONTINENCE OF FÆCES	347
- in meningitis	642
- primary lateral sclerosis	567
- of urine (and see Micturition, Abnormalities of)	437
- chronic cystitis from	628
- from destruction of spinal centres	443
- diagnosis of distention from	440
- distinguished from enuresis	247
- dribbling per urethram in	440
- from enlarged prostate	52
- false	440
- in meningitis	642
- from retroverted gravid uterus	438
- vesical sphincter lesions	440
INCO-ORDINATION (and see Ataxy; and Contractions)	
- causing abnormal gait	277
- in ataxic paraplegia	277
- cerebellar disease	277
- chronic alcoholism	172

Inco-ordination, contd.

- in combined sclerosis .. 277
- disseminated sclerosis .. 277
- distinguished from paralysis .. 515
- in Friedreich's ataxy 131, 277
- peripheral neuritis .. 506
- tabes dorsalis .. 277
- test for presence of .. 277
- India, ankylostomiasis in .. 570
- mycetoma in .. 809
- relapsing fever in .. 373, 619
- India-rubber bottle stomach .. 123, 270, 299
- neuritis in workers in .. 77

INDICANURIA

- abnormal protein decomposition indicated by .. 97, 821
- in acute appendicitis .. 500
- black urine from .. 820, 821
- bleaching powder test for .. 821
- brown urine from .. 820, 821
- cure by calomel .. 821
- darkening of urine on exposure to air, from .. 821
- with liquor potassae due to .. 290
- general account of .. 821
- intestinal origin of .. 821
- and lactic acid therapy .. 319
- nitric acid test for .. 548, 821
- normal colour of urine with .. 821
- in pancreatitis .. 116
- due to pus collections .. 821
- from putrid empyema .. 821
- simulating melanuria .. 821, 822
- trivial significance of .. 319
- Indies, West, yellow fever in .. 372

INDIGESTION

- in children, insomnia from .. 357
- chronic, anæmia in .. 36
- flushing in .. 268
- in general congestion of liver .. 407
- pancreatic lesions causing .. 117
- in pyloric obstruction .. 144
- rosacea from .. 268
- Indigo-blue, blue urine after .. 823
- treatment of epilepsy by .. 823
- Indoor life, anæmia due to .. 36
- Indoxyl-glycuronic acid, blue tint of urine due to .. 823

- Induration of lungs in mitral stenosis .. 245
- Inequality of the Pulses (see Pulses, Inequality of)

- pupils (see Pupil, Abnormalities of)
- Inertia, uterine, dystocia from .. 227
- symptoms of .. 229

Infancy (and see Children),

- athetosis in .. 151
- bulle in .. 111
- in impetigo in .. 446
- choreiform movements in 156, 157
- colic in .. 126
- colitis of .. 92
- constipation in .. 149
- contractures in .. 165
- convulsions in, causes of .. 169
- discussion of .. 170
- not often unilateral .. 174
- porencephalus in .. 170, 172
- diarrhoea of (see Diarrhoea of Infants)
- and vomiting, acetoneuria in .. 4
- epistaxis in .. 251
- eruptions in napkin region in .. 446
- erythema of Jacquet in, diagnosis of congenital syphilis from .. 446
- fibrillary contractions in .. 158
- hemiplegia of .. 338
- ataxy in .. 68
- talipes in .. 131
- hypertrophic stenosis of pylorus in, vomiting from .. 843

Infancy, cont'd.

- insomnia in .. 356
- jaundice in .. 365
- metrorrhæxis in .. 435
- milk in breasts in .. 202
- muscular dystrophy in .. 158, 561
- nystagmus in .. 452
- obscure fever in, possibly due to bacilluria .. 616
- osteochondritis in congenital syphilis in .. 386
- paraplegia of, from spina bifida .. 556
- priapism in, causes of .. 585
- regurgitation of milk in .. 842
- scurvy of (see Scurvy, Infantile)
- seborrhæic dermatitis of .. 446
- spastic paralyses of .. 154
- splenic anæmia in .. 42
- summer diarrhoea of, polycythemia in .. 579, 580

Infantile paralysis (see Paralysis, Infantile)

- Infantilism** .. 212
- causes of .. 215
- in congenital syphilis .. 260
- cryptogenetic .. 216
- cryptorchism in .. 218
- and dwarfism distinguished .. 214
- essential .. 216
- and gigantism together .. 214
- illustrated (*Fig. 66*) .. 215
- intestinal .. 215
- ossification premature in .. 214
- with premature senility in .. 218
- thyroïd type described (*Fig. 67*) .. 216

Infarction (and see Embolism)

- from fungating endocarditis .. 39, 76, 138, 237, 321
- of kidney, albuminuria in .. 9
- diagnosis from acute Bright's disease .. 314
- in fungating endocarditis .. 237
- hæmaturia in .. 305, 314
- renal abscess from .. 625
- casts in urine in .. 314
- of lung, embolic, sudden pain in chest in .. 321
- in fungating endocarditis .. 321
- gangrene of lung from .. 712
- hæmoptysis from 240, 317, 321
- in leukæmia .. 321
- mitral regurgitation .. 240
- stenosis .. 320
- after operations .. 322
- physical signs of .. 321
- pleuritic effusion in .. 123
- puerperal .. 322
- pyopneumothorax from .. 712
- in venous thrombosis .. 321
- in spleen .. 699
- thrombotic .. 700

*Infectious jaundice (see Jaundice, Epidemic)**Infective arthritis (see Arthritis, Infective)**endocarditis (see Fungating Endocarditis)**synovitis (see Synovitis, Infective)***Inferior dental nerve, neuralgia of .. 502****- gluteal nerve, skin distribution of .. 659****- spinal roots derived from 542****- vena cava, obstruction of .. 54, 461, 825****- albuminuria from .. 17, 61****- ascites in .. 60****- hæmaturia in .. 61****- œdema of back from 825****- legs from .. 459, 461***Inferior vena cava, cont'd.*

- obstruction of, varicose veins in .. 61
- thrombosis (see Thrombosis of Inferior Vena Cava)

Inflammation, cardinal symptoms of .. 478**Inflation, in diagnosing carcinoma of pancreas .. 59****- hour-glass stomach .. 353****- pancreatic cyst .. 690****- tumour .. 366****- size of stomach .. 355, 724****Influenza, abdominal pain in 505****- acute general pains in the limbs in .. 503****- hemorrhagic otitis in .. 468****- albuminuria in .. 17****- anæmia in .. 669****- arthritis in .. 376****- bacillus (see Bacillus Influenzæ)****- brachial neuralgia in .. 492****- bronchitis in .. 505****- broncho-pneumonia in 321, 505****- conditions mistaken for .. 620****- conjunctivitis in .. 256****- coryza, severe, in .. 505****- cough in .. 175, 505****- danger of diagnosing 76, 699, 773****- depression in .. 505****- diagnosis of .. 505, 610****- from febricula .. 505****- fungating endocarditis .. 610****- paratyphoid fever .. 611****- tuberculosis .. 610****- typhoid fever 610, 611, 699****- diarrhoea in .. 505****- epididymo-orchitis from 517, 518****- epistaxis in .. 251****- extreme prostration in 505, 699****- gastro-enteritis in .. 610****- headache in .. 505, 610****- jaundice in .. 505****- lachrymation in .. 505****- leucocytosis uncommon in 400, 699****- menorrhagia in .. 428****- micrococci catarrhalis in 505****- muscular atrophy in .. 76****- need for bacterial diagnosis of 293****- caution in diagnosis of .. 609****- nerve deafness after .. 190****- orchitis from .. 79****- pain at the back of the eyes in 610****- in the lumbar region in 610****- severe in .. 505****- pancreatitis from .. 116****- peripheral neuritis after 165, 506****- Pfeiffer's bacillus in 505, 610****- pink-eye in .. 256****- pneumonia in 505, 610, 702****- prolonged, absence of the characteristic symptoms in 610****- pyrexia in 505, 609, 610, 651, 699****- the recently developed refuge of the diagnostically destitute .. 620****- pulse-rate relatively slow in 771****- respiratory type .. 505****- rigors in 647, 648, 651, 699****- significance of delirium in .. 194****- splenic enlargement in 692, 699****- spondylitis deformans after 787****- sputum in pneumonic 505, 702****- sudden onset in .. 699****- sweating in .. 699****- tachycardia after .. 772, 773****- talipes from .. 131****- testicular atrophy after .. 79****- thrombosis after .. 131****- transverse myelitis due to 565****- tropical abscess of liver mistaken for .. 408**

Influenza, contd.

- vagal neuritis after ..	773
- vomiting in ..	505
Infra-orbital nerve, distribution ..	659
Infrapinnatus, atrophy from supra-clavicular nerve paralysis ..	552
- nerve supply of ..	550
- pseudo-hypertrophy of ..	560
- wasting in phthisis ..	72
Infratrochlear nerve, skin distribution of ..	659
Infundibulum, swellings at, in sinusitis ..	255
Infusion, oedema after ..	458, 460
- need for indicated by specific gravity of blood ..	580
Inguinal canal examination in diagnosis of ascites ..	717
- glands (see Lymphatic Glands)	
- hernia (see Hernia, Inguinal)	
- region, organs normally contained in ..	722
- - - various tumours felt in ..	729, 731
INGUINAL SWELLING ..	737
- - due to acute abscess ..	739
- - aneurysm of external iliac artery ..	741
- - chronic abscess from hip disease ..	739
- - - from sacro-iliac disease ..	739
- - distended psoas bursa ..	741
- - femoral hernia ..	739
- - hernia ..	739
- - hydrocele ..	740
- - inguinal hernia ..	739
- - lipoma of spermatic cord ..	741
- - obturator hernia ..	739
- - pelvic abscess ..	760
- - psoas abscess ..	632, 739
- - retained testis ..	523, 740
- - sarcoma of pelvis ..	741
- - tumours of the cord ..	741
- - round ligaments ..	741
- - ureteric calculus ..	135
INGUINO-SCROTAL SWELLING ..	741
- - due to growth in testis ..	742
- - hernia (see Hernia)	
- - torsion of retained testis ..	742
Injuries, abdominal, causing collapse ..	645
- - - chyluria ..	126
- - - chylous ascites ..	58
- - - peritonitis ..	646
- - causing amenorrhœa ..	23
- - amnesia ..	25
- - aneurysm of axillary artery ..	732
- - anuria ..	45, 49
- - bleeding from ear ..	467
- - - gums ..	86
- - - bony swelling ..	750
- - extroversion of bladder ..	587
- - paralysis of arm ..	552
- - paraplegia ..	558
- - ulceration of larynx ..	710
- - cerebral (see Cerebral Injuries)	
- - to cervical cord, rapidly fatal ..	341
- - region, various effects of ..	552, 553
- - chest, emphysema from ..	120
- - pneumothorax from ..	577, 578
- - surgical emphysema from ..	231, 578
- - chordee due to ..	125
- - compression of cord from ..	561
- - corneal ulceration from ..	806
- - diaphragmatic hernia from ..	712
- - of ear, laceration of tympanic membrane visible on examination ..	468
- - ectropion and epiphora from ..	250

Injuries, contd.

- epistaxis from ..	250, 251
- of external auditory meatus from blow on chin ..	467
- - - bleeding from ear in ..	467
- of eye ..	594
- - irregular pupil due to ..	594
- forearm, ischaemic paralysis of hand from ..	552
- - Volkman's contracture from (Fig. 43, p. 166) ..	552
- gangrene from ..	281, 283
- - hæmatemesis from ..	299
- - hæmaturia from ..	304
- - hæmoperitoneum from ..	717
- - hæmorrhage into cord from - to head (see Head Injuries)	563
- - hemiplegia from ..	338
- - history of, in pneumococcal arthritis ..	375
- - hydropneumothorax from ..	712
- - hyperpyrexia after ..	344
- - incontinence of urine from ..	440
- - to internal popliteal nerve, claw-foot from ..	127
- - kidney, diagnosis from urethral or vesical injury ..	308
- - - hæmaturia in ..	304, 308
- - - renal abscess from ..	625
- - - enlargement in ..	308
- - lachrymal duct or canaliculus, epiphora after ..	250
- - larynx, hæmoptysis from ..	318
- - loin, perinephric hæmatoma from ..	392
- - loss of pupil reflexes from ..	594
- - neck, stiff neck from ..	709
- - necrosis of nasal bones from ..	204
- - nerve deafness from ..	191
- - nerves, contracture from ..	163, 165
- - neurasthenia resulting from ..	787
- - nystagmus following ..	453
- - onychia due to ..	445
- - of optic nerve, hippus from ..	595
- - sudden blindness from ..	839
- - orchitis from ..	79
- - pain in the back from ..	475
- - paralysis of serratus magnus from ..	551
- - penile hæmatoma from ..	516
- - periostitis from ..	776
- - professional cramp from ..	177
- - to sacral cord, claw-foot from ..	127
- - sarcoma after ..	756, 803
- - slight, as cause of hæmophilic arthritis ..	388
- - spinal symptoms after ..	787
- - - Brown-Séquard paralysis from (Fig. 181) ..	664
- - - difficult micturition from ..	440
- - - hæmorrhachis from ..	132
- - - paraplegia from ..	561
- - - priapism after ..	585
- - - talipes after ..	151, 132
- - swelling of face from ..	747
- - tender scalp from ..	780, 781
- - spine from ..	784
- - testicular atrophy due to ..	79, 80
- - tetanus due to ..	709
- - of tibia, talipes from ..	132
- - torsion of testis from ..	766
- - transverse myelitis due to ..	564
- - ulceration of larynx from ..	226
- - leg from ..	810
- - to uncinæ gyrus, anosmia from ..	669
- - of vagina causing discharge ..	210
- - vomiting after ..	844
Innominate aneurysm (see Aneurysm, Innominate)	
Innominate veins, obstruction by mediastinal growth ..	465
- - - of, oedema of arm from ..	826

Innominate veins, contd.

- - stenosis by bronchial glands ..	422
- - thrombosis, causes of ..	826
- - - varicose thoracic veins from ..	826
Insane, general paralysis of (see General Paralysis of the Insane)	
Insanity, amenorrhœa in ..	23
- - athetosis in ..	154
- - from chorea of pregnancy ..	156
- - chronic alcoholism ..	172
- - constipation in ..	144
- - gangrene of lung in ..	288
- - and Huntington's chorea ..	156
- - insomnia in ..	356
- - and Little's disease ..	154
- - perverted appetite in ..	50
- - taste in ..	774
- - pupils in ..	595
- - retraction of head in ..	641
- - subjective smell sensations in ..	669
Insect bites on face ..	747
- - wheals from ..	850
INSOMNIA ..	356
- - due to aortic aneurysm ..	848
- - cerebral syphilis ..	173
- - chronic alcoholism ..	797
- - insanity from ..	358
- - methods of mitigating ..	358
- - due to plumbism ..	38
- - pruritus ..	588
Inspiration of blood in cholera ..	187
- - cyanosis from ..	187
- - in dysentery ..	187
- - yellow fever ..	187
Instrumental delivery, birth palsies due to ..	155
- - - paraplegia due to ..	558
Instrumentation, urethritis from ..	206
Insular sclerosis (see Disseminated Sclerosis)	
Insurance (see Life Assurance)	
Intention tremors, differentiation of choreiform movements from ..	156
- - in disseminated sclerosis ..	174, 341
- - - Friedreich's ataxy ..	560
- - - general account of ..	799
- - - in Little's disease ..	154
- - - illustrated (Fig. 205) ..	799
Interostal nerve pain (see Pain, Interostal)	
- - relation of herpes zoster to ..	830
- - skin distribution of ..	659
- - neuralgia (see Neuralgia, Interostal)	
- - spaces, fullness in mediastinitis ..	483
- - sucking in of ..	186, 642
- - tenderness (see Neuralgia, Interostal)	
Interosteo-humeral nerve, skin distribution of ..	59
Intermittent albuminuria ..	19
- - claudication (see Claudication)	
- - closure of cerebral vessels, hemianopsia from ..	36
- - hydrarthrosis, general account of ..	387
Internal capsular lesion causing hemianesthesia ..	666
- - - hemianopsia ..	334, 666
- - - hemiplegia ..	330, 666
- - capsule, changes in disseminated sclerosis ..	666
- - cutaneous nerve, skin distribution of ..	659
- - jugular vein thrombosis ..	651
- - popliteal nerve, muscles supplied by ..	542
- - - roots derived from ..	542

- Internal saphenous nerve, skin distribution of . . . 659
- secretions, effect on menstruation . . . 430
- - - on arteriosclerosis . . . 430
- Interscell, atrophy of . . . 73
- and lumbinales, spinal nerve root supplying . . . 556
- nerve supply of . . . 542, 550
- Interphalangeal joints, hypertrophic osteo-arthritis in . . . 300

- - bright red colour of . . . 603
- - diagnosis from acne . . . 603
- - - acuminate syphilide . . . 604
- - - small-pox . . . 609
- - distribution of . . . 603
- - pustules in . . . 112, 603
- - foul taste in mouth from . . . 774
- - influence on syphilitic pyrexia 615
- - laryngeal symptoms from 185, 465, 709
- - loss of taste due to . . . 774
- - and mercury, aggravation of Bazin's disease by . . . 451
- - in diagnosis of gumma . . . 279
- - effect of, on gumma . . . 677
- - ptialism due to . . . 590
- - purpura from . . . 596
- - relieving pain in secondary syphilis . . . 752
- - simulating laryngeal crises 466
- - swelling of eyes and face from 459
- - testicular atrophy due to . . . 79
- - universal oedema from 458, 460
- - vesicles in . . . 834
- Iodine used by malingerers as vesicant . . . 112**
- scaly eruption due to . . . 655
- test for bile pigment . . . 819
- Iodized serum, psorosperms demonstrated by . . . 803**
- Iodoform capsule test of pancreatic disease . . . 216**
- purpura due to . . . 596

Iridocyclitis, causes of ..	256
- from corneal ulceration ..	806
- oedema of eyelid from ..	256
- severe pain in the eye from ..	256
Iridodialysis, irregularity of pupil from ..	591
Iridoplegia (see Pupil, Abnormalities of)	
Iris , adhesions of, diagnosis between inflammatory and congenital origin of ..	593
- appearance of, in conjunctivitis, iritis, and glaucoma ..	257
- coloboma of ..	462
- photophobia in diseases of ..	571
- prolapse of, from corneal ulceration ..	806
- tremulous in lens dislocation ..	198
Iritis , atrophy of eye from ..	839
- atropine treatment ..	257
- blindness total from ..	839
- blockage of pupils from ..	839
- causes of ..	256
- constriction of pupil in ..	595
- diagnosed from conjunctivitis ..	256, 257
- - glaucoma ..	256, 257
- - glaucoma from ..	839
- headache in ..	327, 328, 783
- irregular pupil from ..	593
- lachrymation from ..	255
- from ophthalmia neonatorum ..	256
- pain in eye in ..	255, 256, 494, 498
- - temporal and maxillary segmental areas in ..	498
- - trigeminal area in ..	494
- photophobia from ..	255, 574
- in syphilis ..	450
- tenderness of the temporal region from ..	783
- - vertex from ..	783
Iron , black stools from ..	428
- blue sweat due to ..	714
- coloration of stools by ..	89
- in diagnosis of chlorosis ..	41
- headache from taking ..	328
- in intestinal sand ..	652
- perchloride of, dryness of the mouth due to ..	789
- relief of headache by ..	329
Irresponsibility of patient after epileptic convulsions ..	169
IRRITABILITY ..	359
- of the bladder ..	443, 817
- in chorea ..	156
- general congestion of liver ..	407
- in idiocy ..	682
- leukæmia ..	31
- meningitis ..	350
- neurasthenia ..	788
- pruritus causing ..	588
- in ricketty children ..	170
Irritable breast of Astley Cooper ..	479
- spine, typhoid spine called ..	787
Irritant , local, causing chloasma ..	571
- - coryza ..	203
- - skin pigmentation from ..	571
- poison , analysis of gastric contents for ..	674
- - eschars on lips or mouth from ..	674
- - hæmatemesis from ..	671
- - symptoms produced by ..	845
- - vomiting from ..	674, 843
Ischemia of calf, talipes from ..	132
- paralysis of the hand from ..	552
Ischio-rectal abscess (see Abscess, Ischio-rectal)	
- fosse, rectal examination of ..	635
ITCHING (and see Pruritus) ..	588
- absence in syphilides ..	601
- in dermatitis herpetiformis ..	781
- drug rashes ..	424, 426

<i>Itching, contd.</i>	
- eczema ..	533, 657, 781, 831
- herpes genitalis ..	830
- - ophthalmicus ..	781
- intense in eczema ..	831
- - papular eczema ..	529
- - prurigo ferox ..	531
- - strophulus ..	850
- - urticaria ..	531
- from leukoplakia ..	770
- of lips in Fordyce's disease ..	403
- pustular eczema ..	602
- ringworm ..	275
- scabies ..	654
- at site of inoculation in ..	
- anthrax ..	603
- slight with psoriasis ..	657
- in small-pox ..	655
- urticaria pigmentosa ..	805
- with vesicular eruptions ..	829
Ivory exostosis (see Exostosis, Ivory)	
JABORANDI, ptialism from ..	590
Jacksonian epilepsy ..	161, 174
- - causing convulsions ..	169
- - from chronic inflammation ..	161
- - clonic convulsions in ..	161
- - diagnostic importance of ..	
- - aura in ..	80
- - motor cortex lesion in ..	174
- - muscular atrophy from ..	161
- - from new growths ..	161
Jacquet's infantile erythema ..	446
Jaffé's test for indican ..	348
Jamaica, ankylostomiasis in ..	570
Japan, distoma pulmonale in ..	325
- - paragonimus Westernmani in ..	705
JAUNDICE ..	360
- acholic ..	372, 819
- - in septicæmia ..	372
- in acute yellow atrophy of liver ..	302
- alcoholism ..	243
- in alveolar echinococcus disease ..	416
- from aneurysm of hepatic artery ..	59
- with ascites, causes of ..	51
- - in portal obstruction ..	58, 301
- with biliary colic ..	135, 152, 846
- from carcinoma of bile-ducts ..	725
- - of duodenum ..	725
- - liver ..	60, 412, 413
- - pancreas ..	280, 500, 690, 724, 725
- - catarrhal ..	363
- - albumosuria in ..	20
- - general account of ..	364, 365
- - similarity to onset of acute yellow atrophy of liver ..	302, 370
- causes associated with ..	
- - disease of liver ..	368
- - with cholangitis ..	650, 651
- - choloria in ..	819
- - with choleystitis ..	650
- in cirrhosis of liver ..	
- - 60, 301, 410, 411, 693, 696	
- from congenital obliteration of bile-duct ..	361
- danger of fatal post-operative oozing in ..	598
- ease of bruising in ..	598
- epidemic , general account of ..	371
- epistaxis in ..	252
- experimental, from toluylene diamine poisoning ..	371
- due to fungating endocarditis ..	370
- from gall-stones ..	278, 300, 410
- grave, of children ..	362, 365
- hæmorrhage from trivial causes in ..	598
- from hepatic abscess ..	408, 651
- in influenza ..	505

<i>Jaundice, contd.</i>	
- irritability in ..	360
- from kinking of bile-duct ..	
- in hepatoptosis ..	407
- with large gall-bladder ..	363
- long-standing, carcinoma of liver the commonest cause ..	412
- - in Hanot's cirrhosis ..	410, 411
- in malaria ..	371
- nervous ..	374
- olive-green, in cancer of liver ..	413
- from pancreatic cyst ..	724
- with pancreatitis ..	
- 117, 135, 280, 292, 724	
- passive congestion of liver ..	370, 407
- purpura with ..	596, 598
- in pyelephlebitis ..	59, 370, 649
- relapsing fever ..	373
- simple, of infants ..	362, 363
- slow heart-action in ..	98, 365
- in splenic anæmia ..	411
- splenomegaly cirrhosis ..	693
- stenosis of bile-ducts ..	365, 410
- tuberculous portal glands ..	59
- tumours of gall-bladder ..	392
- urine colour in ..	360, 820, 821
- urobilinuria and ..	116
- xanthoma planum with ..	805
- xanthopsia in ..	840
Jaw , actinomycosis of (see Actinomycosis)	
- carcinoma of (see Carcinoma of Jaw)	
- clenched during convulsions ..	169
- fibroma of ..	748
- fixed, ptialism from ..	591
- fracture of (see Fracture of Jaw)	
- hypertrophy of, in acromegaly (Fig. 88) ..	263, 749, 753
- lesions of, causing ptialism ..	591
- motor tics affecting ..	160
- muscles, trichinosis of ..	801
- myeloid sarcoma of ..	756
- necrosis of, in acute exanthemata ..	747
- - periosteal abscess ..	747
- - from alveolar abscess ..	747
- - detection of sequestrum in diagnosis of ..	748
- - following injury ..	747
- - from mercurial poisoning ..	747
- - phosphorus poisoning ..	87, 747
- - ptialism due to ..	590
- - stomatitis due to ..	590
- - from syphilis ..	747, 748
- - in typhoid fever ..	747
- - x-rays in diagnosis of ..	748
- new growths of ..	204
- osteoma of, site and characters ..	748
- sarcoma of (see Sarcoma of Jaw)	
- stiffness of, in tetanus ..	162
- lower, pain in ..	501
- - swelling of (see Swelling of Jaw)	
- upper, pain in ..	502
- - swelling of (see Swelling of Jaw)	
Jejunum, obstruction to, absence of distention in ..	152
Jelly-fish stings, pruritus from ..	588
Jenner's stain ..	27
Jerk, achilles (see Ankle-jerk)	
- knee (see Knee-jerk)	
Jewellers, nail-staining in ..	444
JOINTS, AFFECTIONS OF (and see Arthritis and Osteoarthritis) ..	374
- - contractures from ..	167
- - local muscular atrophy in ..	72
- - mistaken for paralysis ..	545
- - in peliosis rheumatica ..	699

Joints, affections of, contd.

- simulating occupation neuroses .. 178
- chief site of pain in some cases of chronic rheumatism .. 507
- gummatous (of see Arthritis, Syphilitic)
- hæmorrhage into, in hæmophilia .. 302
- malignant disease of .. 388
- mechanism of recognition of movements of .. 661
- obscure pyrexia due to osteomyelitis near .. 620
- pains in, in acute rheumatism .. 121
- dengue .. 506
- Henoch's purpura .. 600
- (and see Pain in Joints)
- prominent in achondroplasia .. 212
- pseudo-ankylosis of, in chronic rheumatism .. 507
- rheumatic nodules round .. 452
- Jordan Lloyd, on renal pain with calculus .. 306
- Judgment defects in general paralysis .. 172
- Jugular vein, obstruction by thyroid gland tumour .. 793
- thrombosis (see Thrombosis)
- Juvenile muscular dystrophy .. 561
- fibrillary contractions in .. 158

- KAHLER'S DISEASE .. 21
- Kala-azar .. 34, 693
- enlarged spleen with anæmia in (*Plate XII, Fig. H, p. 696*) .. 34
- geographical distribution of .. 693
- Leishman-Donovan bodies in (*Plate XII, Fig. H*) .. 693, 696
- spleen enlarged in .. 692, 693
- splenic puncture in .. 693
- Kaposi's disease .. 575, 804
- Kathode, meaning of .. 633
- Keith on rectal malformation .. 637
- Keratin-coated capsules in testing for pancreatic disease .. 364
- of methylene blue in diagnosing pyloric obstruction .. 713

Keratitis in congenital syphilis

- conjunctivitis due to .. 256
- corneal opacity from .. 806
- e lagophthalmos .. 807
- neuroparalytica .. 807
- photophobia in .. 574
- Keratomalacia, age incidence .. 807
- associated with marasmus .. 807
- corneal opacity in .. 807
- foamy white patches on conjunctiva in .. 807
- night blindness in .. 807
- prognosis in .. 807
- xerosis of conjunctiva in .. 807

Keratosis follicularis

- simulated by keratosis pilaris .. 806
- molluscum contagiosum .. 806
- pilaris, papules of .. 530
- relationship to ichthyosis .. 530
- scales in .. 655
- simulated by keratosis follicularis .. 806
- Kerion, tender scalp from .. 781
- Kernig's sign in meningitis .. 350

Kidney abscess (see Abscess, Renal)

- affection from back-pressure from distended bladder .. 440
- alveolar sarcoma of .. 395

Kidney, contd.

- angiosarcoma .. 395
- atrophy of, due to complete ureteral obstruction .. 627
- bimanual examination of .. 306, 394, 689
- calculus in (see Calculus)
- carcinoma of (see Carcinoma of Kidney)
- changes in old people .. 14
- colon carcinoma communicating with .. 577
- cystic disease of (see Cystic Disease)
- disease, brachial monoplegia in .. 546
- compensatory hypertrophy of other kidney .. 394
- high blood-pressure from (and see Bright's Disease) .. 96
- insomnia in .. 356
- pain in the back in .. 476
- referred pain in area of 10th dorsal nerve in .. 509
- reno-reflex pain on the sound side in .. 394
- displacement in general viscerotropis .. 407, 473
- effect of fevers on .. 17
- embolism of .. 8, 9, 237
- embryoma of .. 395
- endothelioma of .. 395

KIDNEY, ENLARGEMENT OF (and see Kidney, Tumour of)

- aching in loin in .. 307
- albuminuria in .. 367
- band of colon resonance in .. 367
- causing excessive fatness in children .. 454
- confusion with movable kidney .. 394
- from cystic disease .. 310, 396, 558
- filling of loin by .. 729
- hæmaturia in .. 304, 307, 367
- in hydronephrosis .. 500, 583
- from hypernephroma .. 395
- injury .. 308
- jaundice from .. 362, 367
- liver mistaken for .. 405
- from new growth .. 307, 391, 394, 395

- obscured in various ways .. 394
- palpable in epigastrium .. 725
- lumbar region .. 727
- from papilloma .. 308
- pelvic swelling due to .. 757
- possibly the only functioning one .. 394
- in pyelitis .. 500, 625
- due to pyonephrosis .. 583, 624, 626
- pyramidal clots in urine in .. 307
- pyuria in .. 367
- in renal calculus .. 500
- colic in .. 307
- tuberculosis .. 312, 515, 629
- sickening sensation from pressure on .. 280
- simulated by enlarged spleen .. 726, 729
- tumour of right suprarenal capsule simulating .. 367
- from vesical tumour .. 395
- worm-like clots in urine in .. 307
- evidence of bleeding from .. 305
- felt in left iliac fossa .. 735
- floating .. 407
- confusion with Riedel's lobe of liver .. 405
- granular (see Granular Kidneys)

Kidney, contd.

- hydatid cyst of .. 396
- simulating hydronephrosis .. 396
- hypernephroma from suprarenal rests in .. 690
- hypertrophy, compensating for atrophy of the other .. 394
- infarction of (see Infarction of Kidney)
- inflammations of, general pains in the limbs in .. 503, 505
- subphrenic abscess from .. 720
- injury to (see Injuries to Kidney)
- lardaceous (see Lardaceous Disease)
- lesions causing pleuritic effusion .. 123
- Cheyne-Stokes respiration .. 124
- movable (see Movable Kidney)
- new growths of (see Carcinoma of Kidney; Sarcoma, etc.)
- normal situation of .. 722
- of old people, interstitial fibrosis in .. 14
- pain in penis from disease of .. 510
- papilloma of (see Papilloma of Kidney)
- polycystic disease of .. 310, 394, 558
- rhabdomyoma of .. 395
- right, normally palpable .. 727
- Rose-Bradford .. 14
- sarcoma of (see Sarcoma of Kidney)
- serous cyst of, simulating hydronephrosis .. 396
- stone in (see Calculus, Renal)
- tenderness (see Tenderness over Kidney)
- tuberculosis of .. 309, 394, 612
- abscess in .. 394
- absence of symptoms in .. 626
- miliary form .. 309, 626
- aching in loin in .. 309
- age of patient in .. 309
- albuminuria with .. 8, 16, 310
- slight in .. 626
- anuria in .. 45, 48
- caseous form, abscess in .. 394
- origin as primary focus in one kidney .. 394, 626
- causing pleurisy .. 123
- Cheyne-Stokes respiration .. 124
- colic in .. 135, 309
- cystitis secondary to .. 629
- cystoscopy in (*Plate V, Fig. D, p. 308*) .. 626, 629
- diagnosis from growth .. 395
- renal calculus .. 310, 626
- typhoid fever .. 612
- vesical tuberculosis .. 312, 629
- frequent micturition in .. 306, 310, 312, 394, 438, 626, 629
- hæmaturia in .. 16, 304, 309, 394, 626, 629
- increase in severity of symptoms with infection of pelvis in .. 626
- infection of ureter in .. 310
- inoculation of guinea-pigs in diagnosing .. 626
- kidney enlarged in .. 394, 515, 629
- miliary form of .. 394, 626
- muco-pus in urine with .. 306
- pain in penis at end of micturition in .. 629
- plugs in urine in .. 306
- polyuria in .. 626
- primary .. 309
- pyelitis from .. 438
- pyonephrosis due to .. 626

Kidney, tuberculosis of, contd.

-- pyuria in ..	16, 310, 391, 623, 626, 629
-- renal pain in ..	312, 626
-- tumour in ..	391
-- skiagraphy in ..	310
-- tenderness of kidney in ..	394, 515
-- in loin in ..	629
-- thickened ureter in ..	312, 394, 626, 629
-- felt per rectum in ..	626, 629
-- vaginam in ..	629
-- tubercle bacilli in urine in ..	394, 626
-- tuberculosis of prostate with ..	394, 626
-- testis in ..	394, 513
-- vesiculæ seminales in ..	394, 626
-- tuberculous cystitis due to ..	629
-- urinary changes in ..	626
-- urine normal in early stages ..	309
-- very slight symptoms in ..	earliest stages of .. 626
-- x-rays in diagnosis of ..	626
-- tumour of (and see Kidney, Enlargement of) ..	307
-- albuminuria with ..	9, 16, 689
-- ascites in ..	59
-- bimanual examination of ..	391
-- bulking of loin due to ..	689
-- cystic ..	15
-- cystoscopy before operation in ..	395
-- diagnosis from bladder tumour ..	311
-- fecal accumulations ..	393
-- hæmatoma due to leaking aneurysm ..	692
-- hepatic tumour ..	391, 392
-- gall-bladder tumours ..	392
-- growth of colon ..	393
-- mesentery tumours ..	394
-- omental tumour ..	394
-- ovarian cyst ..	392
-- tumour ..	391
-- pancreatic tumour ..	394
-- pelvic tumours ..	392, 393
-- perinephric abscess ..	391, 392
-- splenic tumours ..	391, 392, 689
-- suprarenal tumour ..	690
-- thickening round appendix ..	393
-- uterine tumour ..	392
-- fixation in loin by preceding inflammation ..	391
-- hæmaturia in ..	9, 16, 305, 689
-- due to hydronephrosis ..	391
-- increased hæmaturia after movement in ..	305
-- laparotomy in diagnosis from suprarenal tumours ..	393
-- in movable kidney ..	500
-- pelvic swelling due to downward growth of ..	758
-- in perinephric abscess ..	500
-- physical signs of ..	391, 689
-- due to pyonephrosis ..	391
-- pyuria in ..	16, 689
-- due to renal abscess ..	391
-- right, bile-duct obstruction from ..	367
-- in right lumbar region ..	727
-- simulation by tumour of liver ..	392
-- sudden, painless, profuse hæmorrhage in ..	305
-- due to tuberculosis of kidney ..	391
-- urinary changes in ..	391
-- varicocele in ..	391
-- sudden appearance suggestive of ..	395

Kink of the colon causing constipation ..	147
Klebs-Löffler bacillus (see Bacillus Diphtheriæ)	
Klumpke's paralysis ..	553, 555
Knee, Baker's cyst of ..	762
-- bursa in neighbourhood of ..	761
-- commonest site of intermittent hydrarthrosis ..	387
-- congenital syphilitic ..	260, 386
-- flexion, impaired in paralysis of anterior crural nerve ..	541
-- lost in sciatic paralysis ..	542
-- in popliteal abscess ..	762
-- gout in ..	382
-- hæmophilic arthritis of ..	388
-- hysterical ..	166
-- injury to, vomiting from ..	844
-- gonococcal arthritis of ..	376
-- lichen planus affecting ..	657
-- locking of, from displaced cartilage ..	388
-- osteo-arthritis of ..	384
-- semi-membranous bursa frequently distended in ..	762
-- pain in, in hip-joint disease ..	278
-- from synovitis ..	483
-- pityriasis rubra pilaris of ..	530
-- pneumococcal arthritis of ..	375
-- psoriasis of ..	656, 657
-- seborrhæic dermatitis of ..	447
-- tuberculous, Baker's cyst in connection with ..	762
-- relative frequency of ..	385
-- with spinal caries ..	561
-- thigh atrophy with ..	72
Knee-elbow position in diagnosing abdominal aneurysm ..	763
KNEE-JERK, ABNORMALITIES OF ..	396
-- absent in Friedreich's ataxy ..	131, 559
-- in anterior crural nerve paralysis ..	541
-- some cases of myelitis ..	74
-- diabetes ..	75
-- Friedreich's ataxy ..	71
-- peripheral neuritis ..	488, 562
-- tabes ..	134, 285, 350, 466, 473, 562, 847
-- dolorosa ..	507
-- in acute poliomyelitis ..	559
-- comparison with other reflexes needed ..	397
-- diminution of ..	398
-- in anterior crural neuralgia ..	488
-- disappearance in bronchopneumonia ..	557
-- in simple diarrhoea ..	557
-- exaggerated in undue abdominal aortic pulsation ..	592
-- amyotrophic lateral sclerosis ..	73, 565
-- birth palsies ..	558
-- causes of ..	397, 398
-- cerebellar abscess, or tumour ..	565
-- compression paraplegia ..	786
-- in disseminated sclerosis ..	342, 539, 565
-- functional paraplegia ..	567
-- hysteria ..	44, 342, 509, 541, 567, 592
-- hysterical paralysis of one leg ..	541
-- due to lesion of upper motor neurone ..	397
-- neurasthenia ..	787
-- neurosis ..	44
-- primary lateral sclerosis ..	567
-- pyramidal tract lesion ..	516
-- relation of ankle-clonus to ..	44
-- spastic paralysis of one leg ..	539

Knee-jerk, exaggerated, contd.

-- in spastic paralysis of upper extremity ..	547
-- paraplegia ..	494, 558
-- syringomyelia ..	554
-- transverse myelitis ..	74
-- method of eliciting ..	396
-- in children ..	397
-- in paralysis from intra- and extra-medullary lesions ..	546
-- ready disappearance in children who are ill ..	557
-- "reinforcement" in the eliciting of ..	397
-- in Tooth's peroneal atrophy ..	560
-- unequal with coma ..	137
-- in general paralysis of the insane ..	398
-- hemiplegia ..	337, 397
-- strong evidence of organic nervous change ..	397
Knee-joint, locking of, from displaced cartilage ..	388
Knife-grinders, cirrhosis of lung in ..	319
-- lung, hæmoptysis from ..	317
Knife-rester crystals of triple phosphate (Fig. 155) ..	573
Knock-knee in Mongolism ..	216
-- from rickets ..	212
Kocher, re cervico-brachial plexus ..	553
-- re lumbo-sacral plexus ..	544
Koplik's spots in measles ..	203
Korsakow's psychosis ..	25, 505
Krallenhaut (see Claw-hand) ..	127
Krallen der Zehen (see Claw-foot) ..	126
Kraurosis vulvæ , age incidence of ..	770
-- confusion with leukoplakia vulvitis ..	770
-- dyspareunia from ..	221
-- pain and tenderness from ..	770
-- vulval swelling from ..	768
Kyphosis , causes of ..	181
-- combined with lordosis ..	183
-- dwarfism due to ..	214
-- from hydatid disease of vertebrae ..	181
-- infantilism with ..	215
-- in Little's disease ..	164
-- from osteo-arthritis ..	214
-- osteomalacia ..	214
-- with psosa abscess ..	733
-- from rickets ..	214
-- and scoliosis associated ..	181, 183
-- from spinal caries ..	214
-- in spondylitis deformans ..	183
LABIA , condyloma of ..	769
-- herpes of ..	830
-- majora, epithelioma of ..	423
-- leukoplakia of ..	770
-- pain in, from renal calculus ..	135
-- minor, kraurosis of ..	770
-- leukoplakia of ..	221, 770
-- myxoma of ..	805
-- edema of in acute nephritis ..	458
Labour , "after-pains" of ..	509
-- difficult (see Dystocia) ..	227
-- dysmenorrhœa cured by ..	219
-- eclampsia with and after ..	172
-- inversion of uterus after ..	587
-- paralysis of anterior crural nerve during ..	541
-- prolonged, birth palsies due to ..	155
-- pyæmia after ..	372
-- tenderness in the back from ..	789
-- urinary fistula after ..	442
Labyrinth , escape of liquor Cotunnii from ear in injuries of ..	468
-- various affections of ..	190

Labyrinthine deafness, how indicated ..	189	<i>Laparotomy in diagnosing, contd.</i>		<i>Laryngismus stridulus, contd.</i>	
Laceration of leg, talipes from	132	-- hydatid cyst of liver	279, 364	-- carpopedal spasm with ..	466
Lachrymal abscess, epiphora from ..	250	-- disease ..	720	-- convulsions with ..	466
- duct, epiphora after excision of ..	250	-- intestinal obstruction ..	267	-- cyanosis in ..	185, 466
- glands, enlargement in chloroma ..	599	-- mesenteric embolism ..	432	-- mistaken for diphtheria ..	466
- -- in lymphatic leukaemia ..	31	-- mucocele ..	281	-- orthopnoea in ..	465, 466
- nerve, skin distribution ..	639	-- retroperitoneal cysts ..	725	-- paroxysmal laryngeal obstruction in ..	466
- obstruction causing epiphora ..	250	-- Riedel's lobe ..	279	- -- in rickety children ..	170, 466
- -- syringing in diagnosis of ..	250	-- splenic hæmorrhage ..	700	Laryngitis, acute , association with acute pharyngitis ..	673
- secretion, arrest of in paralysis of fifth nerve ..	807	-- strangulated spleen ..	700	- -- blood streaks in sputum of ..	176
Lachrymation from conjunctivitis ..	255	-- subphrenic abscess ..	501	- -- due to diphtheria ..	673
- corneal ulceration ..	806	-- suprarenal tumour ..	690	- -- dysphagia from ..	225, 226
- date of first ..	250	-- tuberculous cæcum ..	736	- -- œdematous, from staphylococcus ..	709
- in influenza ..	505	-- liver ..	414	- -- rapid œdema of larynx in ..	673, 709
- iritis ..	255	-- distinguishing kidney, suprarenal, and splenic enlargement ..	726	- -- sore throat in ..	673
- major trigeminal neuralgia ..	495	- -- renal and suprarenal tumours ..	393	- -- suffocative, bacteriology ..	185
- running at nose from ..	203	- -- hamatemesis after ..	294, 304	- -- rapid cyanosis from ..	185
Lacrosse, cramp during ..	177	- -- infective peritonitis from ..	644	- -- tracheotomy in ..	673
Lactation , acute mastitis in ..	743	- -- scar, peristalsis visible in ventral herniation of ..	570	- -- bacteriological diagnosis of nature of 185, 226, 465, 670, 673	
- amenorrhœa due to ..	23	- -- urgent, in acute abdominal conditions ..	485, 846	- -- in congenital syphilis ..	446
- anaemia due to prolonged ..	40	- -- visible intestinal peristalsis an indication for ..	571	- -- diagnosis of laryngeal paralysis from ..	537
- breast changes in ..	713	Lardaceous casts, renal ..	10	- -- dry cough in ..	175
- discharge of milk from nipple during ..	201, 743	- -- disease, absence of ascertainable cause extremely rare ..	414	- -- hæmoptysis in ..	318, 325
- flushing in ..	268	- -- affection of intestines in ..	696	- -- hoarseness in ..	226, 673
- mastodynia in ..	479	- -- albuminuria in ..	8, 10, 197, 414, 696	- -- laryngeal obstruction from ..	465
- prolonged, followed by tetany ..	178	- -- anæmia in ..	39, 696	- -- laryngoscopic inspection in ..	673
Lactic acid in gastric contents ..	299, 333, 351, 353, 845, 816	- -- anuria in ..	45, 48	- -- in measles ..	226
- -- in gastræctasis ..	815	- -- blood-count in diagnosis from leukaemia ..	696	- -- pneumococcal ..	465, 466
- -- gastric carcinoma ..	351, 353, 816	- -- in bronchiectasis ..	696	- -- causing rough cough ..	175
- therapy in indicanuria ..	219	- -- causes of ..	39	- -- streptococcal ..	465
- in vaginal secretions ..	210	- -- from congenital syphilis ..	414	- -- stridor due to ..	709
Lactose , darkening with picric acid ..	290	- -- diarrhoea in ..	197, 414, 696	- -- syphilitic ..	86
- distinction from glucose ..	290	- -- from empyema ..	696	- -- bilateral ..	325, 673
- osazone crystals from ..	290	- -- facies in ..	39	- -- diagnosis of ..	325
- reduction of bismuth by ..	290	- -- liver enlarged in ..	414, 696	- -- from carcinoma ..	673
- in urine, tests for ..	290	- -- firm in ..	414	- -- tuberculous ..	226, 673
Laennec, metallic tinkling of ..	193	- -- from long-standing sup-puration ..	414, 696	- -- dysphagia from ..	226
Lænvulose in urine ..	291	- -- -- syphilis ..	414	- -- effect of mercury and iodide in diagnosis of ..	674
Lalling, definition of ..	688	- -- low specific gravity urine in ..	197	- -- extensive bilateral tissue destruction in ..	325
- persistence of, indicative of mental deficiency ..	688	- -- patient weak, frail-looking, and bloodless in ..	696	- -- healing with deformity in ..	325
Lamina cribrosa ..	461, 462, 463	- -- from phthisis ..	696	- -- hæmoptysis from ..	318, 325
Landouzy - Dejerine's facio-scapulo-humeral myopathy, characters of ..	561	- -- polyuria in ..	583, 584, 696	- -- œdema of larynx in ..	466
- -- fibrillary contractions rare in ..	158	- -- renal changes in ..	696	- -- sore throat from ..	670
- -- muscular atrophy in ..	70	- -- sago spleen in ..	696	- -- subacute nature of ..	673
Landry's paralysis, acute onset ..	562	- -- severe chlorotic anæmia in ..	696	- -- Wassermann's reaction in ..	325, 674
- -- paraplegia from ..	562, 567	- -- in spinal caries ..	696	- -- tuberculous , apical lung signs in ..	325
- -- plantar reflexes in ..	81	- -- spleen enlarged in ..	197, 414, 692, 696	- -- association with phthisis ..	674
Language, written, unaffected by word deafness ..	684	- -- symptoms of ..	39	- -- bilateral occurrence of ..	673
Lanugo-like hair ..	84	- -- in tertiary syphilis ..	411, 696	- -- how diagnosed ..	226
Laparotomy , after abdominal injury ..	646	- -- tube-casts in ..	10	- -- diagnosis from carcinoma ..	673
- in diagnosing acute abdominal conditions ..	90, 342, 780	- -- now uncommon in tuberculous joint disease ..	386	- -- syphilitic laryngitis ..	673
- -- hæmorrhagic pancreatitis ..	646	- -- of liver, characters of ..	10	- -- dysphagia from ..	226
- -- pancreatitis ..	724, 846	- -- of spleen ..	10, 414, 696	- -- hæmoptysis from ..	318, 325
- -- carcinoma of cæcum ..	736	Large intestine , carcinoma of (see Colon, Carcinoma of)		- -- multiple shallow ulcers on epiglottis in ..	325
- -- colon ..	501	Laryngeal affections, ptialism from difficulty in swallowing ..	591	- -- œdema of larynx in ..	466
- -- gall-bladder ..	278	- -- branches of vagus, effect on cough ..	174	- -- primary lung disease in ..	325, 674
- -- sigmoid colon ..	735	- -- crises of tabes ..	465, 466, 562	- -- sore throat from ..	670
- -- chronic pancreatitis ..	364	- -- diphtheria (see Diphtheria, Laryngeal)		- -- stridor from ..	710
- -- cicatrized bile-ducts ..	365	- -- obstruction (see Larynx, Obstruction of)		- -- subacute nature of ..	673
- -- colic ..	615	LARYNGEAL PARALYSIS (see Paralysis, Laryngeal)		- -- tubercle bacilli in sputum in ..	325, 674
- -- encysted ascites ..	719	Laryngismus stridulus , acute dyspnoea in ..	466	- -- in tuberculosis of tonsil with Laryngoscope in diagnosis of cause of hæmoptysis ..	325
- -- gall-stones ..	364, 365			- -- essential in diagnosing laryngeal ulceration ..	226
- -- gastric carcinoma ..	352, 715, 818			- -- inspection by in laryngitis ..	673
- -- general peritonitis ..	615, 713			- -- in laryngeal paralysis ..	537, 539
- -- gumma of liver ..	279			Larynx , affected early in nyctasthenia gravis ..	225
- -- hepatic abscess ..	279			- -- affections of, vertigo due to ..	828
- -- growth ..	279				

Larynx, contd.

- angioma of, hæmoptysis from	318, 325
- carcinoma of (see Carcinoma of Larynx)	
- cyanosis in syphilitic ulceration of	185
- decubital ulceration of	226
- deficiency of deep tenderness in locomotor ataxy	562
- epithelioma of (see Carcinoma of Larynx)	
- fibroma of, stridor from	710
- foreign body in (see Foreign Body in Larynx)	
- gangrene of lung after operation on	288
- injury, hæmoptysis in	318, 325
- - - - - oedema of larynx from	466
- - - - - irritable, cough with	175
- - - - - suggested by cough on getting into bed	176
- - - - - leprosy ulceration of	226
- - - - - hæmoptysis in	318
- - - - - lupus of	226
- - - - - cyanosis from	185
- - - - - hæmoptysis in	318, 325
- - - - - oedema of larynx in	466
- up-and-down movement in diagnosis of site of respiratory distress	467
- - - - - in laryngeal obstruction	185, 186, 465, 642
- new growths of, mistaken for asthma	582
- obstruction of, broncho-pneumonia associated with	186
- - - - - causes of	185, 465, 709
- - - - - in children	185
- - - - - from crises of tabes	465
- - - - - cyanosis from	184
- - - - - diagnosis of	465
- - - - - from diphtheria	642, 709
- - - - - extreme dyspnœa from	642
- - - - - from foreign body	465, 642
- - - - - head retracted in	641, 642
- - - - - orthopnœa in	465
- - - - - paroxysmal, in laryngismus stridulus	466
- - - - - from pneumococcal laryngitis	465, 466
- - - - - retropharyngeal abscess	642, 710
- - - - - simulating meningitis	642
- - - - - from streptococcal laryngitis	465
- - - - - stridor in	185, 465, 642
- - - - - sucking in above and below clavicles in	465, 642
- - - - - intercostal spaces	465, 642
- - - - - up-and-down movements of larynx in	465, 642
- oedema of (see Oedema of Larynx)	
- pain in, causing dysphagia	225
- paresis of, due to syphilis	640
- post-diphtheritic ulceration, hæmoptysis in	318, 325
- progressive weakness of, in bulbar paralysis	224
- sarcoma of, hæmoptysis in	318, 325
- stridor from obstruction of	709
- syphilitic (see Laryngitis, Syphilitic)	
- - - - - potassium iodide in diagnosing	226, 674
- tuberculous (see Laryngitis, Tuberculous)	
- typhoid ulceration of	226, 318, 325, 466
- ulcers of (see Ulcers of Larynx)	

Lateral sclerosis, amyotrophic (see Amyotrophic Lateral Sclerosis)

Lateral sclerosis, contd.

- - - - - primary	565
- - - - - ankle-clonus in	567
- - - - - bladder and rectal troubles in	567
- - - - - conditions simulating	565
- - - - - contractures in	162, 164
- - - - - extensor plantar reflex in	567
- - - - - incontinence of feces in	567
- - - - - knee-jerks increased in	567
- - - - - loss of abdominal reflexes in (Fig. 146)	567
- - - - - paraplegia from	561, 565
- - - - - retention of urine in	567
- - - - - shuffling gait in	278
- - - - - spastic paresis of	567
- - - - - syphilitic origin of	567
- - - - - sinus, erosion from chronic tympanic suppuration	468
- - - - - thrombosis (see Thrombosis)	
- - - - - spinal curvature (see Scoliosis)	
- Lateral pulsation in paralysis agitans	796
- Latissimus dorsi, atrophy of	560
- - - - - nerve supply of	550
- - - - - spinal nerve roots supplying	556
- Laughter, explosive bursts of, in double hemiplegia	258
- - - - - hicough from	342
- - - - - in paralysis agitans	262
- Lavage of stomach, diagnostic	352, 353, 354, 355
- - - - - indications for in cases of coma	137
- Law-suit, influence on neurasthenia	788
- Lead miners, ankylostomiasis in	570
- - - - - poisoning (see Plumbism)	
- Leicithin, derivation of urinary phosphorus from	571
- Leech-bite, purpura from	596, 597
- Leg, atrophic palsy of one, from acute poliomyelitis	128, 544
- - - - - analgesia, in tabes dorsalis	665
- - - - - atetosis of	151, 536
- - - - - causes of oedema of one	455
- - - - - compound fracture of, talipes from	132
- - - - - drawing up of right in appendicitis	736
- - - - - infants	136, 357
- - - - - in intussusception	92
- - - - - erythema of, from excessive standing	450
- - - - - induratum of	450
- - - - - nodum affecting	450
- - - - - papulatum of	531
- - - - - hysterical paralysis of	541
- - - - - lupus vulgaris of	812
- - - - - method of measuring length of	180
- - - - - multiple benign sarcoid of	451
- - - - - muscles, atrophy of, in mycetoma	810
- - - - - sciatica	487
- - - - - innervation of (Fig. 143)	541
- - - - - nigging pain in, from tabes dorsalis	489
- - - - - nodules in Bazin's disease	450
- - - - - oedema of (see Oedema of Legs)	
- - - - - in osteitis deformans	183
- - - - - peroneal atrophy	128
- - - - - predilection of psoriasis for	447
- - - - - sensation impaired in transverse myelitis	564
- LEG, PARALYSIS OF ONE (and see Paralysis)	539
- - - - - intermittent claudication in	489
- - - - - paresis of, in diabetes	75
- - - - - pruritus of	588
- - - - - in pseudo-hypertrophic paralysis	560
- - - - - pseudo-oedema of, in myxoedema	585

Leg, contd.

- spasticity of (see Paraplegia)	
- tremor of, in disseminated sclerosis	800
- - - - - in Graves' disease	797
- - - - - ulceration (see Ulceration of Leg)	
- - - - - Werdnig-Hoffmann paralysis of	158
- Legal's test for acetoneuria	4
- Leishman-Donovan bodies in kala-azar (Plate XII, Fig. H, p. 696)	34, 693
- Leishman's stain	27, 33, 34
- Lemon-yellow colour of skin in pernicious anemia	616, 849
- Lemonade, artificial, transient polyuria caused by	581
- Lens, coloboma of	462
- - - - - dislocation of, irregularity of pupil from	594
- - - - - monocular diplopia in	198
- - - - - signs of	198
- Lentigo (see Freckles)	
- Leontiasis ossea	749, 753
- Lepidophyton in tineæ imbricata	276
- Leprosy, anæsthesia in	75, 450, 575
- - - - - diagnostic importance of	424
- - - - - due to pressure of infiltration on peripheral nerves	424
- - - - - bullæ in	654
- - - - - cachexia from	575
- - - - - diagnosis of erythema nodosum from	450
- - - - - from erythema simplex	424
- - - - - leucoderma	575
- - - - - syphilis	75, 450
- - - - - syringomyelia	75, 424
- - - - - tineæ versicolor	276
- - - - - erythema on face, limbs, and trunk in	424
- - - - - exacerbation of symptoms with each crop of macules	424
- - - - - gangrene in	282, 285
- - - - - hyperæsthesia of nodules in	450
- - - - - of larynx	226
- - - - - hæmoptysis in	318, 325
- - - - - lepra bacillus in lesions of	425
- - - - - in nasal discharge in	425
- - - - - lupus simulating	450
- - - - - lymph glands enlarged in	424
- - - - - macular	424, 450
- - - - - absence of sweating in	424
- - - - - mucous membrane affected in	450
- - - - - nerve trunks thickened in	424
- - - - - neuritis in (Fig. 144, p. 551)	75, 551
- - - - - nodules of (Fig. 124, p. 451)	75, 450
- - - - - pain in joints in	450
- - - - - perforating ulcer of foot from	809
- - - - - rosacea simulating	450
- - - - - scabs in	654
- - - - - scarring in	450, 654
- - - - - skin pigmentation in	575
- - - - - sore fingers from	266
- - - - - sycosis simulating	450
- - - - - tinealectases simulating	450
- - - - - three types of	450
- - - - - ulceration in	450, 654
- - - - - of larynx in	185
- - - - - nose, epistaxis in	260
- Leucin, absent from urine in phosphorus poisoning	373
- - - - - and tyrosin in urine in acute yellow atrophy	302, 370, 843
- Leucocyte count, differential	28
- - - - - in bullous dermatoses	114
- - - - - malaria	402, 583, 615
- - - - - splenomedullary leukaemia	693
- - - - - typhoid	402, 615

- Leucocytes**, abnormal varieties of 29
- in blood, variations with digestion and time of day 399
 - excess of, in urine in bacteriuria 83, 84
 - normal varieties (*Plate II*) 28
- Leucocythæmia** (see *Leukæmia*)
- Leucocytic renal tube casts**.. 7
- LEUCOCYTOSIS** .. 399
- absence of in malaria 371, 583
 - in acute general peritonitis 472
 - cellulitis .. 455
 - after severe loss of blood .. 400
 - definition of .. 399
 - with empyema of gall-bladder 280
 - with hepatic abscess 279, 369, 408
 - in Hodgkin's disease .. 617
 - in leukæmia 64, 302, 366, 599, 620, 693
 - new growth of stomach .. 620
 - with parasitic worms .. 691
 - in pneumonia .. 39, 645
 - pregnancy .. 399
 - pyæmia .. 649
 - with ruptured tubal gestation .. 646
 - significance of, in pyrexia without obvious cause .. 620
 - in septic arthritis .. 375
 - slight in fungating endocarditis .. 39
 - in subperiosteal abscess .. 750
 - subphrenic abscess, 601, 720, 721
 - due to suppuration .. 614, 620
 - in suppurative peritonitis .. 645
 - trichinosis .. 504
 - typhus fever .. 371
- Leucodermia**, diagnosis of
- chloasma from .. 575
 - lineæ albicantes from .. 402
 - from scleroderma, morpha, macular leprosy, syphilides, and partial albinism .. 575
 - macular .. 423
 - pigmentation of the skin in 424
- Leucopenia** .. 445
- in malaria .. 303, 369, 698
 - pernicious anæmia .. 30
 - splenic anæmia .. 411
 - typhoid fever 90, 372, 697
- Leucorrhæa** (see *Discharge, Vaginal*)
- Leukæmia**, acute, without enlarged spleen or gland 617
- albuminuria in .. 10, 17
 - albumosuria in .. 20, 21
 - amenorrhœa in .. 23
 - anæmia severe in 459, 599, 649
 - ascites in .. 64, 122
 - basophile corpuscles in 31, 32
 - bleeding gums in .. 85
 - blood per anum in .. 90
 - blood-count in diagnosis
 - from lardaceous disease 696
 - cachexia in .. 114
 - Charcot-Leyden crystals in 118
 - compression of the lung in 657
 - duration of .. 31
 - enlarged portal glands in .. 562
 - lachrymal glands in .. 81
 - liver in .. 76, 414
 - lymphatic glands in 31, 362
 - salivary glands in .. 31
 - spleen in 31, 59, 64, 76, 302, 314, 599, 617, 667, 692, 693
 - epistaxis in .. 251, 302
 - hæmaturia in .. 309, 314
 - hæmoptysis in .. 318
 - hæmorrhage from mucous membranes in .. 649
 - heavy sweats in .. 649
 - hyperplasia of marrow in 776
- Leukæmia**, contd.
- infarction of lung in .. 321
 - irritability in .. 31
 - jaundice in .. 362
 - leucocytosis in 64, 302, 399, 599, 617, 620, 693
 - lymphatic, albumosuria in 20

- - - foetid sputum in .. 246
- - - physical signs of .. 324
- - cavernous or amphoric breathing in .. 246
- - clubbing of fingers in 128, 129, 193, 246, 324
- - congestion of liver in .. 370
- - cough in .. 246
- - cracked-pot sound in .. 246
- - crackling râles in .. 332
- - cyanosis from .. 186
- - diagnosis of phthisis from 246
- - dyspnoea in .. 246
- - enlarged right ventricle due to .. 245, 246
- - epigastric pulsation in .. 246
- - from epithelioma of bronchus .. 324
- - foul sputum in .. 246
- - haemoptysis in .. 246
- - heart displaced with 129, 193, 232, 246, 330, 332
- - failure from 61, 186, 464, 525

Lung, fibrosis of, contd.

-- hypertrophic osteo-arthro-	390
pathy in	
-- impairment of percussion	246
note in	
-- increased resonance and	332
vocal fremitus in ..	
-- inspissated mucus in ..	324
-- from mediastinal new	121
growth	
-- orthopnea in	464
-- palpitation in	525
-- passive congestion of liver	370
from heart failure in ..	
-- periodic cyanosis from ..	579
-- physical signs of	193, 232
-- polycythemia in	579, 580
-- retraction of chest wall	193, 194
from	
-- scoliosis with	180, 193
-- shortness of breath with	579
-- shoulder drawn down in	246
-- spinal curvature from ..	246
-- tactile vocal fremitus	246
increased in	
-- tubular breath sounds in	332
-- vomiting with	814
- fluke (see Paragonimus	
Westernmani)	
- gangrene of (see Gangrene	
of Lung)	
- growth of, progressive loss	322
of weight from	
- hydatid cyst of (see Hydatid	
Cyst)	
- infarction of (see Infarction	
of Lung)	
- injuries causing surgical	231
emphysema	
-- mottling of, in phthisis ..	120
- new growth, blood-stained	322
pleuritic effusion in ..	
-- sputum in	322
-- breaking down, pneumo-	578
thorax from	
-- bronchial stenosis in ..	322
-- diagnosis of	322
-- effects of	185
-- gangrene from	578
-- hæmoptysis in	317, 322
-- heart displaced in	330
-- particles of growth in	322
pleuritic effusion in ..	
-- in sputum in	322
-- physical signs of	322
-- pleuritic effusion in 121,	322
-- pneumothorax from ..	578
-- profuse hæmorrhage in	322
-- red-currant-jelly-like	322
sputum in	
-- varicosity of thoracic	322
veins in	
- obstruction to root of, by	322
aortic aneurysm	
- passive congestion of, in	245
mitral stenosis	
- rupture of aortic aneurysm	322
into	
- secondary deposits in hyper-	455
nephroma	
- sporotrichosis of (see Spor-	
otrichosis)	
- thrombotic infarction ..	320
- wounds and contusions	287, 288
gangrene of lung from	
Lumbricals, nerve supply of	542, 550
Lupoid, miliary benign, diag-	
nosis of lupus and sar-	
coma from	451
Lupus erythematosus affecting	
fingers	266
-- sebaceous ducts	657
-- age incidence of	449, 781

Lupus erythematosus, contd.

-- atrophy of ears in	658
-- baldness from	84, 85, 781
-- course long of	781
-- diagnosis from favus ..	272
-- from granulosis rubra	
nasi	714
-- lupus vulgaris	449
-- other forms of erythema	656
-- psoriasis	657
-- ringworm	656
-- rosacea	268
-- erysipelas simulated by	781
-- of hands and face	656
-- involvement of lips in ..	403
-- nodules of	449
-- scabs and scales in	656
-- scales with	268, 657, 714
-- scarring in	268, 272, 656, 658
-- sex incidence of	781
-- simulating chilblains ..	656
-- tenderness of scalp from	780
- vulgaris, affection of cartilage	
by	808
-- fingers by	266
-- age incidence of 449, 808,	812
-- apple-jelly nodules in	204, 603, 655, 812
-- bones never eroded by ..	808
-- in caries of spine	564
-- characters of	808
-- of cheek, ectropion and	250
epiphora from	
-- crusts with	448
-- description of	448
- diagnosis from carcinoma	808
-- epithelioma	449
-- leprosy	450
-- lupus erythematosus ..	449
-- multiple benign sarcoid	452
-- rodent ulcer	449, 809
-- scrofuloderma	449, 603
-- syphilis	808
-- yaws	449
- epithelioma starting from	803
-- involvement of lips in ..	403
-- Koch's tuberculin test in	812
-- of larynx (see Larynx,	
Lupus of)	
-- of leg	812
-- leprosy nodules simula-	450
ting	
-- nodules of	448
-- of nose	448
-- discharge due to	204
-- occasional implication of	449
glands in	
-- penis	677
-- scabs in	655
-- scarring from	448
-- tuberculous ulcer of palate	640
with	
-- ulceration with	448
-- of larynx	226
- von Pirquet's skin test in	812
Lymphadenoma (Hodgkin's	
Disease), general (Fig.	
119)	417
-- absence of anæmia in ..	695
-- breaking down of glands ..	420
-- definite blood changes in	64, 695
-- fixation of glands in ..	416, 420
-- of leucocytosis	64, 366, 699,
617, 695	
-- splenic enlargement in ..	695
-- suppuration in	416
-- acute	695
-- albuminuria in	17
-- amenorrhœa in	23
-- anæmia in	303, 366, 459, 617,
649, 695, 715, 738	
-- ascites in	58, 64, 122
-- basophile cells in	303, 695

Lymphadenoma, contd.

-- bleeding gums in	85
-- from mouth in	302
-- blood changes in (and see	
Anæmia)	41, 417, 695
-- examination negative in	617
-- bronchial obstruction from	343
-- stenosis in	324
-- cerebral hæmorrhage in ..	302
-- of cervical glands, diagnosis	420
from tuberculosis	
-- characteristic temperature	617
chart in (Fig. 168)	
-- no characteristic differen-	695
tial leucocyte count in ..	
-- chloasma in	574
-- commencement usually in	416
glands of neck	
-- course of	303, 695
-- deposits in abdominal wall in	715
-- distinction between lympho-	
sarcoma and Hodgkin's	
disease	417, 695
- enlarged abdominal lym-	
phatic glands in	725
-- axillary glands in (Fig.	
119, p. 417)	421
-- cervical glands in	420, 421
-- femoral glands from 734, 738	
-- glands in	64, 76, 303, 416,
599, 617, 695, 715, 738	
-- inguinal glands in	738
-- liver and spleen in 59, 303, 366	
-- portal glands in	58, 362
-- epistaxis in	302
- fibroid lung and bronchi-	
ectasis from	324
- general lymphatic gland	
enlargement in	416, 617
-- hæmatemesis in	294, 302
-- hæmoptysis in	318
-- hæmorrhage from mucous	649
membranes in	
-- heavy sweats in	649
- and Hodgkin's disease, syn-	
onymous terms with	
most authors	417
-- increasing anæmia with ..	738
-- intermittent pyrexia in ..	738
-- jaundice in	362, 366
-- leucocytosis in	617
-- leucopenia in	401
-- liver changes in (and see	
Liver, Lymphadenoma of)	
303, 414	
- lymphatic gland enlarge-	
ment in	58, 362, 416,
421, 599, 695, 734, 738	
-- myelocytes in	29, 303, 695
-- œdema of legs from	459, 461
-- paralysis of vocal cord in ..	538
-- pericarditis in	122
-- peripheral neuritis in ..	76
-- pleuritic effusion in ..	122
-- possibly a chronic tuber-	
culosis	420
-- prognosis in	303
-- purpura in	596, 599
-- pyrexia in (Fig. 168, p. 617)	32, 609, 616, 649
-- rigors in	649
-- severe anæmia in	459, 649, 695
-- spleen enlarged in	64, 76, 86,
303, 416, 420, 617, 692, 695, 738	
- thrombotic infarction of	
spleen in	700
-- varicose thoracic veins from	343
-- wasting in	649
Lymphangioma circumscrip-	
tum	833
-- age incidence of	833
-- vesicles in	833
- of the cord, diagnosis from	
irreducible hernia	741

Lymphangitis, causing blubber lips	746
- of penis	515
Lymphatic glands, abdominal (and see Lymphatic glands, Portal; Lymphatic glands, Retropertitoneal; etc.)	
- - - calcified	725
- - - caseous	725
- - - cystic	725
- - - enlarged, in chronic peritonitis	725
- - - Hodgkin's disease	725
- - - malignant disease	725
- - - tuberculous perito- nitis	691, 725
- - - axillary, enlarged (<i>Fig.</i> 119, p. 417)	421, 732
- - - in carcinoma of breast 421, 743, 745	
- - - chronic mastitis	743
- - - diagnosis between inflammatory and malignant	421, 743
- - - in herpes zoster	479
- - - Hodgkin's disease 59, 417, 421, 617	
- - - inflammatory 421, 731, 743	
- - - in leukæmia	59, 421
- - - malignant	718, 745
- - - in prurigo ferox	531
- - - simulating brachial neuritis	492
- - - tuberculous	421, 744
- - - bronchial, caseous, in sputum	704
- - - enlarged, cyanosis from diagnosis from aortic aneurysm	422
- - - - chronic mediastinitis 422	
- - - - mediastinal growth 422	
- - - - dyspnoea from	466
- - - in Hodgkin's disease inflammatory, rarity of bronchial stenosis from	422
- - - laryngeal paralysis from	422
- - - in lymphatism	423
- - - obstruction from	422
- - - stenosis of innominate vein from	422
- - - - vena cava by	422
- - - x-rays in diagnosis	617
- - - tuberculous, almost al- ways due to infected milk	427
- - - caseous, in sputum	704
- - - cough due to	176
- - - frequency of	427
- - - general tuberculosis from	427
- - - hemoptysis from	318
- - - irritative hicough due to	343
- - - irruption into bron- chus	466
- - - marasmus from	427
- - - meningitis from	427
- - - opening into trachea periodic febrile at- tacks from	343
- - - stenosis of bronchus from	324
- - - x-rays in diagnosis of - - - caseous (and see under the various groups of glands, e.g., Lymphatic glands, Cervical, Tuberculous, etc.), anæmia with	36
- - - lichen scrofulosorum associated with	529
- - - mesenteric, causing ob- struction	151

<i>Lymphatic glands, contd.</i>	
- - - cervical acutely inflamed after scarlatina	674
- - - - diagnosis from mumps	674
- - - acutely inflamed, dys- phagia from	674
- - - - sore throat from	674
- - - - with sore throat and pyrexia sometimes the only symptoms of scarlet fever	674
- - - - sources of infection in	674
- - - - stiff-neck from	674
- - - carcinomatous , diagnosis from tuberculous	421
- - - sites of primary growth 420	
- - - - vocal cord paralysis from	538
- - - enlarged (<i>Fig.</i> 119, p. 417) 13, 417, 420	
- - - age incidence of	421
- - - due to carcinoma of oesophagus	296
- - - epithelioma of ear	419
- - - German measles 418, 607	
- - - hospital sore throat length of history in diagnosis of	421
- - - from local septic ab- sorption	420
- - - in lymphadenoma 59, 421, 465, 617	
- - - tracheal obstruction from	465
- - - lymphosarcoma	421
- - - from malignant thy- roid gland	792
- - - otitis media	420
- - - pediculosis capitis	420
- - - sarcomatous, rarity of after scarlet fever	420
- - - secondary growth in tuberculous	564
- - - from ulceration of the tongue	815
- - - in epithelioma of face fixation to deeper parts leukæmia	417
- - - lupus of face	59
- - - malignant	449
- - - stridor from	465, 812
- - - tracheal obstruction from	710
- - - normal anatomy of 731, 732	
- - - obstruction to trachea by	465, 710
- - - paralysis of vocal cords from	538
- - - stiff-neck from inflam- mation of	708
- - - tuberculous, general account of	420, 421
- - - paralysis of vocal cords due to	538
- - - phthisis not related to 420	
- - - scrofuloderma with 449, 529	
- - - tuberculous lesions elsewhere with	420
- - - enlarged in German measles 418	
- - - epitrochlear, enlarged in digital chancre 266, 422	
- - - in infective synovitis of finger	422
- - - rheumatoid arthritis 39, 379	
- - - femoral, area of drainage of 738	
- - - diagnosis from femoral hernia 734, 738, 740	
- - - from hydrocele of hernial sac	733
- - - enlarged	422, 738

<i>Lymphatic glands, femoral, contd.</i>	
- - - in groin in	738
- - - prurigo ferox	531
- - - inflammatory	734
- - - in lymphadenoma	734
- - - malignant	734
- - - position of	738
- - - iliac, area of drainage of 738	
- - - enlarged, causes of	422
- - - secondary to inguinal or femoral glands 738	
- - - swelling in right iliac fossa from 730, 736	
- - - inflamed, asymmetrical oedema from	455
- - - malignant	735
- - - palpable in left iliac fossa	735
- - - in malignant disease per rectum	422
- - - in peritonitis	736
- - - position of	738
- - - inguinal, area of drainage 738	
- - - carcinomatous 209, 636, 738	
- - - site of primary growth 423	
- - - enlarged	422
- - - buboes from 422, 675	
- - - from carcinoma of rectum	636
- - - - urethra	209
- - - from chancre	675
- - - on scrotum	681
- - - constitutional sym- ptoms with	422
- - - in epithelioma of labium majus	423
- - - penis	676, 677
- - - perineum	678
- - - scrotum	679, 765
- - - epitheliomatous 718, 738, 739	
- - - pain without signs of inflammation in 739	
- - - herpes genitalis	830
- - - zoster	479
- - - in Hodgkin's disease 617	
- - - inflammatory 675, 676, 738	
- - - from local irritation 738	
- - - - sepsis	421, 422
- - - in lymphadenoma	738
- - - lymphatic leukæmia 738	
- - - melanotic sarcoma	423
- - - pediculus pubis	738
- - - primary syphilis 675, 678, 681	
- - - secondary carcinoma 423, 769	
- - - in syphilis	209, 769
- - - urethral discharge	422
- - - lymphadenomatous	59
- - - position of	738
- - - sarcomatous	739
- - - from soft sores on penis 675, 676	
- - - suppurating, from balanitis	675
- - - tuberculous	738
- - - lumbar, enlarged in car- cinoma of rectum	636
- - - - testis	520, 766
- - - mastoid, earache from inflammation of	230
- - - mediastinal (and see Lym- phatic glands, Bronchial)	
- - - enlarged	422
- - - fibroid lung and bron- chiectasis from	324
- - - hicough due to	343
- - - in Hodgkin's disease lymphadenomatous 343	
- - - obstructing bronchus 324	
- - - pyrexia due to	775
- - - tachycardia from 772, 773	
- - - x-rays in diagnosis of 617	

Lymphatic glands, mediastinal, contd.

- - - primary new growth arising from ..	826
- - - sarcoma of ..	322
- - - in secondary carcinoma ..	417
- - - secondary deposits in, causing paralysis of vocal cord ..	538
- - - suppuration in ..	416
- - - tuberculous, hiccough due to ..	343
- - - irritating vagus nerve ..	772
- - - obscure ill-health due to ..	773
- - - obstruction to right bronchus from ..	773
- - - mesenteric, enlarged ..	422
- - - in lymphatism ..	423
- - - palpable in epigastrium ..	725
- - - seldom palpable ..	422
- - - tuberculous, intestinal obstruction from ..	151
- - - occipital, enlarged, in German measles 417, 418, 419	
- - - Hodgkin's disease ..	419
- - - impetigo of the scalp ..	419
- - - leukæmia ..	419
- - - pediculosis capitis 417, 419	
- - - seborrhæic dermatitis of scalp ..	419
- - - syphilis ..	417, 419
- - - tuberculous ..	419
- - - pelvic, enlarged ..	422
- - - in carcinoma of bladder ..	307
- - - rectum ..	636
- - - epithelioma of bladder ..	630
- - - popliteal, abscess from suppuration of ..	762
- - - enlarged ..	762
- - - from local joint infection ..	423
- - - septic absorptions ..	423
- - - portal, enlarged, jaundice from ..	362
- - - leukemic .. 58, 362, 366	
- - - lymphadenomatous ..	362, 366
- - - jaundice in ..	366
- - - malignant ..	362
- - - pressure on portal vein by .. 58, 362, 696	
- - - tuberculous ..	58, 362
- - - ascites with ..	59
- - - bile-duct obstruction from ..	366
- - - jaundice with ..	59, 366
- - - malignant .. 58, 365, 422	
- - - secondary to colon ..	366
- - - ovary ..	367
- - - pancreas ..	366
- - - rectum ..	366
- - - stomach ..	366
- - - obstruction of bile-duct by .. 58, 365	
- - - pre-auricular, various causes of enlargement of ..	419
- - - retroperitoneal, carcinoma of, obstruction to inferior vena cava by ..	825
- - - secondary to ovary ..	826
- - - testis ..	826
- - - varicose abdominal veins from ..	825
- - - enlargement of ..	422
- - - sarcoma of ..	825
- - - submaxillary, enlarged, various causes of .. 419, 420	
- - - from carious teeth ..	419
- - - malignant ..	419, 420, 749, 812
- - - pain in ..	419
- - - in pharyngitis ..	419

Lymphatic glands, submaxillary, enlarged, contd.

- - - from septic absorption from mouth ..	419
- - - suppurating ..	419
- - - leucocytosis in ..	400
- - - septicæmia from ..	614
- - - in tonsillitis ..	419, 708
- - - supraclavicular, enlarged ..	421
- - - from abdominal growths, various ..	421
- - - in carcinoma of colon ..	690
- - - mamma ..	421, 743
- - - stomach .. 351, 421, 691	
- - - malignant peritonitis ..	57
- - - secondary growth in ..	9, 123, 223, 278, 351, 421, 690, 691, 803, 812
- - - syphilitic .. 209, 266, 417, 533, 605, 675, 678, 681, 813	
- - - tuberculous, matting of ..	417, 420
- - - in spinal caries ..	564
LYMPHATIC GLAND ENLARGEMENT, general	
- - - account of ..	416
- - - (and see under Lymphatic Glands, Abdominal; Lymphatic Glands, Axillary; etc.) ..	
- - - ascites in ..	64
- - - blood count to exclude leukæmia in ..	419
- - - in chloroma ..	599
- - - German measles ..	253
- - - Hodgkin's disease ..	42, 59, 64, 76, 303, 416, 599, 617, 695, 715, 734
- - - leprosy ..	424
- - - leukæmia ..	31, 59, 76, 599, 617, 693
- - - lymphosarcoma ..	695, 715
- - - multiple benign sarcoïd ..	451
- - - mycosis fungoides ..	804
- - - in prurigo ferox ..	532
- - - ringworm ..	275
- - - Still's disease ..	40
- - - syphilis ..	533, 675, 738
- - - tuberculosis ..	419, 421, 738
- - - leukæmia (see Leukæmia, Lymphatic)	
- - - obstruction, abdominal, ascites in ..	58
- - - asymmetrical œdema from ..	456
- - - from cellulitis ..	455
- - - elephantiasis from ..	456, 810
Lymphatism	
- - - death under anæsthetics due to ..	423
- - - doubtful whether it is really a pathological state ..	423
- - - enlarged lymphatic glands in ..	423
- - - infantile convulsions in ..	170
Lymphocytes	
- - - in cerebrospinal fluid ..	139, 339, 340, 489, 558, 643
- - - tuberculous meningitis ..	558, 643
- - - general paralysis of insane ..	139, 269
- - - tabes ..	489
- - - in blood, in typhoid fever ..	402, 697
- - - large hyaline, relative increase in malaria ..	303, 369, 371, 402, 615, 649, 698
- - - in Hodgkin's disease ..	76
- - - pernicious anemia ..	76
- - - in leukæmia ..	32, 59, 366, 693
- - - normal blood count ..	28
Lymphoma (see Lymphadenoma)	
Lymphosarcoma, absence of	
- - - leucocytosis in ..	695
- - - pathogenomic blood changes in ..	417
- - - of abdominal wall ..	715

Lymphosarcoma, contd.

- - - affection of spleen, slight in ..	417
- - - albuminuria in ..	17
- - - anemia in ..	715
- - - of cæcum ..	729
- - - cervical glands ..	421
- - - distinction between Hodgkin's disease, lymphadenoma, and ..	695
- - - eosinophilia in ..	249
- - - generalized enlargement of lymphatic glands in ..	416, 417, 695, 715
- - - jaundice in ..	366
- - - rapidly fatal ..	417, 695
- - - relation of chloroma to ..	44
- - - similarity to acute lymphadenoma ..	417
MCBURNERY'S point, tenderness over, in appendicitis ..	
M'Call Anderson, psoriasis rupioides of ..	
Mackenzie, re heart pains ..	
- - - re pain in the back from disease of the rectum ..	788
- - - heart (Fig. 204) ..	788
- - - liver (Fig. 204) ..	788
- - - stomach (Fig. 204) ..	788
- - - uterus (Fig. 204) ..	788
M'Kerron, re fatal infantile metrostaxis ..	
Macrocystis (Plate II, Fig. B) ..	
MACULES ..	
- - - absence of subjective symptoms with ..	424
- - - of early nodular leprosy ..	450
- - - in erythema multiforme ..	531
- - - itching in drug rashes ..	424
- - - in measles ..	607
- - - subcutaneous, in typhus fever ..	699
- - - syphilitic, (Fig. 121) ..	425
- - - becoming papules ..	425, 532
- - - colour brought out by coolness ..	426
- - - diagnosis from drug rashes ..	426
- - - measles ..	426
- - - seborrhœa corporis ..	426
- - - tinea circinata ..	426
- - - varicolar ..	426
- - - distribution ..	425
- - - evanescence of ..	425
- - - measles-like character of ..	425
- - - Maculo-papules ..	424, 528
Madura foot ..	
Magnesium in intestinal sand ..	
- - - phosphates, acid and alkaline reactions of ..	573
"Main botte" in Friedreich's disease ..	
Main-en-Griffe (see Claw-hand)	
Main succulente in syringomyelia ..	
Malar flush in mitral stenosis ..	
- - - of myxœdema ..	61, 526, 773
- - - process, hyperplasia in acromegaly ..	263
Malaria ..	
- - - acetoneuria in ..	34
- - - active congestion of liver in ..	371
- - - æstivo-autumnal, jaundice in ..	371
- - - ague-cake spleen in ..	693
- - - albuminuria in ..	17, 301
- - - algidity in ..	35
- - - anemia in 27, 37, 303, 459, 698	
- - - blood changes in ..	34
- - - brachial neuralgia in ..	492
- - - cachexia from 114, 459, 461, 575	
- - - characters of attacks in ..	649
- - - characteristic pyrexia of ..	34, 698
- - - Cheyne-Stokes respiration in ..	125
- - - chill in ..	615

Malaria, contd.

- cirrhosis of liver in ..	371
- cold and hot stages of ..	583
- coma in ..	35, 136
- crescents in blood in (<i>Plate XII, Fig. E, p. 696</i>) ..	373
- cure by quinine ..	583, 649, 650
- diagnosis from abscess of liver ..	369, 371, 408
- - pyæmia ..	615, 650
- - relapsing fever ..	373
- - typhoid fever ..	615
- diazo-reaction in ..	198
- diminution of leucocytes in ..	698
- eosinophilia in ..	248
- functional bruits in ..	106
- gangrene in ..	282
- geographical distribution of ..	693, 698
- hæmatemesis in ..	294, 302, 303
- hæmaturia in ..	301, 305
- hæmoglobinuria in ..	315
- hyperpyrexia in ..	344
- impotence in ..	347
- jaundice in ..	301, 362, 371
- leucocytosis uncommon in ..	371, 400, 615, 649
- leucopenia with ..	303, 369, 402
- - relative increase in large hyaline lymphocytes in ..	303, 369, 371, 402, 615, 649, 698
- loss of weight in ..	848
- malignant, coma in ..	136
- - diagnosis from yellow fever ..	301, 373
- menorrhagia in ..	428
- œdema of legs in ..	459, 461
- pain and tenderness in the scalp from ..	784
- parasites in blood in (<i>Plate XII, p. 696</i>) ..	35, 369, 371, 373, 583, 615, 649, 650, 693, 698
- - most typical stage at onset of ague fit ..	371
- - rapid disappearance after quinine ..	371
- peripheral neuritis in ..	76
- pernicious, crescents in ..	373
- polyuria in ..	581, 583
- purpura in ..	596
- pyrexia due to ..	609, 615, 622
- quinine in diagnosis of ..	615, 698
- - dosage of ..	615
- relationship to blackwater fever ..	315
- relative increased leucocyte count in diagnosis from hepatic abscess ..	401, 402
- rigors in ..	647, 648
- skin pigmentation in ..	424, 575
- spleen, enlarged in ..	302, 303, 615, 692, 693, 698
- sweating in ..	615
- thyroid gland swelling in ..	792
- tinnitus from ..	794
- wasting from ..	69
Malformations, congenital (see Congenital Malformations)	
Malignant disease, absence of pyrexia as a rule in ..	617
- - albuminuria in ..	17
- - amenorrhœa in ..	23
- - anaemia in ..	37, 616
- - bed-sore in ..	718
- - chylous ascites in ..	58
- - eosinophilia in ..	249
- - functional bruits in ..	106
- - loss of elasticity of skin in ..	718
- - multiple serositis in ..	123
- - pains in limbs in ..	503
- - pigmentation of the skin in ..	718
- - simulated by alcoholism ..	849
- - loss of weight due to old age ..	849

Malignant disease, contd.

- - and syphilis, not distinguished by pyrexia ..	618
- (and see Carcinoma; Epithelioma; Sarcoma; etc.)	
- endocarditis (see Fungating Endocarditis)	
- scarlet fever (see Scarlatina Maligna)	
Malingering, aortic aneurysm invading spine, mistaken for ..	508
- apparent hyperpyrexia in ..	345
- bullæ caused by ..	111
- carcinoma invading spine mistaken for ..	508
- convulsive form of ..	160, 169, 173, 464, 652
- distinction from hysteria ..	389
- fatigue in ..	464
- hæmatemesis from swallowed blood in ..	294, 295
- hæmaturia simulated by aniline dyes in ..	820
- hemoptysis in ..	317
- imitation of deafness by ..	191
- - epileptic convulsions by ..	160
- - fits, described ..	173
- - paraplegia by ..	562, 567
- - strychnine poisoning by ..	464
- - tetanus by ..	464
- insomnia type ..	356, 359
- lockjaw variety of ..	801
- neurasthenia simulating ..	787
- œdema of limbs induced by pain-in-the-chest type ..	479
- perspiration in ..	464
- professions of insomnia in ..	359
- quivering of eyelids in ..	160
- risus sardonicus variety ..	651, 652
Mallein in diagnosis of glanders ..	603
Malpresentations, dystocia due to ..	227
Malt liquors as cause of obesity ..	453
Malta fever, absence of diarrhoea in ..	612
- - agglutinating reaction in ..	507, 612
- - arthritis in ..	376, 507
- - bacteriuria in ..	83
- - bronchitis in ..	507
- - characteristic temperature chart of (<i>Fig. 163</i>) ..	612
- - constipation in ..	506
- - diagnosis from typhoid fever ..	612
- - enlargement of spleen in ..	507
- - gastric derangements in ..	507
- - geographical distribution ..	506
- - goat's milk as source of infection in ..	507, 612
- - headache in ..	507
- - micrococci in blood in ..	507, 612, 650
- - orchitis in ..	507
- - perspiration in ..	506
- - pyrexia in ..	506, 609, 611, 612
- - rheumatic pains in limbs in ..	503, 506
- - rigors rare in ..	647
- - technically a septicæmia ..	650
Mamma, deficiency of deep tenderness in, in locomotor ataxy ..	562
Mammary abscess (see Abscess Mammary; and Mastitis, Acute)	
- neuralgia (see Mastodynia)	
- swelling ..	742, 743, 744, 745
Manchester epidemic of arsenical neuritis ..	77, 576
Mandible (see Jaw)	
Mania, acute, in plumbism ..	38, 139, 173

Mania, contd.

- delirium in ..	195
- insomnia in ..	356, 358
- pupils in ..	594
- temporary following epileptic convulsions ..	169
Mannerisms, motor tics as ..	160
Manson, re dhobie's itch ..	275
- re yaws and syphilis ..	450
Manufacturing districts, gastric ulcer in ..	298
MARASMUS ..	426
- in cyclical vomiting of infants ..	426, 843
- from defective feeding ..	427
- infantile, gangrene in ..	282
- keratomalacia with ..	807
- subnormal temperature in ..	621
- tuberculous, tubercle bacilli in faeces in ..	427
Marie, re spondylose rhizomélifique ..	787
Marriage, when permissible in case of urethral discharge ..	209
Marrow, hyperplasia of in leukemia ..	776
- - in pernicious anæmia ..	776
Marsh cachexia ..	115
Marsh's test ..	92
Mask facies of paralysis agitans ..	262
Massage in avoidance of contractures ..	165
- effects on chronic rheumatic pains ..	507
- influence on œdema of legs in convalescence ..	459
- in insomnia with high blood-pressure ..	359
- of prostate ..	208
- in rheumatoid arthritis ..	379
Masseter muscle, paralysis of ..	775
Mast-cells ..	29
Mastication difficult, in bulbar paralysis ..	159
- imperfect, in etiology of dyspepsia ..	354
- influence on trigeminal neuralgia ..	495
- muscles of, in bulbar palsy ..	687
Mastitis, acute, due to cracked nipples ..	743
- - fluctuation in breast in ..	743
- - formation of abscess in ..	743
- - during lactation ..	743
- - in the new-born ..	743
- - pain in the breast in ..	743
- - during pregnancy ..	743
- - at puberty ..	743
- - purulent discharge from nipple in ..	202, 743
- - pyrexia in ..	743
- - shivering at onset of ..	743
- - skin red and œdematous in ..	743
- - swelling in breast in ..	743
- - not uncommon in virgins ..	743
- chronic, characters of swelling in ..	743, 745
- - diagnosis from carcinoma ..	743, 745
- - - fibro-adenoma ..	744
- - enlargement of axillary glands in ..	743
- - forming cyst ..	202, 743, 744
- - frequent affection of opposite breast in ..	743
- - from tuberculosis ..	744
- - - purulent discharge from nipple in ..	202
- - vague pains and tenderness in breast in ..	743
- serous discharge from nipple in ..	202
Mastodynia, association with pelvic disease ..	479

Mastodynia, contd.

- pain in the chest from .. 477, 479
- in pregnancy or lactation.. 479
- redness, swelling, and tenderness of breast in .. 479

Mastoid abscess (see Abscess, Mastoid)

- disease, cerebral abscess due to .. 547
- headache in .. 327
- spastic brachial monoplegia due to .. 547
- process, hyperplasia in acromegaly .. 263
- tender in otitis media .. 229
- swelling with thrombosed cavernous sinus .. 254

Masturbation, priapism from

- Match manufacture, phosphorus poisoning from .. 87

Matches in urethra .. 210**Match-heads, phosphorus poisoning from taking** .. 373**Maxillary segmental area, pain in, in iritis and glaucoma** .. 498**Measles, albuminuria in** .. 17**albumosuria in** .. 20**arthritis in** .. 376**cancerum oris in** .. 282**coryza in** .. 203, 426, 668**cough in** .. 426**crepuscent character of eruption in** .. 426**delirium in** .. 194**diagnosis from dengue** .. 506**erythema scarlatiniforme** .. 253**German measles** .. 418**macular syphilides** .. 426**small-pox** .. 607**diazo-reaction in** .. 198**and diphtheria associated** .. 226**empyema after** .. 650**eosinophilia after** .. 248**epistaxis at onset of eruption macular in** .. 251**gangrene in** .. 607**German (see German Measles)** .. 282**infantile convulsions in** .. 170**Koplik's spots in** .. 203**laryngitis in** .. 226, 465**leucocytosis uncommon in** .. 400**loss of smell sensation in** .. 668**malignant, hemoptysis in** .. 318**menorrhagia in** .. 428**nerve deafness after** .. 190**oedema of face, neck, and arms from** .. 461**pain in limbs at onset of** .. 505**purpura in** .. 596, 597**rigors in** .. 647, 650**scaly eruption with** .. 655**simulating a cold** .. 203**sore throat in** .. 670**swelling of eyes and face in** .. 459**talipes from thrombosis following** .. 131**Tooth's peroneal atrophy after** .. 71, 560**tuberculosis following** .. 427**Meat-fibres in motions in chronic pancreatitis** .. 135**Meatus urinarius, redness of** .. 207**small, frequent micturition from** .. 438**Meckel's diverticulum causing acute obstruction** .. 151**Median nerve, muscles supplied by** .. 550**paralysis of** .. 552**skin distribution of** .. 659**spinal roots derived from** .. 550**paralysis, diagnosis of Volkmann's contracture from** .. 552**Mediastinitis, acute, causes of** .. 483**episternal fullness in** .. 483**fullness of intercostal spaces in** .. 483**mediastinal crepitation resembling pleural friction in** .. 483**pain behind sternum in** .. 483**rarity of** .. 483**tenderness in back from** .. 786**over sternum in** .. 483**chronic (see Mediastinum, Fibrosis of)** .. 483**Mediastinum, abscess in (see Mediastinitis, Acute)** .. 483**aneurysm in (see Aneurysm)** .. 483**caseous glands in (see Lymphatic Glands, Mediastinal)** .. 483**congenital fibroma of** .. 826**dermoid cyst of, varicose thoracic veins from** .. 826**disease of, tenderness in the chest from** .. 776**fibrosis of, adherent pericardium associated with** .. 242**age incidence of** .. 484**anasarca in** .. 484**aneurysm and new growth simulating one another** .. 185**ascites in** .. 61, 63, 484**cardiac troubles in** .. 484**clubbed fingers in** .. 128**diagnosis from enlarged bronchial glands** .. 422**dyspnoea in** .. 484**gummatous** .. 826**hiccough in** .. 343**irritation of vagus nerve by** .. 772, 773**lividity in** .. 484**obscure cases of** .. 123**obstruction to superior vena cava by** .. 461, 746, 826**oedema of face, neck, and arms from** .. 296, 458, 461**pain in the chest in** .. 478**behind sternum in** .. 484**palpitation from** .. 526, 528**paralysis of vocal cord from** .. 538**pleurisy and pericarditis preceding** .. 343**in rheumatism** .. 826**sense of tightness and dragging in the chest in** .. 484**slight degrees of chronic** .. 63**tachycardia from** .. 772**tuberculous** .. 826**varicose thoracic veins from** .. 484, 826**gumma of, effects of** .. 468**obstruction to superior vena cava by** .. 461**oedema of face, neck, and arms from** .. 458, 461**hydatid cyst of** .. 826**varicose thoracic veins from** .. 826**lymphatic gland, affections of (see Lymphatic Glands, Mediastinal)** .. 483**new growth in, alteration of voice in** .. 483**anaemia in** .. 483**ascites in** .. 61**bronchial stenosis in** .. 324**cachexia in** .. 483**clubbed fingers from** .. 128**compression of lung by** .. 667**cough and expectoration in** .. 176, 483**cyanosis in** .. 296**diagnosis of** .. 465**from aneurysm** .. 296, 483**bronchial glands** .. 422*Mediastinum, new growth in, contd.***disturbance of heart in** .. 483**dyspnoea in** .. 483**enlarged right supraclavicular gland in** .. 421**fibroid lung and bronchiectasis from** .. 324**gangrene of lung in** .. 288**hematemesis from** .. 294, 296**hemoptysis in** .. 176, 483**hiccough in** .. 343**illustrative case** .. 296**inequality of pulses from** .. 593**irritating vagus nerve** .. 772, 773**mistaken for asthma** .. 582**hysteria** .. 777**intercostal neuralgia** .. 777**obstructing bronchus** .. 343**great veins** .. 465**superior vena cava** .. 461, 826**trachea** .. 710**oedema of face, neck, and arms from** .. 456, 458, 461**orthopnoea from** .. 465, 467**pain in the chest in** .. 478, 483**side and down arm in** .. 483**pleuritic effusion in** .. 121**pressure on trachea and bronchi in** .. 483**pyrexia in** .. 483**sense of tightness of chest in** .. 483**skodaic resonance due to** .. 667**stridor from** .. 710**symptoms, physical signs and effects of** .. 121**tachycardia from** .. 772**tightness in chest from** .. 483**tracheal obstruction by** .. 465**varicose thoracic veins from** .. 296, 343, 465, 483, 773, 826**x-rays in diagnosing** .. 422, 465, 474, 483, 582**rupture of aneurysm into** .. 140**sarcoma of, illustrative case** .. 296**tumour of (including aneurysm), general diagnosis of** .. 483**displacement of cardiac impulse in** .. 330**intercostal nerve pain in** .. 478**interscapular pain in** .. 474**local bulging of chest wall from** .. 193**mechanical explanation of orthopnoea in** .. 465, 467**muscular atrophy in arm from** .. 74**unilateral enlargement of chest from** .. 192**x-rays in diagnosis of** .. 422, 474**from asthma** .. 582**veins, obstruction in new growths of pleura** .. 118**Medical examination for life assurance, transient polyuria due to** .. 581, 582**men, digital chance in** .. 266**Medicines causing pytalism** .. 590**Mediterranean, Malta fever in** .. 506, 612**Medulla oblongata, bulbar paralysis due to lesion in** .. 159, 641**degeneration of, from alcoholism** .. 225**Cheyne-Stokes respiration from** .. 124**dissociative anaesthesia from** .. 666**hiccough from** .. 343**paralysis of vocal cords from** .. 538, 539

Medulla oblongata, contd.

-- degeneration of, from	
plumbism	225
syphilis	224
-- hæmorrhage into, diagnosis	
from bulbar palsy ..	687
-- -- dysarthria from ..	687
-- influence on blood distribution	619
-- -- heat distribution ..	619
-- -- lesions causing ataxy ..	68
-- -- diabetes insipidus ..	585
-- -- polyuria	583, 585
-- spastic paralysis of upper limb	547
-- softening in, diagnosis	
from bulbar palsy ..	687
-- -- from dysarthria ..	687
-- tumour of, asymmetrical muscular atrophy in ..	687
-- -- diagnosis from bulbar palsy	687
-- -- dysarthria in	687
-- -- laryngeal paralysis due to	539
-- -- vomiting centre in ..	842
Megaloblasts	28
Megalocytes (<i>Plate II, Fig. B</i>) ..	28
-- in pernicious anæmia ..	76
Megaspores in ringworm ..	273
Meigs's disease	456, 460
MELÆNA (and see Blood per Anum)	428
Melancholia, catalepsy with ..	651
-- high blood-pressure in ..	96
-- insomnia in	358
-- irritability in	360
-- perversion of appetite in ..	50
-- speechlessness in	682
Melanogen	821
Melanotic carcinoma of genital organs or extremities ..	802
-- microscope in diagnosis of ..	802
-- sarcoma of eye, enlargement of pre-auricular gland in ..	419
-- -- inguinal glands	423, 739
Melanuria	820, 821
-- bromine water test for ..	821
-- ferric chloride test for ..	821
-- due to melanotic sarcoma ..	423, 821, 822
-- simulated by alkaptonuria ..	822
-- -- indicuria	821, 822
-- sodium nitroprusside test for ..	821
-- urine darker on standing ..	821
Melon-seed bodies in tenosynovitis	179
Membrana tympani, appearance of in otitis media ..	230
-- hyperæmic and swollen in otitis media	469
-- -- petechiæ on	468
-- -- lacerated in fractured base ..	467
-- -- perforated in otitis media ..	469
-- rupture from foreign body in meatus	468
-- -- head injuries without fracture	468
-- -- in otitis media	230
Membrane in fæces (see Fæces, Mucous in)	
Membranes, adherent, dystocia due to	227
-- early rupture of, dystocia due to	227
Membranous colitis (see Colitis, Membranous)	
-- dysmenorrhœa described ..	219, 220
-- rhinitis (see Rhinitis, Membranous)	
-- vaginitis, flakes from ..	211
MEMORY, LOSS OF (Amnesia) ..	25
-- due to frontal cerebral tumour	798

Memory, loss of, contd.

-- for recent events in alcoholic peripheral neuritis ..	505
-- defects in general paralysis ..	172
-- illusions of, in chronic alcoholism	172
-- for written words, centre for storage of	683
Menière's disease, cause of ..	190, 828
-- coma in	828
-- deafness in	828
-- nausea in	828
-- pallor of the face in ..	828
-- recurrence of attacks in ..	828
-- sudden onset of vertigo in ..	828
-- syphilis of ear simulating ..	828
-- tinnitus in	794, 828
-- vertigo due to	828, 847
-- vomiting from	828, 844, 847
Meningeal hæmorrhage (see Hæmorrhage, Meningeal)	
Meninges, not coloured in jaundice	361
-- disease of the cervical, pain in the upper extremity in ..	491
-- new growth of, compression of cord by	561
-- -- pain in the back in ..	476
-- spinal, tumours causing hyperæsthesia	667
-- -- paraplegia	561
-- tumour of, headache in ..	327
Meningitis, albuminuria in ..	17
-- bed sore in	286
-- cerebral symptoms of ..	558, 563
-- Cheyne-Stokes respiration in ..	125
-- choroidal tubercles in ..	341
-- coma in	136, 642
-- constipation in	149
-- convulsions in	139, 169, 172, 173, 341, 558, 563, 642
-- deafness from	191
-- diagnosis of encephalitis from	139, 558
-- -- from fungating endocarditis ..	614
-- -- otitis media	229
-- -- superior longitudinal sinus thrombosis from	558
-- -- in fungating endocarditis ..	614
-- -- in gingivitis	642
-- -- headache in	139, 326, 327, 328, 350, 359, 563, 622, 642, 847
-- -- worse at night	326
-- -- hemiplegia in	340, 341
-- -- hydrocephalus due to ..	557
-- -- hyperpyrexia in	344
-- increase in specific gravity of cerebrospinal fluid in ..	338
-- incontinence of urine and fæces in	642
-- infantile diplegia due to ..	556
-- insomnia in	356
-- irritability in	350, 359
-- Kernig's sign in	350
-- leucocytosis in	401
-- lumbar puncture in diagnosis of	328, 464, 563, 643
-- muscular twitchings in ..	642
-- occipital headache in ..	327
-- opisthotonos in	464
-- optic neuritis in	139, 341, 464, 563, 642
-- pain in the back in	476, 477, 642
-- paralyses in	642
-- paraplegia from	556, 561, 563
-- photophobia in	350
-- polymorphonuclear cells in cerebrospinal fluid in ..	643
-- pulse-rate in	98
-- purpura in diagnosis of cerebrospinal fever from other forms of	598

Meningitis, contd.

-- pyrexia in	558, 642
-- rarity of rigors in	651
-- retraction of the head in ..	328, 359, 641, 642, 699, 709
-- rigidity of face muscles from ..	801
-- sensory disorders in ..	563
-- simulated by diphtheria ..	642
-- -- encephalitis	558, 643
-- -- laryngeal obstruction ..	612
-- -- retropharyngeal abscess ..	642
-- -- superior longitudinal sinus thrombosis	558, 643, 651
-- simulating dyspepsia	350
-- stiff-neck in	328, 709
-- strabismus in	350, 359
-- tache cérébrale in	771
-- tenderness of scalp in	781
-- trismus simulated by ..	802
-- tubercles of choroid in (<i>Plate VIII, Fig. W, p. 463</i>) ..	341, 563
-- unilateral convulsions in ..	170, 173
-- vomiting in	139, 174, 341, 359, 558, 563, 622, 642, 844, 847
-- basal and epidemic cerebrospinal, relationships between	643
-- loss of convergent accommodative reflex with retention of light reflex ..	594
-- cerebrospinal, antineurococcocal serum in diagnosis of	643
-- -- bacteriological examination of cerebrospinal fluid	598
-- -- Cheyne-Stokes respiration in	125
-- -- coma in epidemic	136
-- -- epidemic character of ..	598, 643
-- -- fluid changes in	338, 339, 643
-- -- head retraction in	328, 641
-- -- hyperpyrexia in	344
-- -- intense occipital headache in	328
-- -- leucocytosis in	401
-- -- lumbar puncture in	328
-- -- purpura in	596, 597, 598, 643
-- -- rigors in	647
-- -- stiff neck in	328
-- -- universal pain and tenderness in	643
-- -- vesicular skin eruption in ..	643
-- chronic, paraplegia from (see also Pachymeningitis)	563
-- -- subjective smell sensations from	669
-- meningococcocal	464
-- -- arthritis in	376
-- -- Cheyne-Stokes respiration in	125
-- -- coma in	136
-- -- duration of	642
-- -- head retraction in	328
-- -- hemiplegia in	337, 338
-- -- hyperpyrexia in	344
-- -- occipital headache in	328
-- -- lumbar puncture in	328
-- -- polymorph. leucocytosis in cerebrospinal fluid in ..	339
-- -- pyrexial crises in	344, 642
-- -- retraction of the head in ..	641
-- -- stiffness of neck in	328
-- -- and tuberculous distinguished	642
-- post-basal (see Meningitis, Meningococcocal)	642
-- pneumococcocal	642
-- -- polymorph. leucocytosis in cerebrospinal fluid in ..	339
-- spinal, diagnosis of sciatica from pain due to	487
-- -- tetanus from	162

Meningitis, spinal, contd.

- opisthotonos in ..	463, 464
- pain on moving neck and head in ..	162
- priapism in ..	586
- pyrexia in ..	464
- staphylococcal ..	642
- polymorph. leucocytosis in cerebrospinal fluid in ..	339
- streptococcal ..	642
- polymorph. leucocytosis in cerebrospinal fluid in ..	339
- suppurative from bacillus coli communis ..	642
- cavernous sinus thrombosis ..	254
- Cheyne-Stokes respiration in ..	125
- coma in ..	136, 137
- from diphtheria bacilli ..	642
- facial erysipelas ..	642
- fatal in two or three days ..	642
- hyperpyrexia in ..	344
- from infection of the ethmoidal air-cells ..	642
- frontal air-cells ..	642
- naso-pharynx ..	642
- sphenoidal air-cells ..	642
- mastoid disease ..	612
- otitis media ..	98, 642
- pediculosis capitis ..	642
- polymorphonuclear cells in cerebrospinal fluid in ..	558
- pyrexia in ..	642
- retraction of the head in ..	641
- from scalp sepsis ..	642
- suppuration in antrum of Hichmore ..	642
- in the nose ..	642
- orbit ..	642
- tachycardia in ..	98
- typhoid bacilli ..	612
- various causes of ..	642
- syphilitic , atrophic palsy of one leg from ..	543
- dysarthria from ..	687
- increased intracranial pressure in ..	687
- involvement of cranial nerves in ..	687
- lumbar puncture in diagnosis of ..	488
- spinal, girdle pain in ..	289
- trigeminal neuralgia in ..	496
- tuberculous (and see Meningitis) ..	173, 699
- age incidence of ..	642
- Cheyne-Stokes respiration in ..	125
- choroidal tubercles in ..	642, 699
- coma in ..	136
- convulsions in ..	612
- diagnosis from typhoid fever ..	611, 612
- duration of ..	642
- gastro-intestinal symptoms in ..	174
- headache in ..	612
- hyperpyrexia in ..	313
- irregular pyrexia in ..	642
- lumbar puncture in diagnosis ..	699
- lymphocytosis in cerebrospinal fluid in ..	339, 558, 643
- mental apathy in ..	174
- optic neuritis in ..	612, 699
- paralyses in ..	612
- pyrexia in ..	622, 642
- relatively slow pulse-rate in ..	771
- retraction of abdomen in ..	612
- head in ..	641, 699
- from tuberculous bronchial glands ..	427
- vomiting in ..	699

Meningocele, diagnosis from

- dermoid cyst ..	254
- dystocia due to ..	227
- of face, illustrated (<i>Fig. 75</i>) ..	254
- paraplegia due to ..	556, 557
- pulsation in ..	254
- unilateral exophthalmos due to ..	254
- Meningococci (<i>Plate XII, Fig. N, p. 696</i>) ..	
- in cerebrospinal fluid ..	340, 643
- Gram-negative ..	643
- meningitis due to ..	172, 339, 464, 643
- occurrence within leucocytes ..	613
- of Weichselbaum ..	172, 340
- Meningo-myelitis, gangrene in ..	282
- Meningo-myelocele, movement with respiration in (<i>Fig. 75, p. 254</i>) ..	764

Menopause, calcium deficiency

- at the ..	432
- epistaxis at the ..	251
- eructatio nervosa at ..	267
- flushing at the ..	268
- menorrhagia at ..	430
- metrorrhagia at, causes of ..	433
- obesity developing at the ..	454
- phantom tumour at the ..	761
- priapism at male ..	586
- tinnitus increased by ..	793

MENORRHAGIA, causes, etc.

- from anaemia ..	36, 430
- endometritis ..	220
- at menopause, from arteriosclerosis ..	430
- high blood-pressure ..	430
- from endometritis ..	210
- puberty due to sarcoma ..	430
- with pyosalpinx ..	632
- salpingo-oöphoritis ..	760
- uterine fibroid ..	758, 759

Menstrual onset, menorrhagia and metrorrhagia at ..

435	
Menstruation , abnormalities of (see also Amenorrhoea; Dysmenorrhoea; Menorrhagia; Metrorrhagia) ..	22, 431

- absent ..	22
- continuance possible in pregnancy ..	758
- effect of ovarian secretion on ..	430
- pituitary secretion on ..	430
- sexual intercourse on ..	431
- suprarenal secretion on ..	430
- thyroid secretion on ..	430
- excessive at one single period, causes of ..	428
- flushing with ..	268
- headache with ..	329
- meaning of ..	758
- pain and tenderness in back from ..	789
- recurrent pain in right iliac fossa with, due to appendicitis ..	737
- relation to conception ..	758
- single profuse, nervous causes of ..	430
- suppressed ..	22
- swelling of thyroid gland in ..	791
- tinnitus increased by ..	793
- vicarious ..	303
- epistaxis of ..	251
- hematomidrosis in ..	715
- hemoptysis in ..	318, 319

Mensuration in ascites, method

51

in ovarian cyst

52

Mental anguish in angina

481

- apathy in tuberculous meningitis ..

174

- area, referred pain in ..

498

- attitude in disseminated sclerosis ..

174

Mental attitude, contd.

- tetanus, strychnine poisoning, and hysteria ..	464
- causes of dyspepsia ..	354
- changes due to frontal cerebral tumour ..	798
- in general paralysis of the insane ..	269
- deficiency in acquired infantile paralysis ..	155
- in congenital defect of cortex ..	558
- syphilis ..	260
- delay in acquiring speech due to ..	682
- and infantile convulsions ..	170
- in infants, insomnia in ..	357
- lalling with ..	688
- in Little's disease ..	154
- loss of power of speech in ..	682
- priapism in certain conditions of ..	585
- degeneration in myxoedema ..	460
- disease, ptyalism in ..	591
- emotion, pyalorrhoea from ..	592
- excitement giving rise to hæmoglobinuria ..	315
- failure in chronic chorea ..	156
- hebétude after epileptic convulsions ..	169
- incapacity in congenital spastic paraplegia ..	131
- nerve, skin distribution of ..	659
- overwork, headache from ..	327, 329
- temporary impotence from ..	347
- symptoms in alcoholic peripheral neuritis ..	505
- Dercum's disease ..	455
- hydrophobia ..	162
- under-development in cretinism ..	259
Mercury , amenorrhoea due to ..	23
- anaemia due to ..	37, 797
- anuria due to ..	45, 48
- bleeding gums from ..	85, 86
- cachexia from ..	115
- cerebral symptoms due to ..	797
- dangers of, in nephritis ..	590
- deafness from ..	191
- in diagnosis of syphilis ..	226, 279, 387, 520, 521, 604, 640, 653, 674, 677, 681, 769, 808, 813
- foul taste from ..	774
- and iodide in diagnosis of gumma ..	279
- loss of taste due to ..	774
- purpura from ..	596
- salivation from ..	37, 86, 590, 797
- spongy gums from ..	295
- stomatitis due to ..	37, 86, 295, 590, 774, 797, 815
- swelling of cheeks due to ..	86
- tremor from ..	37, 77, 795, 797
- simulating disseminated sclerosis ..	797
- paralysis agitans ..	797
- poisoning in hat-makers ..	38
- albuminuria in ..	16
- leucopenia in ..	401
- mirror-makers ..	38
- muscular atrophy in ..	77
- necrosis of jaw from ..	747
- neuritis from ..	77, 551
- in rabbit-skin curers ..	38
- thermometer-makers ..	38
MERYCISM ..	431
- diagnosis from flatulence ..	431
- pyrosis ..	431
- vomiting simulated by ..	842
Mesenteric embolism (see Embolism, Mesenteric)	
- glands (see Lymphatic Glands, Mesenteric)	

Mesenteric plexus, meteorism from interference with ..	432	Microsomia (see Dwarfism)	
- - thrombosis of (see Thrombosis, Mesenteric)		Microscope in diagnosis (see Histology)	
Mesentery , hydatid disease of ..	720	Microsporon Audouini ..	272, 273
- thickened and contracted in tuberculous peritonitis ..	56	- canis ..	272, 273
- tumour of, diagnosis from renal tumour ..	391	- felineum ..	272, 273
Metabolism , congenital errors of, causing alkaptonuria ..	822	- furtur in d'hoobie's itch ..	275
- errors of, causing obesity ..	453	- - in tinea vesicolor ..	276
- - coma due to ..	136	- minutissimum in d'hoobie's itch ..	275
Metacarpal bones , affection in jaws ..	449	- - erythrasma ..	276
- - chondroma of (<i>Fig.</i> 195) ..	754	- - mycelium and spores of ..	277
Metatarsal bones , in jaws ..	449	- tardum ..	272, 273
- neuralgia, symptoms and causes ..	488	Microsporosis ..	272
Metallic taste in major trigeminal neuralgia ..	495	- pleomorphism in ..	273
METEORISM ..	431	MICTURITION, ABNORMALITIES of (and see Incontinence of Urine) ..	437
- abdominal swelling from ..	715	- - with irritable bladder ..	443
- diminished liver dullness in ..	716	- - in prostatic enlargement ..	311
- displacement of heart in ..	716	- changes in stream of urine in ..	438
- in hysteria, importance of excluding organic basis for ..	433	- differences day and night ..	438
- simulating free gas in peritoneum ..	716	- difficulty of, in acute prostatitis ..	511
Methæmoglobin ..	12	- - prostatic abscess ..	511, 631
- in hemoglobinuria ..	304, 314	- - starting ..	439
- spectral absorption band of ..	95	- - urethral stricture ..	511
- spectroscopic in diagnosis of ..	821	- disorders of, from diseases of nervous system ..	442
- urine black from ..	821	- through fistule ..	442
Methæmoglobinæmia , account of ..	187	- frequency of ..	394, 437
- cyanosis in ..	184, 187	- - in appendicitis ..	632
Methæmoglobinuria (see Hæmoglobinuria) ..		- - bacilluria ..	84, 616
Methyl-orange test for free HCl ..	355	- - bladder tumours ..	47, 311, 512, 514, 630, 632
Methylene blue , blue urine after ..	823	- - cystitis ..	221, 628, 631, 817
- green urine from ..	823	- - in descending ureteritis ..	515
- staining of mucus by ..	444	- - distinction from polyuria ..	581
- test of pancreatic disease ..	364	- - in general peritonitis ..	644
- - pyloric obstruction ..	713	- - impacted ureteral calculus ..	514
- for, in urine ..	823	- - implication of bladder in neighbouring growth ..	632
- - in vesico-vaginal fistula ..	442	- - importance of uric acid crystals in ..	817
Methylxanthin bases , uric acid derived from ..	817	- - increased, causes of ..	437
Metritis , tenderness of uterus in ..	221	- - from irritable bladder ..	443
- chronic, dyspareunia from ..	221	- - movable kidney ..	310
METORRHAGIA ..	433	- - on movement, in vesical calculus ..	513, 628
- in acute inversion of uterus ..	587	- - in oxaluria ..	471
- in acute yellow atrophy ..	370	- - pelvic affections ..	817
- anaemia with ..	36	- - prostatic abscess ..	511
- definition ..	428	- - enlargement ..	440, 581, 817
- due to blood changes ..	433, 435	- - prostatitis ..	207, 511
- from ruptured tubal gestation ..	646	- - pyelitis ..	625
METROSTAXIS ..	435	- - renal calculus ..	308
- anaemia with ..	36	- - colic ..	135, 516
- definition ..	428	- - from renal infection ..	624
Microblasts ..	28	- - single simple ulcer of bladder ..	630
Microcephaly , dwarfism with ..	214	- - in tuberculous bladder ..	306, 312, 513, 581, 629
- infantilism with ..	215	- - cystitis ..	628
Micrococcus catarrhalis, acute tonsillitis from ..	670	- - kidney ..	135, 306, 310, 312, 394, 626, 629
- causing colds ..	203	- - in ulceration of the bladder ..	630
- laryngitis from ..	670	- - uninfluenced by rest in vesical tuberculosis ..	513
- in nasal or bronchial secretions in influenza ..	505	- - in ureteric calculus ..	135, 511
- pharyngitis from ..	670	- - impacted ..	514, 627
- urethritis due to ..	83	- - urethral stricture ..	581
- melitensis infection, bacteriuria in ..	83	- - in urethritis ..	207
- in Malta fever ..	507, 612	- - vesical calculus ..	312, 513, 627, 628, 629
- rheumaticus in fungating endocarditis ..	237	- - impossible in urethral rupture ..	308
- tetragenus in sputum ..	705	- - involuntary (see Enuresis) ..	646
Microcystes (<i>Plate II, Fig. B</i>) ..	28	- - in epilepsy ..	437
Microides in ringworm ..	273	- - mechanism of control of ..	443
Micromelia ..	214	- - nervous mechanism of ..	437
Microspia ..	840, 841	- - normal ..	437
- from cannabis indica ..	841	- - painful ..	441
- often unexplainable ..	841	- - in acute cystitis ..	627
		- - prostatitis ..	207
		- - urethritis ..	207, 675
		- - appendicitis ..	632
		MICTURITION, painful, contd.	
		- - in carcinoma of urethra ..	209
		- - in implication of bladder in neighbouring cancer ..	632
		- - pain in penis after ..	512, 629
		- - with prostatic abscess ..	207
		- - from soft sores of urethra ..	209
		- - ulceration of the bladder ..	630
		- - urethritis ..	675
		- - vesical growth ..	47, 632
		- - precipitate, with incontinence of faeces ..	348
		- - scalding in bacteriuria ..	84
		- - gonorrhœa ..	769
		- - sudden stoppage by impaction of calculus ..	210, 313
		- - urgent desire for ..	45
		MID-BRAIN, tumour of, deafness from ..	190
		- - defective reaction of pupil to light with ..	798
		- - eccentric pupil from ..	798
		- - fifth nerve anaesthesia from ..	798
		- - third nerve paralysis from ..	798
		- - unilateral tremor from ..	798
		- - weakness of upward movement of eyeballs with ..	798
		Middle cerebral artery , speech centres supplied by ..	684
		- cutaneous nerve, skin distribution of ..	659
		Middle-ear deafness ..	190
		- inflammation (see Otitis Media)	
		Mid-orbital segmental area , pain in, in errors of refraction ..	498
		Midwives , chance of finger in ..	266
		Migraine , absence of optic neuritis in ..	582
		- acetoneuria in ..	4
		- amblyopia with ..	836
		- central scotoma in ..	836, 838
		- headache in ..	326, 329, 837, 840
		- hemicrania in ..	838
		- hemianopsia in ..	333, 336, 836
		- hyperæsthesia acustica in ..	190
		- monocular blindness in ..	836, 840
		- nausea in ..	847
		- short duration of blindness in ..	840
		- sudden blindness from ..	839
		- temporary aphasia in ..	686
		- transient polyuria after ..	581, 582
		- transitory visual disturbance in ..	329
		- tinnitus in ..	794
		- unilateral headache in ..	326
		- hemianopsia in ..	333
		- vertigo in ..	828
		- vomiting in ..	329, 837, 838, 840, 844, 847
		- xanthoma planum with ..	805
		Milia of acne ..	530
		Miliaria , relation to hydrocystoma ..	831
		- rubra, distinction from eczema ..	831
		- - pricking and tingling in ..	831
		- - vesicles in ..	831
		- - vesicles with ..	714
		Miliary abscess of the newborn, dermic pustules ..	601
		- benign lupoid, diagnosis of lupus and sarcoma from ..	451
		- papular syphilides, description of ..	532
		- - - diagnosis of lichen scrofulosorum from ..	530
		- tuberculosis (and see Meningitis) ..	394
		Milium , character of papule of ..	528
		Milium-like bodies in mouth in Fordyce's disease ..	403

- Milk**, caseous glands from
 - curds, infantile colic due to 343, 427, 773
 - discharge from nipple at abnormal time .. 202
 - (goat's) as source of infection in Malta fever .. 507
 - secretion in the new-born .. 743
 - at puberty .. 743
 - tuberculosis from .. 343, 427, 564, 691, 773, 848
 - tuberculous peritonitis from .. 691
 - yellow, in jaundice .. 361
 - Milker's cramp .. 177
 - Milky ascites .. 58
 - urine (see Chyluria)
 - physiological causes of .. 573
- Milroy's disease**, oedema of leg in (*Figs. 127, 129*) 156, 160, 461
 - relation to angioneurosis 460
 - simulating Bright's disease 460
 - Mimicry, nervous .. 389
- Miner's anaemia, occult hæmorrhage in .. 94
 - nystagmus .. 453
 - phthisis (see Cirrhosis of Lung)
 - worm (see Ankylostomum Duodenale)
- Mining districts, gastric ulcer in 298
- Mirror-makers, mercury poisoning in .. 38
- Mitral area** .. 789
 - systolic bruits over 101, 102
 - and aortic disease combined 237
- disease**, accentuation of heart sounds in .. 2
 - cerebral embolism from 138, 155
 - diminished appetite in .. 49
 - venous congestion of liver in 407
- regurgitation**, in adherent pericardium .. 243
 - from alcoholism .. 243
 - bone disease leading to .. 241
 - cardiac impulse displaced outwards in .. 332
 - causes and signs of 102, 103, 239
 - clubbed fingers in .. 128
 - enlarged left ventricle in 232
 - from long-continued over-exertion .. 241
 - general account of, 238, 239, 240, 241, 242, 243
 - hæmoptysis in .. 320
 - heart failure in .. 464
 - hypertrophy of the heart in 102

Mouth, contd.

- catarrh of, cheilitis glandularis in	403
- chicken-pox eruption in	673
- congenital syphilitic condylomata of	446
- drooping of angle of, in facial paralysis	533
- dryness of in peritonitis	774
- due to drugs	789
- pneumonia	774
- septicæmia	774
- severe fevers	774
- typhoid fever	774
- (and see Tongue, Dryness of)	
- eschars on, in irritant or corrosive poisoning	674
- Fordyce's disease affecting	403
- hæmorrhage from, in purpura hæmorrhagica	600
- herpes zoster of	831
- muscles affected early in myasthenia gravis	225
- trichinosis parasites in	801
- non-pathogenic acid-fast bacilli in	701
- open and expressionless in cretinism	258
- operation, bronchio-pneumonia after	321
- pain in, causing dysphagia	225
- pigment deposits in, in Addison's disease	574, 849
- small-pox eruption in	673
- tremors of, in chronic alcoholism	258
- ulceration within	88
Movable kidney, absence of symptoms in	310
- albuminuria from	8
- confusion with enlarged kidney	394
- with constipation	148
- diagnosis from enlarged gall-bladder	279
- Dietl's crises in	310, 729, 844
- frequency of micturition	310, 438
- gastro-intestinal disturbance in	310
- gastroptosis with	353
- hæmaturia from	304, 310
- hydronephrosis from	500, 583, 729
- intermittent hæmaturia from	310
- jaundice from	367
- kinking of ureter in	500
- lumbar aching in	310
- pain in	499, 500
- palpable in right iliac fossa	729
- polyuria in	310, 581, 583, 729
- sickening sensation on compression of	387
- simulated by appendicular abscess	729
- colon carcinoma	727
- enlarged gall-bladder	727
- Falloppian tube affection	727
- gall-stone	500
- hydatid cyst	727
- mucocele	281
- omental masses	727
- ovarian tumour	727
- Riedel's lobe	279, 727
- scybala	727
- simulating biliary colic	500
- swelling in iliac fossa from	727
- symptoms and signs of	727
- transient polyuria due to hydronephrosis from	581, 583
- undue abdominal aortic pulsation associated with	592
- vomiting with	844
- x-rays in diagnosis of	583

Movements, associated, in

paralysis of cerebral origin	548
- in avoidance of contractions	165
- choreiform (see Contractions)	
- inco-ordinated (see Ataxy)	
- involuntary (see Contractions and Athetosis)	
- pain in limbs on, in neuro-myositis	504
- voluntary, the neuro-muscular mechanism of	64
Mucocele, simple, gall-bladder enlargement from (<i>Fig. 94, p. 281</i>)	280, 281
Muco-membranous colitis (see Colitis)	
Mucous colic, synonym for muco-membranous colitis	133
- colitis (see Colitis)	
- membrane lesions of syphilis, spirochæta pallida in	371
- affected by favus	270
- hæmorrhage from (see Hæmorrhage)	
- herpes of	830
- leprosy nodules on	450
- pallor from hæmorrhage	846
- pemphigus, etc., of	114
- pigmented in Addison's disease	849
- from silver	575
- ringworm affecting	272
- septic ulceration of	830
- small-pox eruption on	605
- varicella eruption on	833
- polypus of cervix	587
- tubercles developing from papular syphilide	532
- on scrotum	681
- in syphilis	677, 678
Mucus in the gastric juice in gastritis	352
- passage of, per rectum	690
MUCUS IN THE STOOLS (and see Fæces, Mucus in)	443
MUCUS IN THE URINE	444
- associated with uric acid deposit	816
- in cystitis	221, 628
- hæmoglobinuria	314
- in herpetic urethritis	209
- methylene blue and eosin staining of	444
- simulated by tube-casts	815
- urates	815
- with tuberculous kidney	306
- uric acid crystals	816
Mulberry rash in typhus fever	371
Multiple abscesses of liver (see Abscess, Hepatic)	
- benign sarcoïd, diagnosis from lupus and sarcoma	451
- neuritis (see Neuritis)	
- serositis	123
Mummification	282
Mumps, albuminuria in	16
- diagnosis from acute cedema of neck	674
- cervical adenitis	674
- dysphagia in	225, 674
- hydrocele in	522
- leucocyctosis uncommon in	400
- lymphocytosis in cerebro-spinal fluid in	339
- nerve deafness after	190
- orchitis from	79, 517, 518, 765
- pain in neck from	674
- pancreatitis from	116
- pyralism from difficulty of swallowing in	591
- rigors in	617
- sore throat from	671, 674

Mumps, contd.

- stiff neck from	674
- swelling of face in	746
- in salivary glands in	674
- unilateral becoming bilateral in	674
- testicular atrophy after	79
- trismus simulated by	801
Murmurs, cardiac (see Bruits, Cardiac)	
- vesicular (see Vesicular Murmurs)	
Muscle volantes, relieved by epistaxis	252
Muscle in embryo of kidney	395
- fibres in fæces in pancreatitis	117, 364
Muscles, chief site of pain in some cases of chronic rheumatism	507
- condition of in hemiplegia	336
- fibrillar contractions of	157
- heat production from activity of	619
- hyperalgesia of, in peripheral neuritis	660
- importance of analyzing distribution in paralysis of	549
- inhibitory pains in, mistaken for paralysis	545
- innervated by brachial nerves, table of	550
- lumbar and sacral plexuses	543
- of lower limb, tables of innervation of	542, 543
- normal and abnormal electrical reactions in	633
- pain in, in peripheral neuritis	551
- rigidity of (see Rigidity of Muscles)	
- rupture of, purpura from	596, 597
- spontaneous rupture of, palpation of the gap in	597
- special liability of plantaris longus to	597
- strong in achondroplasia	212
- swellings in, in trichinosis	504
- tenderness of (see Tenderness of Muscles)	
- thenar and hypothenar, spinal nerve roots supplying	556
- trichinosis parasites in	504, 801
- wasted (see Atrophy, Muscular)	
- weak in osteogenesis imperfecta	213
- osteomalacia	213
Muscle-tone, factors influencing	161
- increased in brachial monoplegia	546
Muscular atrophy (see Atrophy, Muscular)	
- contractions (see Contractions)	
- physiology of	794
- distribution of brachial plexus, table of	556
- dystrophies (see Myopathy)	
- exertion, cramp from	177
- displacement of cardiac impulse in	330, 332
- hyperæsthesia in neuritis	165
- inaction in illness, club-foot from	133
- inco-ordination in neuritis	506
- over-strain, acute general pains in the limbs in	503
- slight pyrexia in	503
- tenderness of muscles in	503
- paralysis (see Paralysis)	
- rheumatism	507
- diagnosis of tetanus from	162
- rigidity in acute polymyositis	504
- spasm, post-hemiplegic	157
- (see Contractions, Spasmodic)	

Muscular strain, aortic disease from 237, 238	Mycetoma , atrophy of leg in .. 810	<i>Myelocytes</i> , <i>contd.</i>
- tenderness (see Tenderness in Muscles)	- bacteriology of 809	- lymphatic leukaemia 32
- twitchings and anuria 48	- distinction from actinomycosis 810	- pernicious anaemia 30
- in uremia 45	- general account of 809	- splenic anaemia 64
- weakness in chorea 156	- swelling of the foot in 810	Myeloid sarcoma (see Sarcoma, Myeloid)
- diffuse kyphosis from 182	Mycosis fungoides , characters of 803, 804	Myelomata, Bence-Jones' albumosuria with 21
- lordosis from 183	- lymph. glands enlarged in .. 804	Myalabris used by malingers as vesicant 112
Musculature of the perineum, spinal nerve roots supplying 543	- pruritus in 588	Myocardial affections , age incidence of 103
Musculo-cutaneous nerve , muscles supplied by 550	- simulated by eczema 804	- albuminuria in 18
- numbness in distribution of in sciatic neuritis 487	- of the skin 802	- alcoholic 238
- skin distribution of 659	- of nails 445	- ascites in 61
- spinal roots derived from .. 550	Mydrasis (see Pupils, Abnormalities of)	- Cheyne-Stokes respiration in 125
Musculo-spiral nerve , muscles supplied by 550	Mydriatics contraindicated in glaucoma 257	- congestion of liver in 407
- skin distribution of 659	- dilatation of pupil from 595	- displacement of impulse in .. 330
- spinal roots derived from .. 550	- in iritis 257	- dyspnoea on exertion from .. 333
- tenderness over, in brachial neuralgia 491	Myelitis , acute bed sore in 286	- feeble irregular pulse in .. 333
- paralysis 552	- hyperpyrexia in 344	- feebleness of impulse in .. 333
- history of use of crutch or of fractured humerus in .. 549	- onset of paraplegia due to affecting lumbar section of cord, loss of knee-jerks in .. 398	- gallop rhythm in 333
- in lead neuritis 77	- anaesthesia from 484	- heart failure from 461
Mustard, sore finger from handling 266	- aortic aneurysm causing .. 564	- improvement under digitalis 526
- vomiting from 843	- arms not usually affected .. 565	- Schott's Nauheim 526
Mutism in dementia 682	- Babinski's sign in 82	- treatment 526
- sudden complete restoration of speech in 682	- bladder spasm in 443	- increase of pulse-rate after exercise in 526
Myalgia of the back, lumbago from 507	- causes of compression producing 564	- insomnia in 356
- chill as a cause of 507	- causing contracture 162	- oedema of legs from .. 333, 461
- chronic general pains in the limbs in 503, 507	- chronic cystitis in 628	- palpitation in 333, 526
- definition 478	- compression, pain in umbilical region in 525	- difficulty of diagnosis from dyspepsia 526
- pain in chest in 477, 507	- constipation in 149	- senile, cardiac impulse displaced in 333
- pleurodynia from 507	- contractures in 164	- shortness of breath in 101
- simulating occipital headache 326	- diagnosis of progressive muscular atrophy from 73	- soft systolic bruit in 333
- stiff neck from 507	- difficult micturition in .. 440, 443	- in Stokes-Adams' disease .. 97
- tenderness in the chest from .. 776	- dorsal, loss of knee-jerks in .. 398	- symptoms of 103
- of muscles in 478	- precipitate defaecation in .. 348	- syncope attacks in 333
Myasthenia gravis , absence of atrophy of muscles in 687	- at ninth dorsal segment, analgesia from (<i>Fig.</i> 179) .. 662	- systolic mitral bruit in .. 102, 103
- bulbar paralysis distinguished from 225	- gangrene in 283	- varieties of 54, 464
- characteristic smile of 260	- girdle pain in 289, 484	Myocarditis , acute, in acute rheumatism 241
- chin-drop in 260	- due to influenza 565	- interstitial 241
- closing of eyes in (<i>Fig.</i> 83) .. 260	- in lesions at lumbar enlargement, reaction of degeneration in 563	- parenchymatous 241
- described 225	- - - - - wasting in 563	- bone disease leading to .. 241
- dysarthria in 687	- loss of convergent accommodation with retention of light reflex in 594	- causing mitral regurgitation .. 239, 241
- dysphagia in 842	- main types and causes of .. 564	- dilatation of left ventricle in .. 241
- early supervention of fatigue on faradism in .. 634	- pain in the back in 475	- dyspnoea in 241
- electrical reaction in diagnosis of 225	- paralysis of bowel and meteorism in 432	- feeble irregular pulse in .. 241
- facial asymmetry in 261	- paraplegia due to 561	- pain and tenderness in the back from 789
- facies described (<i>Figs.</i> 83, 84) 260	- relation of injury to .. 564	- palpitation in 241
- marked variation of symptoms with condition of rest or fatigue in 687	- of syphilis to 564, 565	- precordial pain and distress in .. 241
- nasal quality in voice in .. 687	- retention of urine in 441	- pyemic 241
- ocular palsy in 687	- scarlet fever causing 565	- signs of cardiac failure in .. 241
- ptosis in 590	- sensory disorders in 563	- sudden collapse in 241
- ptyalism in 591	- simulating amyotrophic lateral sclerosis 74	Myoclonus 160
- regurgitation of food through nose in 202	- spastic paralysis of one leg in 540	- clonic contractions of .. 161
- thinning of tongue in 687	- transverse , diagnosis of poliomyelitis from 74	- convulsions with 169
- tiring of knee-jerk in 399	- - - - - Tooth's atrophy from .. 74	- in epilepsy 160
- weakness of zygomatic and risorius muscles in .. 260	- knee-jerks in 398	- hysteria 160
Myelium, Gram-staining, in pus in actinomycosis 748	- main-en-griffe in 74	Myokymia of calf muscles in intermittent claudication .. 490
- in erythrasma 277	- paraplegia due to 562	- definition of 490
- of favus 270	- reflexes in 74, 82, 398	Myoma cutis , contraction under the influence of cold 805
- microsporon minutissimum .. 277	- sphincter troubles in 74	- distribution of 805
- ringworm 272	- from typhoid fever 565	Myopathy , absence of sensory changes in 70
- tinea versicolor 276	- of upper dorsal region, priapism in 586	- affecting quadriceps muscle, loss of knee-jerks in .. 398
	Myelocytes , characteristics of (<i>Plate II</i>) 29	- distinction from neuritis .. 70, 561
	- in Hodgkin's disease 41, 76, 303, 695	- electrical reactions in 70
	- leukaemia 31, 64, 76, 302, 693	- fibrillar contractions rare .. 158, 549
		- heredity in 70, 560, 561
		- infantile and juvenile types of .. 561
		- Landouzy - Dejerine, bilateral facial palsy in 687
		- lordosis of, illustrated 183

Myopathy, contd.

- neuropathic muscular atrophy simulating ..	158
- ocular symptoms of ..	260
- paralysis of arm in ..	555
- paraplegia in children from ..	560, 561
- pouting lips in (<i>Fig. 81</i>) ..	260
- pseudo-hypertrophic ..	560
- reflexes in ..	70
- scoliosis due to ..	180, 181
- transverse smile of (<i>Fig. 82</i>) ..	260
- varieties of ..	158
Myopathic facies described (<i>Figs. 81, 82</i>) ..	260
Myopia , crescents in ..	461, 462
- influence of age on ..	462
- ophthalmoscopic appearance of (<i>Plate VII</i>) ..	461, 462
- divergent squint due to ..	709
- large pupil in ..	594
- nyctalopia from ..	841
- posterior staphyloma in ..	462
Myosis (see Pupil, Abnormalities of)	
Myositis , acute general pains in limbs in ..	503
- intercostal, pain in chest from ..	776
- tenderness in chest from ..	776
- from invasion of muscles in trichinosis ..	504
- ossificans, trismus simulated by ..	801
Myotic drugs, constriction of pupil from use of ..	595
Myotonia atrophica, fibrillary contractions rare in ..	158
Myxœdema , abnormal breadth of nose in ..	259
- absence of sweating in ..	585
- affection of hands and feet in ..	455
- age incidence of ..	460
- amenorrhœa in ..	23, 430
- brittle striated nails in ..	259
- broad features in ..	454, 585
- fingers and hands in ..	454
- coarse dry skin in ..	259
- cyanosis in ..	259
- Dercum's disease simulating ..	455
- diagnosis from paralysis agitans ..	259
- dryness of skin in ..	585
- facies of (<i>Figs. 76, 77</i>) ..	259
- falling out of hair and eyebrows in ..	454
- fruste, described ..	216
- hypothermia in ..	315
- illustrated (<i>Figs. 76, 77</i>) ..	43, 258
- increasing obesity in ..	259, 454, 460
- weight in ..	585
- intellect, changes in ..	43, 454, 585
- intellectual dullness in ..	585
- leucocytosis in ..	400
- malar flush of ..	454
- mental changes in ..	43, 454, 460, 585
- œdema of legs in ..	461
- polyuria in ..	583, 585
- pseudo-œdema of legs in ..	585
- puffy eyelids of ..	259
- sallow complexion of ..	259
- scanty hair in ..	259
- sex incidence ..	460
- slowness of pulse in ..	98, 259
- speech in ..	259
- subcutaneous hyperplasia in ..	259
- swelling of legs in ..	460
- lips in ..	259
- symptoms of ..	42
- thickening of ears in ..	259
- thyroid treatment in ..	259
- in diagnosis of ..	454, 460, 585
- urine in ..	460

Myxoma , characters of ..	805
- distinction from molluscum contagiosum ..	805
NÆVI , blood-oozing, of skin and mouth ..	325
- capillary, diagnosis from ..	395
- macules due to ..	423
NAILS, AFFECTIONS OF ..	441
- by favus ..	271, 275
- brittle ..	415
- striated in myxœdema ..	259
- capillary pulsation in ..	233
- disorders of nutrition, diagnosis from ringworm ..	275
- eczema of, diagnosis from ringworm of nails ..	275
- egg-shell, relation to hyperidrosis ..	415
- epidermolysis bullosa affecting ..	445
- exfoliation in ringworm ..	275
- gouty, diagnosis from ringworm of nails ..	275
- greyish stains of, in ringworm ..	275
- onychomycosis of ..	275
- orange-rind type, in eczema ..	445
- psoriasis of, diagnosis from ringworm of nails ..	275
- reddening of, in onychia ..	445
- rheumatic, diagnosis from ringworm of nails ..	275
- ringworm of (see Ringworm of Nails) ..	85, 445
- staining in dyers, washerwomen, jewellers ..	444
- in syringomyelia ..	285
- thick, brittle in ringworm ..	275
- transverse ridging of ..	445
- trophic changes of in acute illness ..	445
- white spots on, origin of ..	445
- yellow stains in favus ..	275
Nanosomia (see Dwarfism) ..	212
Naphtha, hæmoglobinuria from ..	314
- peripheral neuritis from ..	77
Naphthol, hæmoglobinuria from ..	314
NAPKIN-REGION ERUPTIONS ..	446
Narcotic poisoning, Cheyne-Stokes respiration in ..	125
Nares, pruritus of ..	588
- working in pneumonia ..	645
Nasal bones , necrosis of, anoma from ..	668
- causes of ..	201
- foul breath due to ..	99
- obstruction to nose by ..	668
- in syphilis ..	237
- diphtheria, how to recognize ..	203
Nasal discharge (see Discharge, Nasal) ..	
- inflammation, referred pain in fronto-nasal and mid-orbital areas in ..	498
- nerve, skin distribution of ..	650
- obstruction (see Nose, Obstruction of) ..	
- process, hyperplasia in acromegaly ..	263
- secretion, micrococcus catarrhalis in, in influenza ..	505
- sinuses, dilatation of: compression of optic nerve by ..	840
- sudden blindness from ..	839
Naso-labial area, pain and tenderness in, in caries of canine tooth (<i>Fig. 132</i>) ..	497
- folds, affection by seborrhœic eczema ..	533
- inequality in hemiplegia ..	337
- obliteration of, in facial paralysis ..	533

Naso-pharynx , fibro-sarcoma of ..	669
- headache in catarrh of ..	327
- infection, meningitis from ..	642
- otitis media from ..	230
- new growths in causing epistaxis ..	250
Nausea ..	
- absent in cerebral vomiting ..	847
- gastric crises ..	847
- in acute gastritis ..	845
- general peritonitis ..	472
- pancreatitis ..	846
- rheumatism ..	671
- yellow atrophy ..	302, 370
- alcoholism ..	368
- arsenical poisoning ..	75, 297
- associated with flushing ..	268
- with bacteriuria ..	84
- catarrhal jaundice ..	355
- early phthisis ..	360
- gastric carcinoma ..	299, 351
- ulcer ..	298
- gastritis ..	297, 352, 845
- intestinal colic ..	473
- obstruction ..	846
- lead poisoning ..	77
- Menière's disease ..	828
- in migraine ..	847
- onset of scarlet fever ..	843
- in phosphorus poisoning ..	373
- portal obstruction ..	300
- preceding hæmatemesis ..	316
- in tuberculous peritonitis ..	719
- undue abdominal aortic pulsation ..	592
Neck , acne vulgaris of ..	531, 601
- actinomycosis of ..	810
- acute œdema of, diagnosis from mumps ..	674
- cellulitis of (see Cellulitis of Neck) ..	
- glands of (see Lymphatic Glands, Cervical) ..	
- long, in phthisis ..	191
- motor ties affecting ..	160
- muscles affected early in myasthenia gravis ..	225
- in Henoch's chorea electrica ..	157
- clonic contractions of ..	161
- œdema of (see Œdema of Neck) ..	
- pain in (see Pain in Neck) ..	
- pigmentation of the skin in xeroderma pigmentosum ..	804
- rigidity of, from cervical caries ..	708
- scars in, from scrofuloderma ..	449
- seborrhœa of ..	447, 656, 657
- segmental areas of (<i>Figs. 132, 135</i>) ..	497
- short, in apoplectic cases ..	191
- in emphysema ..	192
- stiffness of, in muscular rheumatism ..	162
- in tetanus ..	162, 463, 652
- tumour in posterior triangle of, simulating brachial neuritis ..	492
- veins, diastolic collapse of, in adherent pericardium ..	104
Necrobiosis in fibroids ..	759
Necrosis, arthritis from (see Arthritis, Acute Secondary) ..	
- of bone (see Bone, Necrosis of) ..	
- of cartilage in lupus vulgaris ..	448
- extremities, recurrent in Raynaud's disease ..	284
- fat (see Fat Necrosis) ..	
- jaw (see Jaw, Necrosis of) ..	
Necrospemia, sterility due to ..	706, 707
Needles in the rectum ..	635
Needlewomen's acroparæsthesia ..	493
- cramp ..	494

Needling of autrum of Ilighmore .. 502	Nervous causes, jaundice due 371	Neuralgia, brachial, condl.
- of chest in empyema .. 186	- diarrhoea, chronic .. 197	- - skin hyperæsthesia in .. 491
- - - pyopneumothorax .. 712	- diseases, abnormalities of .. 440, 442	- - tenderness over nerves in .. 491
- - - pyo-, hemo-, and hydropneumothorax .. 712	- - micturition in .. 23	- - - posterior triangle of neck in .. 491
- - - exploratory .. 577	- - amenorrhœa in .. 23	- - tingling with nerve tenderness in .. 491
- in diagnosis of distended ilio-psoas bursa .. 734	- - of children, tea-drinking causing .. 357	- - facial from suppuration in a tooth .. 497
- - subphrenic abscess .. 720	- - constipation in .. 149	- - from tumour of trigeminal nerve .. 783
Negro cachexy .. 115	- - loss of knee-jerks in .. 398	- - varieties of .. 495
Neisser, gonococcus of (see Gonococci)	- - from round-worm infection .. 569	- - in inferior dental nerve, diagnosis of .. 502
Neoplasms (see Carcinoma, Sarcoma, etc.)	- - spasmodic contractions a minor sign in .. 159	- - intercostal, aortic aneurysm mistaken for .. 777
Nephritis (and see Bright's Disease and Granular Kidney)	- excitability in exophthalmic goitre .. 792	- - diagnosis from intercostal nerve pain from organic disease .. 478
- anuria in .. 45, 48	- - night terrors in .. 447	- - after herpes .. 478
- ascending, hyperpyrexia in .. 344	- - exhaustion, convulsions from .. 169	- - influence of breathing on .. 478
- - chronic, albuminuria in 8, 10, 11 .. 54	- - insomnia in .. 356, 358	- - mediastinal new growth mistaken for .. 777
- ascites in .. 84	- - spasmodic contraction from .. 159	- - pain in epigastrium in .. 485
- - chronic ascending .. 5, 10	- factors in acromegaly and myxœdema .. 585	- - increased on movement or breathing .. 478
- in epidemic jaundice .. 372	- - heredity in pavor nocturnus .. 357	- - in the left hypochondrium in .. 499
- febrile albuminuria and .. 17	- - instability in infants, insomnia in .. 357	- - right hypochondrium in .. 501
- in pregnancy .. 11	- - mimicry of joint affections .. 389	- - pneumonia mistaken for .. 480, 777
- rigors in .. 647	- symptoms in acute yellow atrophy of liver .. 370	- - points of maximum tenderness in .. 478
- suppurative , albuminuria from .. 646	- - cirrhosis of liver .. 410	- - spinal caries mistaken for .. 181, 777
- - bacteriuria from .. 646	- - ovarian insufficiency .. 454	- - tender points along nerve in .. 478, 485, 499
- - casts in the urine from .. 646	- system, effect on phosphorus excretion of wear and tear of .. 572	- - tenderness in the chest from .. 776
- - hæmaturia from .. 646	Nervousness due to alcohol .. 797	- - - along affected space in .. 478
- - pyrexia in .. 646	- alcoholism simulated by .. 797	- - intestinal .. 134
- - pyuria from .. 646	- in Graves' disease 253, 772, 849	- - in the lower jaw .. 501
- - simulated by appendicitis .. 646	- polyuria due to .. 581, 582	- - - diagnosis of .. 501
- - acute general peritonitis .. 646	- tachycardia from .. 772	- - mammary (see Mastodynia) metastasal .. 488
- - tenderness in loin with .. 646	- tremor due to .. 795, 797	- - minor, pain in face secondary to local disease .. 496
- - vomiting in .. 307	- with undue abdominal aortic pulsation .. 592	- - two types of pain in .. 496
Nephroma, hæmaturia in 304, .. 307	Neuralgia in astigmatism .. 498	- obturator .. 488
- origin in adrenal rests .. 307	- conditions mistaken for .. 783	- ovarian, simulating appendicitis .. 729
- slow growth of .. 307	- from dental caries 330, 502	- paræsthetica , flat-foot in .. 488
Nerve deafness and its causes .. 190	- - diagnosis of .. 501	- - increase on standing .. 488
- fibres, opaque, normal in rabbit .. 462	- diagnosis from headache .. 330	- - in obesity .. 488
- - opaque, of retina, ophthalmoscopic appearance of (Plate VII) .. 462	- earache in .. 230	- - pain along external cutaneous nerve in .. 488
- roots, affections involving eighth cervical and first dorsal, oculo-pupillary phenomena in .. 494	- from errors of refraction .. 498	- - tender spot below anterior iliac spine in .. 488
- - of brachial plexus, table of muscular distribution .. 556	- examination of urine for sugar in all cases of .. 488	- phrenic , simulated by diaphragmatic pleurisy .. 479
- spinal, inflammation near posterior root ganglion, anæsthesia in .. 494	- in heels in calcanodinia .. 488	- - hepatic disorders .. 479
- - - muscular wasting in .. 494	- pain in chest from .. 477	- - peritonitis .. 479
- - - radicular pain in .. 494	- - upper jaw in .. 502	- - splenic disorders .. 479
- supply of ascending aorta 481, 778	- paroxysmal headache in .. 326	- - spinal caries .. 479
- diaphragm .. 779	- ptyalism due to .. 591	- - pain on coughing and breathing in .. 478
- heart .. 481, 778	- tender spots in .. 330	- - supra-orbital, in iritis and cyclitis .. 256
- symptoms in functional paralysis of vocal cords .. 538	- tenderness of scalp from 781, 782	- - trigeminal (see Trigeminal Neuralgia)
- of Wrisberg, skin distribution of .. 659	- tinnitus with .. 794	Neurasthenia , absence of muscular wasting in .. 787
- trunk, severe pain associated with anæsthesia due to complete lesion of .. 475	- trismus from .. 801	- acute general pains in the limbs in .. 503
Nerves , brachial, table showing muscles innervated by .. 550	- abdominal .. 473	- aggravating menstrual pain .. 220
- of lumbar and sacral plexuses, tables showing muscles distributed to .. 542, 543	- enterospasm in .. 473	- ankle clonus in .. 787
- normal and abnormal electrical reactions in .. 633	- evil effects of morphia in .. 473	- Babinski's sign not present in .. 787
- olfactory, abnormalities of .. 669	- exclusion of spinal disease in diagnosis of .. 473	- constipation in .. 144
- - congenital absence of, anosmia from .. 669	- general abdominal pain from .. 473	- dysmenorrhœa in .. 219, 220
- sensory skin distribution of (Fig. 174) .. 659	- sex incidence of .. 473	- dyspepsia in .. 506
- thickening of, in leprosy .. 424	- anterior crural .. 488	- effect on phosphorus excretion .. 572
- - von Recklinghausen's disease .. 804	- brachial , absence of atrophy or anæsthesia in .. 492	- eructatio nervosa in .. 267
(and see the various nerves by name)	- in alcoholism .. 492	
	- always unilateral .. 492	
	- from cervical rib .. 492	
	- constant aching pain with exacerbations in .. 491	
	- in diabetes .. 492	
	- diagnosis of .. 492	
	- from muscular rheumatism .. 492	
	- flushing and hyperidrosis in .. 491	
	- in gouty diathesis .. 491	
	- influenza .. 492	
	- malaria .. 492	
	- pain in the arm in .. 491	
	- in rheumatic diathesis .. 491	

Neurasthenia, contd.

- headache in ..	506, 788
- hyperæsthetic spots with ..	667
- and hysteria, difficulty of distinguishing ..	788
- ill-effect of worry on ..	788
- imaginary sexual disorders in ..	506
- impotence in ..	347
- increase in deep reflexes in ..	506
- - knee-jerks in ..	397, 787
- influence on dysmenorrhœa ..	219
- of law suit in ..	788
- insomnia in ..	356, 358
- intention tremor in ..	800
- irritability in ..	360, 788
- loss of strength in ..	506
- overwork, worry, and debility as causes of ..	506
- oxaluria with ..	471
- pains in arms in (and see also Pains in Various Organs) ..	494
- - back in ..	494
- - head in ..	494
- - limbs in ..	506
- and tenderness in head from ..	782
- - scalp from ..	784
- palpitation in ..	506, 525, 527
- polyuria in ..	581, 582
- pseudo-neuralgia in ..	498
- psychalgia in ..	494
- from pyorrhœa alveolaris ..	87
- ready fatigability in ..	788
- rigidity of the spine in ..	788
- sex incidence of ..	506
- simulated by phthisis ..	347
- - malingering ..	787
- - organic disease ..	788
- - nerve lesions ..	347
- sphincters unaffected in ..	787
- subjective sensations in ..	506
- subnormal temperature in ..	506
- tenderness of the scalp from ..	781
- - spine in ..	784, 788
- traumatic, account of ..	787
- tremor in ..	795
Neuritis, dyspareunia from ..	222
- early stages of paralysis agitans mistaken for ..	548
- examination of urine for sugar in all cases of ..	488
- pain in the arm from ..	545
- sciatica due to ..	487
- tenderness in the spine in ..	785
- tremor in ..	77
- brachial, almost always bilateral ..	492
- - diagnosis from cervical pachymeningitis ..	492
- - - rib ..	492
- - - spinal disease ..	492
- - - glands in axilla ..	492
- - - spinal gliosis ..	492
- - - tumour ..	492
- - from subclavian aneurysm ..	492
- - - tumour in posterior triangle of neck ..	492
- - generally part of a multiple peripheral neuritis ..	492
- - neuromata of brachial plexus as cause of ..	492
- - pain and tenderness in arms in ..	492
- - intercostal, sites of maximum tenderness in ..	777
- - tenderness in chest from ..	776
- multiple peripheral, acute pains in limbs in ..	503
- - - alcoholic ..	66, 285, 492, 505, 549, 550, 551, 599
- - - Korsakow's psychosis ..	505

Neuritis, multiple peripheral, contd.

- - - alcoholic, loss of memory for recent events in ..	505
- - - - lying without wish to deceive in ..	506
- - - anæsthesia in ..	66, 488, 492, 551
- - - anosmia in ..	669
- - - arsenical ..	38, 87, 285, 492, 506, 551, 575
- - - - paralysis early in ..	506
- - - atrophy and paresis in ..	285
- - - bilateral facial palsy in ..	687
- - - causes of ..	72
- - - causing ataxy ..	66
- - - chronic ..	507
- - - pains in limbs in ..	503
- - - contractures in ..	163, 165, 390
- - - cramps in ..	179, 505
- - - dead fingers in ..	505
- - - deep reflexes increased at first in ..	505
- - - in diabetes ..	69, 282, 492, 507
- - - diagnosis of ..	506
- - - from acute poliomyelitis ..	559
- - - locomotor ataxy ..	562
- - - myopathy ..	70
- - - primary muscular dystrophy ..	560
- - diphtheritic ..	66, 77, 224, 506, 559, 640
- - - affecting heart ..	640
- - - eye symptoms in ..	77
- - - regurgitation of food through the nose in ..	559, 640
- - - dysphagia due to ..	224
- - - electrical reactions in ..	66, 69
- - - extensors more affected than flexors in ..	550
- - - gait in ..	66
- - - gangrene in ..	282, 285
- - - in gouty subjects ..	507
- - - glove and stocking anæsthesia in (Fig. 175) ..	660
- - - glycosuria with ..	507, 551
- - - hyperæsthesia in ..	505, 506, 666
- - - hyperalgesia with cutaneous anæsthesia ..	660, 661
- - - inco-ordination in ..	506
- - - infantile paralysis from ..	559
- - - influenzal ..	506, 507
- - - from lead ..	38, 77, 492, 506
- - - leprosy ..	551
- - - loss of ankle-jerk in ..	488
- - - deep reflexes in ..	398, 505, 559, 562
- - - - knee-jerks in ..	488
- - - mercurial ..	37, 77, 551
- - - motor weakness in ..	505, 562
- - - muscular atrophy in ..	75, 390, 488, 492, 506, 559, 562, 849
- - - numbness and tingling in the extremities in ..	505
- - - cedema of legs in ..	459
- - - olfactory nerves affected in ..	669
- - - pain in ..	505, 551, 559
- - - legs in ..	488
- - - limbs in ..	66
- - - on movement in ..	661
- - - worse at night in ..	489
- - - paraplegia due to ..	557, 561, 562
- - - perforating ulcer of foot in ..	809
- - - pins and needles in ..	505
- - - plantar reflexes in ..	66, 81
- - - purpura in ..	596, 599
- - - reaction of degeneration in ..	69, 488, 506, 559, 562
- - - reflexes in ..	398, 505, 559, 562
- - - scoliosis in ..	180, 181
- - - sensory changes in ..	505, 551, 559, 660, 661, 666, 669

Neuritis, multiple peripheral, contd.

- - - simulated by growths of pelvis or cauda equina ..	562
- - - - muscular atrophy ..	69
- - - slight degrees of ..	508
- - - some varieties of ..	507
- - - sphincters seldom involved in ..	505
- - - spread of pain to trunk in ..	505
- - - symptoms and signs of ..	75
- - - in syphilis ..	506, 507
- - - talipes from ..	131
- - - tenderness of limbs in ..	505
- - - muscles in ..	489, 506, 551
- - - nerve trunks in ..	489
- - - tendon reflexes in ..	66
- - - tremor in ..	285
- - - in tuberculosis ..	506
- - - olfactory, from ammonia ..	669
- - - anosmia from ..	669
- - - part of peripheral neuritis ..	669
- - - from snuff ..	669
- - - optic (see Optic Neuritis) ..	390, 489, 503
- peripheral ..	390, 489, 503
- of pudic nerve, dyspareunia from ..	221
- retrobulbar (see Retrobulbar Neuritis) ..	221
Neurocardiac disease, shortness of breath in ..	101
Neurofibromata, absence of tenderness in ..	478
- distribution of ..	804
- multiple benign false neuromata on the nerves ..	478
- pain in the chest from ..	477
- simulating rheumatic nodules ..	804
- subcutaneous in von Recklinghausen's disease ..	781
Neuroma, brachial neuritis from ..	492
- single, false, pain over affected nerve in ..	478
- - tenderness to pressure of ..	478
- of vulva ..	768
Neuromata, multiple, false (see Neurofibromata) ..	389
Neuromimic ..	389
Neuromyositis, general pains in the limbs in ..	503, 504
- loss of reflexes in ..	504
- sensation in ..	504
- pain in limbs on movement in ..	504
- tenderness in limbs in ..	504
- vasomotor phenomena in extremities in ..	504
Neuropathic muscular atrophies (and see Atrophy, Muscular)	
- - - claw-hand from ..	159
- - - fibrillary contractions in ..	158
- - - following acute poliomyelitis ..	158
- - - gradual onset of ..	159
- - - sensation normal in ..	159
- - - simulating rickets ..	158
- - - sphincters normal in ..	159
Neuro-retinitis (see Retinitis and Optic Neuritis) ..	
Neurosis (and see Hysteria; and Neurasthenia)	
- abdominal distention in ..	465
- angina pectoris type of ..	482
- belching variety of ..	267
- bladder varieties of ..	443
- cheilitis exfoliativa in ..	403
- coloured sweat due to ..	714
- disseminated sclerosis simulating ..	565
- distinction from hysteria ..	527
- exaggerated knee-jerk in ..	44
- hiccough in ..	342
- lachrymal ..	203
- leading to amputation ..	457

- Neurosis, contd.*
 - occupation (see Occupation Neuroses)
 - oedema of leg from .. 457
 - oesophagismus type .. 484
 - pruritus a symptom of .. 588
 - ptyalorrhoea as a .. 592
 - pyrexia due to .. 609, 618
 - spastic constipation and .. 145
 - tremor in .. 795
 - vasomotor .. 634
 - albuminuria in .. 16
 Neurotrophic causes of testicular atrophy .. 79
 Neutrophile corpuscles .. 28
 - myelocytes, characteristics of (*Plate II*) .. 29
New-born, breast changes in .. 743
 - epithelial affections in .. 752
 - haemoglobinuria in .. 315
 - millary abscesses of .. 601
 - milk secretion in .. 743
 - pemphigus of .. 446
 - uterine haemorrhage in .. 435, 436
New growths (see Abdomen; Lung; Mediastinum; Pelvis; Pleura; Spine; etc.; Carcinoma, Sarcoma, etc.)
 New Zealand, hydatid cysts in .. 323
 Nicotine, tremor from .. 797
 Night blindness in keratomalacia .. 807
 - nyctalopia .. 841
 - in retinitis pigmentosa .. 838
 - startings in hip disease .. 357
 - in tuberculous disease of joints .. 385
 - sweating of phthisis .. 319, 577, 714
 - Barlow's disease .. 714
 - infantile scurvy .. 714
 - in rickets .. 714
 - terrors .. 357
 - in children .. 357, 447
NIGHTMARES .. 447
Nipple, affected by scabies .. 832
 - blood discharge from .. 202, 745
 - cracked .. 743
 - discharge from .. 201
 - normal discharge from .. 201
 - Paget's disease of .. 802
 - purulent discharge from .. 202, 743
 - retraction of, in carcinoma of breast .. 745
 - normal in some cases .. 745
 - in Paget's disease .. 802, 803
Nitric acid causing bullæ .. 110, 112
 - test for albumosuria .. 6, 20
 - albuminuria, significance of brown ring with .. 348
 - bile pigment .. 819
 - indian .. 821
 - used by malingers .. 112
 Nitrogen in urine in phosphorus poisoning .. 373
 Nitroprusside test for acetoneuria .. 4
 - for melanuria .. 821
 Nits in hair, enlargement of occipital glands with .. 419
Nocturnal emission, albuminuria from .. 19
 - and oxaluria .. 472
 - enuresis .. 247
 - in children, from oxaluria .. 471
 - pain in gout .. 382
 - tuberculous disease of joints .. 357, 385
 Node on bones from injury .. 750
 - in secondary syphilis .. 752
 - typhoid fever .. 752
 Nodes, Heberden's (*Fig.* 109) .. 380, 452
- NODULES** .. 448
 - "craggy" in tuberculosis of testis .. 519
 - developing from papular syphilide .. 532
 - differentiation of papules from .. 528
 - leprous, simulating erythema nodosum .. 450
 - subcutaneous .. 448
 - in acute rheumatism .. 121, 375, 804
 - simulated by neurofibromata .. 804
 - due to colloid milium .. 805
 - from epithelioma .. 803
 - in erythema keratodes .. 451
 - multiforme .. 531
 - firm rounded, on elbows and knees, in jaundice .. 360
 - in gonorrhoeal arthritis .. 375
 - from iodides or bromides .. 112
 - in leprosy .. 75
 - lupus erythematosus .. 449
 - vulgaris .. 448, 808
 - multiple, eosinophilia with .. 452
 - neurofibromata .. 804
 - osteo-arthritis .. 375
 - von Recklinghausen's disease .. 804
 - with varicose veins .. 450
 - in syphilis vulgaris .. 602
 - of tubercular leprosy (*Fig.* 124) .. 450
 - xanthoma planum .. 805
 Noises in the ears (see Tinnitus)
 - headache .. 329
 - in head from cerebral aneurysm .. 328
 - tinnitus increased by .. 793
 Noma .. 282
 - bleeding gums in .. 86, 88
 Normoblasts .. 28
Nose, abnormal breadth in .. 255

Obstruction)		teeth in cases of	- of larynx	673
- of nose (see Nose, Obstruc-		- innocent nature of	- acute, causes of	466, 709
tion of)		- trismus simulated by	- - - stridor from	709
- œsophageal (see Œsophagus,		- x-rays in diagnosis of ..	- in Bright's disease 185,	466
Obstruction of)		Œdema of abdominal wall	- orthopnea in	465
- portal vein (see Portal Vein,		from ascites	- from potassium iodide 185,	465
Obstruction of)		- - - with redness, in tuber-	- suffocative	673
- pyloric (see Pylorus, Ob-		culous peritonitis ..	- of	466
struction of)		- in acute nephritis 311, 458,	- of legs in ankylostomiasis	570
- of the trachea (see Trachea,		746	- with anæmia from hæmor-	
Obstruction of)		- polymyositis	rhage	461
- ureter (see Ureter, Obstruc-		- angioneurotic (see Angio-	- in aortic disease ..	233
tion of)		neurotic Œdema)	- with ascites	51
Obturator externus, nerve		- of ankles in cirrhosis of liver	- and back in inferior vena	
supply of	542	- in anthrax	cava obstruction	61
		- apparent, of myxœdema ..	- causes of	459, 461
		43		
		- of arms from superior vena		
		cava obstruction		
		826		

Edema of legs, contd.

-- from chronic bronchitis ..	246
-- and emphysema ..	61
-- in heart failure ..	461
-- hereditary trophœdema ..	764
-- mitral stenosis ..	333
-- myocardial degeneration ..	300
-- portal obstruction ..	106
-- tricuspid regurgitation ..	402
-- linee albicantes in ..	
-- local and transient, in ..	
angioneurotic œdema ..	746
-- of loin in perinephric abscess ..	302
-- in mastoid region in cavernous sinus thrombosis ..	254
-- from lateral sinus thrombosis ..	651
-- of meatus urinarius ..	209
-- of neck (Fig. 72) ..	234
-- acute, diagnosis from ..	
mumps ..	674
-- and arms from mediastinal growth ..	296
-- and head from superior vena cava obstruction ..	826
-- various causes of ..	458
-- of the orbit from thrombosis of cavernous sinus ..	651
-- of palms in erythema keratodes ..	451
-- penis in acute nephritis ..	458
-- pitting on pressure in ..	456
-- absent on pressure ..	456
-- with pleural effusion ..	121
-- -- in Bright's disease ..	122
-- polyuria in clearing up ..	582
-- of prepuce in balanitis ..	674
-- relation to angioneurosis in Milroy's disease ..	460
-- from renal tumour ..	9
-- retinal, in optic neuritis ..	462
-- of scalp in acute nephritis ..	458
-- from thrombosis of the superior longitudinal sinus ..	651
-- of scrotum in acute nephritis ..	458
-- skin of breast in mastitis ..	743
-- soles in erythema keratodes ..	451
-- suffocative, simulated by laryngeal paralysis ..	539

EDEMA, SYMMETRICAL

-- of umbilicus in tuberculous peritonitis ..	57
-- universal ..	457
-- causes of ..	460
-- of vulva, causes of ..	768, 770

Œsophagismus, general account

Œsophago-bronchial fistula, ..	288
gangrene of lung in ..	297

Œsophagoscope

Œsophagus, affections of, ..	841
causing food regurgitation ..	591
-- causing ptialism ..	591
branches of vagus of, relation to cough ..	175
-- carcinoma of (see Carcinoma of Œsophagus) ..	673
-- cicatricial stricture, dysphagia in ..	484
-- -- progressive emaciation in ..	484
-- diseases of, pain in chest evoked by swallowing ..	484
-- epithelioma of (see Carcinoma of Œsophagus) ..	225
-- foreign bodies in (see Foreign Bodies in Œsophagus) ..	841
-- idiopathic hypertrophy of ..	225
-- dilatation of ..	225, 841
-- lesions of, causing subcutaneous emphysema ..	231
-- obstruction by abnormal subclavian artery ..	223

Œsophagus, obstruction of, contd.

-- acetoneuria in ..	4
-- anemia in ..	37
-- aneurysm ..	222, 474, 482, 841
-- constipation due to ..	144
-- diagnosis from œsophagismus ..	484
-- -- diverticula ..	841
-- -- fibrous stricture ..	222, 841
-- -- by gastric growth ..	223
-- -- malignant disease ..	483, 841
-- -- pain in the chest in ..	478
-- -- pressure pouches ..	841
-- -- spasm ..	225, 484, 841
-- -- thyroid gland tumour ..	792
-- pain in, causing dysphagia ..	225
-- pemphigus, etc., of ..	114
-- pouch of, dysphagia from ..	224
-- rupture of aneurysm into ..	140, 482
-- sensory area corresponding to ..	222
-- small-pox eruption in ..	673
-- spasm of ..	225
-- spasmodic stricture of (see Œsophagismus) ..	222
-- stenosis of, from a bone ..	776, 779
-- tenderness in the chest from affections of ..	465
-- tumour of, tracheal obstruction from ..	294, 296
-- varix of, hæmatemesis from ..	88, 705
rupture of ..	705
Oidium albicans in sputum ..	705
-- tropicale in Ceylon ..	705
-- phthisis simulated by ..	705
lesions due to ..	143
Old age, constipation in ..	252
-- epistaxis in ..	452
-- Heberden's nodes in ..	358
-- insomnia in ..	183
-- kyphosis in ..	849
-- loss of weight due to ..	461
-- œdema of legs in ..	459
-- -- vasomotor disease in ..	585, 586
-- priapism in ..	849
-- simulation of malignant disease by loss of weight in ..	706
-- sterility due to ..	256
-- subconjunctival hæmorrhage in ..	810
-- ulceration of the leg from ..	669
Olfactory neuritis ..	26
Oligæmia ..	26
Oligochromæmia (see Anæmia) ..	26
Oligocythæmia ..	706, 707
Oligospermia ..	12
Oliguria in acute nephritis ..	15
-- in heart failure ..	799
Oligo-ponto cerebellar atrophy, ataxy and tremor in ..	724
Omentum, abscess of ..	724
-- cysts of ..	757
-- pelvic swelling due to ..	757
-- fat necrosis in, in acute pancreatitis ..	153, 431, 646, 846
-- hernia of (see Hernia, Omental) ..	720
-- hydatid disease of ..	56
-- infiltration of, in tuberculous peritonitis ..	722
-- normal situation of ..	722
-- tumour of, in chronic peritonitis ..	472, 691, 724
-- -- diagnosis from renal tumour ..	394
-- -- jaundice in ..	362, 367
-- -- palpable in umbilical region ..	728
-- -- pelvic swelling due to ..	757
-- -- physical signs of ..	406
-- -- simulating enlarged liver ..	367, 406
-- -- spleen ..	729
-- -- movable kidney ..	727
-- -- tuberculous ..	367

Onions, foul breath from ..	98
Onychia, causes of ..	445
-- and tuberculous changes in eyelid associated ..	445
Onychogryphosis, association with ichthyosis ..	445
Onychomycosis ..	445
-- in favus ..	275
Onychorrhexis ..	445
Oozing after operations in jaundice ..	598
Operation, abdominal (see Laparotomy) ..	
-- anal, coli bacilluria after ..	83
-- anuria following ..	45, 49
-- in diagnosis of actinomyces ..	736
-- -- new growth of epididymis ..	767
-- -- -- of testis ..	766
-- -- torsio testis ..	521
-- gangrene of lung after ..	288
-- genital, coli bacilluria after ..	83
-- hypothermia after ..	346
-- importance of early, in pneumococcal arthritis ..	375
-- infarct of lung after ..	322
-- injury causing extroversion of bladder ..	587
-- neurasthenia after ..	787
-- œdema after ..	456
-- pseudo-elephantiasis from ..	456
-- pyæmia from ..	372, 649
-- rectal, coli bacilluria after ..	83
-- retention of urine after ..	49, 441
-- surgical emphysema after ..	231
-- tetany after ..	802
-- on tonsils, cure of enuresis by ..	248
-- urinary fistula after ..	442
Ophthalmia, gonorrhœal ..	376
-- neonatorum ..	255
-- -- amblyopia from ..	836
-- -- corneal opacity from ..	836, 839
-- -- gonococcal arthritis from ..	376
-- -- nystagmus from ..	453, 836, 839
-- -- perforation of cornea from ..	836
-- -- polar cataract from ..	836
-- -- total blindness from ..	839
Ophthalmic nerve, herpes of ..	781
Ophthalmoplegia (and see Strabismus; and Pupils) in ..	
bulbar paralysis ..	159
in plumbism ..	38
OPHTHALMOSCOPIC APPEARANCES, notes on (Plates VII, VIII) ..	461
OPISTHOTONOS ..	463
-- in hysteria ..	162
-- meningitis ..	642
-- strychnine poisoning ..	652
-- tetanus ..	162, 652, 802
Opium, headache from ..	328
-- constipation relieved by ..	144
-- poisoning, bilateral loss of movement in ..	345
-- -- Cheyne-Stokes respiration in ..	125
-- -- coma from ..	137, 344, 345
-- -- diazo-reaction in ..	198
-- -- hypothermia in ..	138, 344
-- -- pinpoint pupils in ..	138, 345
-- -- pontine hæmorrhage simulating ..	345
Oppler-Boas bacillus in gastric contents in gastric carcinoma ..	351, 353, 355, 845, 846
Opponens minimi digiti, nerve supply of ..	550
-- pollicis, nerve supply of ..	550
Opsonic index in diagnosis of ..	
gonorrhœal arthritis ..	376
-- -- tuberculous cæcum ..	736
-- -- testis ..	519
Optic atrophy from atoxia ..	836
-- from cerebellar tumour ..	643
-- colour-blindness from ..	840

Optic atrophy, contd.

-- total blindness from ..	839
-- in congenital cerebral diplegia ..	800
-- dilatation of sphenoidal sinus ..	255
-- disseminated choroido-retinitis ..	838
-- sclerosis 174, 547, 565, 838 ..	838
-- Friedreich's ataxy 71, 560 ..	838
-- glaucoma ..	838
-- hereditary ..	837, 838
-- with idiocy ..	557
-- from lead ..	836
-- in Little's disease ..	154
-- peripheral constriction of field of vision in ..	838
-- primary, ophthalmoscopic appearance of (<i>Plate VIII</i>) ..	462
-- from quinine ..	836
-- chiasma, lesion in causing total blindness ..	839
-- -- hemianopsia ..	335
Optic disc, ophthalmological appearances of (<i>Plates VII, VIII</i>) ..	461
-- coloboma of ..	462
-- in disseminated sclerosis ..	800, 838
-- glaucomatous cupping of (<i>Plate VIII</i> , p. 463) 257, 838 ..	836
-- in tobacco amblyopia ..	836
-- nerve, compression of, by dilatation of nasal sinuses ..	840
-- lesions, sudden blindness from ..	839
-- new growths of, increasing hypermetropia with ..	255
-- -- unilateral exophthalmos in ..	255
-- and tracts, connections of, illustrated (<i>Fig. 101</i>) ..	334
neuritis (<i>Plate VIII, Fig. K</i>, p. 463) 139, 598, 840 ..	582
-- absence in migraine ..	139
-- in acute encephalitis ..	836
-- from atoxyl ..	565
-- cerebellar abscess ..	565, 643
-- tumour ..	98
-- cerebral hamorrhage ..	98
-- tumour (<i>Plate VII, Fig. K</i> , p. 461) 98, 173, 292, 341, 350, 547, 686, 782 ..	125
-- with Cheyne-Stokes respiration ..	172
-- in cases of convulsions ..	292
-- diabetes ..	463
-- diagnosis of hypertrophic astigmatism from ..	255
-- in dilatation of sphenoidal sinus ..	255
-- fungating endocarditis 10, 76, 314, 598, 613 ..	686
-- from increased intracranial pressure ..	651
-- lateral sinus thrombosis ..	328, 585
-- lesions of central nervous system ..	642
-- meningitis 139, 341, 464, 563, 642 ..	230
-- otitis media ..	38, 139, 836
-- from plumbism ..	836
-- quinine ..	462
-- recent, ophthalmoscopic appearances of (<i>Plate VII</i>) ..	462
-- retinal oedema in ..	840
-- from retrobulbar neuritis ..	462
-- simulating albuminuric retinitis ..	461
-- in spinal meningitis ..	139
-- superior longitudinal sinus thrombosis ..	462
-- swelling of disc in ..	462

Optic neuritis, contd.

-- in tuberculous meningitis ..	612, 699
-- uncommon in disseminated sclerosis ..	565
-- radiations, lesion in causing hemianopsia ..	331
-- thalamus, hyperpyrexia ..	344
-- -- lesion of, causing dissociative anaesthesia ..	666
-- -- intention tremor ..	800
-- tract lesions, hemianopsia from ..	334, 595
-- -- pupil reflexes in ..	594, 595
-- -- rarity of blindness from ..	839
Oral sepsis, anaemia in ..	36
-- in etiology of dyspepsia ..	354
-- gastritis from ..	352
-- septicæmia from ..	650
Oranges, sore fingers from ..	266
Orators, pharyngitis in ..	673
Orbicularis palpebræ, epiphora from paralysis of ..	250
-- hysterical spasm of ..	166
-- watchmaker's cramp of ..	177
-- weakness in myopathy ..	260
Orbit, cellulitis of, cavernous sinus thrombosis due to 253, 254 ..	327
-- disease of, headache in ..	200
-- growth in, diplopia from ..	254
-- -- unilateral exophthalmos ..	754
-- ivory exostosis of ..	651
-- oedema of, from thrombosis of cavernous sinus ..	250
-- periorbitis of, unilateral exophthalmos due to ..	642
-- suppuration in, meningitis from ..	250
-- tumour of, epiphora from ..	764
-- pulsatile, due to arteriovenous aneurysm ..	764
-- due to osteosarcoma ..	254, 255
-- unilateral exophthalmos due to ..	254, 255
Orchitis, acute, association with epididymitis (and see Epididymitis; and Epididymo-orchitis) ..	765
-- due to mumps ..	765
-- post-typhoidal ..	765
-- scrotal swelling due to ..	765
-- due to urethritis ..	765
-- atrophy of testis after 79, 451, 519 ..	79
-- causes of ..	520
-- chronic, diagnosis from syphilitic orchitis ..	520
-- history of injury in ..	520
-- tuberculous (see Testis, Tuberculous) ..	520
-- diagnosis from sarcoma ..	520
-- due to gonococci ..	520
-- liability of undescended testis to recurrent ..	523
-- in Malta fever ..	507
-- scrotal sores due to ..	679
-- syphilitic, absence of pain on pressure in ..	520
-- thickening of cord in ..	519
-- aching in inguinal or lumbar region in ..	519
-- atrophy of testicle after ..	519
-- congenital ..	519
-- diagnosis from chronic orchitis ..	520
-- -- neoplasm ..	520
-- diffuse interstitial ..	519
-- enlargement of testis in ..	519, 520
-- gummatous ..	680
-- epididymis unaffected in ..	519
-- nodules on testis in ..	519
-- hydrocele with ..	519
-- prostate and vesiculae seminales unaffected in ..	520

Orchitis, syphilitic, contd.

-- sense of weight in the scrotum in ..	519
-- tendency to involvement of both testes in ..	520
Orcin in Bial's test ..	290
Organ of Corti, nerve deafness from changes in ..	190
Orientation, physiology of 199, 200 ..	464
ORTHOPNEA ..	320
-- acute, from pulmonary embolism ..	14
-- in chronic nephritis ..	226
-- dyspnoea with ..	358, 764
-- and lung diseases 180, 359 ..	465
-- laryngeal or tracheal obstruction, diagnosis of ..	359
-- mechanics of ..	764
-- in mitral stenosis ..	121, 122
-- with pleuritic effusion ..	186
-- in severe bronchitis and emphysema ..	792
-- from thyroid gland tumour ..	19
Orthostatic albuminuria ..	162
Orthotonus in tetanus ..	115
Osazone crystals in Camidge's test ..	290
-- in urine testing ..	291
-- varieties ..	126
Osmic acid test for chyluria ..	470
Ossicles, caries of ..	227
Ossification, excessive foetal, dystocia due to ..	214
-- premature in infantilism ..	214
-- in progeria ..	754, 763
-- of tendon simulating exostosis ..	376
Osteitis, chronic, of head and neck of femur after typhoid fever ..	763
-- of lower end of femur, diagnosis from endosteal sarcoma ..	753
-- deformans (<i>Figs. 47, 48</i> , p. 182) 753 ..	753
-- bending of bones in ..	753
-- death from multiple sarcomata of bones in ..	753
-- diagnosis from syphilitic osteitis ..	753
-- dyspnoea in ..	182
-- illustrated ..	183
-- increased size of head in ..	183
-- kyphosis in ..	753
-- lengthening of bones in ..	753
-- neuralgic pains in ..	753
-- senile nature of ..	753
-- thickening of bones in ..	782
-- syphilitic ..	753
-- diagnosis from osteitis deformans ..	378
-- tuberculous, secondary arthritis from ..	39
Osteo-arthritis ..	384
-- afebrile course of ..	384
-- affection of spine in ..	384
-- of ankle ..	384
-- bony outgrowths in ..	383, 384
-- confusion with syphilitic pains ..	386
-- crepitus in ..	179
-- destruction of cartilage in ..	384
-- diagnosis from other forms of arthritis ..	385
-- gout ..	383
-- rheumatoid arthritis 379, 384 ..	384
-- sciatica ..	214
-- dwarfism from ..	384
-- eburnation of bone in ..	384
-- of elbow ..	384
-- enlargement of joint in ..	384
-- erosion of cartilage in ..	384
-- fixation of joint in ..	384
-- flail joint from ..	384

Osteo-arthritis, contd.

- grating of joint in ..	384
- Heberden's nodes in ..	384
- hip frequently affected in ..	384
- of knee ..	384
- localized tenderness in ..	384
- pain in ..	384
- semimembranosus bursa ..	
frequently distended in ..	762
- sensation, on palpation, ..	
of wet sand in a bag ..	384
- stiffness in ..	384
- and kyphosis ..	183, 214
- locking of joint in ..	384
- loose body in joint in ..	389
- monarticular type ..	384
- muscular atrophy slight in ..	384
- nipping of synovial fringes in ..	389
- outgrowth of, simulated by ..	
dorsal "pads" on fingers ..	385
(Figs. 114, 115) ..	384
- preference for large joints ..	384
- primary affection of cartilage and bones in ..	384
- similarity to arthritis in ..	
syringomyelia ..	388
- tabetic arthritis ..	388
- in small joints ..	384
- spondylitis deformans with ..	787
- subcutaneous nodules in ..	375
- swelling of bones in ..	754
- in femoral region from ..	734
- temporo-mandibular ..	230, 384
- simulating trismus ..	801
- thickening of synovial membrane in ..	384
- ulnar deviation in (Fig. 108) ..	380, 385
- of wrist ..	384
Osteo-arthropathy, bony swelling in ..	754
- enlarged fingers in ..	128
- hypertrophic pulmonary ..	390
- - - apparent enlargement of joints in ..	390
- - - in bronchiectasis ..	390
- - - chronic emphysema ..	390
- - - clubbing of fingers with ..	390
- - - confusion with acromegaly ..	391
- - - enlarged bones in (Fig. 118) ..	390
- - - fingers in ..	128
- - - erosion of cartilage in ..	390
- - - in fibrosis of lung ..	390
- - - greater frequency in upper extremity ..	390
- - - with subclavian aneurysm ..	391
- - - thickening of synovial membrane in ..	390
Osteochondritis, syphilitic ..	386
Osteogenesis imperfecta, brittle bones in ..	213
- - - dwarfism due to (Fig. 65) ..	212
- - - leading to osteomalacia ..	213
- - - softening of bones in ..	213, 214
Osteoma (Fig. 194) ..	754
- exophthalmos due to ..	255
- of jaw ..	748
- pelvic, dystocia due to ..	227
Osteomalacia described ..	213
- dwarfism in ..	212, 213
- eosinophilia in ..	248
- following osteogenesis imperfecta ..	213
- kyphosis or scoliosis from ..	214
- muscular weakness in ..	213
Osteomyelitis, albumosuria in ..	20
- eosinophilia in ..	248
- fungating endocarditis from ..	314
- of ilium ..	737
- rigors in ..	648, 649
- acute ..	750
- arthritis from (see Arthritis, Acute Secondary)	

Osteomyelitis, acute, contd.

- - diagnosis from erythema nodosum ..	751
- - necrosis of bone in ..	751
- chronic, diagnosis from en-	751
dosteal sarcoma ..	757
- - long duration of ..	751
- - swelling on a bone from ..	751
- gummatous ..	752
- suppurative, anaemia in ..	39
Osteospathyrosis, dwarfism ..	213
- from ..	179
Osteosarcoma, crepitus in ..	179
- egg-shell cracking in ..	177, 763
- of orbit, pulsatile ..	764
- pulsation in ..	177, 179, 763, 764
Osteoscopic pains, pains worst ..	503
- on getting warm in bed ..	503
- in secondary syphilis ..	503
Os uteri stenosed, a cause of ..	219
- dysmenorrhœa ..	219
- - pin-hole ..	219
Otalgia (see Earache)	
Otitis, acute hæmorrhagic, ..	468
- with hæmophilia ..	468
- - influenza ..	468
- - pain in ..	468
- - petechiæ on tympanic membrane in ..	468
- media, acute, paroxysmal ..	469
- pain with pyrexia preceding discharge in ..	469
- - adenoids causing ..	230
- - and albuminuria ..	13
- - broncho-pneumonia in ..	321, 578
- - bubbling noises in ear ..	793
- - due to ..	644
- - cerebellar abscess from ..	793
- - cerebral abscess from ..	98, 173, 341
- - cervical glands enlarged ..	420
- - characters of discharge in ..	469
- - chronic, characters of ..	468, 469
- - discharge in ..	98
- - complications of ..	229
- - convulsions from ..	190, 470
- - deafness in ..	229
- - delirium in ..	229
- - diagnosis of cerebrospinal ..	
fluid from a serous discharge from ..	468
- - meningitis from ..	229
- - eczema of ext. auditory meatus in ..	468
- - emphysema from ..	123
- - in enteric fever ..	648
- - external ear swollen and inflamed in ..	469
- - gangrene of lung from ..	287
- - headache in ..	327
- - hyperæsthesia acustica in ..	190
- - lateral sinus thrombosis ..	186, 578
- - membrane hyperæmic and swollen in ..	469
- - meningitis from ..	642
- - optic neuritis in ..	230
- - pain in the ear in ..	229, 470
- - paralysis of chorda tympani from ..	775
- - perforation of tympanic membrane in ..	469
- - pneumococcal ..	375
- - polyp in ear from ..	468
- - pulmonary embolism from ..	123, 186, 578
- - pyrexia in ..	229
- - referred pain in vertical ..	498
- - and temporal areas in ..	674
- - in scarlet fever ..	614
- - septicæmia from ..	230, 498
- - suppurative ..	229
- - tenderness over mastoid in ..	781, 783
- - of scalp in ..	

Otitis media, contd.

- - thrombosis of cranial sinus from ..	650
- - lateral sinus or jugular vein in ..	123
- - tinnitus in ..	470
- - tuberculous, absence of ..	469
- - pain and pyrexia in ..	469
- - - deafness and tinnitus in ..	469
- - - perforation of tympanic membrane anteriorly in ..	469
- - - rapid bone destruction ..	469
- - unilateral headache in ..	326
- - vertigo due to ..	470, 828
- - vomiting from ..	229, 814
- Otorrhagia ..	468
OTORRHOEA ..	467
- in caries of ext. auditory meatus ..	469
- cerebellar abscess ..	565
- from condylomata of meatus ..	469
- diphtheria ..	469, 602
- examination of ear in ..	470
- from suppurating sebaceous cyst of meatus ..	469
- tenderness of ear in ..	469
Otosclerosis, deafness in ..	829
- fixation of stapes in ..	190
- middle-ear deafness in ..	190
- tinnitus due to ..	793, 829
- vertigo due to ..	829
Otoscopy in cases of otorrhœa ..	470
Ova of ankylostomum duodenale in faeces ..	94
- bilharzia, illustration ..	93
- - in urine ..	313
- distoma hepaticum ..	364
- - pulmonale in sputum ..	325
- intestinal parasites, examination of faeces for (Figs. 152-154, p. 569) ..	94, 569, 570
- paragonimus Westermanni in sputum ..	705
Ovarian abscess ..	621
Ovaritis, undue abdominal ..	592
- aortic pulsation suggesting ..	592
- diagnosis from recurrent ..	729, 737
- appendicitis ..	737
- dysmenorrhœa due to ..	737
- ovaries enlarged and irregular from ..	220
Ovary, absence of activity of ..	707
- - sterility due to ..	706
- - atrophy of ..	24
- - carcinoma of (see Carcinoma) ..	
- cyst of, albuminuria from ..	17
- - ascites in ..	58
- - dipping in through fluid ..	759
- - in diagnosis of ..	473
- - bearing-down pain from ..	52
- - characters of fluid from ..	52, 717, 759, 761
- - diagnosis from ascites ..	730
- - - distended bladder ..	429
- - - fibromyoma of uterus ..	761
- - - hydatid cyst ..	758
- - - pancreatic cyst ..	433
- - - phantom tumour ..	392, 393
- - - renal tumour ..	761
- - - retroperitoneal lipoma ..	760
- - - from unruptured ectopic gestation ..	730, 761
- - - urachal cyst ..	219
- - - dysmenorrhœa with ..	638
- - - felt per rectum ..	438
- - - frequent micturition from ..	711
- - - gas in ..	438
- - - impacted, frequent micturition with ..	367
- - - jaundice in ..	400
- - - leucocytosis with suppuration ..	392
- - - median position of ..	

Ovary, cyst of, contd.

-- nephritis from ..	8
-- obstructing labour ..	228
-- inferior vena cava ..	825
-- obvious pelvic origin of ..	392
-- palpitation from ..	526, 528
-- pelvic swelling due to ..	757
-- physical signs of ..	52, 717, 759
-- pneumaturia caused by ..	576
-- spasmodic pelvic pain from ..	509
-- simulating sciatica ..	74
-- solid feel in very tense ..	758
-- succussion splash in ..	711
-- swelling in iliac fossa due to ..	737
-- twisted, ascites with ..	759
-- constipation with ..	153
-- deep-seated pelvic pain in ..	508
-- diagnosis from appendicitis with pregnancy ..	761
-- dysmenorrhœa ..	220
-- pain in right side of abdomen in ..	500
-- simulating renal colic ..	392
-- spasmodic pelvic pain from ..	509
-- tumour from ..	153
-- vaginal examination in diagnosis of ..	500
-- varicose abdominal veins from ..	825
-- dermoid cyst of, diagnosis from ectopic gestation ..	760
-- disease of, œmœmia in ..	36
-- causing amenorrhœa ..	23, 24
-- eosinophilia in ..	248
-- pain in the back in ..	476
-- referred pain in area of tenth dorsal nerve in ..	509
-- vomiting with ..	844
-- excision of, obesity after ..	454
-- fibroma of, ascites with ..	759
-- growths of, amenorrhœa with ..	24
-- hyperæsthetic patches over, in hysteria ..	667
-- imperfectly developed in infantilism ..	218
-- inflamed (see Ovaritis) ..	
-- in inguinal canal, diagnosis from fibromyoma of round ligament ..	741
-- insufficient activity of, amenorrhœa from ..	707
-- œmœmia from ..	23
-- nervous symptoms in ..	454
-- obesity in ..	453, 454, 707
-- pain in, diagnosis from uterine calculus ..	627
-- prolapsed, pelvic pain from ..	508
-- dyspareunia from ..	221
-- region of, hypersensitive in hysteria ..	509
-- pain in, in carcinoma of cervix ..	510
-- referred pain in, in extra-pelvic disease ..	509
-- in hysteria ..	509
-- limits of ..	509
-- in pelvic disease ..	509
-- sclerosis of, pelvic pain from ..	508
-- secretion of, effect on menstruation ..	430
-- shifting dullness in flanks with malignant tumours of ..	393
-- small cystic, dysmenorrhœa in ..	219
-- and thyroid gland, interrelationship ..	454
-- tumour of (and see Carcinoma of Ovary; and Ovary, Cyst of)	

Ovary, tumour of, contd.

-- absence of distinctive blood changes in ..	691
-- menstrual disturbance in ..	429
-- movement with respiration ..	691
-- ascites with ..	367, 393, 759
-- breaking down, œmœmia in ..	39
-- diagnosis from pregnant uterus ..	758
-- renal tumour ..	391
-- splenic tumour ..	691
-- tuberculous peritonitis ..	691
-- uterine fibroid ..	758, 759
-- difficulty of diagnosis of ..	759
-- direction of growth ..	393
-- double, amenorrhœa with ..	24, 429, 691, 759
-- dyschezia from ..	150
-- dystocia due to ..	227
-- fixation of growth in ..	759
-- uterus with tœnœcium in examination for pedicle of ..	758
-- impaction of, sacralgia in ..	509
-- jaundice in ..	362, 367
-- length of uterine cavity usually unaltered in ..	429
-- menstruation undisturbed by ..	758, 759
-- microscope for exact diagnosis ..	759
-- often inseparable from uterus ..	759
-- pedicle of ..	758, 759
-- pelvic swelling due to ..	757, 758
-- physical signs of ..	691
-- rapid emaciation in ..	759
-- secondary portal glands in ..	367
-- simulating movable kidney ..	727
-- sterility due to ..	706
-- uterus drawn up by ..	691
-- vaginal examination in diagnosing ..	691
Over-eating, active congestion of liver from ..	371
-- obesity from ..	453
Over-exertion, acute dilatation of heart due to ..	243
-- causing mitral regurgitation ..	239, 243
-- cramp from ..	177
-- enlarged heart from ..	232, 243
-- tenderness of spine from ..	785
Overgrowth of tibia after injury ..	132
Over-work, brachial neuralgia from ..	491
-- cramps from ..	177
-- dyspepsia from ..	354
-- insomnia from ..	357
-- loss of weight due to ..	818
-- malarial relapse due to ..	36
-- neurasthenia from ..	596
-- night terrors from ..	447
-- pain in back from ..	476
-- spasmodic contraction from Oxalate of calcium in urine, (see Oxaluria) ..	159
Oxalic acid poisoning, coma due to ..	137, 346
-- hypothermia from ..	346
-- oxaluria from ..	297
OXALURIA ..	470
-- catarrh of urinary passages from ..	444
-- diagnosis from renal calculus ..	311
-- "dumb-bell" crystals in urine in (Fig. 130) ..	470
-- dyspepsia in ..	311
-- after eating rhubarb, gooseberries, or tomatoes ..	311
-- "envelope" crystals in urine in (Fig. 130) ..	470

Oxaluria, contd.

-- frequent micturition from ..	438
-- hæmaturia in ..	304, 311
-- lumbar aching in ..	311
-- nocturnal enuresis and ..	248, 471
-- normal amounts of ..	471
-- from oxalic acid poisoning ..	297
-- pain in the testicle in ..	524
-- in pancreatitis ..	116
-- priapism from ..	585
Oxybutyric acid in urine ..	4, 292
Oxygen, effect on convulsions ..	172
Oxyhæmoglobin ..	12
-- reduction by ammonium sulphide ..	314
-- spectral absorption band of ..	95
-- in urine in hæmoglobinuria ..	314
Oxyuris vermicularis ..	569
-- bleeding and mucus due to ..	93
-- no blood changes with ..	33
-- description of ..	94
-- eosinophilia with ..	249
-- grinding of teeth ..	293
-- priapism from ..	585
Ozœna ..	99, 204
Ozonic ether test for pus ..	623
PACHYMENINGITIS, headache in ..	327
-- cervical ..	493
-- claw-hand in ..	127, 128
-- radicular pain in arm in ..	493
-- simulating brachial neuritis ..	492
-- chronic hypertrophic hæmorrhagic, alcoholism and syphilis causing ..	563
-- diagnosis of spinal caries from ..	563
-- paraplegia from ..	563
-- paralysis of upper extremity from ..	555
Pacific Islands, filariasis in ..	33
Pads, association with Dupuytren's contraction ..	385
-- confusion with osteo-arthritis out-growths ..	385
-- fibrous nature of ..	385
-- on dorsal aspect of fingers (Figs. 114, 115) ..	385
-- supraclavicular, in cretinism ..	259
Page's disease, age and sex incidence of ..	802
-- crusts in ..	802
-- description of ..	802
-- distinction from eczema ..	803
-- duration of ..	802
-- intractability of ..	803
-- retraction of the nipple in ..	803
Pain, absence of, in progressive muscular atrophy ..	515
-- acute in furunculosis of ear ..	469
-- general, in limbs in inflammation of lung ..	503
-- in hysterical joint ..	389
-- with anæsthetic skin ..	475
-- caused by pressure of aortic aneurysm on œsophagus ..	482
-- described as colic by patients ..	133
-- as epileptic aura, in brain lesions ..	81
-- at external abdominal ring, in epididymo-orchitis ..	518
-- in ureter calculus ..	514
-- generalized, in acute poliomyelitis ..	555, 559
-- importance of presence or absence of tenderness with ..	475
-- from inflammation ..	478
-- inhibitory, in joints, mistaken for paralysis ..	545
-- insomnia from ..	356

Pain, contd.

- lightning, of tubes ..	350, 562
- loss of weight due to ..	848
- over lower part of sternum, heartburn causing ..	484
- on moving neck and head, in spinal meningitis ..	162
- in muscles and joints mistaken for paralysis ..	545
- niggling, in legs, in tabes dorsalis ..	489
- trichinosis ..	504, 801
- in paralyzed muscles in multiple neuritis ..	551
- perinephric abscess ..	392
- peripheral neuritis ..	66, 559, 661
- in plumbism ..	136
- popliteal abscess ..	762
- preceding the eruption in herpetic trigeminal neuralgia ..	496
- pricking, in clans penis in tuberculous cystitis ..	628
- pyelonephritis ..	394
- relief by salicylates in acute rheumatism ..	375
- severe, associated with anasthesia ..	475
- in lower spine, in gumma of cauda equina ..	563
- significance of absence or presence of, in transverse myelitis ..	564
- from spasm of levator ani ..	221
- subnormal temperature in conditions associated with ..	621
- supra-orbital, from eyestrain ..	495
- and swelling of external auditory meatus in furunculosis ..	469
- in syphilis ..	386
- in syphilitic pseudo-paralysis ..	387
- universal in cerebrospinal meningitis ..	643
PAIN, ABDOMINAL ..	472
- in acute gastritis ..	845
- from aneurysm ..	299, 368
- in appendicitis ..	133
- biliary colic (and see Colic) ..	846
- from corrosive poisoning ..	297
- diaphragmatic pleurisy ..	133, 645
- in duodenal ulcer ..	390, 500
- extra-uterine gestation ..	436, 500, 646
- general in gastric crises ..	473
- Henoch's purpura ..	380, 600, 846
- influenza ..	505
- intense from perforative peritonitis ..	644, 721
- intestinal neuralgia ..	134
- obstruction ..	133, 153, 350, 846
- in lead neuritis ..	77
- mesenteric embolism or thrombosis ..	90
- pancreatic hemorrhage ..	292
- pancreatitis ..	90, 292, 646, 846
- due to perforation in typhoid ..	622
- peritonitis ..	472, 718
- pneumonia ..	133, 645
- Pott's disease ..	134
- relapsing fever ..	373
- (right side) in hepatoptosis ..	407
- - - salpingitis ..	500
- - - twisting of pedicle of ovarian cyst ..	500
- in ruptured tubal gestation ..	500, 646, 760
- spasmodic, from intussusception ..	727
- from spondylitis deformans ..	787

Pain, abdominal, contd.

- thoracic diseases ..	133
- from torsion of retained testis ..	742
- tuberculous peritonitis ..	56, 719
- ulceration of the intestine ..	90
- from ulcerative colitis ..	92
- undue aortic pulsation ..	592
- due to uterine calculus ..	627
- in anal region after micturition in vesical carcinoma ..	442
- ankle and foot in anterior crural neuralgia ..	488
- in ankle (see Joints, Affections of) ..	
- in aortic aneurysm, mode of production ..	482
- arm (see Pain in Extremity, Upper) ..	
- axilla from enlarged axillary glands ..	421
- right, from hepatic abscess ..	651
PAIN IN BACK (and see Backache) ..	474
- from abdominal aneurysm ..	222, 296, 299, 322, 728, 789
- aortitis ..	789
- arteriosclerosis ..	789
- in biliary colic ..	500
- carcinoma of rectum ..	636
- from cholangitis ..	789
- chronic pancreatitis ..	135
- colitis ..	789
- with compression paraplegia ..	786
- from constipation ..	789
- coronary artery sclerosis ..	789
- disease of the rectum (<i>Fig.</i> 204, p. 788) ..	150, 636, 788
- uterus (<i>Fig.</i> 204) ..	788, 789
- examination of chest and abdomen in ..	476
- from gall-stones ..	500, 789
- gastric ulcer ..	298, 789
- carcinoma ..	789
- gastritis ..	789
- heart disease (<i>Fig.</i> 204) ..	788, 789
- in hysteria ..	788
- inflammation of uterus ..	789
- invagination of rectum ..	150
- during labour ..	789
- from liver disease (<i>Fig.</i> 204) ..	788
- malignant disease of the vertebrae ..	786
- menstruation ..	789
- myocardial fibrosis ..	789
- in neurasthenia ..	494
- new growth of liver ..	789
- nutmeg liver ..	789
- from pleural adhesions ..	789
- new growth ..	789
- pleurisy ..	789
- in relapsing fever ..	698
- from renal calculus ..	500
- sex incidence of ..	789
- from spinal caries ..	785
- stomach disease (<i>Fig.</i> 204) ..	788
- with stone in pancreas ..	135
- tricuspid regurgitation ..	789
- with typhoid spine ..	787
PAIN, BEARING-DOWN ..	473
- in bladder due to bacilluria ..	616
- stone ..	818

- PAIN, PENILE** .. 510
- from affection of trigonal region of bladder .. 441
 - in carcinoma of bladder .. 311, 441, 512, 630
 - cystitis .. 441, 512
 - on erection in chordee .. 516
 - with prostatitis .. 515
 - with hæmaturia, in vesical disease .. 306
 - from herpes .. 515
 - impaction of calculus .. 210, 311, 441
 - after micturition, causes of .. 513
 - during micturition .. 512, 515
 - from penile hæmatoma .. 516
 - prostatitis .. 441
 - renal tuberculosis .. 629
 - scalding .. 207
 - from tuberculous bladder .. 441, 628
 - ureteral calculus impacted near bladder .. 627
 - vesical calculus .. 312, 441, 628, 629
- PAIN IN PERINEUM**, causes .. 516
- in acute cystitis .. 627
 - bacteriuria .. 84
 - from ectopic testis .. 516
 - gouty eczema .. 516
 - in prostatic disease .. 412, 491, 631
 - precordial (and see Heart; and Pain in Chest), in acute dilatation of heart .. 243
 - endocarditis .. 239
 - from ruptured valve .. 238
 - in angina pectoris .. 582
 - aortic disease .. 283
 - incompetence .. 481
 - arteriosclerosis .. 14
 - chronic nephritis .. 14
 - from dyspepsia .. 481
 - fibroid heart .. 242
 - flatulent dyspepsia, increase after exertion .. 481
 - onset after a meal .. 481
 - in myocardial affections .. 18
 - myocarditis .. 241
 - pericarditis .. 480, 777
 - from pressure on oesophagus, in aortic aneurysm .. 482
 - rectal, from abscess .. 635
 - prostatitis .. 628, 631
 - rectal carcinoma .. 636
 - referred (see Referred Pain)
 - renal, with bladder tumours .. 311
 - colic (see Colic)
 - in renal angle from ureter calculus .. 514
 - tuberculous kidney .. 312
 - in retention of urine .. 440
 - sacral region, from carcinoma of rectum .. 93
 - over sacro-iliac joint from joint disease .. 739
 - in scalp, from diabetes mellitus .. 784
 - hysteria .. 784
 - malaria .. 784
 - neurasthenia .. 781
 - rheumatism .. 781
 - syphilis .. 782
 - scapular region in some cases of cervical rib .. 492
 - in diaphragmatic pleurisy .. 479
 - gastritis .. 778
 - phthisis .. 778
 - referred from diaphragm .. 779
 - left, in abscess of left lobe of liver .. 409
- Pain in shoulder, contd.**
- right, from biliary colic .. 135, 500
 - carcinoma of liver .. 412
 - from gall-bladder disease .. 779
 - gall-stones .. 135, 363, 778
 - hepatic abscess .. 369, 409, 651
 - liver disease .. 779
 - in side (left) in injury of spleen .. 700
 - mediastinal growth .. 483
 - in pneumonia .. 372
 - pyonephrosis .. 624
 - in soles of feet in gout .. 382
 - gonorrhoeal arthritis .. 376
 - spastic constipation .. 144
 - spinal region (see Pain in Back)
 - spleen in fungating endocarditis .. 237
 - sternal region (see Pain in Chest)
 - behind sternum in growth in anterior mediastinum .. 483
 - sudden intense, in tabes .. 507
 - dolorosa .. 507
 - in teeth from glaucoma .. 257
 - temporal region from disease of upper bicipids .. 783
 - heart disease .. 783
 - lung disease .. 783
 - stomach disease .. 783
- PAIN IN TESTICLE** .. 517
- due to new growth .. 766
 - from renal calculus .. 308, 846
 - in testicular abscess .. 680
 - ureteric calculus .. 135
 - in thighs, from carcinoma of rectum .. 93
 - in obturator hernia .. 740
 - from renal calculus .. 308
 - ureteric calculus .. 135
 - in throat from corrosive poisoning (and see Sore Throat) .. 297
 - toe from ingrowing nail .. 486
 - tongue from carcinoma .. 812
 - trigeminal neuralgia .. 495
 - tooth from dental caries .. 496
 - due to twisting of pedicle of ovarian cyst simulating renal colic .. 392
- PAIN IN UMBILICAL REGION** .. 524
- due to sebaceous cyst .. 524
 - urethral due to epithelioma .. 767
 - with discharge .. 441
 - from impacted calculus .. 441, 442
 - along vertebral column in neurasthenia .. 494
 - in vulva (and see Dyspareunia)
 - after micturition, in cystitis .. 442
 - with vesical carcinoma .. 442
 - in kraurosis .. 770
 - prolapse of urethral mucous membrane .. 770
 - from ureteric calculus .. 135
 - urethral caruncle .. 770
 - varicocele of vulva .. 770
 - wrist (see Joints, Affections of; Arthritis; and Osteoarthritis)
- Painful coitus (see Dyspareunia)
- Micturition (see Micturition, Painful)
- swallowing (see Dysphagia)
- Painter's cramp .. 177
- Painters, plumbism in .. 136
- Palate, ataxy of** .. 69
- bilateral paralysis of, dysarthria from .. 686, 687
 - carcinoma of .. 673
 - cleft (see Cleft Palate) .. 640
 - endothelioma of .. 420, 640
 - gumma of .. 670, 673
 - inflammation of .. 673
- Palate, contd.**
- paralysis of .. 224, 775
 - from bulbar or pseudo-bulbar paralysis .. 640
 - causes of .. 640
 - in diphteria .. 77, 181, 640, 687, 842
 - ascribed to influenza .. 640
 - course of .. 640
 - Klebs-Löffler bacilli in .. 640
 - nasal quality of voice in .. 640, 687
 - regurgitation of food through the nose in .. 640
 - after removal of tonsils or adenoids .. 640
 - syphilitic .. 640
 - pemphigus, etc., of .. 114
 - perforation of, diagnosis of cause of .. 640
 - malignant .. 640
 - mercury and iodide in diagnosing cause of .. 640
 - microscopic examination of edge of ulcer in diagnosing cause of .. 640
 - regurgitation of food through nose from .. 640
 - syphilitic .. 237
 - traumatic .. 640
 - tuberculous .. 640
 - Wassermann's test in diagnosing cause of .. 640
 - reflex, absent in hysteria .. 509
 - impaired in bulbar palsy .. 687
 - sarcoma of .. 640
 - scarring of, from syphilis .. 237
 - squamous-celled carcinoma of .. 670
 - syphilitic ulcer on .. 237, 813
 - spirochaetes in scraping from .. 640
 - tuberculosis of .. 640, 673
 - sore throat from .. 670
 - tubercle bacilli in scraping from .. 640
 - usually associated with phthisis or lupus .. 640
 - unaffected in herpes of tongue .. 881
 - unilateral palsy of, absence of articulatory defect in .. 687
- Pallor** .. 27
- acute, in duodenal ulcer .. 300
 - in gastric ulcer .. 298
 - in acute nephritis .. 48
 - cachexia alkalina .. 115
 - an indication or not of anæmia .. 27
 - in infantile scurvy .. 599
 - from internal hæmorrhage .. 646, 780
 - local, symmetrical, of extremities, in Raynaud's disease .. 490
 - in Ménière's disease .. 828
 - pyonephrosis .. 396
 - tuberculous joints .. 39
- l'almar fascia, Dupuytren's contracture of .. 167

- Pancreatic artery** opened by gastric ulcer . . . 298
- calculus (see Calculus)
- catarrh, jaundice and colicky epigastric pain in . . . 365
- colic, signs and symptoms of diarrhoea, white stools in . . . 197
- disease and infantilis . . . 216
- glycosuria in . . . 292
- tests for presence of . . . 364
- Pancreatic disease**, contd.
- - undigested muscle in stools in . . . 364
- - hæmorrhage (see Hæmorrhage, Pancreatic)
- - incompetence, signs of . . . 216
- - juice and fat digestion . . . 265
- Pancreatic reaction** (see Cammidge)
- - tumour, diagnosis from renal tumour . . . 394
- - - splenic tumour . . . 690
- - jaundice in . . . 366
- - physical signs of . . . 690
- - (see also Pancreas, Cyst of; and Carcinoma of Pancreas)
- Pancreatitis**, bile pigment in urine in . . . 116
- Cammidge's reaction in . . . 115, 280
- causes of . . . 116
- a common cause of diabetes . . . 117
- diagnosis of . . . 485
- faeces in . . . 116
- hæmorrhage from bowel in . . . 90
- indicanuria in . . . 116
- occult blood in faeces in . . . 117
- ptyalism in . . . 591
- acute, "acute abdomen" due to . . . 431, 485
- - biliary colic in . . . 153
- - collapse from . . . 292, 724
- - constipation in . . . 153, 292, 724, 846
- - epigastric pain from . . . 724
- - fat necrosis with 153, 431, 846
- - frequent absence of rigidity of abdomen in . . . 431
- - glycosuria in . . . 292
- - immediate laparotomy in . . . 431
- - laparotomy in diagnosis of . . . 724, 846
- - meteorism in . . . 431
- - nausea in . . . 846
- - pain in epigastrium in . . . 431
- - pancreas seldom felt in . . . 724
- - passage of flatus in . . . 153
- - pyrexia from . . . 724
- - severe abdominal pain in . . . 292, 484, 846
- - shock and collapse in . . . 484
- - simulating intestinal obstruction . . . 431, 846
- - perforated gastric ulcer . . . 431
- - tenderness over pancreas in . . . 846
- - vomiting in 292, 724, 844, 846
- - hæmorrhagic, abdominal distention with . . . 646
- - - fat necrosis with . . . 646
- - - hiccough in . . . 342
- - - laparotomy in diagnosing . . . 646
- - - pain in upper part of abdomen from . . . 646
- - - simulating general peritonitis . . . 646
- - - intestinal obstruction . . . 646
- - - tympanitis with . . . 646
- - - vomiting and constipation with . . . 646
- - chronic, bulky offensive stools in . . . 135
- - Cammidge's reaction in . . . 135, 280, 364
- - clay-coloured stools with . . . 724
- - cysts resulting from . . . 724
- - diagnosis from gall-stones . . . 265, 363
- - - new growth . . . 265
- - - enlarged gall-bladder in . . . 135
- - - epigastric pain in . . . 135, 486
- - - tumour from . . . 724
- - - fat in stools in 135, 265, 292
- - - fatty iridescent stools in . . . 364
- - gall-bladder enlargement in 280
- Pancreatitis**, chronic, contd.
- - gall-stone disease and . . . 135, 486
- - glycosuria in . . . 135, 292, 724
- - jaundice in 135, 280, 292, 361, 363, 724
- - obstruction of common bile-duct in . . . 362
- - paroxysmal epigastric pain in . . . 280
- - pigmentation in . . . 135, 292
- - recurrent jaundice in . . . 363, 724
- - rigors in . . . 135, 292
- - tenderness and pain in . . . 724
- - undigested meat in stools in . . . 292
- - wasting in . . . 135, 292
- Pandemic chorea . . . 156, 157
- Pannus in trachoma . . . 807
- Panophthalmitis from corneal ulceration . . . 806
- - diphtheritic . . . 807
- - gonococcal . . . 807
- - from herpes frontalis . . . 807
- Papilloma of bladder**, carcinoma simulating . . . 630
- - cystoscopy in 441, 512, 514, 630
- - cystitis from . . . 630
- - diagnosis from carcinoma . . . 630
- - fragments in urine . . . 306, 630
- - hæmaturia from . . . 304, 305, 311, 514
- - pain in penis from 512, 513, 514
- - profuse recurrent hæmaturia in . . . 512
- - pyuria due to . . . 623, 630
- - retention of urine from . . . 441
- - simulated by ureteral calculus . . . 514
- - sloughing of . . . 630
- - sudden, profuse, painless hæmorrhage in . . . 305
- - - stoppage of urine by 439, 514
- - urethra obstructed by . . . 514
- - villous . . . 308, 511
- - bleeding gums due to . . . 86, 88
- - duct, bloody discharge from nipple in . . . 202
- - of kidney, hæmaturia in 304, 308
- - hæmatonephrosis in . . . 308
- - hydronephrosis in . . . 308
- - renal enlargement in . . . 308
- - of larynx mistaken for asthma . . . 582
- - rectal hæmorrhage from . . . 93
- - of scrotum . . . 679
- - sloughing, diagnosis from hernia testis . . . 681
- - ureteral . . . 308
- - urethral . . . 209
- - vulval, gonorrhoeal . . . 769
- Papillomatous ovarian cyst**, ascites in . . . 58
- PAPULES**
- absence of scarring from . . . 528
- in anthrax . . . 603
- congenital syphilis . . . 446
- in dermatitis herpetiformis . . . 831
- development into pustules . . . 601
- in eczema . . . 831
- - folliculorum . . . 528
- - marginatum . . . 275
- - granulosis rubra nasi . . . 714
- - herpes zoster . . . 830
- - impetigo contagiosa . . . 831
- - Jacquet's infantile erythema . . . 446
- - lichen planus . . . 657, 832
- - - ruber planus . . . 658
- - - lupus vulgaris . . . 808
- - and nodules, differences between . . . 448
- - in pityriasis rubra pilaris . . . 658
- - scabies . . . 831
- - of severe goose-skin . . . 528, 530
- - small-pox . . . 605
- - syccosis vulgaris . . . 602

Papulae, s. contd.

- syphilis	423, 416, 532, 601, 769, 832
- syphilitic, anal and genital	447
- in typhoid fever	697
- typhus fever	371, 699
- vaccinia	834
- varicella	833
Papulo-pustules, description of	528
Papulo-squamous syphilo-	
derms	532
Papulo-vesicles, description of	528
Paracentesis abdominis, chronic	
peritonitis from repeated	55
- necessity for catheteriza-	
tion before	717
- perihepatitis from	60
- thoracis, hæmoptysis after	317
- hydropneumothorax from	712
- pneumothorax from	577, 578
Paracnus Willisii, in oto-	
sclerosis	190
Paradoxy dilatation in	
hour-glass stomach	353
Paræsthesia (and see Sensation,	
Abnormalities of)	
- in arms from pressure of	
cervical rib on brachial	
plexus	593
- disseminated sclerosis	565
- hysteria	166
- subacute combined degener-	
ation of the cord	493
- tabes dorsalis	493
- transverse myelitis	74
Paralhu workers, epithelioma	
of scrotum in	679
Parageusia	774
Paragonimus Westerni,	
hæmoptysis from	705
Paraldehyde, foul taste from	774
Paralysis of abdominal mus-	
cles	181
- agnitas, absence of tremor	
with	796
- bent and rigid carriage in	796
- bread - crumbling and	
cigarette-rolling move-	
ments in	796
- defective winking in	262
- differentiation of myxo-	
dema from	259
- expressionless face in	259, 796
- exuberant laughter in	262
- facies, described (Fig. 86)	261
- festinating gait in	278, 796
- flexion of arm in	548
- gait in	278, 541, 548, 796
- general account of	796
- influence of will on tremor of	796
- sleep on tremor of	796
- insomnia in	358
- lateropulsion in	796
- loss of power in one arm	
in early stages of	548
- in one leg in	541
- mistaken for hysteria	548
- neuritis	548
- monotonous voice in	796
- muscular rigidity in	796
- weakness in	796
- normal reflexes in	541
- paræsthesia in	796
- propulsion in	796
- ptalism in	591
- reflexes normal	548, 796
- retraction of eyelids in	262
- retropulsion in	796
- shuffling in	541, 796
- simulated by cerebral	
softening	796
- mercurial tremor	797
- writer's cramp	177
- slow emotional develop-	
ment in	262

Paralysis agitans, contd.

- slowness of speech in	259
- sphincters normal in	796
- stiffness in	541
- tremor in	541, 794, 795, 798
- absent early in	548
- in alcoholic neuritis	551
- amyotrophic lateral sclerosis	131
- of anterior crural nerve	541
- of arm (see Arm, Paralysis of)	
- monoplegia of	547
- atrophic, in acute polio-	
myelitis	128
- of back muscles, scoliosis	
from	180, 181
- bilateral adductor in hysteria	798
- supranuclear facial, in cere-	
bral diplegia	154, 535, 686
- birth, atetosis from	155
- Brown-Séquard type (see	
Brown-Séquard)	
- bulbar, atrophy of muscles	
of hand in	687
- mastication in	687
- tongue in	591, 641, 686
- diagnosis from bilateral	
supranuclear facial para-	
lysis	536
- bulbar hæmorrhage	687
- myasthenia gravis	225
- pseudo-bulbar	641
- softening	687
- tumour of bulb	687
- difficulty of speech and	
swallowing in	159
- dribbling of saliva in	590, 641
- dysarthria from	686
- dysphagia in	
159, 224, 641, 687, 842	
- electrical reactions of	
tongue muscles in	687
- fibrillary contractions of	
tongue in	159, 686
- gangrene of lung in	288
- gradual progress of	641, 686
- insidious onset of	686
- lesions causing	641, 686
- loss of taste due to	774, 775
- nerves affected in	159
- ophthalmoplegia in	159
- palatal paralysis in	640
- paresis of lips and tongue in	641
- vocal cords in	687
- progressive muscular atrophy	
associated with	73, 641
- reflexes in	687
- regurgitation of food	
through nose from	202
- cardiovascular lesions in	546
- cerebral, associated move-	
ments in	548
- convulsions of children in	169
- from cerebral tumour	350
- of cervical sympathetic, ab-	
sence of blushing in	247
- sweating due to	247
- diminished tension of	
globe of eye in	594
- enophthalmos in	247
- loss of pupillary sensory	
reflex in	594
- palpebral fissure dimin-	
ished from	247, 546
- ptosis from	247, 590, 594
- pupil constricted from	
247, 546, 590, 595, 792	
- pupils unequal in	595
- stimulation of, dilata-	
tion of the pupil in	591, 595
- from thyroid gland tu-	
mour	792
- of ciliary muscle after	
diphtheria	77, 224, 610
- circumflex nerve	552

Paralysis, contd.

- conditions simulating	545
- and cramp associated	177
- of cranial nerves in cerebral	
syphilis	173
- muscular atrophy in	75
- crossed (see Hemiplegia)	
- of detractor muscle, difficult	
micriturion from	440, 443
- diaphragm after diphtheria	77
- in Landry's paralysis	567
- unilateral	341
- diphtheritic, muscular at-	
rophy in	76
- palatal	559, 640
- regurgitation of food	
through nose in	202
- Duchenne's, injury at birth	
causing	552
- Erb's, extent and causes of	552
- of ext. popliteal nerve, signs	543
- rectus, effects of	201
- with facial paralysis	536
PARALYSIS OF EXTREMI-	
TIES	539, 545
- in diphtheria	77, 640
- from syphilitic pseudo-	
paralysis	387
PARALYSIS OF EXTREMITY,	
UPPER	545
- hand in Tooth's perio-	
neal atrophy	71
- importance of history	
in	545
- without muscular atrophy	546
PARALYSIS OF ONE EX-	
TREMITY, LOWER	539
- leg with muscular	
atrophy	541
- spastic, electrical re-	
actions in	540
- from tumour of cauda	
equina	74
- without muscular	
atrophy	539
- of eye muscles in myasthe-	
nia gravis	225
PARALYSIS, FACIAL (Figs.	
136-140)	
- atetosis with	536
- atrophy of face from	75
- Bell's, contracture from	165
- bilateral, interference with	
labial articulation in	687
- in Landouzy-Dejerine	
myopathy	687
- peripheral neuritis	687
- ptalism in	591
- and brachial monoplegia	547
- contracture from	534, 537
- epiphora in	250
- and hemiplegia	336
- herpes with	536
- keratitis from	807
- syphilitic (Figs. 158, 159)	
589, 590	
- peripheral	536
- simulated by facial hemi-	
atrophy (Fig. 141)	537
- supranuclear	534
- taste defects in	774, 775
- of fifth nerve, abolition of	
winking reflex in	807
- anosmia from	668
- arrest of lachrymal	
secretion in	807
- dryness of nose from	668
- hypopyon from	807
- insensibility of cornea in	807
- keratitis from	807
- general, of insane (see General	
Paralysis of the Insane)	
- of hand, ischæmic, from	
injury to forearm	552

Paralysis, contd.

- hypoglossal, atrophy of tongue from ..	75
- in hysteria (see Hysteria, Paralysis in)	
- infantile, abnormal gait in ..	277
- acquired, choreiform movements in ..	155
- defective speech in ..	155
- epilepsy from ..	155
- mental deficiency in ..	155
- tremors in ..	155
- trophic lesions in ..	155
- of arm (<i>Fig. 7</i>) ..	70
- causing claw-foot ..	127
- muscular atrophy in ..	70
- plantar reflex in ..	81
- preceded by paraplegia ..	544
- reaction of degeneration in ..	181
- scoliosis from ..	180
- talipes in ..	71, 181
- ulceration of the leg in ..	811
- vasomotor and trophic lesions in ..	131
- of inferior oblique, effects of ..	201
- rectus, effects of ..	201
- intercostal muscles in Landry's paralysis ..	567
- internal popliteal nerve ..	543
- rectus, effects of ..	201
- intestine, in cord affections ..	432
- Jacksonian epilepsy with ..	161
- Klumpke's, cause and effects ..	553
- Landry's (see Landry's Paralysis)	
PARALYSIS, LARYNGEAL ..	537
- abductor, orthopnea in ..	465
- bilateral, aphonia in ..	687
- from bronchial glands ..	422
- cancer of oesophagus ..	296
- central nervous system changes in ..	539
- diagnosis from laryngitis ..	537
- dyspnea from ..	539
- gangrene of lung in ..	288
- in myasthenia gravis ..	225
- progressive ..	224
- simulating suffocative oedema ..	539
- tracheotomy required for ..	539
- urgent dyspnea from ..	537
- (and see Paralysis of Vocal Cord)	
- vascular degeneration associated with ..	539
- lesions of internal capsule causing ..	546
- of both legs (see Paraplegia)	
- lips in bulbar paralysis ..	641
- progressive ..	224
- median nerve ..	552
- motor nerves of bladder ..	443
- mouth in myasthenia gravis ..	225
- multiple, of cranial nerves, / syphilitic ..	590
- in multiple neuritis (see Neuritis, Multiple Peripheral)	
- of muscles of back, lordosis from ..	183
- musculospiral ..	77, 552
- of neck muscles in myasthenia gravis ..	225
- obturator nerve, signs of ..	541
- ocular muscles in diptheria ..	640
- (see Strabismus; and Pupils, Abnormalities of)	
- orbicular palpebrarum, epiphora from ..	250
- keratitis from ..	807
- of palate ..	640
- after diptheria ..	224, 842
- dysphagia from ..	224
- stertor from ..	707
- syphilitic, associated with other cranial nerve palsy ..	640

Paralysis, contd.

- in peripheral neuritis (see Neuritis, Multiple Peripheral)	
- of pharynx, progressive ..	224
- primary muscular, patient's method of raising himself ..	132
- talipes in ..	132
- progressive bulbar, fibrillary contractions in ..	158, 159
- pseudo-bulbar (see Pseudo-bulbar Paralysis)	
- pseudo-hypertrophic (see Pseudo-hypertrophic Muscular Paralysis)	
- ptosis due to (<i>Figs. 156-159</i>) ..	590
- pyramidal from difficulty in swallowing in ..	591
- retention of urine from ..	441
- of sciatic nerve, causes and signs of ..	542
- talipes from ..	132
- serratus magnus ..	551
- sixth nerve, effects of ..	200
- sometimes absent with cerebral hemorrhage ..	138
- from spinal cord lesions, pain in ..	545
- muscles, scoliosis due to ..	181
- superior oblique, effects of ..	201
- rectus, effects of ..	201
- supranuclear ..	531
- facial bilateral (<i>Fig. 140</i>) ..	535
- of suprascapular nerve ..	551
- third nerve ..	595
- from tumour of mid-brain ..	798
- tibial muscles, talipes from ..	132
- tongue in bulbar paralysis ..	641
- progressive ..	224
- transient, in Jacksonian epilepsy ..	161
- in tuberculous meningitis ..	612
- ulnar, disturbed function in other parts with ..	574
- diagnosis of Volkmann's contracture from ..	552
- loss of sensation in ..	128
- of vesical sphincter, incontinence of urine from ..	440
- vocal cord by aneurysm ..	222
- bilateral ..	538
- in bulbar palsy ..	687
- dry cough due to ..	175
- functional ..	538
- lesion of one recurrent laryngeal nerve ..	687
- voice little altered in ..	687
- from mediastinal fibrosis ..	538
- stridor from ..	710
- syphilitic ..	710
- from thyroid gland tumour ..	792
- unilateral organic ..	538
- Volkmann's ..	72
Parametric abscess (see Abscess, Parametric)	
Parametritis, peritonitis from ..	644
- swelling in iliac fossa due to ..	737
Paranthesis in chronic alcoholism ..	172
Paranyoclonus multiplex ..	160, 799
- clonic contractions of ..	161
- retraction of the head in ..	641
Paraphimosis, pain in penis in ..	515
PARAPLEGIA ..	556
- abnormal gait in ..	278
- from affection of cervico-dorsal cord ..	555
- athetosis in ..	154
- ankle-clonus in ..	44, 494, 786
- ataxic ..	493, 561, 565
- abnormal gait, due to ..	277
- Babinski's sign in ..	82

Paraplegia, ataxic, contd.

- cord lesions in ..	565
- extensor plantar response ..	493
- impotence in ..	216
- increased tendon jerks in ..	493
- paresthesia in ..	493
- spastic paraplegia in ..	493
- from bilateral cerebral softening ..	563
- causes of, in adults ..	561
- in children ..	556
- combined sclerosis of the cord ..	493, 667
- from compression ..	270, 494, 786
- Babinski's sign with ..	786
- girdle sensation in ..	289
- increased knee-jerks with ..	786
- pain in the back with ..	786
- retention of urine in ..	441
- tenderness of spine with ..	786
- zone of hyperesthesia in ..	786
- congenital spastic, diffuse kyphosis with ..	182
- talipes in ..	131
- contractures in ..	164
- diminished power of micturition in ..	443
- in disseminated sclerosis ..	547
- extensor plantar response in ..	494
- in Friedreich's ataxy ..	71
- functional ..	567
- girdle sensation in ..	289
- hysterical ..	69
- increased knee-jerk in ..	494
- infantile ..	155
- convulsions with ..	170
- Landry's paralysis ..	567
- in Little's disease ..	154
- from malignant disease of the vertebrae ..	786
- meteorism with ..	432
- from primary lateral sclerosis ..	567
- radicular pain in arm in ..	494
- sensory disorders with ..	563
- simulated by malingering ..	567, 786
- spastic ..	439
- and ataxy ..	565
- exaggerated knee-jerk with ..	397
- of infants and children, athetosis in ..	154
- primary, impotence in ..	346
- from spinal caries ..	558
- talipes in ..	131
- sphincter trouble with ..	348, 441, 786
- in spinal caries ..	181
- loss of sphincter and control in ..	558
- due to spinal hemorrhage ..	787
- sudden, from spinal caries ..	270
- from superior longitudinal sinus thrombosis ..	643
- syringomyelia ..	73, 554
- transverse myelitis ..	73
- typhoid spine ..	787
Parasites in blood in malaria (see Malaria)	
- bile-duct obstruction from ..	364
- cachexia from ..	114
- discovery of eggs in faeces ..	621
PARASITES, INTESTINAL (see Worms, Intestinal)	
- pruritus caused by ..	588
Parasitic affections, anæmia in	
- albuminuria in ..	33, 37, 459
- Charcot-Leyden crystals in stools in ..	118
- eosinophilia in ..	249
- oedema of legs in ..	459, 461
- jaundice ..	361
Parathyroid glands, clonus from excision of ..	161
- insufficiency, tetany from ..	178

- Paratyphoid fever**, agglutination test for .. 611, 697
- - B. paratyphosus in .. 697
 - - bacteriuria in .. 83
 - - diagnosis from tuberculosis .. 611
 - - influenza .. 611
 - - typhoid fever .. 611, 697
 - - prolonged pyrexia in .. 609
 - - splenic enlargement in 692, 697
 - - symptoms like those of benign typhoid .. 611
- Paraxanthin** bases, uric acid derived from .. 817
- Paresis** (see Paralysis)
- Parietal lobe**, aura in tumour of 81
- Paris**, ringworm parasites in 272, 273
- Parkinson's disease** (see Paralysis Agitans)
- Paronychia**, causes of .. 445
- Parotid abscess**, discharge through auditory meatus .. 470
- Parotitis**, acute specific (see Mumps)
- - diagnosis from perioritis .. 747
 - - earache from .. 230
 - - epididymo-orchitis in .. 517
 - - pain in the face from .. 495
 - - swelling of face in .. 746
 - - testicular abscess in .. 680
- Paroxysmal hæmoglobinuria**, general account of .. 315
- - headache in disseminated sclerosis .. 328
 - - in neuralgia .. 326
 - - movements in epilepsy .. 160
 - - pain in intestinal colic 133, 472
 - - tachycardia, brought on by fright or shock .. 772
 - - distinction from Graves' disease .. 772
 - - duration of attacks in .. 772
 - - faintness from .. 772
 - - general account of .. 772
 - - lack of strength in .. 772
 - - numbness of extremities in .. 772
 - - palpitation in .. 525, 772
 - - pins and needles in extremities in .. 772
 - - pulse-rate in .. 772
 - - sex incidence of .. 772
- Parrot's nodes** in congenital syphilis .. 427, 752
- Parturition** (see Labour)
- Passion**, rupture of cortical veins during .. 131
- Patellar clonus**, indicative of organic nervous disease 398
- - method of eliciting .. 398
- Patent ductus arteriosus**, absence of cyanosis with 129, 184
- - symptoms with .. 790
 - - bruit of .. 104, 184
 - - no clubbed fingers with 129
 - - cyanosis, clubbed fingers, and polycythæmia rare in .. 579
 - - systolic thrill due to 184, 790
 - - foramen ovale causes no symptoms .. 184
- septum ventriculorum**, bruits of 104, 105, 184, 579
- - clubbed fingers with .. 129
 - - cyanosis from .. 184
 - - enlarged heart in .. 244
 - - morbus cæruleus from 579
 - - and pulmonary stenosis associated .. 244, 579
 - - systolic bruit of .. 579
 - - thrill with .. 184
- Pavor nocturnus** .. 357
- Pavy's albuminuria** .. 19
- - solution in estimation of glycosuria .. 290, 291
- Pawlik's grip** in abdominal palpation in pregnancy 228
- Pears**, false intestinal sand from 653
- Peas**, oxaluria from .. 471
- Peau lisse** with syringomyelia 128
- Peckham fat boy** .. 451
- Pectineus**, nerve supply of .. 512
- Pectoralis major**, nerve supply .. 550
- - pseudo-hypertrophy of .. 556
 - - spinal nerve root supplying .. 532
 - - wasting in pthisis .. 72
 - - minor, nerve supply of .. 530
- Pectoriloquy** with bronchiectasis .. 324, 703
- - in fibroid lung .. 232, 246
 - - lobar pneumonia .. 186, 702
 - - pthisis .. 319
- Pediculi**, carbolic acid compress for, carboluria from 822
- Pediculosis**, anaemia from 419
- - cervical gland enlargement in .. 417, 419, 708
 - - diagnosis from prurigo .. 532
 - - eosinophilia in .. 249
 - - irritation of skin at back of neck with .. 419
 - - pruritis in .. 588
 - - purpura due to .. 596, 597
 - - scalp tender from .. 780, 781
 - - stiff neck from .. 708
 - - pubis, enlarged glands in groin from .. 738
 - - extent of infection in .. 447
 - - vestimentorum, purpura from 597
- Peeling** (see Desquamation)
- Peliosis rheumatica**, absence of valvular heart disease in 599
- - age and sex incidence of 600
 - - distribution .. 599
 - - erythema in .. 600
 - - joints affected in .. 599
 - - purpura in .. 596, 599
 - - pyrexia in .. 599
 - - relation to acute rheumatism .. 121, 599
 - - slight influence of salicylates in .. 600
 - - soreness of throat in .. 599
 - - theory of origin of 600
- Pelvic grip** in abdominal palpation in pregnancy .. 228
- - pain (see Pain, Pelvic)
 - - peritonitis (see Peritonitis, Pelvic)
- Pelvimeter**, Skutsch's, use of, in pregnancy .. 228
- Pelvis**, abscess of (see Abscess, Pelvic)
- - adhesions causing acute intestinal obstruction .. 152
 - - affections, frequency of micturition with .. 817
 - - beaked or rostrate .. 212
 - - bones, new growths of, pelvic swelling due to .. 757
 - - cellulitis of, absence of local peritonitis in .. 760
 - - always due to labour .. 760
 - - burrowing along round ligament to groin .. 760
 - - diagnosis from pelvic abscess .. 760
 - - pelvic swelling due to 757, 760
 - - uterus fixed by .. 760
 - - vaginal fornix bulged by 760
 - - chondroma of .. 737, 761
 - - congestion of, causes of 508
 - - deep-seated pelvic pain in 508
 - - contracted in achondroplasia 212
 - - dystocia due to .. 227
 - - deformed in rickets .. 212
 - - diseases of, constipation in painful .. 114
 - - diagnosis from lumbago 477
- Pelvis, diseases of, contd.**
- - frequency of micturition in 438
 - - mastodynia in .. 479
 - - sacralgia in .. 509
 - - displacement of, causing prolapse of uterus .. 586
 - - fracture of (see Fracture of Pelvis)
 - - glands enlarged in, causes identical with those of mesenteric gland enlargement 422
 - - growth in, bearing-down pain from .. 473
 - - bilateral hydronephrosis in .. 311
 - - cartilaginous .. 761
 - - complicating pregnancy 761
 - - continuity with pelvic bones 761
 - - diagnosis from salpingo-oophoritis .. 761
 - - sciatica .. 487
 - - enlarged mesenteric and retroperitoneal glands in .. 422
 - - fixity of .. 737, 761
 - - nephritis from .. 8
 - - paraplegia due to .. 561
 - - due to pelvic abscess from appendicitis .. 632
 - - pelvic swelling due to .. 761
 - - rarity of .. 761
 - - rectal examination in diagnosing .. 487
 - - sarcomatous .. 741, 761
 - - simulating peripheral neuritis .. 562
 - - talipes from .. 131
 - - vaginal examination in diagnosing .. 487
 - - hæmatocoele in (see Hæmatocoele, Pelvic)
 - - impaction of lower end of spleen in .. 688
 - - inflammation in, acute, severe pain in pelvis in .. 508
 - - causing amenorrhœa 23, 24
 - - diagnosis from sciatica .. 487
 - - kinking of bowel from .. 147
 - - rectal examination in diagnosing .. 487
 - - simulating sciatica .. 74
 - - vaginal examination in diagnosing .. 487
 - - injury or inflammation of, causing nerve paralysis 542
 - - method of measuring in pregnancy .. 228
 - - sarcoma of (see Sarcoma of Pelvis)
 - - swelling in (see Swelling in Pelvis)
 - - due to uterine cysts .. 757
 - - tuberculous disease, urethral passage of feces in 264
 - - tumours of, or cauda equina simulating neuritis .. 562
 - - diagnosis from renal tumours .. 392, 393
 - - difficult micturition from in female .. 439
 - - dislocated spleen causing 601
 - - dystocia due to .. 227
 - - muscular atrophy in .. 74
 - - cedema of legs from 456
 - - physical signs of .. 393
- Pemphigus**, affecting fingers 266
- - albuminuria in .. 17
 - - bleeding gums in .. 86, 88
 - - of the buccal cavity .. 225
 - - bullæ in 110, 111, 113, 602, 654
 - - crusts in .. 654
 - - diagnosis from cheilopompholyx .. 832
 - - impetigo .. 602

Periosteal abscess (see Abscess, Periosteal)

Periosteum , fibroma of, rarity of	755
- hemorrhage beneath, in scurvy	85
- lipoma of, rarity of	755
- recurrent fibrosarcoma of..	204
- syphilitic thickening of ..	519
- tender in infantile scurvy ..	599
- thickening of, in acromegaly	753
Periostitis , abscess in heart from	650
- albumosuria in ..	20
- alveolar, diagnosis from	
parotitis ..	747
- anaemia from ..	39
- acute (and see Abscess) ..	750
- simulated by scurvy-rickets ..	753
- chronic , diagnosis from	
gumma ..	752
- sarcoma ..	756, 763
- long duration of ..	751
- operation in diagnosis of	751
- thickening of bone from (Fig. 192) ..	751
- x-rays in diagnosis from sarcoma (Figs. 196, 198, 199, p. 754, 756) ..	751
- in enteric fever ..	648
- gummatous ..	681
- trigeminal neuralgia in	496
- of mastoid process, pain behind ear from ..	230
- orbital, unilateral exophthalmos due to ..	254
- pericarditis from ..	650
- popliteal swelling due to	761, 763
- syphilitic, diagnosis from periosteal sarcoma ..	756
- tuberculous , bones commonly affected by ..	752
- diagnosis from syphilitic	752
Peripheral nerve , effects of	
- dividing ..	661
- distribution (<i>Plate XI</i> , p. 663) ..	551
- lesions causing ataxy ..	65
- muscular atrophy in ..	72, 75
- neuritis (see Neuritis, Multiple Peripheral)	
Perirectal abscess (see Abscess, Perirectal)	
Perisplenitis , friction sound in	499
- obscure cases of ..	123
- pain in left hypochondrium in ..	499
Peristalsis and borborygmi ..	96
- palpable in intussusception	92
PERISTALSIS, VISIBLE , conditions causing ..	570, 571
- in acute obstruction ..	152
- with carcinoma of colon ..	91, 145, 147
- in chronic intussusception ..	92, 148
- constipation due to deficient ..	143
- in excluding gastric atony	713
- gastric, due to pyloric or duodenal obstruction ..	134, 352, 570, 713, 723, 725
- Hirschsprung's disease ..	148, 718, 724
- with hypertrophic stenosis of the pylorus ..	845
- in intestinal colic ..	473
- obstruction, 151, 152, 267, 350, 431, 571, 723, 727 ..	724
- thin adults ..	
Peritoneal adhesions (see Adhesions, Peritoneal)	
- band, intestinal obstruction from ..	431
- cavity, free gas in, causing obliteration of liver dullness ..	406

Peritoneal cavity, contd.

- free gas in, simulated by meteorism ..	716
- gas in (see Meteorism)	
- fluid in (see Ascites and Peritonitis)	
- encysted, pelvic swelling due to ..	757, 761
Peritoneum , diseases of, causing	
ascites ..	53, 57
- hydatid disease of ..	720
- primary carcinoma of ..	57
- rupture of aneurysm into ..	482
Peritonitis, acute general	
- abdominal distention in ..	134, 472, 644
- pain from ..	472, 644, 718, 846
- after abdominal injury ..	644, 646
- abortion ..	644
- operations ..	644
- from abscess of kidney ..	644
- liver ..	644
- spleen ..	644
- albumosuria in ..	20
- from appendicitis ..	55, 431, 644, 780
- bands from, causing obstruction ..	151, 152, 431
- borborygmi absent in ..	97, 431, 644, 645
- from Bright's disease ..	14, 63
- carcinoma of the colon ..	645
- after childbirth ..	644
- and colic, points of distinction between ..	644
- collapse in ..	346
- constipation in ..	147, 153, 472, 644, 718
- danger of morphia administration in ..	472
- diagnosis of ..	431
- from intestinal obstruction ..	431, 645
- laparotomy in ..	645
- suppurative pyelophlebitis ..	614
- diarrhoea in ..	644
- drawing up of legs in ..	472, 644
- dry furred tongue in ..	431
- mouth in ..	774
- dullness of the flanks in ..	644
- from duodenal ulcer ..	55, 644, 780
- dysentery ..	55
- embolism ..	432
- endometritis ..	644
- extreme thirst from ..	789
- facies Hippocratica in ..	431, 644
- a first symptom of chronic nephritis ..	14
- fluid in abdomen in ..	644
- foul breath in ..	98
- taste in ..	774
- frequency of micturition in ..	644
- furred tongue in ..	774
- from gastric ulcer ..	55, 644, 780
- gall-bladder rupture ..	281, 644
- general account of ..	644
- gonococcal ..	55
- from growth in liver ..	412
- hicough in ..	342
- history of gastric or duodenal ulcer in ..	431
- hypothermia in ..	346
- immediate laparotomy needed for ..	846
- immobility of abdominal wall in ..	472
- impaired note in flanks in ..	431
- importance of early diagnosis in ..	472
- indicanuria in ..	349
- leucocytosis in ..	472, 645
- liver dullness lost in ..	404, 644
- meteorism in ..	431, 644
- nausea in ..	472

Peritonitis, acute general, contd.

- non-suppurative, ascites in ..	55
- causes of ..	55
- pain increased by pressure in ..	473
- local at onset of ..	472
- paralysis of bowel in ..	472
- from parametritis ..	644
- perirectal abscess ..	55
- phrenic neuralgia simulating ..	478
- pleuritic effusion from ..	122
- pneumococcal ..	55
- prostatic abscess ..	55
- pulse, increasingly rapid in ..	431, 472
- rapid in ..	644
- wiry in ..	472
- pyoperitoneum from ..	717
- pyosalpinx ..	55, 123
- pyrexia in ..	134, 153, 472, 718
- retention of urine in ..	644
- retraction of abdomen at onset of ..	472
- rigid abdomen in ..	134, 153, 431, 644, 846
- rub over liver or spleen in ..	431
- from ruptured tubal gestation ..	646, 780
- septicaemia from ..	698
- simulated by acute haemorrhagic pancreatitis ..	646
- colic ..	645
- diaphragmatic pleurisy ..	645
- dissecting aortic aneurysm ..	646
- embolism of mesenteric artery ..	646
- pneumonia ..	472, 645
- ruptured abdominal aneurysm ..	646
- suppurative nephritis ..	646
- thrombosis of inferior vena cava ..	646
- from stercoral ulcer of bowel ..	55
- supervention on intestinal obstruction ..	431, 644
- tenderness of abdomen in ..	134, 153
- thoracic respiration in ..	644
- tuberculous ..	55
- from tuberculous ulcer of bowel ..	55
- in typhoid fever ..	55, 431, 648
- various causes of ..	644
- vomiting in ..	431, 472, 718, 844, 846
- wasting with ..	718
- chronic , "doughy" feel of abdomen in ..	472
- dull feeling of heaviness in ..	472
- enlarged abdominal lymphatic glands in ..	725
- fluid in peritoneal cavity in ..	472
- localized, followed by constipation ..	147
- loculated ascites with ..	51
- masses of thickened peritoneum felt in ..	472
- omental tumour from ..	406, 472
- simulating malignant growth of stomach ..	472
- tumour of colon ..	472
- perihepatitis in ..	60, 412
- in severe anemias ..	64
- simple, ascites in ..	55
- causes of ..	55
- constipation with ..	56
- vomiting with ..	56
- tubercle the commonest cause of ..	472
- hydatid , account of ..	719
- intestinal adhesions with ascites in ..	56

Pharynx, contd.

- gangrene of lung after operation on	288
- paralysis of	775
- progressive weakness of, in bulbar paralysis.. .. .	224
- rhinoscleroma of	805
- small-pox eruption in	673
- small-track ulcers of, in secondary syphilis	672
- spasm of	225
- syphilitic stenosis of	225
- ulceration of, earache from	230
Phenazone, reducing body in urine due to	290
Phenol, gangrene from	282
Phenylalanin, relation of alkaptonuria to	822
Phenyl-glucosazone crystals.. .. .	290
Phenyl-lactosazone crystals.. .. .	291
Phenylhydrazine in sugar testing	115, 290, 818
Phimosis in balanitis.. .. .	674
- - - pain in the penis in	515
- causing infantile convulsions	170
- - - chance obscured by	675
- - - enuresis with	248
- - - frequency of micturition in	438
- - - priapism from	585
- - - pyuria due to	631
Phlebitis , oedema of one leg from	459
- - - face, neck, and arms from	458
- - - pain in the leg from	486
- - - pyrexia due to	621
- - - (and see Thrombosis)	
Phlegmasia alba dolens, after labour	810
- - - during pregnancy	810
- - - infective thrombus causing	456, 810
- - - ulceration of leg from	810
Phloroglucin in urine testing	290
Phocomelus	214
Phonation (see Speech)	
Phosphates in acute Bright's disease	12
- in boiling test for albumin	5
- dissolved by acid	623
- effects of hæmaturia on colour of	12
- and nucleo-proteid, difficulty of distinguishing in urine	471
- physiology of, in urine	572
- simulated by urates	815
- turbidity of urine due to	208
- variation in amounts normally excreted	572
Phosphatic diabetes (see Diabetes, Phosphatic)	
PHOSPHATURIA	571
- absolute	571
- diagnosis from chyluria	126
- - - pyuria	623
- - - sacralgia from	510
- - - in simple ulcer of bladder	630
Phosphorus poisoning , absence of leucin and tyrosin from urine in	373
- - - acute irritant symptoms in	373
- - - albuminuria in	17
- - - albumosuria in	20
- - - anuria in	45, 48
- - - ascites in	62
- - - black vomit in	373
- - - bleeding gums in	85, 87
- - - burning epigastric pain in	373
- - - chemical analysis of vomit	845
- - - collapse in	373
- - - coma in	373
- - - concentrated acid urine in	373
- - - concentration and viscosity of bile in	373
- - - convulsions in	373

Phosphorus poisoning, contd.

- - - delirium in	373
- - - diagnosis from acute yellow atrophy of liver	373
- - - diminution of chlorides in urine in	373
- - - drowsiness in	373
- - - from eating match-heads or rat paste	373
- - - extreme thirst in	373
- - - fatty heart from	62, 87, 241
- - - liver in	87, 414
- - - great destruction of albuminous tissues in	373
- - - hæmatemesis in	294, 297
- - - hæmorrhages in	373
- - - headache in	373
- - - increase of ammonia coefficient in urine in	373
- - - jaundice in	362, 373
- - - liver enlarged, in	363, 373
- - - in match manufacture	87
- - - nausea and vomiting in	373
- - - necrosis of jaw from	87, 747
- - - pain in epigastrium in	373
- - - post-mortem appearances	373
- - - priapism caused by	586
- - - ptyalism due to	590
- - - rapid feeble pulse in	373
- - - respiration in	373
- - - simulating acute gastritis	845
- - - suicidal origin of	373
- - - tenderness in right hypochondrium in	373
- - - in epigastrium in	373
- - - total nitrogen in urine in	373
- - - urinary changes in	373
Phosphotungstic acid test for albumose	20
Phosy jaw	87
PHOTOPHOBIA	574
- from conjunctivitis	255
- corneal ulceration	806
- with electric blindness	840
- in iritis	255
- major trigeminal neuralgia	495
- meningitis	350
- snow blindness	840
Phrenic nerves , compression in aortic aneurysm	482
- - - diaphragm supplied by	779, 842
- - - diphtheritic paralysis of	77
- - - hiccough in irritation of	342, 343
- neuralgia (see Neuralgia, Phrenic)	478
Phtheiriiasis, chloasma in	574
Phthisical cachexia, albuminuria in	17
- - - impotence in	347
Phthisis (and see Pulmonary Tuberculosis)	
- absence of abnormal apical signs in	319, 577
- - - tubercle bacilli in sputum	704
- - - acute, rigors in	647
- - - advanced, indicanuria in	349
- - - alar or flat chest in	191
- - - albuminuria in	17
- - - albumosuria in	20
- - - anæmia in	27, 36, 39, 620
- - - bronchial breathing in	319
- - - bronchophony and pectoriloquy in	319
- - - caseous mass in sputum	704
- - - with cavitation, abundant foul sputum in	651, 703
- - - affection chiefly of upper lobes	703
- - - nummular sputum in	700
- - - simulating gangrene of lung	288
- - - tubercle bacilli in	703

Phthisis, contd.

- chronic, fibroid lung and bronchiectasis from	324
- - - clubbed fingers in	128, 129
- - - gangrene of lung in	287
- - - coagulation of sputum in	704
- - - consanguineous râles in	319
- - - cough in	101, 175, 176, 185, 319, 480, 577, 620
- - - cretaceous pellet in sputum	704
- - - cyanosis in	185
- - - deficient respiratory movement in	319
- diagnosis from apical broncho-pneumonia	321
- - - of fibroid lung from	246
- - - from gangrene of lung	321
- - - sporotrichosis of lung	322
- - - syphilis of bronchus	325
- - - typhoid fever	611
- diarrhoea from	197
- diazo-reaction a grave sign in	198
- - - early shortness of breath in	101
- - - elastic fibres in sputum	319, 701
- - - empyema from	120
- - - family history in	848
- - - fatty heart in	241
- - - fibroid	129
- - - vocal cord paralysis from	538
- - - foetid sputum in	321
- - - foul breath caused by	99
- - - taste in	774
- general, diagnosis from broncho-pneumonia	615
- - - gingivitis in	87
- - - hæmoptysis in	123, 176, 185, 317, 319
- - - various causes of	319
- - - headache in	328
- - - hernia of the lung in	194
- - - hydropneumothorax from	712
- - - impairment of resonance in	319
- - - impotence early in	347
- - - indigestion an early sign	350
- - - insomnia in	359
- - - knee-jerks exaggerated in	397
- - - lardaceous disease from	10, 696
- - - liability to, in congenital heart disease	320
- - - lichen scrofulosorum with lining of cavities by granulation tissue in	701
- - - local muscular atrophy in	72
- - - long neck and sloping shoulders in	191
- - - loss of appetite in	319
- - - weight in	319, 847
- - - malaise at onset of	620
- - - mistaken for rheumatism of the shoulder	778
- - - nausea and vomiting in early	350
- - - night sweating in	319, 577, 714
- - - pain in chest in, various causes of	480
- - - in umbilical region in	525
- - - pleurisy in, chronic	480
- - - and pneumothorax in	578
- - - preventing pneumothorax	578
- - - pleuritic effusion in	123, 712
- - - pneumococci in	701
- - - pneumothorax from	577, 578
- - - prolonged expiration in	319
- - - prominence of one clavicle in	319
- - - ptyalism in	591
- - - pulmonary aneurysm in	319
- - - purpura in	598
- - - pus cells, tubercle bacilli, elastic fibres in sputum in	319
- - - pyrexia the earliest symptom in many cases of	620
- - - pyrexial albuminuria in	17
- - - rapid in diabetes	292
- - - rarely associated with tuberculous joint disease	366

Phthisis, contd.

- not related to tuberculous cervical glands ..	420
- retraction of chest wall in ..	194
- rigors in ..	648, 651
- secondary pyogenic infection the cause of many of the symptoms of ..	651, 701
- simulation by aneurysm ..	322
- anorexia nervosa ..	850
- hydatid cyst of lung ..	323
- neurasthenia ..	347
- pneumonia ..	321
- sarcoma ..	296
- sputum in ..	39, 319, 577, 578, 700, 701, 704
- staphylococci in ..	701
- streptococci in ..	701
- succussion sounds in cavity ..	711
- sudden acute pain in chest from pneumothorax arising in ..	577
- suggested by cough which wakes patient ..	176
- tenderness in chest from ..	778, 779
- testicular atrophy in ..	80
- tiredness at onset of ..	620
- tubercle bacilli in ..	99, 577, 578, 703, 704
- tuberculous stomatitis in ..	591
- affection of mouth with ..	814
- laryngitis in ..	674
- ulceration of intestine ..	90
- of palate with ..	640
- tonsil from ..	672
- unequal vocal fremitus in ..	319
- unknown almost in infancy ..	427
- vomiting in ..	844
- wasting in ..	185, 319
- x-rays in detection of ..	120, 319, 736, 847
Physiological albuminuria ..	19
- polyuria in ..	584
Physostigmine, pupil constriction from ..	595
Planist's cramp ..	177
Pica ..	50, 115
Picric acid, discoloration of skin and conjunctiva by ..	575
- poisoning, xanthopsia in ..	840
- test for glycosuria ..	290
Pied-en-griffe (see Claw-foot)	
Pigeon feeders, aspergillosis in ..	705
- breast in rickets ..	191, 212
Pigmentation, buccal ..	38, 813, 819
- of conjunctiva in oedema ..	822
- scars after syphilides ..	604
PIGMENTATION OF SKIN ..	574
- in Addison's disease ..	38, 843, 849
- arsenical ..	38, 76, 87, 411, 423

- xeroderma pigmentosum ..	804
Pigmented crescents, ophthalmoscopic appearances of (Plate VII) ..	461
Pigments in urine, abnormal, method of precipitation ..	820

Piles (see Hæmorrhoids)

Pillows if high may cause headache on rising ..	327
Pilocarpine, ptialism due to ..	590
Pimples (see Papules)	
Pinguecula, conjunctivitis distinguished from ..	256
- from exposure to weather ..	256
Pink eye, epidemics of ..	256
Pins and needles in extremities in paroxysmal tachycardia ..	772
- peripheral neuritis ..	505
- in oesophagus, hæmatemesis from ..	297
- rectum ..	635
- urethra ..	210
"Pits" in small-pox ..	605
Pitting, absence of, in oedema from obstructed lymphatics ..	456
- on pressure in oedema ..	456
Pituitary body, enlargement, polyuria from ..	585
- hypertrophy of, in acromegaly ..	335, 585, 749
- hemianopsia from ..	335
- secretion, effect on menstruation ..	430
Pityriasis, diagnosis from ring-worm of scalp ..	274
- rosea, distribution ..	658
- diagnosis from erythrasma ..	276
- pityriasis rubra ..	658
- psoriasis ..	658
- seborrhœa corporis ..	658
- syphilides ..	658
- tinea circinata ..	658
- versicolor ..	276
- macules in ..	424
- pruritus in ..	558
- rare below elbow or knee ..	658
- scales in ..	658
- rubra (Plate X) ..	658
- absence of bullæ in ..	658
- itching in ..	658
- papules in ..	658
- death from ..	658
- diagnosis from eczema ..	658
- erythema scarlatini-forme ..	253
- pemphigus foliaceus ..	658
- pityriasis rosea ..	658
- psoriasis ..	658
- impaired health in ..	658
- scales in ..	658
- sequel of another lesion ..	658
- rubra pilaris, of fingers ..	266
- soles and palms ..	658
- diagnosis from dermatitis exfoliativa ..	530
- lichen ruber planus ..	530
- psoriasis ..	530
- distribution of ..	530
- health unaffected in ..	530
- papules in ..	528, 530, 658
- plucked-fowl skin in ..	530
- pruritus in ..	558
- scales in ..	655, 658
- slightness of itching in ..	530
- versicolor (see Tinea Versicolor)	
Placenta, adherent ..	227
- causes of delay in delivery of ..	229
- origin of eclampsia in ..	172
- prævia, hæmorrhage from ..	436, 437
- need for early delivery in ..	437
- signs of ..	437
Plague, bacteriological diagnosis in ..	418
- gangrene in ..	282
- generalized glandular enlargement in ..	416, 418
- purpura in ..	596
- rigors in ..	647

Plantar fascia, gonococcal inflammation ..	376
- reflexes (and see Babinski's sign) ..	81
- asymmetrical, with coma ..	137
- in hysterical monoplegia ..	541
- infantile paralysis ..	81
- paralyses from intra- and extra-medullary lesions ..	546
- relation of ankle-clonus to ..	44
- in sciatica ..	487
- extensor (see Babinski's sign)	
Plantaris, nerve supply of ..	542
- longus, liability to spontaneous rupture ..	597
Plants as cause of bulke ..	110
Plethoric habit, epistaxis from ..	252
Pleura, B. coli infection, causing pneumothorax ..	577, 578
- carcinoma of, bloody effusion in ..	118
- cohesion of layers preventing traumatic pneumothorax ..	578
- effusion into, from bronchial obstruction ..	121
- endothelioma of, gangrene of hand from ..	287
- gas in (see Pneumothorax) ..	777
- insensitiveness of ..	777
- new growth of, displacement of cardiac impulse in ..	330
- pain and tenderness in back from ..	789
- pleuritic effusion in ..	118, 121, 322
- pneumothorax from gangrene of ..	577, 578
- rupture of aneurysm into ..	482
Pleurisy from abscess of lungs ..	649
- in acute rheumatism ..	671
- with aortic aneurysm ..	482
- clubbed fingers in ..	128
- cough from ..	176, 480
- danger of regarding as pleurodynia ..	478
- disappearance of pain with effusion in ..	480
- distinction from pleurodynia ..	776
- with effusion in chest (see Pleuritic Effusion)	
- empyema after ..	650
- in cuticæ fever ..	648
- intercostal tenderness in ..	479
- leucocytosis moderate in ..	401
- and mediastinitis ..	61
- mistaken for hysteria ..	777
- indigestion ..	351
- intercostal neuralgia ..	777
- pain in the back from ..	789
- chest in ..	478, 479, 480
- increased by movement ..	479
- relieved by immobilizing chest ..	479
- epigastrum in ..	485
- left hypochondrium in ..	499
- limbs in ..	505
- right hypochondrium in ..	501
- in phthisis ..	480, 578
- pleuropericardial rub in ..	481
- in pneumonia ..	480
- rigors with ..	650
- rub in ..	479, 481, 499
- secondary to abscess of liver ..	409, 651
- subphrenic abscess ..	501, 721
- shortness of breath in ..	101
- simulated by herpes zoster ..	830
- systolic thrill due to ..	790
- tenderness in chest from ..	776, 777, 779
- in back from ..	789
- epigastrum from ..	779

Pleurisy, contd.

- **diaphragmatic**, abdominal pain in .. 133, 645
- - - rigidity from .. 645
- - - distribution of pain from .. 779
- - - frequent absence of rub in .. 480
- - - pain in chest in .. 478
- - - near costal margin in .. 479
- - - about the crest of the shoulder in .. 479
- - - simulating phrenic neuralgia .. 479
- - - general peritonitis .. 645
- - - slight depression of liver in .. 405
- **Pleuritic effusion** (and see Chest, serous effusion in) 120, 121
- - - egophony in .. 332
- - - ascites with .. 62
- - - blood-stained from new growth in lung .. 118, 322
- - - from inflammation .. 118
- - - cardiac impulse displaced by .. 232, 330, 764
- - - character of fluid in .. 118, 121
- - - in chronic nephritis, a first symptom of .. 15
- - - communicated pulsation in .. 764
- - - compression of lung in .. 324, 331
- - - confusion of hydatid cyst of liver with .. 415
- - - depression of liver from large right-sided .. 405
- - - empyema following .. 119
- - - fibroid lung and bronchiectasis from .. 324
- - - heart failure from .. 525
- - - from infarction of lung .. 123
- - - immobilization of diaphragm by .. 721
- - - latent, with shortness of breath .. 101
- - - from new growth .. 118, 121, 185, 322
- - - palpitation in .. 525
- - - particles of new growth of lung found in .. 322
- - - physical signs of .. 192
- - - pneumothorax with .. 480
- - - after tapping for .. 577, 578
- - - shrinkage of one side of chest from .. 193, 194
- - - skodaic resonance over .. 667
- - - tuberculous, inoculation of guinea-pig in .. 121
- - - unilateral enlargement of chest from .. 192
- - - x-rays in diagnosis of .. 721
- - - rub (see Rub, Pleuritic)
- **Pleurodynia**, definition .. 478
- - - distinction from pleurisy .. 776
- - - myalgia .. 507
- - - pain in the chest in .. 477
- - - pneumonia mistaken for .. 480
- - - tenderness in chest from .. 776
- - - of muscles in .. 478
- **Pleuropericardial rub** (see Rub, Pleuro-pericardial)
- **Plexus patellae nerves**, skin distribution of .. 659
- **Plucked-fowl skin in pityriasis rubra pilaris** .. 530
- **Plumbism**, albuminuria in .. 16
- - - amblyopia with .. 836
- - - amenorrhoea from .. 23
- - - anaemia in .. 36, 37, 38, 136, 144, 507, 798
- - - anuria in .. 45, 48
- - - arteriosclerosis from .. 144, 507
- - - bleeding gums in .. 85, 87
- - - blue line on gums in .. 136, 144, 473, 507, 525, 551, 645, 798
- - - brachial palsy in .. 551
- - - cachexia in .. 115
- - - central scotoma from .. 836

Plumbism, contd.

- cerebral symptoms in (and see Saturnine Encephalopathy) .. 38, 173
- - - colic in .. 136, 144, 798
- - - coma due to (see also Saturnine Encephalopathy) 137, 139
- - - constipation in (Fig. 36, p. 145) 136, 144, 153, 507, 798
- - - deafness from .. 181
- - - delirium due to .. 195
- - - diagnosis from renal colic .. 500
- - - dysphagia from .. 225
- - - epileptiform convulsions in .. 173
- - - foul taste in mouth from .. 774
- - - general abdominal pain in .. 473
- - - gout in .. 507
- - - granular kidney in .. 144
- - - headache in .. 328
- - - high blood-pressure in .. 485, 507
- - - impairment of sight in .. 77
- - - impotence in .. 346
- - - infantilism from .. 215
- - - intestinal motor activity inhibited in .. 144
- - - irritability in .. 360
- - - lead in urine in .. 87, 525
- - - leucopenia in .. 401
- - - medulla degeneration from .. 225
- - - muscular atrophy in .. 77
- - - neuritis from .. 77, 131, 165, 492, 506, 507, 797
- - - of external popliteal nerve .. 543
- - - obscure sources of .. 77
- - - occupation in diagnosis of .. 473
- - - optic neuritis due to .. 139, 836
- - - pain in epigastrium in .. 486
- - - limbs in .. 507
- - - umbilical region only complained in some cases .. 525
- - - palsies in .. 144
- - - paralysis of limbs in .. 797
- - - punctate basophilia in .. 30
- - - rise of blood-pressure in .. 485
- - - simulating general paralysis of the insane .. 797
- - - mucro-membraneous colitis .. 486
- - - symptoms of .. 38, 77
- - - talipes due to .. 131
- - - tetany in .. 178
- - - tremor in .. 795, 797
- - - wrist-drop in .. 77, 507, 798
- **PNEUMATURIA** .. 576
- - - association with faeces per urethram .. 264, 633
- - - intestinal fistula .. 676
- **Pneumobacilli**, cerebrospinal fluid .. 340
- - - in sputum in lobar pneumonia .. 702
- **Pneumococcal arthritis**, general account of .. 375
- - - infections, bacteriuria in .. 83
- - - pleurisy with .. 122
- - - middle-ear disease .. 375
- - - peritonitis, acute .. 55
- **Pneumococci**, acute laryngitis from 185, 226, 465, 466, 670, 673, 709
- - - tonsillitis from .. 670
- - - in ascitic fluid .. 57
- - - bronchopneumonia .. 615
- - - in cerebrospinal fluid .. 340
- - - circulating blood .. 650
- - - empyema from .. 119, 122
- - - fungating endocarditis .. 237, 614
- - - general septicæmia .. 642
- - - in healthy persons .. 702
- - - meningitis due to .. 339, 642
- - - in nasal discharge .. 203
- - - nephritis due to .. 83
- - - pharyngitis from .. 670
- - - in phthisical sputum .. 701
- - - pleurisy from .. 122

Pneumococci, contd.

- - - pyelitis due to .. 625
- - - pyelonephritis due to .. 83
- - - in sputum, in lobar pneumonia (Plate XII, Fig. O, p. 696) .. 702
- - - no proof of pneumonia .. 702
- - - ulcus serpens .. 807
- - - urethritis due to .. 83
- **Pneumonia** (and see Bronchopneumonia), abdominal pain in .. 133, 472, 645
- - - rigidity in .. 645
- - - absence of signs in chest in some cases of .. 702
- - - albuminuria in .. 12, 13, 17, 18
- - - albumosuria in .. 20
- - - anaemia in, suggesting empyema .. 39
- - - biliary catarrh in .. 372
- - - bleeding gums in .. 85
- - - bromidrosis with .. 714
- - - bronchial casts in sputum .. 704
- - - casts in sputum in .. 704
- - - Cheyne-Stokes respiration in .. 125
- - - consolidation of lung in .. 372
- - - cough from .. 175, 176, 372
- - - crisis of, need for stimulants at .. 622
- - - profuse perspiration after .. 702
- - - sudden drop in temperature at .. 622
- - - cyanosis in .. 186
- - - deep-seated .. 702
- - - deficiency of chlorides in urine in .. 186, 321, 372
- - - delay in appearance of physical signs in .. 480
- - - delirium in .. 194
- - - in diabetes .. 292
- - - diagnosis from peritonitis .. 472
- - - suppurative pyelophlebitis .. 614
- - - diazo-reaction in .. 198
- - - dry mouth in .. 774
- - - dullness in the chest from .. 645
- - - empyema after .. 119, 323, 650
- - - slight value of leucocyte count in diagnosis of .. 401
- - - endocarditis in .. 103, 314
- - - in enteric fever .. 648
- - - eosinophilia after .. 248
- - - fibroid lung and bronchiectasis from .. 324
- - - foul taste in .. 774
- - - fungating endocarditis from .. 314
- - - furred tongue in .. 774
- - - gangrene of lung from .. 287, 578, 703, 712
- - - gradual resolution in .. 702
- - - hæmoptysis in .. 317, 320, 321
- - - simulating phthisis .. 321
- - - heart impulse displaced in .. 330
- - - herpes facialis in .. 186, 372
- - - hyperpyrexia in .. 343
- - - hypothermia after convalescence .. 346
- - - infantile convulsions from .. 170
- - - in influenza .. 505, 610
- - - frequently fatal .. 505
- - - sputum like that of mucopurulent bronchitis .. 702
- - - inhalation, gangrene of lung in .. 703
- - - initial rigor in .. 372
- - - jaundice in .. 362, 372
- - - leucocytosis in .. 39, 401, 645
- - - liver enlarged in .. 372
- - - loss of knee-jerks in .. 399
- - - mistaken for hysteria .. 777
- - - intercostal neuralgia .. 480, 777
- - - pleurodynia .. 480
- - - pain in chest in .. 372, 478, 480
- - - physical signs in .. 186, 701, 702
- - - pleurisy in .. 122, 372, 480

Pneumonia, contd.

- pneumococcal arthritis in .. 375
- pneumococci in blood in .. 650
- in sputum in (*Plate XII*, p. 696) .. 321, 702
- pneumothorax from .. 578
- polyuria after .. 582, 583
- prognosis in alcoholics .. 194
- pulse relatively slow in .. 372
- respiration ratio in .. 321, 372
- temperature ratio in .. 697
- pyopneumothorax from .. 712
- pyrexia in .. 321, 372, 622, 702
- and crisis of .. 186
- resolution delayed in .. 321
- respiration rapid in 372, 645, 702
- ratio in .. 321, 372, 697
- right basal, special association of jaundice with .. 372
- rigidity in .. 645
- rigors in .. 372, 647, 648, 650
- rub in .. 372
- secondary to abscess of liver .. 409
- septic, gangrene of lung from .. 703
- hemoptysis in .. 371
- shortness of breath in .. 101
- simulated by general millary tuberculosis of lung .. 702
- simulating general peritonitis .. 645
- skin flushed, dry, pungent in .. 372, 702
- skoda resonance with .. 667
- spleen enlarged in .. 692, 698
- sputum rusty in .. 175, 186, 320, 372, 700, 701, 702
- various colours of .. 702
- viscid in 320, 321, 372, 700, 702
- sudden onset of .. 321, 372, 701
- technically a septicaemia .. 650
- temperature curve (*Fig. 188*) .. 702
- urate deposit in .. 815
- vomiting in .. 622
- working of the nares in .. 645
- x-rays in diagnosis (*Fig. 99*) .. 321
- Pneumonoconiosis (see Cirrhosis of Lung)
- Pneumoperitoneum, causes of .. 711
- succussion sounds in .. 711
- PNEUMOTHORAX** .. 577
- absence of breath sounds in .. 480
- pain in some cases of .. 480
- symptoms from .. 378
- vocal fremitus in .. 480
- acute dyspnoea in .. 185
- onset in half the cases of .. 480
- causes of .. 577
- cyanosis in .. 185, 480, 577
- dyspnoea in .. 480
- with fluid, succussion with .. 193
- from gangrene of pleura .. 577, 578
- heart displaced by .. 232, 330, 480, 712, 721
- failure in .. 464
- hemoptysis from .. 577
- liver depressed by .. 405
- in lobar pneumonia .. 578
- loss of movement of chest on affected side in .. 480
- onset insidious in many cases .. 480
- orthopnoea in .. 464
- pain in the chest in 193, 478, 577
- aggravated by breathing in .. 480
- severe sudden at onset .. 480
- partial .. 577
- in phthisis .. 578
- physical signs of .. 193, 480, 577
- pleural effusion in .. 480
- prostration in .. 480
- rapid feeble heart's action in sense of "something giving way" at onset of .. 480
- simulated by subphrenic abscess .. 578

Pneumothorax, contd.

- symptoms caused by .. 577
- tubercle bacilli in sputum .. 578
- commonest cause of .. 185
- tympanic resonance in .. 480
- unilateral enlargement of chest from .. 192, 193, 480
- x-rays in diagnosis of .. 480, 577
- Poikilocytosis (*Plate II, Fig. E*) .. 28
- in pernicious anaemia .. 616
- severe anaemias .. 620
- Poisoning** (and see various poisons, e.g. Arsenic; Corrosive; Irritant; Opium; Phosphorus; Ptomaine; Shell-fish; Strychnine; etc.)
- anuria in .. 45, 48
- bleeding gums in .. 85, 87
- chronic, causing amenorrhoea .. 23
- irritant, diarrhoea from .. 197
- condition of skin in .. 195
- delirium from .. 195
- diazo-reaction in some cases .. 198
- fatty degeneration with ascites in .. 62
- haematemesis in .. 294, 297
- hypothermia in coma due to .. 346
- jaundice due to .. 362, 373
- nystagmus following .. 453
- universal oedema from .. 458
- Polarimetry in quantitative estimation of glycosuria .. 291
- Polio-encephalitis, acquired
- paralysis of childhood from .. 155
- athetosis after .. 155
- Poliomyelitis, acute anterior,**
- acute onset of .. 562
- in adults .. 73, 562
- atrophic palsies in .. 128, 544
- claw-hand in .. 127
- contractures after .. 163, 165
- convulsions in .. 128, 555
- defects of growth, deformities, etc., in .. 555
- diagnosis from peripheral neuritis .. 559
- electrical reactions in .. 70, 555, 558, 559
- generalized pains in .. 555
- headache in .. 128
- infantile paralysis from 70, 559
- lymphocytosis in cerebrospinal fluid in .. 339
- muscular atrophy in paralysis of .. 70, 158, 558
- paralysis of arm in .. 555
- paraplegia due to 557, 561, 562
- pyrexia in .. 128, 555
- reflexes in .. 555, 559
- rigors in .. 647
- talipes from .. 559
- vasomotor changes in .. 555
- vomiting in .. 128, 555
- chronic anterior, fibrillary contractions in .. 158
- claw-foot from .. 127
- diagnosis of transverse myelitis from .. 74
- Landry's paralysis an acute variety of .. 567
- Politzer's accumulator, illustrated .. 188
- Polycystic disease (and see Cystic Disease) .. 48
- of kidney, general account of .. 396
- POLYCYTHÆMIA** .. 579
- in congenital heart disease .. 244, 247, 790
- cyanosis and enlarged spleen .. 187
- delirium from .. 195
- dyspnoea associated with .. 580
- low colour index with .. 580
- in mitral valve disease .. 38

Polycythæmia, contd.

- pulmonary stenosis .. 247
- shortness of breath in .. 100
- splenomegalia (see Splenomegalia Polycythæmia)
- Polydipsia (see Thirst, Extreme)
- Polyorphism of syphilides 446, 533
- Polymorphonuclear cells in cerebrospinal fluid in meningitis .. 558, 643
- in normal blood count .. 28
- leucocytosis (see Leucocytosis)
- Polymyositis, acute, anorexia in .. 504**
- diagnosis from trichinosis .. 504
- erythematous rash in .. 504
- oedema of extremities in .. 504
- pain in muscles in .. 503, 504
- pyrexia in .. 504
- rigidity of muscles in .. 504
- tenderness of muscles in .. 504
- Polyorchitis .. 123
- acute hydrocele in .. 522
- Polypus, aural** .. 468
- bleeding from ear due to .. 468
- deafness from .. 190
- tinnitus due to .. 793
- nasal, with accessory sinus inflammation .. 255

- - premature appearance of, associated with hyperne-
 phroma .. 690
 - - priapism at .. 586
 Pubic hair, early develop-
 ment, with hypernephro-
 ma .. 690
 - - region, sycosis vulgaris of .. 602
 Puckering of skin .. 745
 Pudic nerve inflamed, dys-
 pareunia from .. 221
Puerperal fever, endocarditis in .. 103
 - - infection of uterus in .. 649
 - - offensive vaginal dis-
 charge in .. 649
 - - rigors in .. 648, 649
 - - simulating rheumatism .. 650
 - - infection, pelvic peritonitis
 from .. 508
 - - sepsis, pelvic abscess from .. 760
 - - septicæmia in .. 698
Puffiness of ankles in acute
nephritis .. 48
 - - eyelids in myxoedema .. 259
 - - face in acute nephritis .. 48
 - - joint in hamophilic arthritis .. 388
Pulmonary and aortic regurgi-
tation distinguished .. 247
 - - aneurysm (see Aneurysm,
 Pulmonary)
 - - area, systolic bruits over .. 104, 105
 - - artery, arising from aorta .. 184
 - - atheroma, mitral stenosis a
 cause of .. 323
 - - branches of vagus, relation
 to cough .. 175
 - - diseases, ascites in .. 61
 - - causing enlarged right
 ventricle .. 246
 - - chronic, hypertrophic
 osteo-arthritis in (and
 see Osteo-arthropathy) .. 390
 - - - venous liver congestion
 in .. 407
 - - - shortness of breath in .. 101
 - - embolism sudden death in .. 321
 - - gangrene (see Gangrene of
 Lung)
 - - osteo-arthropathy (see Osteo-
 arthropathy)
 - - regurgitation, causes of .. 107
 - - causing diastolic bruit .. 107
 - - enlarged right ventricle in
 .. 245, 247
 - - from fungating endocar-
 ditis .. 247
 - - mitral stenosis .. 247
 - - second sound, reduplicated
 in mitral regurgitation .. 239
 - - stenosis, acquired .. 105
 - - bruits of 104, 105, 184, 247, 579
 - - clubbed fingers and toes
 with .. 104, 129, 247
 - - cyanosis in .. 104, 184, 247
 - - dyspnoea in .. 247
 - - with patent interventri-
 cular septum .. 244, 579
 - - polycythæmia in .. 247, 579
 - - right ventricle enlarged in
 .. 245, 246, 247
 - - symptoms of .. 247
 - - systolic thrill due to .. 184, 247, 790
 - - systolic bruit in normal chil-
 dren .. 105
 - - thrombosis (see Thrombosis,
 Pulmonary)
 - - tuberculosis (and see Phthisis)
 - - miliary, absence of pul-
 monary signs in some
 cases of .. 612
 - - - quick breathing in .. 612
 - - - pyrexia with weakness
 and anorexia at onset .. 612

Pulmonary tuberculosis, contd.

- - pain in limbs in ..	503, 505
- valve, fungating endocarditis of ..	321
- veins, rupture of aortic aneurysm into ..	482
Pulpy knee (see Arthritis, Tuberculous, of Knee)	
Pulsatile liver (see Liver, Pulsatile)	
- swelling (see Swelling, Pulsatile)	
- - in the orbit (see Orbit, Tumour of Pulsatile)	
Pulsation of arteries in aortic disease ..	233, 240, 247, 764
- - marked in exophthalmic goitre ..	244, 764
- capillary, in aortic disease ..	106, 240
- cessation of, in one or other of the accessible arteries in fungating endocarditis ..	613
- epigastric (see Epigastrium, Pulsation in)	
- expansile with aneurysm ..	235, 476, 786
- - in iliac aneurysm ..	741
- in eyeball from local aneurysm ..	255
- - meningocele ..	254
- - osteosarcoma ..	177, 179
- - pelvic sarcoma ..	741
- - psosa bursa ..	741
- - transmitted aortic ..	366
- - by carcinoma of pancreas ..	59
- - ovarian cyst ..	691
PULSATION, UNDOE ABDOMINAL AORTIC ..	592
- - - age and sex incidence ..	592
- - - diagnosis from abdominal aneurysm ..	728, 764
- - - feeling of discomfort in ..	592
- use of ear in detecting slight ..	235
Pulse in acute general peritonitis ..	431, 472, 611
- - yellow atrophy ..	370
- in aortic disease ..	106, 233, 234, 235, 237, 240, 247, 526
- - appendicitis ..	736
- in catarrhal jaundice ..	365
- chart of rheumatoid arthritis (Fig. 106) ..	377
- collapsing, in aortic regurgitation ..	247, 526
- disproportionately rapid in rheumatoid arthritis ..	378
- in endocarditis ..	239
- exhaustion of obstructed labour ..	229
- feeble and irregular, in fibroid heart ..	242
- - in toxic cases of diarrhoea ..	196
- - in myocardial degeneration ..	241, 333, 526
- increased rate, after exercise, in dyspepsia ..	526
- irregular in organic cerebral disease ..	328
- - tuberculous meningitis ..	171
- in jaundice ..	361, 365, 370
- paroxysmal tachycardia ..	772
- radial, diminished from cervical rib ..	493
- rapid and feeble; from corrosive poisoning ..	297
- - in fevers ..	771
- - after hemorrhage ..	140, 298, 646, 717, 780
- - and irregular, in arsenical poisoning ..	92
- - in malignant scarlatina ..	301
- - phosphorus poisoning ..	373

Pulse, rapid, contd.

- - pneumothorax ..	480
- - proportion to temperature in tropical abscess of liver ..	408
- - relapsing fever ..	698
- - small and intermittent, in mitral stenosis ..	245
- - with subphrenic abscess ..	720, 721
- - relatively slow in cerebral abscess ..	547, 771
- - - influenza ..	771
- - - tuberculous meningitis ..	771
- - - typhoid fever ..	196, 610, 697, 771
- - - yellow fever ..	301, 373, 771
- and respiration ratio in pneumonia ..	372
- during rigors ..	646
- in simple colic ..	133, 645
- slow in cerebral tumour ..	782
- - cretinism ..	259
- - myxoedema ..	259
- splashing, in aortic disease ..	240
- sudden halving in Stokes-Adams syndrome ..	527
- and temperature ratio in normal conditions ..	622
- - in pneumonia ..	697
- - typhoid fever ..	372, 697
- variations in mitral regurgitation ..	238
- water-hammer, in aortic regurgitation ..	106
- (see also Bradycardia and Tachycardia)	
PULSES, INEQUALITY OF.. ..	592
- unequal, from aneurysm ..	222, 236, 732
- - from cervical rib ..	128, 493, 593
- - femoral, from iliac aneurysm ..	741
- - tibial, in popliteal aneurysm ..	762
Pulsus paradoxus in adherent pericardium ..	101
Puncta lachrymalia, mal-position of, causing epiphora ..	250
Punctate basophilia (Plate II, p. 28) ..	30
PUPIL, ABNORMALITIES OF ..	593
- appearance of, in conjunctivitis, iritis, and glaucoma ..	257
- Argyll Robertson (see Argyll Robertson Pupils)	
- blockage of, by iritis ..	839
- changes from affections of cervico-dorsal cord ..	554
- - in tabes ..	262
- contracted, acute encephalitis ..	591
- - brain disease, ultimate replacement of dilatation in all cases ..	594
- - cervical sympathetic paralysis ..	247, 590, 792
- - in hypermetropic eyes ..	591
- - intracranial abscess ..	594
- - growth ..	594
- - paralysis of cervical sympathetic ..	516
- - in spinal lesions ..	553
- - tabes ..	591
- - - uremia ..	45, 46, 195
- dilated in acute mania ..	591
- - from belladonna ..	773
- - in glaucoma ..	840
- - with retention of light reflexes in catalepsy ..	591
- - - in epilepsy ..	591
- - - stimulation of cervical sympathetic ..	591
- double aperture of ..	198, 599
- eccentric, from tumour of mid-brain ..	798
- in Graves' disease ..	261

Pupil, contd.

- immobile in epilepsy ..	160
- - general paralysis ..	172
- irregular, due to adherence to corneal ulcer ..	594
- - dislocation of the lens ..	594
- - from injury to the eye ..	593
- - in insanity ..	595
- - due to old iritis ..	593
- - persistent pupillary membrane ..	593
- - rupture of the sphincter ..	593
- - in tabes ..	595
- large in myopic eyes ..	594
- - membrane persistent ..	593
- peculiar light reflex in hemianopsia ..	595
- - pinpoint, in opium poisoning ..	138, 345
- - - pontine hemorrhage ..	138
- - reaction in hysteria ..	160
- - reactions of, in hemianopsia ..	336
- - - uremic amaurosis ..	839
Pupil reflex to light, loss of (and see Argyll Robertson Pupil) ..	594
- - - in alcoholic intoxication ..	594
- - - - bilateral character of ..	594
- - - - in cerebral tumour ..	594
- - - - in 70 to 90 per cent of cases of tabes ..	594
- - - - epilepsy ..	594
- - - - general paralysis of the insane ..	594
- - - - due to injury ..	594
- - - - in some intracranial diseases ..	594
- - - - mania ..	594
- - - - never found in health ..	594
- - - - nuclear lesion causing ..	594
- - - - retained in acute encephalitis ..	594
- - - - stimulating of cervical sympathetic ..	594
- - - - in syphilis ..	594
- - - - tabes ..	594
- - - - tumour of corpora quadrigemina ..	594
- reflexes, in ciliary paralysis ..	594
- - description of the four normal ..	594
- - dilatatory in sensory and emotional reflexes ..	594
- - in diphtheritic neuritis ..	77
- - hemianopic, description of ..	595
- - to "light" and "accommodation" ..	594
- - loss of "convergent accommodation" with retention of "light," in meningitis ..	594
- - - - myelitis ..	591
- - - - paradoxical, definition of ..	595
- - retained with dilated pupil in acute mania ..	594
- - in tabes ..	595
- - unilateral ..	591
- - in unilateral lesion of optic tract ..	594, 595
- size of, variations with age of patient ..	591
Pupils, small, in encephalitis ..	594
- unequal, in aortic aneurysm ..	222, 595
- - carotid aneurysm ..	595
- - coma ..	137
- - congenital cerebral diplegia ..	800
- - general paralysis ..	172, 195, 595
- - in glaucoma ..	595
- - iritis ..	595
- - from use of mydriatics ..	595
- - - myotic drugs ..	595
- - in organic cerebral disease ..	328

Pupils, unequal, contd.

- from physostigmine ..	595
- possibly of no significance in slight degrees ..	595
- in tabes ..	595
- third nerve paralysis ..	595
- trigeminal neuralgia ..	595
- unilateral cervical sympathetic lesion ..	594, 595
- from unilateral intracranial lesion ..	595
- Purgatives, colic from ..	144
- constipation due to ..	848
- in distinguishing scybalæ from other abdominal tumours ..	501, 723
- intestinal obstruction ..	151
- loss of weight due to ..	848
- Purin bases, uric acid from ..	817
PURPURA ..	595
- albuminuria in ..	20
- anaemia with ..	36
- bleeding gums in ..	85
- and cerebral embolism ..	138
- in cerebrospinal meningitis ..	643
- cirrhosis of liver ..	696
- definition of ..	595
- diagnosis from capillary nævi ..	595
- ecchymoses or bruises in ..	595
- epistaxis in ..	251
- from flea bites ..	596
- in fungating endocarditis ..	38, 76, 237, 338, 610, 613
- gastric erosions in ..	298
- hæmatemesis in ..	294, 302
- hæmaturia in ..	305, 314
- hæmoptysis in ..	318
- Henoch's (see Henoch's Purpura) ..	
- in leukaemia ..	31
- menorrhagia in ..	428, 430
- metrorrhagia due to ..	433, 435
- in morbus maculosus of Werthof ..	596, 600
- persistence of discoloration under pressure in ..	595
- scarlatina maligna ..	301
- in scurvy ..	85, 302
- from septic infection of umbilical cord ..	90
- small-pox ..	301, 605
- typhus fever ..	371, 699
- vibices or lines in ..	595
- white fever ..	301, 373
- fulminans ..	596, 600
- theory of causes of ..	600
- diagnosis from scurvy ..	302
- hæmorrhagica, blood per anum in ..	90
- - mouth in ..	600
- - nose in ..	600
- hæmaturia in ..	600
- hæmorrhage from bowel in ..	600
- purpuric rash in ..	596, 600
- theory of causes of ..	600
- hæmosiderin in the macules following ..	424
- macular ..	423
- rheumatica, age incidence of ..	380
- diagnosis from Henoch's purpura ..	380
- (see Peliosis Rheumatica) ..	
- simplex ..	596, 607
- subconjunctival, causes of ..	256
Pus in actinomycosis, Gram-staining mycelium in ..	748
- small yellow granules in ..	748
- cells, gonococci in ..	211
- in sputa of phthisis ..	319
- urethral discharge not a bar to marriage ..	209
- in the chest ..	119
- chocolate coloured ..	279

Pus, contd.

- collections, indicanuria due to ..	821
- in expectoration ..	176
- from empyema bursting through lung ..	323
- liver abscess ruptured into lung ..	369
- extrapleural, simulating empyema ..	119
- with gas in pleural cavity ..	577
- greenish yellow, in pneumococcal arthritis ..	375
- under pressure, polymorphonuclear leucocytosis associated with ..	400
- not under pressure, no leucocytosis with ..	400
- per rectum, from ruptured abscess ..	635
- sterile in liver abscess bursting through lung ..	323
PUS IN THE STOOLS ..	600
- in anal fistula ..	92
- colitis ..	501
- dysentery ..	501
- in urine (see Pyuria) ..	
PUSTULES ..	601
- of acne ..	531
- in bromide eruption ..	603
- congenital syphilis ..	446
- dermatitis herpetiformis ..	831
- dimpling of, in Large acuminated syphilides ..	604
- eczema ..	831
- granulosis rubra nasi ..	714
- herpes progerialis ..	675
- impetigo contagiosa ..	654
- lichen scrofulosorum ..	529
- malignant (see Anthrax) ..	
- microscopical character of contents ..	601
- in military abscesses of newborn ..	601
- prurigo ferox ..	531
- rhinophyma ..	805
- ring of, in anthrax ..	603
- scabies ..	654, 831, 832
- in scrofuloderma ..	603
- small-pox ..	605, 655, 829
- syphilis ..	446, 532, 833
- transition of papules into ..	528, 601
- in vaccinia ..	834
- varicella ..	833
- varioliform syphilides ..	601
- from vesicles ..	829
Putrefaction, emphysema from ..	231
- intestinal, borborygmi due to ..	97
- indicanuria from ..	97, 349, 821
- muscle fibres in faeces in ..	268
- urinary sulphates in ..	97
Pyæmia , abscess of chest wall in ..	478
- in heart from ..	650
- diagnosis confirmed by blood-cultures ..	598
- from malaria ..	650
- diarrhoea in ..	619
- emaciation in ..	372
- embolism in ..	649
- gangrene of lung in ..	288
- hyperpyrexia in ..	313
- jaundice in ..	362, 372
- leucocytosis in ..	400, 649
- metastatic abscess in ..	649
- muscular atrophy in ..	76
- after operations and wounds ..	649
- peripheral neuritis in ..	76
- portal (see Pylephlebitis) ..	
- progressive loss of strength in ..	372
- prostration in ..	372, 649
- purpura in ..	596, 598
- from pyorrhœa alveolaris ..	87
- pyrexia in ..	313, 372, 614, 649
- rapid pulse in ..	372

Pyæmia, contd.

- rigors in ..	372, 598, 647, 618, 649, 650
- septic skin rashes in ..	650
- and septicæmia, relationships between ..	650
- simulating acute rheumatism ..	650
- enteric fever ..	650
- gout ..	383
- subcutaneous abscesses in ..	649
- from subperiosteal abscess ..	750
- sudden onset of ..	649
- suppuration in joints in ..	649
- suppurative pericarditis in ..	650
- sweating in ..	372, 649
- temperature chart of ..	614
- tenderness in spine in ..	785
- thyroid abscess in ..	792
- unaffected by quinine ..	650
- vomiting in ..	649
Pyelitis ..	16
- aching in loin in ..	625
- in acute fevers ..	625
- due to B. coli ..	625
- bilateral in cystitis ..	625
- cystoscopic appearances in ..	
(Plate V, Fig. C, p. 308) ..	625, 628
- diagnosis from chronic cystitis ..	628
- dry harsh skin in ..	625
- glazed tongue in ..	625
- from growth in bladder ..	625
- hæmatogenous infection in ..	625
- hyperpyrexia in ..	344
- infections elsewhere with ..	625
- with intestinal affections ..	625
- from involvement of ureters in carcinoma of uterus ..	625
- kidney enlarged in ..	500, 625
- little pus in acid urine in ..	623
- micturition frequent in ..	438, 625
- pain in the right hypochondrium in ..	500
- pneumococcal ..	625
- in pregnancy ..	625
- prostatic enlargement ..	625
- pyonephrosis from ureteral obstruction in ..	396
- pyrexia in ..	625
- pyuria in ..	500, 623, 625
- from renal calculus ..	438, 625, 627
- rigors in ..	625, 648
- simulating nocturnal enuresis ..	248
- staphylococcal ..	625
- streptococcal ..	625
- in stricture ..	625
- tenderness in loin in ..	625
- from tubercle of kidney ..	438, 626
- in typhoid fever ..	625
- urinary changes in ..	625, 628
- from urinary obstruction ..	625
Pyelonephritis (see also Pyelitis) ..	16
- albuminuria in excess of the pus present in ..	626
- anuria with ..	45, 48
- due to bacillus pyocyaneus ..	83
- bacteriuria in ..	83
- commonly bilateral ..	394
- hæmatogenous infection in ..	625
- kidney enlarged in ..	394
- from obstruction in lower urinary tract ..	395
- polyuria in ..	626
- pus casts in urine in ..	626
- pyuria in ..	394, 623, 625
- recurring rigors in ..	648
- renal abscess due to ..	625
- calculus causing ..	627
- pain in ..	394
- uremia in ..	625
Pylephlebitis , adhesive, ascites in ..	301
- enlargement of spleen in ..	301

Pylephlebitis, adhesive, contd.

- hæmatemesis in	301
- melæna in	301
- sudden onset of	301
- albumosuria in	20
- after appendicitis 59, 370, 614, 649	
- due to appendicitis in 50	
- per cent of cases	369
- ascites in	58
- colour of faeces in	649
- diagnosis from appendicitis	614
- peritonitis	614
- pneumonia	614
- typhoid fever	614
- diarrhoea in	649
- hæmatemesis in	301
- jaundice in 59, 362, 370, 372, 649	
- leucocytosis in	400
- liver enlarged in	370
- multiple abscesses in liver	
- from	369, 408, 649
- pain in liver from	649
- pleuritic effusion from	123
- pyrexia due to	609, 621, 649
- rigors in 59, 362, 370, 618, 649	
- septicæmia from	614, 698
- tenderness of liver from	649
- vomiting in	649

Pylorus, carcinoma of (see Carcinoma of Stomach)

- enlarged, diagnosis from	
- enlarged gall-bladder	406
- hypertrophy of, in congenital pyloric stenosis	426
- normal, palpable in epigastrium	724
- situation of	722
- obstruction of, by calcified retroperitoneal cyst	713
- from carcinoma	723
- causing constipation	144
- cicatricial	723
- colicky pains of	134
- congenital, p.m. findings in	426
- due to spasm from wrong feeding	427
- persistent vomiting	426, 845
- constipation due to	144
- and wasting in	845
- differentiation between inflammatory and malignant	353, 713
- dipping in diagnosis of	134
- extreme thirst due to	789
- flatulence and other symptoms in	267
- gastrectasis from	712, 789
- HCl in stomach contents	353
- history of previous gastric ulcer	352
- from hypertrophy of pylorus in infants	723
- increased area of tympanic resonance in	134
- lactic acid	353
- Oppler-Boas bacilli in	353
- sarcinæ in vomit with	353, 355, 713
- from spasm	723
- spasm of, in dyspepsia	354
- perhaps the real cause of "congenital" pyloric stenosis	426
- stagnation of stomach contents in	353
- symptoms produced by	845
- torule in vomit in	134
- tumour in	353
- visible gastric peristalsis in	134, 352, 570, 571, 713
- vomiting in	134, 713, 843
- copious in	353
- x-rays in diagnosis of	134
- yeasts in stomach in	353, 355

Pyoderma, no leucocytosis with	400
Pyometra, metrorrhæxis from	436
- in old women	211
Pyonephrosis, growth of bladder	
- causing	626
- diarrhoea in	396
- disappearance of pyuria in	624
- fluctuation in	395
- hydronephrosis causing	396
- intermittence in size in	626
- pyuria in	396, 626
- kidney enlarged in	391, 394, 583, 624, 626
- pain in side in	624
- pallor in	396
- pelvic swelling due to	757
- polyuria in	583
- prostatic enlargement causing	626
- pyrexia in	396, 624
- pyuria in 396, 583, 623, 625, 626	
- renal calculus causing 309, 396, 626, 627	
- tuberculosis causing	626
- round smooth outline of	395
- sense of tenseness and elasticity in	395
- symptoms those of causative lesion plus suppuration	626
- sweating in	396
- ureteral obstruction causing	396, 625, 627
- urethral stricture causing	626
- urine normal in "closed"	626
- uterine carcinoma causing	626
- x-rays in (Fig. 97, p. 309)	396
Pyopericardium, churning sounds in	711
Pyoperitoneum from pneumococcal or tuberculous peritonitis	717
Pyopneumopericardium, succussion sounds in	711
Pyopneumothorax	577
- from broncho-pneumonia	712
- cachexia with	712
- due to gangrene of lung	712
- needling of chest in diagnosis of	711, 712
- from obstruction of bronchus	712
- pneumonia	712
- pulmonary infarct	712
- pyrexia with	712
- rigors with	712
- simulated by subphrenic abscess	712
- subphrenic, general account	721
- succussion sounds with	711
- x-rays in diagnosis of	712
Pyorrhæa alveolaris, anæmia in	36, 39
- bleeding gums due to	86, 87
- chronic joint lesions from	278
- foul breath due to	99
- gastritis from	297
- loss of weight due to	848
- pytalism due to	590
- purpura from	600
- pyrexia in	620
- retraction of gums from	641
- secondary effects of	87
- septic arthritis from	375
- septicæmia from	698
- stomatitis from	590
Pyosalpinx	760
- aching lumbo-sacral pain in	632
- acute peritonitis from	55
- albumosuria in	20
- anæmia in	39
- diagnosis from appendicitis	737
- dysmenorrhæa with	229, 632
- felt per rectum	638
- vaginam	638, 737
- frequency of micturition in	438
- fullness of vaginal fornices in	632

Pyosalpinx, contd.

- infective peritonitis from	644
- leucocyte count in diagnosis	401
- from typhoid fever	401
- leucocytosis in	400, 401
- leucorrhœa in	632
- malaise in	632
- pelvic swelling due to	757
- periods profuse in	632
- pleuritic effusion in	123
- pneumaturia in	576
- after pregnancy	737
- pus in stools from rupture of	601
- pyuria from	624, 632
- rupture into bladder 624, 631, 632	
- spasmodic pelvic pain	509
- septicæmia from	698
- vaginal discharge with	737
Pyramidal tract, lesions of, absence of abdominal reflexes with	546, 547
- ankle-clonus with	547
- effects on reflexes	44
- extensor plantar reflex	82, 546, 517
- facial paralysis from	534
- increased knee-jerk with	546
- paralysis of upper extremity due to	546
Pyrexia, absent in spastic constipation	145
- endocarditis	103
- in active congestion of liver	371, 407
- acute gastritis	845
- mastitis	743
- nephritis	48
- otitis media	469
- pancreatitis	724
- poliomyelitis	128, 555
- polymyositis	504
- prostatitis	207, 511, 631
- yellow atrophy	370
- in alveolar abscess	747
- echinococcus disease	416
- anthrax	603
- antitoxic serum rashes	597
- appendicitis	133, 135, 145, 153, 313, 729, 736
- axillary abscess	731
- bacteriuria	84
- bullous dermatoses	89, 114
- carcinoma of cæcum	729
- liver	362, 413
- stomach	299
- in catarrhal jaundice	365
- cellulitis	455
- cerebellar abscess	565
- cerebral abscess	341
- embolism	138
- tumour	341
- in children, a bad night sufficient to cause	621
- excitement as a cause of	621
- due to febricula	621
- moderate, with tonsillitis, suggestive of diphtheria	622
- observations on	621
- onset of zymotic disease causing	622
- of unexplained origin, discussion of	618
- without discoverable cause	622
- cholangitis	499, 650
- cholecystitis	650
- cirrhosis of the liver	40, 362, 368, 410
- colic	363, 500, 645
- convulsions	622
- crises of, in meningococcal meningitis	642
- in pneumonia	186
- cystitis	312, 512, 620, 627

Pyrexia, contd.

- distinguishing intestinal obstruction and peritonitis ..	133, 134
- - - pontine hæmorrhage and opium poisoning ..	138
- - - distoma hepaticum infection ..	364
- the earliest symptom in some cases of typhoid fever and phthisis ..	620
- in endocarditis ..	622
- epidemic jaundice ..	372
- erysipelas (<i>Fig.</i> 166, p. 614) ..	698, 746
- erythema nodosum ..	450
- exhaustion of obstructed labour ..	229
- frequently absent in tuberculous disease of joints ..	386
- in fungating endocarditis ..	9, 10, 38, 76, 103, 237, 314, 368, 370, 593, 598
- from gall-stones ..	278, 280, 363
- gangrene of lung ..	287
- gonorrhœa ..	620
- gonorrhœal arthritis ..	377
- gout ..	382, 455
- gumma formation in congenital syphilis ..	615
- Henoch's purpura ..	380
- hepatic abscess ..	324, 369, 408, 651
- herpes zoster ..	496
- Hodgkin's disease ..	32, 609, 616, 649, 738
- hysterical ..	618
- with inflamed axillary glands ..	421
- influence on pain in limbs ..	508
- - - of potassium iodide on syphilitic ..	615
- in influenza ..	505, 610, 651, 699
- jaundice, significance of absence of ..	362
- kala-azar ..	34
- leukæmia ..	32, 609, 617, 620, 649
- malaria ..	34, 35, 371, 615, 622, 698
- Malta fever ..	611
- in mediastinal growth ..	483
- meningitis ..	622, 642
- Milroy's disease ..	460
- neurotic ..	609
- - - association with pelvic symptoms ..	618
- - - diagnosis of ..	618
- - - sex incidence of ..	618
- - - otitis media ..	229
- in peliosis rheumatica ..	599
- pelvic peritonitis ..	760
- in perinephric abscess ..	392
- periods of, in leukæmia ..	620
- - - lymphadenoma ..	738
- - - severe anæmias ..	620
- in peritonitis ..	134, 153, 472, 718
- pernicious anæmia ..	32, 33, 616, 649
- pleurisy ..	118
- pneumonia ..	186, 321, 372, 622
- pontine hæmorrhage ..	138
- due to prolonged convulsions ..	169
- with prostatic abscess ..	207
- post-critical, in pneumonia, suggestive of empyema ..	622
- post-operative, not necessarily infective in the first forty-eight hours ..	623
PYREXIA, PROLONGED ..	609
- - - in Addison's anæmia ..	609
- - - bacilluria ..	616
- - - blood diseases ..	609
- - - broncho-pneumonia ..	615
- - - carcinoma ..	609, 618
- - - children, obscure origin of some cases of ..	609
- - - cirrhosis of liver ..	609, 618
- - - erysipelas (<i>Fig.</i> 166) ..	614
- - - fatty heart from ..	62

Pyrexia, prolonged, contd.

- - - in fungating endocarditis ..	612, 623
- - - Hodgkin's disease ..	609, 616
- - - infectious diseases ..	609
- - - influenza ..	505, 609, 610, 651, 699
- - - leukæmia ..	609, 617
- - - malaria ..	615
- - - Malta fever ..	506, 609, 611
- - - miliary tuberculosis ..	612
- - - neurosis ..	618
- - - the only symptom for weeks in some cases ..	612
- - - in pernicious anæmia ..	616
- - - pylephlebitis ..	609
- - - sarcoma ..	609, 617
- - - septicæmia ..	343, 609, 614, 650
- - - syphilis ..	614
- - - toxic absorption (alimentary) in children ..	618
- - - tuberculous peritonitis ..	618
- - - typhoid fever ..	697
- - - typhus fever ..	610
- - - in renal tuberculosis ..	135
- - - in prostatic affections ..	511
- - - pseudo-leukæmia ..	42
- - - with pustular syphilides ..	607
- - - pyæmia ..	372, 649
- - - pyelitis ..	625
- - - pylephlebitis ..	649
- - - pyonephrosis ..	396, 624
- - - with pyopneumothorax ..	712
- - - relapsing fever ..	33, 373
- - - relatively low in influenzal bronchopneumonia ..	321
- - - in renal colic ..	500
- - - tuberculosis ..	135
- - - rheumatoid arthritis ..	39, 378
- - - rigors ..	646
- - - salpingo-oöphoritis ..	710
- - - scarlet fever ..	301, 674
- - - septicæmia ..	650
- - - in septic arthritis ..	375
- - - severe anæmias ..	32, 620, 649
- - - with sinus thrombosis ..	558, 650
- - - in spinal meningitis ..	162
- - - with splenic tumour ..	691
- - - superiosteal abscess ..	750
- - - subphrenic abscess ..	501, 720, 721
- - - sudden drop in crisis of pneumonia ..	622
- - - in typhoid, suggestive of perforation ..	432
- - - due to suppurating gums ..	620
- - - in suppurative meningitis ..	612
- - - nephritis ..	646
- - - syphilis ..	371, 614, 615, 672
- - - influence of potassium iodide on ..	615
- - - testicular abscess ..	680
- - - tonsillitis ..	620, 622, 672
- - - in traumatic anuria ..	49
- - - tremor from ..	795
- - - in trichinosis ..	504, 801
- - - tuberculous meningitis ..	174
- - - peritonitis ..	56, 472, 691
- - - with typhoid spine ..	787
- - - typhus fever ..	698
- - - ulcerative colitis ..	92, 727
- - - urethritis ..	207
- - - after urinary operations ..	49
- - - in von Jaksch's disease ..	42
- - - yellow fever ..	301, 373

PYREXIA WITHOUT OBVIOUS CAUSE, blood

cultures in ..	620
- - - affections of gums, ear, nose, or throat ..	620
- - - - - vagina, rectum, or urethra ..	620
- - - Calmette's reaction in ..	621
- - - coli bacilluria ..	621
- - - due to deep caseous glands ..	622

Pyrexia without obvious cause, contd.

- - - ear disease ..	620
- - - fæces in ..	621
- - - fungating endocarditis ..	623
- - - gall-stones ..	621
- - - genito-urinary tubercle ..	621
- - - leucocytosis in ..	620
- - - osteomyelitis ..	620
- - - ovarian abscess ..	621
- - - parasites in blood ..	620
- - - phlebitis ..	621
- - - pylephlebitis ..	621
- - - renal or vesical calculus ..	621
- - - sores on fingers or toes ..	620
- - - - - Widal's reaction in ..	620
Pyriformis, nerve supply of ..	542
Pyrocatechin in cerebrospinal fluid ..	203
Pyrogallic acid, hæmoglobinuria from ..	314
Pyrosis (see Heartburn) ..	623
PYURIA ..	623
- with albuminuria ..	15, 623
- appendicitis ..	313, 632
- bacilluria ..	83, 576, 615, 848
- due to bilharzia hæmatobia ..	630
- casts in, in pyelitis and pyelonephritis ..	628
- in catarrh of urinary passages ..	444
- catheter in diagnosing renal from vesical causes of ..	624
- characters of deposit in ..	623
- contamination with a leucorrhœal discharge ..	631
- - - pus from behind a phimosi ..	631
- in cystitis ..	221, 312, 512, 623, 627, 628, 630, 631
- cystoscopic appearances in diagnosis of (<i>Plate V, Fig. B, p. 308</i>) ..	624
- diagnosis from phosphaturia ..	574, 623
- - - from urates in urine ..	623
- epithelial cells in urine in ..	623
- examination of urine for tubercle bacilli in ..	626
- from extension of ulceration of intestine to bladder ..	624, 633
- due to iliac abscess ..	632
- intermittent, in pyonephrosis ..	396, 626
- lavage of bladder in distinguishing renal and vesical ..	624
- liquor potassæ test for ..	623
- microscopic characters of pus cells in ..	623
- ozonic ether test for ..	623
- in papilloma of bladder ..	630
- due to pelvic abscess ..	631
- persistent in gonorrhœa ..	626
- due to prostatic abscess ..	631
- - - psoas abscess ..	632
- in pyelitis ..	500, 623, 625
- pyelonephritis ..	394, 625
- pyonephrosis ..	396, 583, 626
- pyosalpinx ..	632
- in renal abscess ..	626
- - - calculus ..	16, 46, 308, 312, 626
- - - enlargement ..	689
- tuberculosis ..	16, 136, 310, 394, 626, 629
- - - tumour ..	16, 367
- due to rupture into bladder of an extra-urinary abscess ..	631, 632
- simple ulcer of bladder ..	630
- simulated by urates ..	815
- sudden cessation in pyonephrosis ..	624
- from suppurative nephritis ..	646
- ureteral calculus ..	514, 627
- urethral stricture ..	631

<i>Pyuria, contd.</i>		<i>Râles, contd.</i>		<i>Reaction of degeneration, contd.</i>	
- urethritis	630, 631	- crepitant, from pulmonary infarction	321	- - partial	634
- urinary changes with	623, 624	- in infarction of lung	321	- - in peripheral neuritis 66, 69, 75, 488, 506, 559, 562	
- in vesical calculus .. 512, 513, 629		- non-consonating, with bronchitis and emphysema	186	- - progressive muscular atrophy	73
- with vesical growth 47, 311, 512, 630		- and rhonchi in emphysema	216	- - in Tooth's neuro-muscular paralysis	132, 560
- - tuberculosis .. 312, 513, 628		- sticky basal, in influenza bronchopneumonia	321	- - transverse myelitis at lumbar enlargement	563
QUADRATUS femoris, nerve supply of	542	- Ranula, pytalism due to	591	- of vaginal secretions	210
- lumbar, spinal nerve root supplying	543	- Rarefaction of bones in tabetic arthritis	588	- Wassermann's (see Wassermann's Reaction) (and see Electrical Reactions)	
Quadriceps extensor femoris, clonus of	161	- Rash due to drugs	603	Reading, difficulty in, due to post-diphtheritic ocular paresis	640
- - nerve supply of	542	- - serum (see Serum Rashes)		- pain behind eye intensified by	498
- spinal nerve root supplying	543	- erythematous, at onset of dengue	506	- relation of word blindness to power of	685
Quartan fever	34	- "mulberry" in typhus fever	371	Receptaculum chyli, ascites from obstruction of	58
Quinine, amblyopia from	836	- "petechial" in typhus fever	371	- - rupture of, chyluria from	126
- central scotoma from	836	- in pyæmia and septicæmia	650	Rectal crises of locomotor ataxy	562
- cure of malaria by	649	- roseolar, beginning on hands and wrists in the relapse of dengue	506	- polypus	635
- in diagnosis of malaria .. 583, 698		- in secondary syphilis	615	- shelf due to secondary malignant deposits in pelvis	639
- dosage in malaria	615	- typhoid fever, rose-red flattened papules in	697	- tenesmus, association with bearing-down pain	473
- no effect of, in pyæmia	650	- typhus fever, characters of	371, 699	- trouble in cerebellar tumour	565
- headache from	328	- (and see Bullæ; Macules; Papules; Pustules; Vesicles, etc.)		- disseminated sclerosis	565
- hæmoglobinuria from	314	Rat paste, phosphorus poisoning from	373	- locomotor ataxy	562
- influence on malaria parasites	371	- - strychnine poisoning from	652	- transverse myelitis	74
- nerve deafness from	191	Rat-like faces of microcephaly Ray fungi (see Actinomycosis)	214	- (and see Incontinence of Fæces)	
- optic neuritis or atrophy from	596	Raynaud's disease , affection of extremities in	284	Recti muscles, divarication of (see Divarication of the Recti)	
- purpura from	596	- - hands in	490	- - abdominal, divarication causing visible peristalsis	570
- relation to blackwater fever	315	- - toes in	490	Rectocele	587
- scaly eruption due to	655	- - albuminuria in	17	RECTUM, ABNORMALITIES	
- tinnitus from	794	- alteration of response to galvanism in	634	FELT PER	634
Quinsy , asymmetry of	671	- - bullæ in	110, 112	- abscess of (see Abscess, Rectal)	
- bursting of abscess in	671	- - coma in	136	- - sacrum felt per	638
- dysphagia in	225, 591	- diagnosis from erythromelalgia	284, 490	- ballooned, with obstruction	153
- enlargement of submaxillary lymphatic glands in	419	- - intermittent claudication	490	- blood per (see Blood per Anum; and Melæna)	
- pytalism from	591	- - senile gangrene	284	- bulging from cystocele	587
- sore throat from	670	- - gangrene in (Plate IV, and Figs. 95-6)	282, 283, 284	- carcinoma of (see Carcinoma of Rectum)	
- stertor from	707	- - hæmoglobinuria in	315	- congenital absence of lower portion of	637
- trismus simulated by	801	- - local asphyxia in	490	- constipation from stricture of	150
Quotidian fever	34	- - syncope in	490	- diseases of, pain in the back in (Fig. 204, p. 788)	476, 788
RABBIT, opaque nerve fibres in	462	- - cedema of face, neck, and arms from	461	- - lower extremity from	491
Rabbit-skin workers, mercurial neuritis in	77	- - legs in	459, 461	- enlarged, from atony	149
Rabies, delirium in	195	- - recurrent necrosis in	284	- enterolith in	635
- leucocytosis in	400	- - severe pain in	490	- examination of, in abscess of sacrum	638
- slightness of fever in	195	- - simulated by cervical rib	493	- - acute prostatitis	511, 628, 631
Racing, albuminuria after	19	- - ergotism	287	- - aneurysm of internal iliac artery	638
Radial artery thick and tortuous in chronic nephritis	240	- - sore fingers from	266	- - appendicitis	729, 736
- nerve, skin distribution of	659	- - swelling of hands or feet in	459	- - appendicular abscess	638
Radicular pain in arm (see Pain in Extremity, Upper)		REACTION OF DEGENERATION	488, 633	- - colic	135
Radium in relief of Mooren's ulcer	807	- - absent in myopathies	70	- - in bearing-down pain	474
Radius, myeloid sarcoma of (Fig. 197)	755, 756	- - in acute poliomyelitis	555, 558	- - bladder affections	306, 307, 311, 312, 514, 638
- thickening lower end of, in rickets	181, 182	- - amyotrophic lateral sclerosis	565	- - calculous disease of the prostate	512, 515
Railway spine, account of	787	- - atrophic palsy of arm	549	- - carcinoma of bladder	307, 311, 312, 512, 514, 628, 630, 638
- tenderness of the spine in	784	- - cervical rib	534	- - colon	367, 501
- tremor in	795	- - diagnostic uses of	644	- - liver	60
Rainbow vision in conjunctivitis	840	- - faradic current in	633	- - peritoneum	57
- in glaucoma	257, 840	- - galvanic current in	633	- - rectum	636
Râles , apical, from aortic aneurysm	322	- - in indication of presence of lower neurone lesion	634	- - in cases of chyluria	126
- bronchitic	192	- - in infantile paralysis	558, 559	- of coccyx	635
- characters in bronchiectasis	193, 703	- - methods of examining for	633	- condition like pea or bean in submucous coat in ruptured rectal abscess	635
- consonating, with fibroid lung	232	- - with muscular atrophy	69		
- - from growth of lung	322	- - neuromuscular	159		
- in phthisis	319	- - nuclear facial paralysis	536		
- crackling, in empyemata of children	119	- paralytic talipes	130, 131		
- in fibroid lung	246, 332				
- with fibroid lung and bronchiectasis	324				
- - from obstructed bronchus	296				

<i>Rectum, examination of, contd.</i>		<i>Rectum, contd.</i>		Redux crepitations in lobar pneumonia	
- constipation	141	- hair-ball in	635	- in tabes dorsalis	827
- cystic disease of the ovaries ..	638	- incontinence of faeces (see Incontinence)		- in affections of the tongue ..	498
- descending urethritis	515	- invagination of, dyschezia due to	150	- area of 10th dorsal nerve in gall-bladder disease ..	509
- diagnosing cause of pus in stools	600	- lesions of, causing surgical emphysema	231	- - - - intestinal affections ..	509
- in cases of diarrhoea	196	- loaded, causing priapism in elderly men	586	- - - - kidney and ureter disease	509
- distended bladder felt on ..	638	- - - - dystocia due to	227	- - - - uterine, tubal or ovarian disease	509
- in dyschezia	119, 150	- - - - malformations of, descriptions of (<i>Figs.</i> 170-173) ..	637	- - - - from diseased to sound side in renal disease ..	394
- dysmenorrhoea of virgins ..	219	- - - - mode of examination of ..	634	- - - - ear disease	498
- dyspareunia	221	- - - - mucus from (see Faeces, Mucus in)		- - - - errors of refraction	498
- ectopic gestation	638	- new growths of, sacralgia in ..	510	- - - - frontal sinusitis	498
- enlarged pelvic lymph glands	628, 630	- occlusion by foetal head ..	638	- - - - glaucoma	498
- fibrous stricture of	636	- operation on, coli bacilluria after	83	- - - - head and neck, segmental areas of (<i>Figs.</i> 132-135) ..	498
- fistula of, pneumaturia from ..	576	- - - - retention of urine after ..	441	- - - - Head's segmental areas, in visceral disease ..	498
- foreign bodies in	635	- pain in (see Pain, Rectal) ..		- - - - with hyperaesthesia ..	476, 494
- fracture of coccyx	638	- - - - in acute prostatitis ..	628	- - - - iritis	498
- gonorrhoeal enlargement of vesiculæ seminales ..	638	- - - - pemphigus, etc., of	114	- - - - nasal inflammation	498
- hæmaturia	307	- polypi of (see Polypi, Rectal) ..		- - - - neck and arm in angina pectoris	482
- hydatid disease	58	- pressure on, bearing-down pain from	473	- - - - shoulder in diaphragmatic pleurisy	480
- impacted calculus 439, 514, 627		- - - - causing dyschezia	150	- - - - suppurative otitis media ..	498
- for internal hæmorrhoids ..	635	- proctoscope examination in stricture of	150	- - - - testicle, causes of	524
- intestinal obstruction ..	151, 152	- sense of fullness and weight in, from piles	92	- - - - tuberculous hip disease ..	386
- intussusception 92, 148, 196, 636		- stricture of, due to carcinoma of rectum	636	- Reflex centres in spinal cord, diagrams illustrating (<i>Figs.</i> 146, 147)	566
- ischiorectal abscess	638	- - - - common positions of ..	636	- - - - extensor plantar (see Babinski's Sign) ..	
- - - - fosse	635	- - - - constipation from	150	- - - - winking, abolition of, in paralysis of fifth nerve ..	807
- of lower end of ureter	307	- - - - fibrous, annular or tubular character of	636	- Reflexes, abdominal, absent in amyotrophic lateral sclerosis	554
- in lumbago	476	- - - - rectal examination in ..	636	- - - - disseminated sclerosis ..	547
- malignant iliac glands ..	422	- - - - suppuration round, scrotal fistula from	679	- - - - lesion of pyramidal tract ..	547
- method of making	634	- - - - tenderness per (see Tenderness per Rectum) ..		- - - - pressure on cervical cord	494
- new growth of ovaries ..	638	- ulceration of (see Ulceration of Rectum)		- - - - primary lateral sclerosis (<i>Figs.</i> 146, 147) ..	567
- - - - in sacrum .. 635, 638, 761		- villous tumours of, hæmorrhage in	93	- - - - spastic paralysis of upper extremity ..	547
- - - - vagina	638	- Rectus abdominis, local rigidity ..	644	- - - - in paralysis from intra- and extramedullary lesions	546
- in obscure loss of weight ..	847	- - - - contracted, simulating intra-abdominal tumour ..	723	- - - - spastic paralysis of one leg ..	547
- - - - pyrexia	620	- - - - extensus, paralysis of ..	201	- - - - asymmetrical, with coma ..	137
- obturator hernia	740	- - - - inferior, paralysis of ..	201	- - - - in Brown-Séquard paralysis ..	540
- oedema of one leg	456	- - - - internus, paralysis of ..	201	- - - - corneal, in facial paralysis ..	535
- ovarian tumour	367	- - - - superior, paralysis of ..	201	- - - - in congenital defect of cortex	558
- in parametric abscess ..	638	- Recurrent laryngeal nerve paralysis, causes of (and see Paralysis of Vocal Cord) ..	538	- - - - deceptive, in paraplegias of infancy	557
- paraplegia from peripheral neuritis	562	- Red blood corpuscles, normal numbers of	579	- - - - deep, in Werdnig-Hoffmann paralysis	158
- pelvic abscess	760	- - - - nucleus, intention tremor from lesion of	800	- - - - in disseminated sclerosis 174, 547	
- - - - growth	487	- - - - vision, or erythropsia ..	840	- - - - during epileptic convulsions ..	169
- - - - hæmatocele	760	- Red-currant-jelly sputum ..	322	- - - - exaggerated in paralytic talipes	130, 131
- - - - inflammation	487	- Redness of skin (see Erythema)		- - - - progressive muscular atrophy	127
- pessary in vagina	638	- Reducing bodies in urine, drugs giving rise to	290	- - - - functional paraplegia	567
- for polypus	635	- - - - other than glucose ..	290	- - - - gastric	591, 723
- in prostatic abscess ..	511, 632, 638, 678	- REDUPLICATION OF HEART SOUNDS	2, 639	- - - - general paralysis	172
- - - - adenoma	512, 638	- - - - in acute cardiac dilatation	243	- - - - hysteria 157, 166, 541, 548, 567	
- - - - carcinoma	512, 638	- - - - arteriosclerosis	639	- - - - increased in earliest stages of peripheral neuritis ..	505
- - - - enlargement 439, 441, 638		- - - - diagnosis from canter-rhythm	639	- - - - neurasthenia	506
- - - - tuberculosis	307, 678	- - - - mid-diastolic bruit ..	639	- - - - lost, in neuromyositis ..	504
- - - - pyosalpinx	638	- - - - in granular kidney ..	639	- - - - neuropathic muscular atrophy of infants ..	158
- in rectal abscess	635, 638	- - - - hypertrophy of the left ventricle	331	- - - - peripheral neuritis ..	505, 562
- rectal speculum in	635	- - - - mitral stenosis 108, 320, 639		- - - - in transverse myelitis at lumbar enlargement ..	563
- in recto-vaginal fistula ..	636	- - - - regurgitation	239		
- recto-vesical fistula	636	- - - - relation to accentuation ..	639		
- of sacrum	635				
- in sarcoma of prostate ..	638				
- sciatica	487				
- scybalous mass felt on ..	635				
- sigmoidoscope in	635				
- in suspected malignant disease in the abdomen ..	638				
- for thickening of ureter ..	513				
- in tuberculosis of prostate ..	519				
- - - testis	519				
- - - ureter	513, 626, 629				
- - - vesiculæ seminales ..	638				
- tumour of cauda equina ..	71				
- in uterine calculus ..	627, 638				
- uterine enlargement or retroversion	638				
- vesical calculus	638				
- of vesiculæ seminales ..	307				
- vesiculæ seminales palpable only when diseased ..	638				
- fibrous stricture of, dyschezia from	150				
- hæmorrhage from (see Blood, per Anum)					

Reflexes, contd.

- in myopathies .. 70, 560
- palate, absent in hysteria.. 509
- impaired in bulbar paralysis .. 687
- in paralysis from intra- and extramedullary lesions 546
- due to peripheral neuritis 559
- plantar (see Plantar Reflexes; and Babinski's Sign)
- pupillary (see Pupil, Abnormalities of; and Pupil Reflexes)
- retention of, in encephalitis 594
- in rickets .. 158
- spastic paralysis of one leg 539
- transverse myelitis .. 74
- unequal and exaggerated in hemiplegia .. 337
- (and see Knee-jerk, Pupil, and Ankle-clonus)

- Refraction, errors of, burning, pricking, or watering of eyes from .. 328**
- defective visual acuity due to .. 838
- headache due to 327, 328, 495
- hemioropia due to .. 495
- migraine due to .. 495
- neuralgia in (and see Eye-strain) .. 498
- pain and tenderness in mid-orbital region in .. 498
- strabismus due to .. 709
- supra-orbital pain due to 495
- Regeneration of cut nerve, order of return of sensibility in .. 661

- REGURGITATION** of food through the nose 202, 639, 640
- - - - in bulbar or pseudo-bulbar paralysis.. 640
- - - - diphtheria 77, 181, 224, 559, 640, 842
- from oesophageal pouch 224
- milk in healthy children .. 842
- mitral (see Mitral Regurgitation)
- pulmonary, diastolic bruit in .. 107
- tricuspid (see Tricuspid Regurgitation)
- Reinforcement as an aid in eliciting the knee-jerk .. 397
- Reinisch's test.. 92

- Relapsing fever, abdominal pain and tenderness in .. 373**
- acute onset in .. 698
- blood changes in (*Plate XII*, p. 696) .. 33
- chills in .. 698
- contagious character of .. 698
- diagnosis from malarial .. 373
- epidemic character .. 649
- epistaxis in .. 373
- famine in etiology of 373, 698
- general account of .. 649
- geographical distribution .. 649
- hematemesia in .. 373
- hyperpyrexia in .. 344
- hypothermia in convalescence from .. 346
- jaundice in .. 362, 373
- liver enlarged in .. 373
- pain in back in .. 698
- rapid pulse in .. 698
- rarity of .. 698
- rigors in .. 647, 648, 649
- spirochæta Obermeieri in the blood in (*Plate XII*, *Fig. 1*, p. 696) 373, 649, 698
- spleen enlarged in 373, 692, 698
- sweating in .. 698
- temperature curve of 373, 698

- Religious excitement, pandemic chorea caused by 157
- Remittent fever, purpura 596
- Renal abscess** (see Abscess, Renal)
- calculus (see Calculus, Renal)
- cells and tube casts with chyluria .. 126
- changes of arteriosclerosis 14
- colic (see Colic, Renal)
- crises of locomotor ataxy .. 562
- cystic tumours, albuminuria in .. 15
- **disease** (and see Bright's Disease), blood-pressure high in .. 96, 331
- chronic, diarrhoea in .. 197
- cystoscopic appearances in 624
- diminished appetite in .. 49
- displacement of cardiac impulse in .. 330, 331
- dyspnoea in .. 579, 580
- eosinophilia in diagnosing .. 249
- asthma from .. 172
- epileptiform convulsions in .. 397
- exaggeration of knee-jerks .. 352
- gastritis in .. 329
- headache in .. 359
- insomnia in .. 579
- periodic cyanosis from .. 580
- polycythemia in .. 583
- polyuria in .. 579
- shortness of breath from .. 582
- dyspnoea, asthma mistaken for .. 582
- enlargement (see Kidney Enlarged)
- epithelium in urine in ureteric calculus .. 135
- pain (see Colic, Renal; and Pain, Renal)
- in affected side in impacted ureteral calculus 514
- from involvement of ureter in carcinoma of bladder 514
- pelvis, fistula of, causing pneumaturia .. 576
- tailed epithelial cells from 818
- suppuration, absence of leucocytosis if ureter unblocked .. 400
- tube-casts (see Casts, Renal)
- tuberculosis (see Kidney, Tuberculous Disease of)
- tumour (see Kidney, Tumour of)
- veins, thrombosis of 8, 9
- Rennin in stomach contents, test for .. 355
- Reno-reflex pain .. 394
- Residual urine with prostatic enlargement .. 438
- Resin, bulbar in workers among .. 110
- a source of fallacy in tests for albumin .. 6
- Resonance deficient, from aneurysm .. 322**
- in bronchiectasis .. 703
- in fibroid lung .. 321, 332
- from growth of lung .. 322
- from pulmonary infarction 321
- in phthisis .. 319
- skodaic (see Skodaic Resonance)
- Resorcin, black urine from .. 82 0
- Respiration, Cheyne-Stokes** (see Cheyne-Stokes Respiration)
- influence on heat loss .. 619
- jerky, in chorea .. 156
- pulse and temperature ratio in normal conditions .. 622
- rapid from abscess of lungs 649
- phosphorus poisoning .. 373
- pneumonia 186, 372, 645, 702

Respiration, contd.

- ratio in pneumonia .. 697
- sighing with hæmoperitoneum 717
- slow in cerebral abscess .. 547
- thoracic in general peritonitis .. 644
- Respiratory blood pump in orthopnoea .. 467**
- distress, severe, diagnosis between lungs and larynx as site of origin of 466, 467
- movements, abdominal, absent in ascites .. 51
- deficient in phthisis .. 319
- muscles, effect of hydrophobia on .. 162
- Responsibility, loss of weight due to .. 848
- Rest, coma as indication for** 137
- influence on pain due to cervical rib .. 491
- treatment in diagnosis of chlorosis .. 41
- urine increased during .. 581
- Rests, adrenal** (see Adrenal Rests)
- Restlessness in acute rheumatism .. 622**
- yellow atrophy of liver 370
- and anuria .. 48
- from chronic alcoholism .. 797
- intestinal colic .. 473
- rickety children .. 170, 782
- Retained products of conception, metrostaxis from** 436
- testicle (see Testis, Ectopic)
- Retching, definition of .. 842**
- tenderness in epigastrium from .. 779
- in undue abdominal aortic pulsation .. 592
- Retention of urine** (see Micturition, Abnormalities of; and Urine, Retention of)
- Retina, changes in, in uræmia** 329
- detachment of (*Plate VIII*, *Fig. 7*) .. 463, 839
- sudden blindness from .. 839
- œdema of in optic neuritis 462
- Retinal artery** (central), embolism of, ophthalmoscopic appearance of (*Plate VIII*) .. 463
- changes in chronic nephritis 48
- hæmorrhage (see Hæmorrhage in Retina)
- nerve fibres, opaque, ophthalmoscopic appearances of (*Plate VII*) .. 462
- vein, central, ophthalmoscopic appearance of thrombosis of (*Plate VIII*) 462
- Retinitis, albuminuria, amblyopia with nystagmus from** 836
- in cerebral hæmorrhage 138, 563
- with Cheyne-Stokes respiration .. 125
- in chronic parenchymatous nephritis .. 454
- renal disease 1, 13, 14, 56, high blood-pressure conditions 102, 103, 122, 240, 303, 526
- ophthalmoscopic appearance of (*Plate VIII*) .. 462
- with shortness of breath 101
- simulated by optic neuritis .. 462
- in uræmia 350, 836, 839
- uræmic anaærosis with .. 839
- pigmentosa, constriction of field of vision in .. 838**
- familial character of .. 838

Retinitis pigmentosa, contd.

- night blindness in .. 838
- nyctalopia in .. 841
- ophthalmoscopic appearances in .. 838, 841

Retraction of abdomen (and see Rigidity of Abdomen) in tuberculous meningitis .. 612

-- with colic .. 134

-- of the eyeball (see Enophthalmos) ..

-- eyelids in Graves' disease .. 792

RETRACTION OF GUMS .. 641**RETRACTION OF HEAD,**

causes of .. 641, 642, 643

-- in meningitis ..

328, 359, 641, 642, 699, 709

-- of intercostal spaces in laryngeal obstruction .. 465

-- ribs, systolic .. 63

-- in adherent pericardium .. 103

-- without adherent pericardium .. 103

Retrolabial neuritis, affection of one eye only .. 838

-- central scotoma from .. 837, 838, 840

-- occurrence in young adults .. 838

-- ophthalmoscopic appearances may be normal .. 840

with .. 840

-- optic neuritis from .. 840

-- pain and tenderness in .. 840

eye from .. 840

-- rapid recovery from .. 838

-- sudden blindness from 839, 840

-- onset of .. 838

Retroflexion of uterus (see Uterus, Retroflexion of)

Retroperitoneal glands (see Lymphatic Glands, Retroperitoneal)

-- lipoma (see Lipoma, Retroperitoneal)

-- tissues, rupture of aneurysm into .. 140

Retropharyngeal abscess (see Abscess, Retropharyngeal)

Retropulsion in paralysis agitans .. 796

Retroversion and flexion of uterus (see Uterus, Retroversion of)

Retroverted gravid uterus (see Uterus, Retroverted Gravid)

Rhabdomyoma of kidney .. 395

Rheumatic arthritis (see Arthritis, Acute Rheumatic)

Rheumatic diathesis, brachial neuralgia in .. 491

Rheumatic myositis diagnosed from torticollis .. 167

-- tonsillitis (see Tonsillitis, Rheumatic)

Rheumatics, lightning pains of tabes described as .. 489

Rheumatism, acute

-- albuminuria in .. 17

-- albumosuria in .. 20

-- anaemia in .. 38

-- aortic disease from 233, 237, 481

-- arthritis in .. 378

-- bromidrosis with .. 714

-- cerebral embolism from .. 138

-- in children, chorea in .. 504

-- -- diagnosis from growing pains .. 504, 507

-- -- endocarditis in .. 504

-- -- inflammations of fibrous tissues in .. 504

-- -- muscles often the chief seat of pain in .. 503

-- -- pain in the epigastrium in 485

Rheumatism, acute, in children, contd.

-- sore throats in .. 504

-- chorea in .. 156, 504, 548, 671

-- contractures following .. 167

-- coronary sclerosis mistaken for .. 778

-- delirium of grave significance .. 194

-- diagnosis from dengue .. 506

-- -- endosteal sarcoma .. 756

-- -- Henoch's purpura .. 380

-- -- rheumatoid arthritis .. 378

-- -- endocarditis with .. 103, 236, 239, 671

-- -- eosinophilia after .. 218

-- -- epididymo-orchitis in 517, 518

-- -- erythema nodosum in .. 671

-- -- family history in .. 671

-- -- fibrous mediastinitis in .. 826

-- -- fungating endocarditis in 314

-- -- gall-stones mistaken for .. 778

-- -- gastritis mistaken for .. 778

-- -- generalized erythema in .. 671

-- -- history of, in cerebral embolism .. 338, 563

-- -- chorea .. 156, 548

-- -- mitral stenosis .. 320

-- -- hydrocele in .. 522

-- -- hyperpyrexia in 194, 344, 622

-- -- rare in .. 314

-- -- infantlism from .. 215

-- -- inflammation of soft palate, uvula, and fauces in .. 672

-- -- iritis and cyclitis in .. 256

-- -- joint pains from .. 671

-- -- leucocytosis in .. 400

-- -- lumbago from .. 785

-- -- menorrhagia in .. 428

-- -- mitral disease from 102, 240

-- -- stenosis from 320, 773

-- -- multiple serositis in .. 123

-- -- myocarditis in .. 211

-- -- nausea in .. 671

-- -- night terrors in .. 447

-- -- nodules of .. 452

-- -- age incidence of .. 452

-- -- of elbows and scalp .. 804

-- -- orchitis from .. 79, 517

-- -- pain in the back in 475, 476

-- -- limbs in .. 503, 504

-- -- muscles in, worse on getting warm in bed .. 503

-- -- and tenderness in scalp from .. 784

-- -- pericarditis in .. 671

-- -- phthisis mistaken for .. 718

-- -- pleurisy in .. 671

-- -- with effusion in .. 121

-- -- prominence of articular manifestation in adults .. 504

-- -- non-articular manifestation in children .. 504

-- -- restlessness in .. 622

-- -- scarlatinal .. 376

-- -- scleritis and episcleritis in 256

-- -- simulated by puerperal fever .. 650

-- -- pyaemia .. 650

-- -- trichinosis .. 504

-- -- simulating occupation neuroses .. 178

-- -- scarlet fever .. 671

-- -- swelling of thyroid gland in .. 792

-- -- tabes mistaken for .. 484

-- -- tenderness of spine from 784

-- -- testicular atrophy after 79

-- -- tonsillitis in 239, 419, 671

-- -- urate deposit in .. 815

-- -- urethral discharge due to 206

-- -- valvular heart disease from .. 523

-- -- various manifestations of 121

-- -- vomiting in .. 671

Rheumatism, contd.

-- chronic, no cardiac affection in adults as a rule in .. 507

-- -- effect of change of weather on the pains of .. 507

-- -- massage and movement on .. 507

-- -- impairment of general health in .. 507

-- -- increase of pain and stiffness after rest in .. 503

-- -- pain chiefly in joints in some cases .. 507

-- -- -- muscles in some cases 507

-- -- -- less after movement 503, 507

-- -- pseudo-ankylosis in .. 507

-- -- seldom a sequel of acute gonorrhoeal (see Arthritis, Gonorrhoeal)

-- -- muscular (see Myalgia)

-- -- diagnosis from brachial neuralgia .. 492

-- -- from tetanus .. 162

-- -- pain in the back in .. 476

Rheumatoid arthritis, absence of bony outgrowths in (Fig. 108) .. 379

-- -- endocarditis in .. 379

-- -- grating in .. 379

-- -- suppuration in .. 379

-- -- acuteness of first attack .. 378

-- -- age incidence of .. 378, 379

-- -- anaemia in .. 39

-- -- chloasma in .. 574

-- -- contractures in .. 167

-- -- correspondence to Still's disease .. 418

-- -- diagnosis from acute rheumatism .. 378

-- -- -- osteo-arthritis 379, 384

-- -- disproportionately rapid pulse in .. 378

-- -- enlarged glands in .. 39

-- -- epitrochlear gland in .. 379

-- -- fixation of joints in .. 379

-- -- freckles in .. 378

-- -- gradual disappearance of .. 379

-- -- loss of appetite in .. 39

-- -- weight in .. 39

-- -- muscular atrophy in .. 379

-- -- pain in the back from .. 476

-- -- parts affected by .. 378

-- -- passive movements and massage in .. 379

-- -- pigmentation in .. 39, 378

-- -- pyrexia in (Fig. 106, p. 377) .. 39, 378

-- -- recurrence of .. 378, 379

-- -- sex incidence of .. 378

-- -- simulating occupation neuroses .. 178

-- -- skiagram (Fig. 108) .. 379

-- -- spindle-shaped interphalangeal joints in (Fig. 107) .. 378

-- -- stiff neck from .. 708

-- -- sweating of hands and feet in .. 378

-- -- temperature curve of (Fig. 106) .. 377

-- -- ulnar deflection of fingers in (Fig. 108) .. 380

Rhine valley, mollities ossium in 269

Rhinitis associated with corneal ulceration .. 806

-- atrophic .. 204

-- -- anosmia from .. 668

-- -- chronic, method of investigating cause of .. 204

-- -- syphilis causing .. 204

-- -- in cutaneous diphtheria .. 602

-- -- foul breath due to .. 99

-- -- hypertrophic .. 204

-- -- loss of taste due to .. 774

- Rhinitis, hypertrophic, contd.**
 -- obstruction to nose by .. 668
 -- snoring due to .. 669
 -- impairment of taste from 774, 775
 -- membranous, not necessarily diphtheritic .. 204
 -- purulent, diphtheria bacilli in .. 203
 -- from glands .. 203, 204
 -- gonococci causing .. 203
 -- micro-organisms connected with .. 203
 -- tuberculous, rare .. 204
 Rhinoliths, from rhinitis .. 204
 Rhinophyma .. 268, 805
 Rhinorrhagia (see Epistaxis)
 Rhinoscleroma, age incidence .. 805
 -- characters of .. 805
 -- epithelioma simulating .. 805
 Rhomboid muscles, spinal nerve root supplying .. 556
 -- nerve supply of .. 550
 Rhonchi, bronchitic .. 192
 -- with bronchitis and emphysema .. 186
 -- and rales in emphysema .. 246
Rhubarb, yellow or red urine from .. 819, 820
 -- chrysophanic acid in .. 819, 820
 -- oxaluria after .. 311
Rhus toxicodendron, sore fingers from handling .. 266
 -- causing bullæ .. 110, 111
Ribs, affections of, tenderness in the chest from .. 776
 -- beaded, in rickets 182, 191, 695
 -- carcinoma of .. 776
 -- caries of, abscess of chest wall from .. 478
 -- pain in chest from .. 478
 -- cartilages eroded by aortic aneurysm .. 482
 -- cervical, absence of nerve tenderness in .. 492
 -- absolute relief of pain by giving up work in .. 492
 -- accessory .. 492
 -- anaesthesia along ulnar border of forearm in 493, 593
 -- anaesthesia from .. 554
 -- analgesia from .. 128
 -- atrophic palsy of arm from .. 554
 -- -- flexors of forearm in 493
 -- -- intrinsic hand muscles from .. 493
 -- bilateral .. 492, 593
 -- brachial neuralgia in .. 492
 -- claw-hand from 127, 128, 493
 -- cyanosis of hands from .. 493
 -- diminished radial pulse from 128
 -- dull boring pain in arm in 492
 -- effects of exertion on symptoms of .. 554
 -- frequent absence of symptoms in .. 492
 -- muscular atrophy from 74, 554
 -- pain in arms from 128, 554, 593
 -- -- worse in the evening 492
 -- -- neck from .. 128
 -- -- radiating along inner side of arm from neck to fingers in .. 492
 -- -- in scapular region in .. 492
 -- -- paresis in arms from pressure due to .. 593
 -- pressure effects due to fibrous band between it and first dorsal rib .. 493
 -- -- pulses unequal in 493, 593
 -- relief of pain on lying with hand behind head .. 492
 -- sex incidence of .. 492
 -- simulated by Raynaud's disease .. 493
- Ribs, cervical, contd.**
 -- size, as seen in skiagram, no guide as to symptomatic importance of 493
 -- subclavian artery sometimes pushed forward by 764
 -- symptoms present more frequently in women than men .. 492
 -- tenderness on pressure in posterior triangle in .. 492
 -- vasomotor changes from 128
 -- disturbances in arm due to .. 493
 -- x-rays in diagnosis of .. 493
 -- eversion of lower, in rickets fractured (see Fracture of Rib) 695
 -- multiple tender syphilitic swellings on .. 752
 -- new growth of, tenderness in the chest from .. 776

- inguinal swelling due to	741
- simulating sciatica	74
- swelling in right iliac fossa due to	737
- talipes from	132
- unaltered by compressing common iliac artery	741
- x-rays in diagnosis of	737, 741
- pleura, bloody effusion in	118
- prostate	638
- ribs	776
- skin	802
- characters of	803
- stomach	690
- felt in epigastrium	723
- very large tumour in	690
- suprarenal, secondary deposits in cranial bones from	782
- of testis	520, 766
- age incidence of	520, 766
- diagnosis from orchitis	520

Sarcoma of testis, contd.

-- dissemination via the veins	766
-- shorter course than in carcinoma	766
- tibia (Fig. 196)	754, 756, 763
- tonsils, not common	672
- sore throat from	670
- unilateral	672
- uterus, arising from fibromyoma	434
- early age of some patients	430
- histology in diagnosis of	434
- pelvic swelling due to	757
- rapid enlargement of	434
- simulated by fibromyoma	434
- vulva	768
- vertebræ	786
- x-rays in diagnosis (Figs. 195, 196, 197, 198, 199, p. 754)	737, 741, 748, 754, 756, 757, 763
Sarcomatosis, purpura in	596
Sartorius, nerve supply of	542
- spinal nerve-root supplying	543
Satin-wood workers, bullæ in	110
Saturnine encephalopathy	77
- 82, 137, 139, 173	
- Babinski's sign in	82
- coma in	137, 139
- dementia and mania in	139
- difficulties in diagnosis of	139
- epileptiform convulsions in	139
Scabies, bullæ in	654, 832
- burrows in	608, 831
- diagnosis of prurigo from	532
- from eczema	831
- small-pox	608
- eosinophilia in	249
- extent of lesions in	447
- face rarely affected by	832
- fingers affected in	266, 588, 609, 832
- heterogeneity of lesions in	608
- itching in	654
- papules in	831
- parts affected by	609, 832
- pruritus in	588
- pustules in	601, 654, 831, 832
- vesicles in	608, 654, 829, 831, 832
SCABS	653
- in anthrax	746
- eczema	653
- erythema	832
- multiforme	653
- impetigo	602, 653, 654
- leprosy	654
- lupus erythematosus	656
- vulgaris	655
- seborrhœa	653
- small-pox	605, 655
- syphilis	654
- yaws	655
Scalding pain on micturition (see Micturition, Scalding)	
Scalds, albuminuria from	16
- bullæ from	110
Scalp, affected by favus	270
- seborrhœic eczema	533
- circoid aneurysm of	764
- hyperæsthetic spots over, in traumatic neuræsthenia	667
- multiple benign sarcoïd of	451
- nerve supply of (Fig. 200)	781
- œdema of, in acute nephritis	458
- from thrombosis of superior longitudinal sinus	651
- pain in (see Pain in Scalp)	
- psoriasis of	657
- pustular syphilides of	601
- rheumatic nodules of	452, 804
- ringworm of (see Ringworm of Scalp)	
- sebaceous cyst of	804
- seborrhœa of	656, 657

Scalp, contd.

- segmental areas of (Figs. 202, 203)	783
- septic infection of, preauricular gland enlarged in	419
- tender (see Tenderness of Scalp)	
- varicella affecting	833
SCALY ERUPTIONS	655
- due to belladonna	655
- carbolic acid	655
- eczema	655, 656, 657, 831
- marginatum	275
- seborrhœic	275
- erythema	655, 656
- scarlatiniforme	253
- German measles	655
- ichthyosis	655
- iodine	655
- keratosis pilaris	655
- lichen scrofulosorum	529
- lupus erythematosus	268, 656, 657, 714
- measles	655
- mycosis fungoides	803
- in pemphigus foliaceus	654
- pityriasis rosea	658
- rubra	253, 655, 658
- pilaris	530, 655, 658
- prurigo	531
- psoriasis	274, 655, 657
- quinine	655
- scarlatina	655
- seborrhœa	447, 655, 656, 657
- syphilis	446, 532, 656
- tineæ circinata	274
- imbricata	276
- tonsurans	274, 655
- versicolor	276, 426, 655
- transition of papules into	528
- in urticaria	656
- xeroderma	655
Scanning speech in disseminated sclerosis	686
Scapula, deformed, in paralysis of serratus magnus	551
- pain under right, from gall-stones	135
Scarlatina, acute dilatation of heart in	243
- albuminuria in	12, 13, 17, 674
- albumosuria in	20
- angina maligna in	674
- aortic disease after	237
- arthritis after	376
- bald tongue in	674
- cancrum oris in	282
- cervical adenitis, pyrexia and sore throat sometimes the only symptoms of	674
- glands enlarged in	420, 674
- delirium in	194, 301
- desquamation in	674
- not proof of	671
- diagnosis from dengue	506
- from erythema scarlatiniforme	253
- German measles	418
- small-pox	607
- diazo-reaction in	198
- empyema after	650
- endocarditis complicating	236, 239
- eosinophilia after	248
- epididymo-orchitis in	517, 518
- epistaxis in	251, 301
- gangrene in	282
- hæmoglobinuria in	315
- heart disease from	237, 526
- hyperpyrexia in	301, 343
- infantile convulsions from	170
- infantilism from	215
- leucocytosis in	400
- menorrhagia in	428

Scarlatina, contd.

- nausea and vomiting at onset of .. 843
- nephritis in .. 671, 674
- nerve deafness after .. 190
- otitis media in .. 674
- pain in limbs at onset of .. 505
- purpura in .. 301, 596, 597
- pyrexia in .. 674
- rigors with .. 647, 650
- simulated by acute rheumatism .. 671
- small-pox .. 605
- urticaria .. 850
- sore throat in .. 670, 674
- spinal arthritis in .. 708
- spleen enlarged in .. 692, 698
- stiff neck in .. 708
- strawberry tongue in .. 607
- submaxillary lymph glands enlarged in .. 419
- testicular abscess in .. 680
- transverse myelitis due to .. 565
- **maligna**, hæmatemesis in 294, 301
- hæmaturia in .. 301
- headache in .. 301
- rapid, weak pulse in .. 301
- Scarlatinal arthritis** .. 376
- rheumatism .. 376
- Scars, after burns** .. 709
- contractures from .. 168
- from favus .. 270, 272
- healed gumma of face (*Figs.* 156, 157) .. 589
- after herpes zoster .. 479
- in leprosy .. 450, 654
- lupus erythematosus 268, 272, 656, 658
- vulgaris .. 448
- on lips in congenital syphilis (*Fig.* 79) .. 259
- in multiple benign sarcoid .. 452
- neck, from scrofuloderma .. 449
- pigmented, in syphilis 237, 604
- after small-pox .. 655
- syphilis .. 604, 769, 811
- of palate .. 237
- talipes from .. 132
- varioloid, after the small papulo-pustule of scrofuloderma .. 603
- vulval, syphilitic .. 769
- x-ray, epithelioma starting in 803
- Sclisotomiasis** (see *Lilharzia Hematobia*)
- Schönlein's disease** (see *Peliosis Rheumatica*)
- Schott's Nauheim treatment** in myocardial degeneration 526
- Sciatic nerve**, growth of .. 132
- injury to, talipes from .. 131
- muscles supplied by .. 542
- paralysis, causes and signs of .. 542
- skin distribution of .. 542, 659
- spinal roots derived from .. 542
- Sciatica**, ankle-jerk absent in .. 487
- anterior crural neuralgia with .. 488
- conditions simulating .. 487
- **diagnosis** from osteo-arthritis .. 487
- hip-joint disease .. 487
- lumbo-sacral spine disease .. 487
- new growth in pelvis .. 487
- retroversion of uterus .. 487
- spinal cord lesions .. 488
- meningitis .. 487
- tumour of spinal cord .. 487
- enquiry as to sphincters before diagnosing .. 488
- examination of urine for sugar before diagnosing .. 488
- generalized slight wasting of whole limb in .. 487

Sciatica, contd.

- knee-jerk not affected in .. 487
- lumbago associated with .. 487
- muscular atrophy in .. 74, 487
- need for caution in diagnosing .. 488
- a neuralgia of the sciatic nerve in some cases .. 487
- a neuritis of the sciatic nerve in other cases .. 487
- numbness and slight anæsthesia of foot in .. 487
- pain in the leg in .. 487
- increased by movements which stretch the nerve .. 487
- plantar reflex flexor in .. 487
- rectal or vaginal examination in all cases of .. 487
- **simulated** by carcinoma of ovary .. 74
- rectum .. 74
- uterus .. 74
- fibromyoma of uterus .. 74
- ovarian cyst .. 74
- pelvic gummata .. 74
- inflammation .. 74, 487
- sarcoma .. 74
- sacro-iliac joint disease .. 74
- spondylitis deformans .. 787
- tumour of cauda equina 74, 487
- symptoms and test of .. 74
- tenderness over gluteal region, over sciatic notch and down nerve in .. 487
- of sciatic nerve in .. 384
- unilateral character of .. 488
- x-rays to exclude organic disease in .. 488
- Scissor gait .. 154, 164
- in Little's disease .. 154
- Scleritis, causes of .. 256
- conjunctivitis distinguished from .. 256
- Scleroderma**, anidrosis with .. 714
- atrophy of the skin in .. 781
- diagnosis from leucoderma .. 575
- ectropion and epiphora from .. 250
- gradual onset of .. 652
- pigmentation of the skin in .. 424
- relation to pseudopelade of Brocq .. 782
- risus sardonius simulated by .. 652
- tenderness of scalp in .. 780, 781
- ulceration of fingers from .. 266
- Sclerosis**, amyotrophic lateral (see *Amyotrophic Lateral Sclerosis*)
- combined, of cord (see *Paraplegia, Ataxic*)
- lateral and posterior (see *Paraplegia, Ataxic*)
- disseminated (see *Disseminated Sclerosis*)
- insular (see *Sclerosis, disseminated*)
- of ovaries (and see *Ovary*) .. 508
- primary lateral (see *Lateral Sclerosis, Primary*)
- subacute combined (see *Paraplegia, Ataxic*)
- Sclerotics pigmented in ochronosis .. 575
- Scoliosis** from asymmetrical chest .. 180
- backache from .. 475
- causes of .. 180
- from cervical caries .. 708
- dwarfism from .. 214
- with fibroid lung .. 193, 246
- in Friedrich's ataxy 164, 559
- heart impulse displaced in .. 330
- with kyphosis .. 181, 183
- from muscular weakness 180, 214
- osteomalacia .. 214

Scoliosis, contd.

- due to rickets .. 214
- from Sprengel's shoulder .. 180
- in syringomyelia 128, 388, 554
- torticollis .. 708
- Scoparius, polyuria after .. 582
- Scorbutus** (see *Scurvy*)
- Scotoma**, central, from alcohol .. 836
- from atoxyl .. 836
- in disseminated sclerosis .. 565, 837
- hereditary optic atrophy .. 837
- hippus with .. 595
- from lead .. 836
- migraine .. 837, 838
- peripheral .. 837
- from quinine .. 836
- retobulbar neuritis .. 837, 838
- tobacco .. 836, 837
- general account of .. 837
- negative or positive .. 837
- paracentral .. 838
- use of perimeter in mapping .. 838
- from retinal hæmorrhage .. 837
- ring form .. 838
- in migraine .. 837
- Scratching**, pruritus associated with .. 588
- Screaming** in hysteria .. 160
- due to indigestion in children 136
- in intussusception .. 92
- rickety children .. 170
- Scrofula**, age incidence of .. 808
- ulceration of the skin from .. 808
- Scrofuloderma**, age incidence .. 603
- crusting slow in .. 603
- diagnosis from lupus 449, 603
- syphilitic ulcer .. 449, 603
- enlarged cervical glands with .. 449
- granular scrofulous ulcers in .. 603
- large flat pustules in .. 603
- lichen scrofulosorum with .. 529
- nodules of .. 449
- presence of other tuberculous signs in .. 604
- scars in neck in .. 449
- small papulo-pustules in .. 603
- undermined edge of ulcer in .. 604
- varioloid scars after .. 603
- Scrotal hernia** (see *Hernia*)
- sores (see *Sores, Scrotal*)
- swelling (see *Swelling, Scrotal*)
- Scrotum**, abscess of (see *Abscess, Scrotal*)
- adhesion to tuberculous testis 765
- chancre on .. 681
- condylomata on .. 681
- epithelioma of (see *Carcinoma of Scrotum*)
- fibro-sarcoma of .. 765
- fistula in tuberculous (and see *Fistula, Scrotal*) .. 518
- injury to, hydrocele from .. 522
- Jacquet's erythema of .. 446
- mucous tubercles on .. 681
- myxoma of .. 805
- œdema of, in acute nephritis .. 458
- gonorrhœal epididymitis .. 766
- papilloma of .. 679
- diagnosis from hernia testis 681
- pruritus of .. 588
- scabies of .. 447
- **sebaceous cyst** of .. 765
- microscope in diagnosing .. 681
- simulating epithelioma .. 681
- suppurating .. 681
- smooth oval swelling in one side of, in hydrocele .. 522
- suppurating cysts of .. 679
- tuberculous sinus in .. 766, 767
- ulcer of (see *Ulceration of Scrotum*)
- wart of, pre-cancerous changes in .. 679

- Scurvy** in adults, rarity of .. 599
 - albuminuria in .. 20
 - anæmia in .. 44, 85, 302
 - bleeding from gums in .. 85, 295
 - bromidrosis with .. 714
 - bullæ in .. 112
 - cutaneous hæmorrhages
 round hair sacs in .. 302
 - debility in .. 302
 - diagnosis from purpura hæ-
 morrhagica .. 302
 - epistaxis in .. 251
 - hæmatemesis in .. 294, 302
 - hæmaturia in .. 305, 311
 - hæmoptysis in .. 318
 - hæmorrhage in .. 85
 - infantile, anæmia in .. 115
 - - bleeding gums in .. 85, 115
 - - bone tenderness in .. 115
 - - cachexia in .. 115
 - - diet in etiology of .. 599
 - - night sweats in .. 714
 - - pasty pallor in .. 599
 - - profuse perspiration in .. 115
 - - purpura in .. 596, 599
 - - spongy gums in .. 599
 - - knotty hæmorrhagic swell-
 ings in calf muscles in .. 599
 - - menorrhagia in .. 428, 430
 - - metrorrhagia due to .. 433, 435
 - - nyctalopia from .. 811
 - - nyctophobia in .. 571
 - - pytalism due to .. 590
 - - purpura in .. 85, 596, 599
 - - relation to diet .. 302, 599, 753
 - - spongy gums in .. 295, 302, 599
 - - stomatitis in .. 85, 590
 - - subcutaneous indurations in .. 302
 - - subperiosteal hæmorrhages
 in .. 314
 - - symptoms of .. 41
 - - tenderness of long bones in .. 85, 599
Scurvy-rickets, general account 753
Scybalæ, abdominal tumour
 produced by .. 723, 724
 - in intestinal constipation .. 111
 - mucous colitis .. 134
 - palpable .. 145, 718
 - - in left inguinal region .. 731
 - - palpation per rectum .. 635
 - - simulating appendicitis .. 729
 - - movable kidney .. 727
 - - masking tumour in right
 iliac fossa .. 729
Seamstresses, actinomyces in .. 705
 - - cramp in .. 177
 - - sporotrichosis of lungs in .. 322
Sea-sickness .. 844
Seal-type of dwarf .. 214
Season, influence on pigmenta-
 tion in xeroderma pig-
 mentosum .. 801
Sebaceous cyst, distinction
 from fibroma molluscum .. 804
 - - lipoma .. 804
 - - of external auditory meatus .. 469
 - - scrotum .. 765
 - - - simulating epithelioma .. 681
 - - - simulating enlarged thy-
 roid gland .. 791
 - - sites of occurrence .. 804
 - - tenderness of the scalp
 from inflammation of .. 781
 - - of vulva .. 768
 - - ducts, affection in lupus
 erythematosus .. 657
 - - glands, affection in acne
 vulgaris .. 530
 - - relation to lichen scrofulo-
 sorum .. 529
Seborrhœa of scalp, cheilitis
 - - exfoliativa with .. 403
 - - sternal region affected by .. 533
Seborrhœic dermatitis, bald-
 ness from .. 84
 - - corporis, chronic character .. 658
 - - diagnosis from congenital
 syphilis .. 447
 - - - favus .. 272
 - - - macular syphilide .. 426,
 532, 533
 - - - pityriasis rosea .. 658
 - - - psoriasis .. 656
 - - - ringworm .. 274
 - - - rosacea .. 268
 - - distribution of .. 656
 - - exfoliation of vermillion
 of lips in .. 403
 - - infants, napkin-region in-
 cidence of .. 446
 - - limited distribution of .. 426
 - - occipital glands enlarged
 in .. 419
 - - oleosa .. 656
 - - pruritus in .. 588
 - - scales in .. 653, 655, 656,
 657
 - - scalp, face, and neck affec-
 ted by .. 533, 657
 - - sicca .. 656
 - - tenderness of scalp from .. 781
Sebum, coloured (see Chromi-
 drosis)
Sedatives, constipation relieved
 by .. 144
 - "See-saw" phenomenon, pre-
 cordial, causes of .. 63
Segmental areas of face, defi-
 nite relation to individual
 teeth, table showing .. 498
 - - head and neck, maximal
 points in (*Figs.* 132-
 135) .. 497
Selditz powder in determining
 gastric succussion .. 712
 - "Seizures" in hysteria .. 506
Semen, necessity for examin-
 ing in sterility .. 707
Semicircular canal, effects of
 lesions of each .. 827
 - - hæmorrhage into, Mé-
 nière's disease, due to .. 828
Semilunar cartilage, displaced .. 388
Seminembranosus bursa, sym-
 ptoms and signs of dis-
 tended .. 762
 - - muscle, nerve supply of .. 542
Seminal vesicles (see Vesiculæ
 Seminales)
Semitendinosus, clonus of .. 161
 - - nerve supply of .. 542
Senator, re neuromyositis .. 504
Senile changes, cerebral hæ-
 morrhage from .. 563
 - - degeneration, Cheyne-Stokes
 respiration in .. 124
 - - - premature .. 218
 - - - trophic changes of nails in .. 415
 - - dementia, amnesia in .. 25
 - - dyspepsia .. 354
 - - gangrene (see Gangrene, Senile)
 - - intestinal hypoplasia, con-
 stipation due to .. 143
 - - impotence, priapism preced-
 ing .. 585
 - - nocturnal mania .. 558
 - - pruritus .. 588
 - - tremor, general account of .. 795
 - - vaginitis, metrorrhagia from .. 436
Senilism and infantilism com-
 bined in progeria .. 218
Senility (and see Old Age;
 and Impotence) .. 347
 - - testicular atrophy in .. 78
Senna, chrysophanic acid in .. 819, 820
 - - urine pink from .. 819, 820
 - - yellow from .. 819
**SENSATION. SOME ABNOR-
 MALITIES OF** .. 659
 - changes in, in syringomyelia .. 73, 388, 554, 563
 - - loss of (see Anæsthesia)
 - - perversion of, in chronic al-
 coholism .. 172
Sense of position, impaired in
 tabes .. 493
Sensibility, cutaneous, loss of,
 mistaken for paralysis .. 545
 - - deep, meaning of .. 661
 - - delayed in tabes dorsalis .. 665
 - - epicritic, definition of .. 661
 - - loss of, in Brown-Séquard
 paralysis .. 540
 - - sciatic nerve paralysis .. 542
 - - protopathic, definition of .. 661
Sensory areas corresponding
 to spinal segments (*Plate*
 XI) .. 663
 - - disturbances, lower neurone
 paraplegias causing .. 563
 - - in peripheral neuritis .. 75
 - - - tabes dorsalis .. 66
 - - transverse myelitis .. 564
 - - localization in spinal cord,
 diagrams illustrating
 (*Figs.* 146, 147) .. 566
Separation of epiphyses (see
 Epiphyses, Separation of)
Sepsis, chronic, anæmia in .. 39
 - - deep-seated, blood cultures
 in detection of .. 648
 - - post-puerperal, foul breath
 in .. 98
 - - shortness of breath due to .. 100
Septic absorption, lymphatic
 gland enlargement from .. 419
 - - arthritis (see Arthritis,
 Septic)
 - - conditions, hyperpyrexia in .. 622
 - - infection of umbilical cord,
 blood per anum in .. 90
 - - poisoning, diagnosis from
 quotidian malaria .. 615
 - - urethritis (see Urethritis,
 Septic)
 - - wounds, gangrene in .. 282
Septicæmia from abscesses in
 the throat .. 614
 - - acholuric jaundice in .. 372
 - - anæmia in .. 650
 - - from appendicitis .. 614
 - - cerebral abscess .. 614
 - - debility in .. 650
 - - from deep-seated glandular
 suppuration .. 614
 - - diagnosis by blood cultures .. 598, 698
 - - - from typhoid fever .. 611
 - - dryness of the mouth in .. 774
 - - from empyema .. 614
 - - endocarditis in .. 103
 - - foul taste in .. 774
 - - furred tongue in .. 774
 - - hæmoglobinuria in .. 315
 - - hyperpyrexia in .. 343
 - - jaundice in .. 372
 - - otitis media causing .. 614
 - - pelvic abscess causing .. 614
 - - pneumococcal, meningitis in .. 642
 - - purpura in .. 596, 598
 - - and pyæmia, relationships
 between .. 650
 - - pyrexia in .. 343, 609, 614, 650
 - - rigors in .. 598, 614, 647, 648, 650
 - - septic skin rashes in .. 650
 - - sources of infection causing .. 698
 - - splenic enlargement in .. 692, 698
 - - streptococcal .. 372
 - - from suppurative pylophle-
 bitis .. 614
 - - sweating in .. 375

Septico-pyæmia , general account		<i>See incidence, contd.</i>		<i>Shock, contd.</i>	
of	650	-- functional aphonia ..	538	-- hypothermia in ..	346
-- perioritis from ..	776	-- gall-bladder disease ..	500	-- intestinal obstruction ..	153
-- recurring rigors in ..	648	-- gall-stones ..	135	-- from inversion of uterus ..	587
Septum nasi , deflected, anosmia		-- gas-containing subphrenic		-- mental, anorexia from ..	50
from	668	-- abscess ..	721	-- in paroxysmal tachycardia ..	772
-- snoring due to ..	669	-- gastralgia ..	485	-- from perforated duodenal

-- Friedreich's ataxy ..	164	-- from gangrenous appendicitis	484	-- teeth ..	259

Signs, contd.

- Kernig's	350
- Koplik's spots	203
- Moebius's	244, 253
- Parrot's nodes	427, 752
- Pawlik's	228
- Romberg's	66, 67, 665
- Stellwag's	244, 253, 792
- Tache cérébrale	771
- Trousseau's	3, 178
- von Graefe's	244, 253, 792
Silica in intestinal sand	652
Silicosis (see Cirrhosis of Lung)	
Silken crepitus in osteo-arthritis	179
Silver nitrate as an aid to cystoscopy	630
- - copious precipitate of silver chloride on adding to hydatid fluid	415
- - irrigation of bladder with	307
- - pigmentation of skin from	575
- - in quantitative estimation of homogentisic acid	822
- - test for alkaptonuria	822
Singing in ears (see Tinnitus)	
Sinus of foot from mycetoma	809
- infections, anaemia in	39
- of scrotum	767
- suppuration, cerebral abscess from	173
- thrombosis (see Thrombosis)	
Sinusitis, polypi in	255
Sixth nerve paralysis, effects of	200
Size, abnormal sense of	840, 841
Skeleton, dwarfism due to defects of the	212
Skene's tubes, gonococci in	211
Skiagraphy (see X-rays)	
Skin , bleeding naevi of	325
- boils on, in ankylostomiasis	570
- bruising (see Bruising of Skin)	
- capillary pulsation in	233
- carcinoma of (see Carcinoma of the Skin)	
- central scab with ring of vesicles on, in anthrax	746
- changes in cretinism	259
- - in Graves' disease	261
- - myxœdema	43, 259, 585
- - pseudo- elephantiasis	456
- - - myxœdema	259
- cold and clammy from internal hæmorrhage	646
- coloration in carbon monoxide poisoning	138
- - from drugs	575
- dimpling of, over carcinoma of breast	745
- disease, eosinophilia in	249
- distribution of sensory nerves to (Fig. 174)	659
- dry and flushed in belladonna poisoning	195
- - harsh in cirrhosis of liver	410
- - - pyelitis	625
- - shrivelled in carcinoma	413
- flushed, dry, and pungent in lobar pneumonia	372, 702
SKIN, FUNGUS AFFECTIIONS OF	270
- greenish in acute yellow atrophy	370
- gumma of	279
- lemon-yellow colour in pernicious anaemia	616
- lesions, pruritus associated with	588
- - in syringomyelia	563
- loose, dry, café-au-lait, of congenital syphilis	446
- loss of elasticity in, in malignant disease	718
- - - with emphysema	186
- mycosis fungoides of	802

Skin, contd.

- myoma of	805
- Paget's disease of	802
- pale and sweaty in poisoning	195
- pigmentation of (see Pigmentation of Skin)	
- sarcoma of	802
- shiny over affected joint in gout	383
- signs of jaundice in	360
- staining of (see Staining of Skin)	
- trophic changes in major trigeminal neuralgia	495
- - - syringomyelia	285, 554
- tumours of	802
- ulceration of (see Ulceration of Skin)	
- vesicles on (see Vesicles)	
- - (and see Bullæ, Crusts, Macules, Papules, Pustules, Scabs, and Wheals)	
- white crystals on, in uridrosis	715
- xeroderma pigmentosum of	802
- yellow, in cretinism	259
- - patches on, due to xanthoma planum	805
Skin-curers, mercury poisoning in	38
SKODAC RESONANCE	667
- - due to ascites	668
- - gastric or colonic tympany simulating	668
- - in lung compression	332
- - over pleuritic effusion	192, 667
- - various causes of	667
Skull , bossing of, in rickets	753
- defects in anosteoplasia	213
- fractured (see Fracture of Skull)	
- hyperostosis of in leontiasis ossea	749
- increase of size in acromegaly	263
- ivory exostosis of	751
- local tenderness of, with organic intracranial disease	327
- misshaped in rickets	212, 753
- multiple tender syphilitic swellings on	752
- natiform in congenital syphilis	752
- rarefaction in rickets	179
- secondary growth of, causes of	782
- tumours of, headache in	327
- - base near foramen ovale and foramen rotundum, trigeminal neuralgia in	496
Skutch's pelvimeter, use of, in pregnancy	228
Sleep , average necessary amounts at different ages	356
- Babinski's sign during deep	82
- cerebral anaemia in	359
- cessation of motor tics during	160
- spasmodic contractions during	160
- influence on chorea	156
- - hysterical spasms	133, 166
- - - stridor	710
- - tremors	795
Sleepiness after epileptic convulsions	169
Sleeping on back, priapism from	586
- sickness (see Trypanosomiasis)	
Sleeplessness, loss of weight due to	818
- in rickety children	170
Sloughing	283
- in erysipelas	716
Slowing of pulse-rate	97
Small intestine, normal situation of	722
- occipital nerve, skin distribution of	659
- sciatic nerve, skin distribution of	659

Small-pox

- absence of enlarged glands	603
- early in	607
- acute hydrocele in	522
- affection of pharynx in	670
- albuminuria in	17, 20
- arthritis in	376
- bleeding gums in	301
- characters of the individual lesion in diagnosis of	605
- confluent (Fig. 160)	605, 606
- dark stains, scars, and pits in	605
- diagnosis from acne vulgaris	603, 609
- - acute eczema	608
- - bromide eruption	609
- - chicken-pox	833, 834
- - copaiba eruption	609
- - erythema multiforme	607
- - German measles	607
- - impetigo vulgaris	607
- - iodide eruption	609
- - measles	607
- - purpura simplex	607
- - scabies	608
- - scarlet fever	607
- - syphilides	604, 607
- - from typhoid fever	607
- discrete (Fig. 160)	606
- distribution of eruption in (Fig. 213, p. 833)	605, 606, 607, 833, 834
- effects of exposure in distribution of lesions in	605
- - friction of clothes on distribution of lesions in	605
- epistaxis in	301
- eruption in bathing-drawers area	598
- gangrene in	282
- hæmatemesis in	294, 301
- hæmaturia in	301, 305
- hæmoptysis in	318, 325
- hæmorrhage between the pustules, etc., grave significance of	598
- - into pustules in, prognosis unaffected in	598
- - - skin and pustules in	605
- hæmorrhages in	301
- hæmorrhagic eruption in "bathing drawers area"	598
- - in prodromal stage of	598
- - - hopeless outlook in	598
- intense backache and headache in	301
- - itching in	655
- invasion of mucous membrane of air-passages in	605
- leucocytosis uncommon in	400
- melena in	301
- menorrhagia in	428
- modified	605
- occurrence of eruption in mouth, pharynx, and œsophagus in	673
- pain in limbs at onset of	505
- preliminary roseolar scarlatiniform rash in	605
- prodromal hæmorrhagic eruption	598
- - rashes of, in bathing-drawers area	447
- - ptyalism in	590
- - purpura in	596, 598
- - pustules in	601, 605, 829
- - Ricketts on	608
- - rigors in	301, 647
- - scabs in	635
- - scarring after	655
- - simulated by vaccinia	834
- small shotty pink papule embedded in skin in	608
- sore throat in	670, 675

Small-pox, contd.

- spleen enlarged in .. 692, 698
- stomatitis in .. 590
- swelling of thyroid gland in .. 792
- symmetrical distribution of rash in .. 607
- ulceration of larynx in .. 185, 226, 318, 325
- umbilication of pustules in .. 655
- vesicles in .. 829
- vacuolation of papules in .. 605
- vesicles of .. 605
- vomiting in .. 301
- malignant .. 301

SMELL, ABNORMALITIES OF

- centre in uncinate gyrus .. 669
- loss of, during ordinary cold .. 668
- with hysterical hemianesthesia .. 666
- normal, idiosyncrasies of sense of .. 668
- offensive, vomiting from .. 844
- subjective, as epileptic aura .. 80
- sensations of .. 669

Smile in myasthenia gravis

(Fig. 84, p. 261) .. 260

- transverse type in myopathy

(Fig. 82) .. 260

Smoking, anorexia from .. 49

- foul taste due to .. 774

- granular pharyngitis from .. 670, 673

- insomnia from .. 356

- intermittent claudication from .. 489

- relation to chronic glossitis .. 812

- sore throat from .. 670

Snail-track ulcers of pharynx

- in secondary syphilis .. 672

- Snake-bite, albuminuria after .. 458

- gangrene in .. 282

- jaundice in .. 362, 374

- purpura from .. 596

- universal oedema from .. 458, 460

- Sneer, myasthenic (Fig. 81) .. 260

- Sneezing, epistaxis from .. 250

- violent, causing subcutaneous emphysema .. 231

Snellen's coloured types in detecting hysterical amblyopia .. 837

- Sniffing tic .. 159

SNORING .. 669, 707

- various causes of .. 669

Snow blindness, conjunctivitis with .. 840

- - erythropsia in .. 840

- - hemeralopia in .. 841

- - photophobia in .. 574, 840

- Snuff, anosmia from .. 669

- causing coryza .. 203

- olfactory neuritis from .. 669

- Snuffles, in congenital syphilis .. 427, 446, 695

- Soap method of inducing defecation .. 149

- Soda, sore fingers, washing in .. 266

- Soda-water, explosive eructation of gas from .. 639

Sodium bicarbonate, necessity for, in hematuria .. 820

- chloride, extreme thirst due to .. 789

- nitrite reagent .. 197

- for acetonaemia .. 4

- nitroprusside test for melanuria .. 821

- phosphates, varieties and physiology of .. 572

- salicylate, bradycardia from .. 98

- nerve deafness from .. 191

- in rheumatic affections .. 671

- (and see Salicylates)

- urate crystals in tophi, etc., in gout .. 380, 382, 383

Soft chancre (see Soft Sores)

- palate paralysis in diphtheria .. 559
- sores, balanitis from .. 675
- bubo with .. 675
- characters of .. 769, 830
- and condyloma occurrence together .. 769
- cure by antisepsis .. 769
- diagnosis from herpes genitalis .. 675
- mistaken for condyloma .. 769
- on penis .. 209, 674, 675
- commoner sites .. 675
- conversion into chancre .. 676, 738
- diagnosis from chancre .. 675, 676
- due to sexual infection .. 675
- incubation period .. 675, 676
- inguinal glands infected from .. 675, 676
- multiple .. 675, 676
- perforation of frænum by .. 675
- rapid destruction of tissue by .. 675
- on scrotum .. 765
- swelling from .. 765
- ulcers due to, characters of .. 675
- in the urethra, account of .. 209
- of vulva .. 768
- diagnosis from syphilitic condyloma .. 768

Softening of bones in osteogenesis imperfecta .. 213

- cerebral, Stokes of .. 125

- Cheyne-Stokes respiration in .. 125

- diabetes insipidus in .. 585

- pseudo-bulbar paralysis due to .. 641

- from sinus thrombosis .. 643

- of uncinate gyrus, anosmia from .. 669

- Solar plexus irritation, influence on skin pigmentation .. 574

- meteorism from interference with .. 432

Soles of feet, arsenical hyperkeratosis of .. 87

- congenital syphilitic condylomata of .. 446

- papulo-squamous syphilitic derms of .. 532

- pityriasis rubra pilaris of .. 658

- pruritus of .. 588

- Soleus, nerve supply of .. 542

- pseudo-hypertrophy of .. 560

- Solitary follicles of intestines, enlarged in lymphatism .. 423

- Sordes, bleeding gums with .. 85, 87

- foul breath from .. 98

SORE FINGER .. 266**SORE THROAT (and see Pain in Neck; and Tonsillitis)**

- acute and fatal, in some cases of scarlet fever .. 674

- from acute cervical adenitis .. 671, 674

- in acute laryngitis .. 673

- in pharyngitis .. 673

- albuminuria in .. 17

- in cervical spinal caries .. 673

- chicken-pox .. 673

- chronic pharyngitis .. 673

- clergymen's .. 670

- in coelemongers .. 670

- dengue .. 506

- diagnosed by bacteriological examination .. 225

- diphtheritic .. 76, 670

- dysphagia from .. 225

- from follicular tonsillitis .. 670

Sore throat, contd.

- foul breath due to .. 99
- in German measles .. 670
- from gumma of fauces, or palate .. 670
- from irritants or corrosives .. 674
- local appearances in mild .. 673
- in measles .. 670
- mumps .. 674
- necessity for examining for Klebs-Löffler bacilli in .. 671
- in peliosis rheumatica .. 599
- phlegmonous ulceration of the tonsils .. 670
- post-pharyngeal abscess .. 673
- relation of weather to .. 673
- in scarlet fever .. 670, 674
- small-pox .. 673
- squamous-celled carcinoma of palate .. 670
- in stockbrokers .. 670
- syphilis .. 371, 533, 605, 615, 670, 769
- from tuberculosis of fauces .. 670
- Vincent's angina .. 670
- Sores from herpes zoster .. 653
- SORES, PERINEAL, causes of .. 674, 675
- SORES, PERINEAL .. 677
- various causes of .. 677, 678
- SORES, SCROTAL .. 679
- causes of .. 679, 680, 681
- soft (see Soft Sores)
- Sorrow, loss of weight due to .. 848
- Sound, in diagnosis of calculus .. 629
- elongated cervix .. 586, 587
- fibromyoma .. 429
- hyperinvolution of uterus .. 706
- inverted uterus .. 587
- uterine, antiseptic precautions in passage of .. 429
- Sound-conducting apparatus, deafness due to defect in .. 189, 190
- South America, hydatid disease in .. 720
- Spade - users, Dupuytren's contracture in .. 167
- Spasmodic abdominal pain (see Colic)
- contractions (see Contractions, Spasmodic)
- dysmenorrhœa (see Dysmenorrhœa, Spasmodic)
- dyspepsia (see Dyspepsia)
- tics, muscle twitching in .. 159
- Spasmogenic zones of Charcot .. 777
- Spasms (and see Cramps, Contractions, Contractures)
- of articulatory muscles in stammering .. 688
- bowel in carcinoma coli .. 147
- carpo-pedal .. 3
- in association with laryngismus stridulus .. 466
- infantile tetany .. 466
- of rickety children .. 178
- in tetany .. 802
- clonic in hysteria .. 652
- of colon, constipation due to dilator tube, clicking noises in the ear due to .. 793
- dorsal muscles in spondylitis deformans .. 787
- face (see Face, Spasm of) .. 495, 537
- glottis as an epileptic aura .. 828
- vertigo associated with .. 828
- in hydrophobia .. 162
- hysterical facial .. 637
- talipes .. 133
- of levator ani, painful .. 221
- palpebrae superioris in exophthalmic goitre .. 253
- mobile .. 154
- in occupation neuroses .. 494
- of œsophagus .. 225, 841

- Spasms, contd.**
- pharynx .. 225
 - post-hemiplegic .. 157
 - retinal artery, transient blindness from .. 839
 - salpingopharyngeus, clicking noises in the ear due to .. 793
 - sphincter ani, dyschezia due to .. 150
 - - genito-urinary diseases causing .. 150
 - sternomastoid, torticollis from .. 708
 - tetanus .. 162
 - tonic, differentiation from tetanus .. 161
 - uterine, dystocia due to .. 227
 - of vesical sphincter, after operations .. 411
 - warning, of major epilepsy .. 160
- Spastic and atrophic paralysis of arm, mixed, in spinal cord lesions .. 553**
- constipation .. 144
 - mucus in stools in .. 145
 - pain in .. 144
 - contractures .. 162
 - paralyseis, acquired .. 155
 - of the arm, clinical signs of .. 516
 - in infants, choreiform movements in .. 156, 157
 - of one leg, absence of atrophy in .. 539
 - in Little's disease .. 154
 - syringomyelia .. 128
 - paraplegia (see Paraplegia, Spastic)
- Spasticity (see Gait; and Paraplegia)**
- in birth palsies .. 558
- Speaking, influence on trigeminal neuralgia .. 495**
- Specific gravity of blood, rise of, in collapse from loss of fluid .. 580**

<i>Stomach, dilated, contd.</i>					
-- demonstration of stagnation by treatment in ..	352	Stomach-ache and spinal caries			
-- diagnosis from duodenal carcinoma ..	725	confused ..	181	<i>Streptococcus</i> , in ascitic fluid	57
-- -- gastroptosis of ..	352, 353	Stomach-tube in diagnosis of		bacteriuria from ..	83
-- -- from hour-glass stomach ..	353	pyloric obstruction ..	144	broncho-pneumonia ..	615
-- -- of indigestion from ..	352	Stomatitis , aphthous ..	815	in cerebrospinal fluid ..	340
-- -- extreme thirst due to ..	789	-- in childhood ..	815	the circulating blood ..	650
-- -- flatulence in ..	267	-- ptyalism in ..	590	cystitis ..	83
-- -- in gastric carcinoma ..	846	-- bacteriology in diagnosis of ..	591	empyema ..	119
-- -- indicanuria in ..	349	-- bleeding gums in ..	86, 88	epididymo-orchitis ..	518
-- -- large quantities of fluid vomited with ..	845	-- dysphagia in ..	225	erysipelas ..	113
-- -- limited value of succussion in indicating ..	712	-- enlargement of submaxillary lymphatic glands in ..	410	fungating endocarditis ..	22
-- -- percussion tests for ..	352	-- foul breath due to ..	99	-- and gonococci associated ..	377
-- -- ptyalism in ..	591	-- taste from ..	774	-- in impetigo ..	601
-- -- from pyloric obstruction ..	723, 789	-- impetiginous, <i>perlèche</i> in association with ..	404	-- laryngitis due to ..	226, 465, 466, 670, 673
-- -- -- colicky pains of ..	134	-- loss of taste due to ..	774	-- -- œdematous ..	709
-- -- pylorus sometimes in right iliac fossa ..	737	-- malignant ..	590	-- -- suffocative ..	185
-- -- sarcinæ in vomit with ..	713	-- mercurial, 37, 295, 590, 774, 797 ..	797	-- meningitis due to ..	339, 642
-- -- simulated by dilated colon ..	714	-- ptyalism in ..	590	-- in nasal discharge ..	203
-- -- simulation of ascites by ..	717	-- in scurvy ..	85	-- nephritis due to ..	83
-- -- succussion sounds in ..	352, 711	-- sprue ..	197	-- normal urethra ..	82
-- -- tetany after ..	3, 178, 802	-- suppurative ..	590	-- <i>perlèche</i> from ..	403
-- -- visible gastric peristalsis in ..	571	-- in syphilis ..	86	-- pharyngitis from ..	670
-- -- vomiting with ..	737, 843	-- tuberculous, in phthisis ..	591	-- phthisical sputum ..	701
-- -- wasting in ..	737	-- ptyalism in ..	590, 591	-- prostatitis due to ..	83
disease , constipation in ..	144	-- ulcer of the tongue with ..	812	-- pyelitis due to ..	625
-- of negroes ..	115	-- ulcerative, causes of ..	815	-- in septicæmia ..	372
-- pain in temporal region from ..	783	-- varieties of ..	86, 88, 590	-- suppurative meningitis ..	642
-- -- and tenderness in back from (<i>Fig. 204</i>) ..	788	-- Wassermann's reaction in ..	591	-- tonsillitis ..	670
-- -- tenderness in chest from ..	776, 779	Stone (see <i>Calculus</i>) ..		-- ureteritis ..	83
-- -- epigastrium from ..	779, 783	Stomach's lung ..	317	Streptotrichosis of liver ..	415
-- downward displacement in general visceroptosis (<i>Fig. 105</i> , p. 353) ..	473	Stools black after bismuth ..	428	syphilis (<i>Fig. 79</i>) ..	259
-- dry cough due to ..	175	characters in pancreatic insufficiency ..	216	Stricture of œsophagus (see <i>Œsophagus</i>) ..	
-- flatulence in functional disorders of ..	267	STOOLS, FATTY ..	265	-- of urethra ..	510
-- flatulent distention of, pain in left hypochondrium in ..	499	-- of dysentery, <i>amœba coli</i> in ..	196	-- albuminuria from ..	16
-- hæmorrhagic erosions of, hæmatemesis from ..	294, 298	-- examination of in diarrhoea ..	196	-- associated with carcinoma ..	209
-- herniated into thorax ..	712	-- hepatic pus in ..	409	-- bilateral hydronephrosis in ..	310
-- hour-glass, anomalies of resonance in ..	353	-- pale, in obstruction of bile-ducts ..	362, 410	-- bougie in diagnosing ..	439, 440, 511
-- -- diagnosis from gastric dilatation ..	353	-- rice-water, in cholera ..	301	-- and calculus associated ..	439
-- -- gastric lavage in diagnosing ..	353	-- sloughs from Peyer's patches in typhoid fever ..	697	-- catheter in diagnosing ..	439
-- -- paradoxical dilatation in ..	353	-- trichinellæ in, in trichinosis ..	504	-- changes in stream of urine from ..	438
-- -- symptoms of ..	845	-- vibrio of cholera in ..	301	-- cystitis from ..	627
-- -- vomiting from ..	843	Stoutness in etiology of gall-stones ..	135	-- dribbling of urine after cessation of stream in ..	511
-- -- inflation of, in diagnosis of pancreatic cyst ..	690	STRABISMUS. ..	709	-- endoscope in diagnosing ..	511
-- -- for diagnostic purposes ..	352, 355, 690	-- amblyopia with ..	836	-- -- feeble stream of urine in ..	511
-- injuries, hæmatemesis in ..	294, 299	-- in association with laryngeal paralysis ..	539	-- forced urination in ..	511
-- methods of examination of ..	355	-- without diplopia ..	200	-- gradually increasing difficulty of micturition in ..	511
-- motor insufficiency of, evidence from gastric contents ..	844	-- diplopia from ..	709	-- hydronephrosis due to ..	310
-- normal emptying time of ..	355	-- in disseminated sclerosis ..	838	-- micturition, difficulty in starting in ..	439
-- -- situation of ..	722, 727	-- meningitis ..	350, 359, 563	-- -- frequency of, in ..	581
-- -- pain in ..	484	-- myasthenia gravis ..	687	-- -- pain during, in ..	441
-- -- reflexes, ptyalism from ..	591	-- organic cerebral disease ..	328	-- -- in penis during ..	510, 511
-- -- rupture of aneurysm into ..	140	-- due to syphilis ..	640	-- -- neplritis from ..	8
-- -- sarcoma of (see <i>Sarcoma of Stomach</i>) ..		-- thrombosis of cavernous sinus ..	651	-- -- pyelitis in ..	625
-- -- succussion sounds in normal ..	710, 711	-- tuberculous meningitis ..	174	-- -- pyonephrosis from ..	626
-- ulceration of (see <i>Gastric Ulcer</i>) ..	842	Strain , aortic disease due to ..	236, 237, 238	-- -- pyuria due to ..	623, 631
-- vagus nerve supplying ..	842	-- conjunctival hæmorrhage from ..	256	-- -- retention of urine in ..	45, 440
-- x-rays and bismuth in demarcating ..	727	-- orchitis from ..	79	-- -- from spasm or congestion ..	440
Stomach-ache in Henoch's purpura ..	600	-- rupture of aortic valve from ..	106	-- -- urethral abscess due to ..	679
		-- sudden muscular, spinal lesions produced by ..	787	-- -- calculus behind ..	677
		Strangulated hernia (see <i>Hernia</i> , Strangulated) ..		-- -- fistule from ..	442, 677, 678
		-- fibromyomata of uterus ..	434	-- -- urethritis from ..	766
		-- spleen ..	700	STRIDOR ..	709
		Strangury from retention of urine ..	440	-- distinction from stertor ..	707
		Strapping in distinguishing growth and gumma of testis ..	521	-- in laryngeal obstruction ..	185, 465, 642
		Stramonium in diagnosis of asthma ..	582	-- due to potassium iodide ..	709
		Straw, actinomycosis from ..	88	Strophanthus, bradycardia from ..	98
		-- sporotrichosis from ..	322	Strophulus , papules of ..	528
		Strawberry tongue in scarlet fever ..	607	-- severe itching in ..	850
				-- varicella simulating ..	833
				-- vesicles in ..	833
				-- wheals in ..	850
				Strychnine poisoning , absence of lockjaw in ..	463
				-- consciousness retained in ..	464

<i>Strychnine poisoning, contd.</i>		Suggestion (fear of pregnancy)		Supinator brevis , nerve supply	
-- convulsions in	169, 170, 801	causing amenorrhœa ..	23	-- jerks exaggerated in upper	550
-- diagnosis by analysis	464, 652	-- in diagnosis of phantom tumours ..	721	-- neurone lesions ..	546
-- from hysteria	464, 652, 801	-- hysteria ..	150, 343, 527	-- longus, clonus of ..	161
-- tetanus ..	162, 802	-- treatment of functional hicough ..	343	-- escape in lead palsy ..	77
-- opisthotonos in ..	463, 652	-- -- paralysis of vocal cords	538	-- nerve supply of ..	550
-- retraction of the head in	641	Suicide by phosphorus ..	373	-- spinal nerve-root supplying	556
-- risus sardonius in	463, 651, 652	-- the result of extreme tinnitus ..	793	Suppositories in diagnosis of	
-- spasms in ..	178	Sulphæmoglobinæmia 184, 187		nature of constipation ..	142
-- symptoms brought on by touching patient ..	652	Sulphanilic acid reagent ..	197	Suppression in accessory nasal sinuses, earache from ..	230
-- trismus late in ..	162, 802	Sulphates, aromatic, in the urine ..	823	-- deep-seated, anæmia in ..	39
-- twitchings and convulsions in ..	802	-- urinary, ratio of organic to inorganic ..	97	-- headache in ..	328
-- -- from vermin-killers ..	464	Sulphides formed during putrefaction ..	283	-- leucocytosis due to 399, 614, 620	
-- priapism caused by	586	Sulphonal , Cheyne-Stokes respiration due to ..	125	-- long-standing, lardaceous disease from 197, 414, 696	
Stuffing rooms, headache from	327	-- coma due to ..	137	-- causing amenorrhœa ..	23
Stunting in cretinism ..	258	-- hematoporphyrinuria due to poisoning, influence of sex on ..	820	-- in onychia ..	445
-- Hanot's cirrhosis ..	410	-- --	820	-- polymorphonuclear leucocytosis as evidence of ..	400
-- spleno-megalic cirrhosis ..	369	-- purpura from effect of taking Sulphur dioxide causing coryza ..	203	Suppurative meningitis (see Meningitis Suppurative)	
Stupor in cholæmia ..	361	-- granules in abscess in actinomycosis of liver ..	415	-- otitis media (see Otitis Media)	
Stuttering (see Speech, Abnormalities of)		Sulphuretted hydrogen in urine ..	187	Supraclavicular glands , diagnosis of site of abdominal growth by microscopic examination of ..	421
Stye, conjunctivitis due to ..	256	Sulphuric acid, in Ziehl-Neelsen tubercle stain ..	700	-- enlarged (see Lymphatic Glands, Supraclavicular)	
Stylomastoid foramen, effects of lesion at ..	537	Summer season, relation to cheiropompholyx ..	832	-- nerve, skin distribution of	659
Subclavian artery, abnormal	223	-- severe diarrhœa in infants in	579	Supraorbital nerve region, herpetic eruption of ..	807
-- aneurysm of (see Aneurysm, Subclavian)		Sun, erythema from exposure to ..	252	-- skin distribution of ..	659
-- unequal pulses from atheroma of ..	593	Sunstroke, headache in ..	329	-- neuralgia in iritis and cyclitis ..	256
Subdiaphragmatic abscess (see Abscess, Subphrenic)		-- hyperpyrexia in ..	344	-- pain from eye-strap ..	495
Subinvolution of uterus ..	429	Superciliary ridges, enlargement in acromegaly 749, 753		Suprarenal gland , carcinoma of (see Carcinoma of Suprarenal)	
-- menorrhagia from ..	428	Superficial cervical nerve, skin distribution of ..	659	-- malignant disease of, (see also Suprarenal Tumour) ..	690
-- metrorrhœa from ..	436	Superinvolution of uterus causing amenorrhœa ..	23, 24	-- normal situation of ..	722
-- uterine congestion in ..	429	Supernumerary ribs (see Rib, Cervical)		-- sarcoma of, secondary deposits in cranium from ..	782
Submammary abscess ..	711	Superior gluteal nerve , muscles supplied by ..	542	-- rests in kidney, hypernephroma from ..	690
Submaxillary abscess ..	419	-- -- spinal roots derived from ..	542	-- secretion, effect on menstruation ..	430
-- lymphatic glands (see Lymphatic Glands, Submaxillary)		-- longitudinal sinus thrombosis (see Thrombosis)		-- tumour, abdominal swelling due to ..	393
Subnormal temperature ..	345	-- -- convulsions in ..	558	-- no Addison's disease if unilateral ..	690
Subphrenic abscess (see Abscess, Subphrenic)		-- mesenteric artery, embolism of, in fungating endocarditis ..	646	-- associated with sexual precocity ..	729
Subscapular nerve, muscles supplied by ..	550	-- -- vena cava , obstruction of, cyanosis from ..	184	-- diagnosis from renal tumour ..	690
-- spinal roots derived from	550	-- -- by aortic aneurysm (Figs. 72, 73) 234, 235, 236, 826		-- excessive fatness of children from ..	454
Subscapularis muscle, spinal nerve-root supplying ..	556	-- -- aneurysm ..	746	-- filling of loin by ..	729
-- nerve supply of ..	550	-- -- bronchial glands ..	422	-- hæmaturia from involvement of kidney in ..	690
Subthalamic region, hyperpyrexia from lesions of ..	346	-- -- bruit with ..	236	-- jaundice in ..	362
-- tumour of (see Mid-brain, Tumour of) ..	798	-- -- causes of ..	461	-- laparotomy in diagnosing ..	690
Succinic acid, leucocytosis from	400	-- -- causing cedema of face, neck and arms ..	468	-- from renal tumours ..	393
Succulent hand in syringomyelia ..	285	-- -- by chronic fibrous mediastinitis ..	826	-- malignant ..	690
SUCCUSSION SOUNDS ..	710	-- -- cyanosis from ..	184	-- obesity with ..	454
-- in abdomen, causes of ..	711	-- -- in mediastinal fibrosis ..	484, 746	-- palpable in epigastrium ..	725
-- epigastrium, gastric or colonic ..	723	-- -- growth 465, 483, 826		-- right lumbar region ..	727
-- gastric ..	352, 723	-- -- by new growth 121, 322		-- physical signs of ..	690
-- limits of normal ..	710	-- -- cedema of arms and head from ..	826	-- premature development of genitalia with ..	454
-- with pneumothorax ..	577	-- -- face, neck and arms from ..	461	-- in right capsule, bile-duct obstruction from ..	367
-- in pyloric or duodenal obstruction ..	571	-- -- rupture of aortic aneurysm into ..	482	-- rounded movable hypochondriac swelling due to ..	393
-- thoracic ..	193	-- -- thrombosis (see Thrombosis)		-- simulating enlarged spleen ..	726, 729
-- list of causes of ..	711			-- simulation of renal or hepatic swelling ..	367
"Sucking in" above the clavicles in laryngeal or tracheal obstruction	465, 642			-- urinary changes, from involvement of kidney in	690
Sudamen, vesicles with ..	714				
Sudan III test for chyluria ..	126				
Sudden death from fibroid heart ..	242				
-- ruptured aneurysm ..	107, 140				
Suffocation, sense of, associated with flushing ..	268				
Suffocative cedema simulated by laryngeal paralysis ..	539				
Sugar in cerebrospinal fluid ..	389				
Sore fingers from handling in urine (see Glycosuria)	266				

Suprascapular nerve, muscles supplied by 550	<i>Swelling, Abdominal, contd.</i>	<i>Swelling of the face, contd.</i>
-- paralysis of 551	-- in carcinoma of colon .. 91, 499	-- subjective sensation of in trigeminal neuralgia .. 495
-- spinal roots derived from .. 550	-- pancreas 500, 690	-- varicella 746
Supraspinatus, nerve supply of .. 550	-- classified list of causes of .. 715	SWELLING, FEMORAL .. 732
-- wasting in phthisis 72	-- constipation from pressure of large 148	-- due to ectopic testis .. 740
Supratrochlear nerve, skin distribution of 659	-- displacement of cardiac impulse by 330, 332	-- of foot from mycetoma .. 809
Surgical emphysema (see Emphysema, Surgical)	-- due to faecal accumulation .. 692	-- hypochondrium, left, due to splenic enlargement .. 688
-- kidney (see Nephritis, Ascending)	-- from intussusception .. 736	-- hypogastric, due to bladder (Fig. 191, p. 730) .. 45
Swabbing of tonsils in diagnosis of throat infections .. 419	-- multiple, in tuberculous peritonitis 152	SWELLING IN ILIAC FOSSÆ .. 735, 737
Swallowing, difficulty in (see Dysphagia)	-- orthopnea from pressure of .. 465	-- in psoas or iliac abscess .. 632
Sweat, bloody 715	-- pancreatic affections .. 486	-- fossa, left, from acute diverticulitis 731
-- coloured from chromidrosis .. 714	-- due to phantom tumour .. 761	-- aneurysm of external iliac artery .. 735
-- ducts involved in granulosis rubra nasi 714	-- pulsatile 763	-- carcinoma of sigmoid .. 735
-- foul smelling 714	-- pulsating and expansile, in abdominal aneurysm .. 486	-- congenital dilatation of the colon .. 735
-- retention, cheilopompholyx due to 111	-- due to splenic enlargement .. 689	-- diverticula simulating carcinoma in .. 152
-- urinous odour of 715	-- suprarrenal tumour .. 393	-- enlarged lymph glands .. 735
SWEATING, ABNORMALITIES OF 714	-- tuberculous peritonitis .. 691	-- spleen in 735
-- absence of 714	-- tympanic on percussion, in subphrenic abscess .. 501	-- kidney palpable in .. 735
-- facial in cervical sympathetic paralysis .. 247	SWELLING, AXILLARY .. 731	-- psoas abscess .. 733

-- tropical abscess of liver .. 408	-- epithelioma 746	-- fracture 747
-- urate deposit with .. 815	-- erysipelas 746	
-- yellow in jaundice 361	-- fibroma 746	
Sweep's cancer 765, 803	-- insect bites 747	
Sweets, blue urine after .. 823	-- lipoma 746	
-- eosin used in colouring of .. 820	-- mumps 746	
-- green urine after .. 823	-- oedema (see Œdema of Face)	
-- red urine after .. 819, 820	-- parotitis 746	
SWELLING, ABDOMINAL .. 715	-- sebaceous cyst 746	
-- ascites with various .. 59		

Swelling of jaw, contd.		Sycosis vulgaris, contd.		Syphilis, contd.	
- - hematoma	747	- - diagnosis from eczema ..	602	- aneurysm of heart from ..	241
- - injury	747	- - ringworm of the beard ..	274	- angina pectoris from ..	62
- - odontomata	749	- - tertiary syphilis ..	603	- anosmia from ..	668
- - osteoma	748	- - dropping out of the hairs in	602	- aortic disease from ..	18, 62,
- - periostitis	747	- - of face	654	233, 236, 237, 238	
- - tumours of antrum of		- - leprous nodules simulating	450	- aortitis from ..	38, 106, 481
Hilumore	749	- - parts affected by ..	602	- arthritis in (see Arthritis,	
- - lower	747	- - pustules in	601, 602	Syphilitic)	
- - due to actinomycosis	748	- - scabs in	654	- ascites from	55, 60
- - alveolar abscess ..	747	- - slightness of itching in ..	602	- ataxic paraplegia from ..	565
- - callus from fracture ..	747	- - due to staphylococci ..	602	- atheroma from	233, 238
- - carcinoma (and see Car-		Sympathetic, abdominal: in-		- atrophic palsy of one leg	
cinoma of Jaw) ..	749	fluence on pigmentation	574	from	543
- - mode of examination in	747	- cervical (see Cervical Sym-		- balanitis in	675
- - situation often masked		pathetic)		- baldness from	84, 85
by superficial swelling	747	Syncope in Addison's disease 38,	849	- bleeding gums in	85, 86
- of joints (and see Arthritis)	450	- fatty heart	241	- of bone, simulating sarcoma	756
- of legs (see Edema of Legs)		- from gastric ulcer bleeding	298	- bronchial stenosis from	288,
- - multiple, red, tender, in		- local, in Raynaud's disease	490	324, 325, 582	
erythema nodosum ..	751	- in myocardial degeneration	333	- bulke in	110, 112
- of limbs, local, from em-		- thymic infantilism	215	- cachexia from	17, 37, 114,
bolism	237	Synovial effusion (see Arthritis		115, 347, 459, 461, 575, 658	
- of lips, due to mercury ..	86	and Syngovitis)		- and cancer, not distinguished	
- - in stomatitis	88	Synovitis from displaced		by pyrexia	618
- in lumbar region, left, in		semilunar cartilage ..	388	- cavernitis in penis from ..	516
splenic enlargement ..	688	- in secondary syphilis ..	386	- cerebral, coma in	136, 138
SWELLING, MAMMARY (and		- infective, anemia in ..	36	- convulsions in	169, 172
see Breast)	742	- neighbouring lymphatic		- endarteritis from	327, 337
- in the muscles in trichinosis	504	glands enlarged in ..	418, 422	- hemianopsia in	335
- nodular, with varicose veins	450	- from pyorrhea alveolaris	87	- hemiplegia from	337
- of orbital tissues in cavernous		- secondary syphilis ..	386	- insomnia in	356, 358
sinus thrombosis ..	254	- (and see Arthritis)		- multiple cranial nerve	
SWELLING, PELVIC 757, 761		Syphilides , circinate tubercular,		paralysis from	590
- - behind uterus in salpingo-		diagnosis from ringworm		- - ptosis from (<i>Figs. 156-159</i>)	590
ophoritis	220	of beard	274	- - thrombosis from ..	138, 173, 563
- - ectopic gestation ..	436, 757	- - - tinea circinata ..	275	- - varieties of	173
- - nephritis from	8	- - cornes	533	- chance of (see Chancro)	
- - retention of urine with ..	45	- - distinction from epithelioma	803	- Cheyne-Stokes respiration	
- - sciatic nerve paralysis from	542	- - pityriasis rosea ..	658	from	125
- perinephric (see Kidney		- - from tinea versicolor ..	276	- choroiditis in, ophthalmo-	
Enlargement)		- - distribution of	533	scopic appearance of	
- in perineum due to mis-		- - impetiginous	604	(<i>Plate VII</i>)	462
placed testis	523	- - itching absent in	604	- chronic hypertrophic hæ-	
SWELLING, POPLITEAL		- large acuminate, description		morrhagic pachymeni-	
761, 762, 763		of lesion of	604	gitis from	563
- in pubic region due to mis-		- - flat pustular, coppery		- condylomata in ..	403, 404,
placed testis	523	areola and base in ..	604	469, 664, 769	
SWELLING, PULSATILE 763, 764		- - military	604	- - soft sore mistaken for ..	769
- - in aortic aneurysm ..	561	- - papular	532	- congenital, adiposis dolorosa	
- - of back in aortic aneurysm	476	- - diagnosis of lichen scrofu-		from	455
- - chest wall	194	losorum from	530	- - arthritis in (and see Ar-	
- - inguinal, due to aneurysm		- - varieties of	532, 533	thritis)	260, 386
of external iliac artery ..	741	- - pigmentary, diagnosis of		- - cirrhosis in	365, 370
- - popliteal, from sarcoma of		chloasma and leucoder-		- - condylomata in ..	427, 446
femur	762	mia from	575	- - convulsions from ..	170
SWELLING, SCROTAL 764, 767		- - polymorphism of ..	533, 607	- - cranioctabes in	782
- - due to cysts of epididymis	767	- - pustular	532, 601, 607	- - deafness in	260
- - testis	521	- - diagnosis from acne ..	603	- - depression of nose in ..	259
- - hæmatocele	523	- - small-pox	607	- - Dercum's disease due to	455
- - hydrocele	522	- - preference for genitals,		- - diagnosis from Jacquet's	
- supraorbital, from frontal		scalp, and face	601	infantile erythema ..	416
sinus inflammation ..	255	- - pyrexia with	607	- - seborrhoeic eczema ..	447
- in thigh due to misplaced		- - raw-ham colour of ..	532, 533	- - enlargement of head, dia-	
testis	523	reaction to mercury, arsenic,		gnosis of hydrocephalus	
- of toe, in gout	381	and iodides	601	from	557, 558
- tongue due to mercury ..	86	- - scaly	656	- - epiphysitis in	386, 752
- umbilical region from abscess		- - secondary cutaneous, coppery		- - erythema of	253
in tuberculous peritonitis	524	colour of	601	- - facies in (<i>Figs. 78, 79</i>)	259, 416
- - in carcinoma of colon ..	524	- - small acuminate	604	- - family history in dia-	
- - - pylorus	524	- - flat pustular	604	gnosis of	695
- - due to divarication of		- - raw-ham areola in ..	601	- - frontal bosses in (<i>Fig. 78</i>)	259
recti	524	- - varioliform	601	- - hot-cross-bun skull in	752, 782
- - hernia	524	Syphilis (and see Syphilides),		- - Hutchinson's teeth in	
- - sebaceous cyst	524	acetoneuria in	4	(<i>Figs. 79, 80</i>)	259, 260
- - splenic enlargement ..	688	- - acquired, enlarged liver in	370	- - hyperplastic osteitis in ..	782
- at vaginal orifice (see		- - albuminuria in ..	13, 16, 17, 86, 371	- - infantile convulsions due to	169
Prolapse of Uterus)		- - alopecia in	450	- - infantilism in	260
SWELLING, VULVAL	768	- - amyloid disease from ..	197	- - interstitial keratitis in ..	828
- - due to fibromyoma of		- - anemia in	27, 37, 38	- - jaundice in	365, 370
vagina	587, 768	- - severe, from	459	- - lardaceous disease from	414
Swimmer's cramp	177	- - aneurysm after ..	223, 238,	- - laryngitis in	446
Sycosis vulgaris , diagnosis of	602	296, 300, 322, 368,		- - lipomatosis from	455
- - - from acne vulgaris ..	603	483, 486, 538, 564, 728, 786		- - liver changes in ..	365, 370, 411

Syphilis, congenital, contd.

-- liver enlarged in ..	370
-- loose, dry, café-au-lait skin of ..	446
-- marasmus in ..	427
-- mental deficiency in ..	260
-- napkin-region eruptions in ..	446
-- natifom skull in ..	752
-- ocular symptoms of ..	259
-- orchitis in ..	519
-- osteo-chondritis in ..	386
-- Parrot's nodes in ..	427, 752
-- pemphigus from ..	111
-- pseudo-paralysis in ..	886, 387

-- dysphagia from ..	224
-- ear affections in ..	469, 828
-- endarteritis from (see Endoarteritis)	
-- enlarged inguinal glands in ..	738, 769
-- epididymitis in ..	519
-- epistaxis in ..	250
-- esthiomène due to ..	769
-- Eustachian tube obstruction in ..	828
-- eye paralysis from ..	224
-- facial paralysis from (<i>Figs.</i> 158, 159) ..	589
-- fibroid heart from ..	62, 241, 242
-- lung and bronchiectasis from ..	324
-- fibrous mediastinitis in ..	538, 826
-- fingers affected by ..	266
-- fissured tongue from ..	813
-- gangrene in ..	282
-- general paralysis of the insane from ..	269, 539
-- giddiness due to ..	828
-- gingivitis in ..	86
-- glossitis from ..	812, 813
-- gumma in (see Gumma)	
-- hæmoglobinuria in ..	315
-- herpes progenitalis with ..	675
-- herpetic urethritis in ..	209
-- impotence in ..	347
-- incubation period of ..	675, 676
-- infantilism from ..	215
-- intermittent claudication from ..	489
-- iritis in ..	256, 450
-- Jacksonian epilepsy from ..	161
-- jaundice from ..	362, 366, 371
-- of jaw, rarity of ..	748
-- lardaceous disease from ..	10, 411, 414, 696
-- laryngeal paresis from ..	539, 640
-- laryngitis in (and see Laryngitis, Syphilitic) ..	86, 325, 673

Syphilis, contd.

-- of larynx, dysphagia in ..	226
-- hæmoptysis in ..	318
-- leukoplakia from ..	237, 813
-- lips affected in ..	403, 404, 813
-- and Little's disease ..	154
-- of liver ..	411
-- absence of ascites and jaundice in ..	410, 411
-- general symptoms in ..	410, 411
-- ascites with ..	55, 60
-- diagnosis from carcinoma of liver ..	411, 413
-- of catarrhal jaundice from ..	362, 366, 371
-- from cirrhosis ..	410, 411
-- hydatid disease of ..	415
-- enlargement of liver in ..	411
-- jaundice with large liver in ..	363
-- lumpy irregular shape of liver in ..	411
-- rarity of ..	410
-- spirochæta pallida in ..	371
-- Wassermann's reaction in ..	371
-- loculated hydrocele in ..	765
-- lupoid variety of ..	449
-- lymphatic gland enlargement in ..	266, 416, 417, 533, 605, 675, 738
-- macular eruption in throat ..	425
-- macules in (see Macules, Syphilitic)	
-- medullary softening due to ..	224, 343
-- meningeal, headache in ..	327
-- meningitis from (see Meningitis, Syphilitic)	
-- mercury in diagnosis of (see below, Potassium Iodide)	
-- meteorism in ..	432
-- moist anal papules in ..	447
-- genital papules in ..	447
-- of mucous membranes ..	371
-- mucous patch on fauces or tonsils in ..	676
-- tongue from ..	813
-- multiple tender swellings on bones in ..	752
-- muscular atrophy in ..	76
-- necrosis of jaw from ..	747, 748
-- nasal bones from ..	204, 237, 252
-- nephritis in ..	86
-- nerve deafness from ..	190, 828
-- night pains of ..	386
-- nodes on bones in ..	752
-- nodules in ..	449
-- epididymis in ..	519
-- obstruction to nose by ..	668
-- œdema of face, neck, and arms from ..	458
-- larynx in ..	466
-- legs in ..	459, 461
-- onychia in ..	445
-- orchitis from ..	79, 519
-- osteocopic pains in ..	503
-- otorrhœa in ..	469
-- œzema from ..	201
-- pachymeningitis in paralysis of upper extremity from ..	555
-- pain in arm from aortic disease due to ..	494
-- bones in ..	503
-- worse at night in ..	752
-- pains of, confusion with osteo-arthritis ..	386
-- pancreatitis from ..	116
-- papular skin rash in ..	769, 832
-- paraplegia from ..	563
-- paralysis of palate in ..	640
-- paroxysmal hæmo-globinuria from ..	315
-- perforating ulcer of foot from ..	809
-- of palate from ..	202, 237, 640

Syphilis, contd.

-- perichondritis in ..	791
-- perihepatitis from ..	60
-- perineal sores in ..	677, 678
-- periosteal thickening in ..	519
-- peripheral neuritis in ..	76, 506, 507
-- pharyngitis in ..	86
-- pigmented scars from ..	237, 575
-- potassium iodide and mercury in diagnosing ..	226, 254, 325, 449, 520, 615, 640, 658, 674, 677, 681, 808, 814
-- primary, lateral sclerosis from ..	567
-- ptal'm in ..	590
-- pupil reflexes in ..	594
-- pustules in ..	833
-- association with cachectic state of health ..	604

- painless swelling of joints in	563	- subcutaneous fat in ..	262	- Tomberg's sign in ..	67, 665
- paralysis of arm in ..	554	- drooping eyelids in ..	262	- slow complexion in ..	262
- paraplegia from ..	561, 563	- dull, boring, aching pains		- sense of position and move-	
- parts affected by ..	664	in legs in ..	489, 664	ment abnormal in ..	493, 665
- perversion of sensation in ..	778	- erythromelalgia in ..	490	- sensory changes in, 66, 350,	
- precipitate defecation in ..	348	- external popliteal nerve		493, 498, 662, 664,	
- preservation of cutaneous		paralysis in ..	543	665, 666, 669, 778	
sensibility in ..	73	- facies of (<i>Fig.</i> 87) ..	262	- shedding of nails in ..	415
- pupil phenomena in ..	128	- gait in ..	277, 278, 827	- simulating gastric ulcer ..	350
- reflexes in ..	554	- gangrene in ..	282, 285	- writer's cramp ..	177
- scoliosis in ..	128, 388, 554	- gastric crises in 350, 473,		- sphincter trouble in ..	285, 441,
- sense of drenching sweat		485, 489, 562, 665, 814, 847		562	
in part which is dry in ..	664	- rise of blood-pressure		- sweating crises in ..	562
- sensory changes in 73, 112, 128,		350, 485		- symptoms of syringo-	
285, 388, 554, 563, 664, 665		- simulating dyspepsia ..	350	myelia simulating ..	563
- simulating amyotrophic		- violent vomiting in ..		- syphilitic affection of	
lateral sclerosis ..	73	350, 485		heart in ..	527
- leprosy ..	75	- general abdominal crises in	562	- tenderness in chest in ..	777
- progressive muscular atro-		palsy ..	289, 484, 664	- ulnar analgesia in ..	493
phy ..	73	- high-stepping gait in ..	278	- vertigo due to ..	827
- spastic paralysis of leg in ..	128	- history of syphilis in ..	562	- vesical crises in ..	562
- spontaneous fracture in ..	285				

Tabes dorsalis, contd.

- vomiting in	350, 485, 844	847
- Wassermann's reaction		
with	489	
- wrinkled forehead in	262	
- mesenterica, with ascites	56	
- meteorism in	432	
- simulation by anorexia nervosa	850	
TACHE CÉRÉBRALE	771	
TACHYCARDIA	771	
- in acute yellow atrophy	370	
- causes of	772	
- in diphtheritic neuritis	77	
- exophthalmic goitre	244, 253, 772, 792, 797	849
- - - sometimes only evidence of	772	
- mitral stenosis	61, 245	
- otitis media complications	98	
- with parenchymatous goitre	792	
- paroxysmal	772	
- palpitation in	525	
- in pyæmia	372	
- pyrexial jaundice	361	
- in tropical abscess of liver	369	
- tuberculous meningitis	98	
Tactile vocal fremitus (see Vocal Fremitus)		
Tenia infection, anæmia in	568, 569	
- echinococcus in dogs	719	
- hydatid disease due to bladder stage of	719	
- medicocanellata (Fig. 150)	568	
- solium (Figs. 148, 149, 152)	568	
Tailor's cramp	177	
- sporotrichosis of lung	322	
TALIPES	130	
- in alcoholic neuritis	165	
- arsenical neuritis	165	
- calcaneus, definition of	130	
- cavus, definition of	130	
- cold and blue feet in	130, 131	
- congenital	130, 224	
- from contracting scars	132	
- from disuse	165	
- dystocia in etiology of	131	
- equinus, definition of	130	
- from fibrosis and contraction of calf muscles	132	
- in Friedreich's ataxy	71, 164, 559	
- hyperextended toes in	130	
- hysterical	132, 166	
- from infantile paralysis	71, 559	
- inflammation of bone	132	
- new growths in pelvis	131	
- poliomyelitis	165	
- progressive muscular atrophy	165	
- in Tooth's peroneal atrophy	71, 560	
- trophic ulcers in	130	
- valgus, definition of	130	
- varus, definition of	130	
Tannic acid, dryness of the mouth and thirst due to	789	
Tapping (see Paracentesis Thoracis)		
Tape-worms (Figs. 148, 151)	567	
- diagnosis of muco-membranous casts from	567	
- eggs of (Fig. 152)	569	
- - - microscopical examination of feces for	569	
- eosinophilia from	249, 568, 569	
- increased appetite with	49	
- infection, chlorotic anæmia in	569, 570	
- simulated by mucous colitis	134, 443, 444	
Tar products, bullæ in workers among	110	
Tarry stools	89, 316	

Tartar, bleeding gums due to	86, 87	
- foul breath due to	99	
- retraction of gums from	641	
Tartrates, transient polyuria from drinks containing	581	
TASTE, ABNORMALITIES OF	773	
- aura of epilepsy	80	
- foul, causes of	774	
- impaired with peripheral facial paralysis	536, 537	
- - from paresis of glossopharyngeal nerve	774, 775	
- loss of, list of causes of	774	
- - with hysterical hemianæsthesia	666	
- metallic, in trigeminal neuralgia	495	
- offensive, vomiting from	844	
- perverted, list of causes of	774	
Taylor, re splenomegalic cirrhosis	369	
Tea-drinking by children, nervous effects of	357	
- excessive, constipation due to	144	
- - pseudo-angina in	482	
- gastritis from	297	
- insomnia from	356, 357	
- oxaluria from	471	
- palpitation from	525, 527	
- polyuria from	581	
- rosacea from	268	
Tears , not coloured in jaundice	361	
- explosive bursts of, in double hemiplegia	258	
- - - paralytic agitans	262	
- first shed on seventh day after birth	250	
- overflow of (see Epiphora)		
Teeth in acromegaly	263	
- affections, neuralgia from	781	
- - locality of pain and tenderness due to	783	
- - tenderness of scalp in	781	
- caries (see Caries, Dental)		
- in congenital syphilis (Figs. 79, 80)	259, 260	
- defective, in etiology of dyspepsia	354	
- - gastritis from	352	
- delayed eruption in rickets	182	
- displacement of, due to fibrous epulis	748	
- grinding during sleep (see Grinding of Teeth during Sleep)		
- impacted wisdom, diagnosis of tetanus from	162	
- pain in, from glaucoma	257	
- pegged and notched in congenital syphilis (Figs. 79, 80)	259, 260	
- relation to definite segmental areas in the face, table showing	498	
- suppuration in, spreading neuralgia from	497	
- tumours of (see Odontomata)		
- undue projection in acromegaly	263	
- unerupted molar, pain in the lower jaw in	501	
- - x-rays in diagnosis	501	
Teething, insomnia from	357	
Tegumentum, intention tremor from lesion of	800	
Telangiectasis of cheeks in chronic alcoholism	59	
- face in rosacea	268	
- macules due to	423	
- multiple hereditary bleeding in nodular leprosy	251	
- thoracic from emphysema	450	
- in xeroderma pigmentosum	826, 804	

Telegraphist's cramp	177, 494	
Temperature (and see Pyrexia)		
- chart in Hodgkin's disease (Fig. 168)	617	
- - facial erysipelas (Fig. 166)	614	
- - fungating endocarditis (Fig. 164)	613	
- - lobar pneumonia (Fig. 188)	702	
- - Malta fever (Fig. 163)	612	
- - pernicious anæmia (Fig. 167)	616	
- - pyæmia (Fig. 165)	613	
- - rheumatoid arthritis (Fig. 106)	377	
- - sarcoma of neck and mediastinum (Fig. 169)	617	
- - typhoid fever (Fig. 162)	611, 697	
- in diagnosing early disease	620	
- elevation in health to 102° F. by strenuous exertion	619	
- general observations on variations in health and disease	619	
- lowering to dangerous or fatal degree from physical exhaustion	619	
- mechanism of maintenance of normal	618	
- pulse, respiration ratio in normal conditions	622	
- in relapsing fever	698	
- subnormal	345	
- sudden changes in, menorrhagia from	428	
- in tuberculosis	612	
- unexplained oscillations in chronic disease	619	
Temporal lobes, auditory word centre in (Fig. 185)	683	
- muscle, paralysis of	778	
- region, referred pain in, in severe ear disease	498	
- - tenderness of	783	
- segmental area, pain in, in iritis and glaucoma	498	
Temporo-malar nerve, skin distribution of	650	
Temporo-mandibular joint abscess, occasional discharge through auditory meatus	470	
- - - osteo-arthritis of	230, 354, 801	
- - - earache in	230	
- - - rheumatoid arthritis of	378	
Temporo-sphenoidal lobe, olfactory aura in tumour of	80	
Tender spot below anterior iliac spine in neuralgia paræsthetica	488	
- - in neuralgia	330	
Tenderness , absence of, in intermittent hydrarthrosis	387	
- importance of, in relation to pain	475	
- of joint (see Arthritis)		
- abdominal, general, absence in simple colic	133	
- - - in colitis	134	
- - - peritonitis	134, 153	
- - - relapsing fever	373	
- - - tuberculous peritonitis	56, 719	
- - - ulcerative colitis	90, 92	
- along diaphragm attachments, in phrenic neuralgia	478	
- in the arm from brachial neuralgia	491	
- of bones in infantile scurvy	85, 115	
- - rickets	117	
- - secondary syphilis	672	
- breast in mastitis	712	
- - mastodynia	470	

TENDERNESS IN CHEST .. 775	<i>Tenderness in loins, contd.</i>	<i>Tenderness of testis, contd.</i>
— causes of .. 776	— in renal tuberculosis .. 629	— in testicular abscess .. 680
— from hepatic abscess .. 779	— suppurative nephritis .. 646	— from torsion .. 742
— behind ear from inflamed mastoid gland .. 230	— lumbar region from colitis .. 727	— over ulnar nerve at elbow in brachial neuralgia .. 491
— lateral sinus thrombosis .. 651	— over McBurney's point in appendicitis .. 500	— universal in cerebrospinal meningitis .. 643
— otitis media .. 229	— over metatarsus in metatarsal neuralgia .. 438	— uterine, from metritis .. 221
— of ear in otitis media .. 230	— in mid-orbital region in errors of refraction .. 498	— per vaginam, from obturator hernia .. 740
— otorrhoea .. 469	— of muscles in acute polymyositis .. 504	— vulval, from Bartholinitis .. 221
— epididymis, acute, in gonorrhoeal epididymitis .. 766	— multiple neuritis 489, 506, 551	— caruncle .. 221
TENDERNESS IN EPIGASTRIUM .. 779	— muscular overstrain .. 503	— kraurosis .. 770
— in arsenical poisoning .. 92	— myalgia .. 478	— leukoplakia .. 221
— chronic pancreatitis .. 724	— pleurodynia .. 478	
— gall-bladder disease 486, 779	— in tetany .. 178	Tendo-achillis jerks absent in locomotor ataxia .. 562
— gastralgia .. 435	— over musculospiral nerve in brachial neuralgia .. 491	Tendon ossification of, simulating exostosis .. 754, 763
— gastric disorders .. 779, 783	— in naso-labial area in caries of canine tooth (<i>Fig. 132</i>) 497	Tendon-jerks (see also Knee-jerk; Babinski's Sign; and Ankle-jerk)
— ulcer .. 89, 248, 352, 485	— in neck, posterior triangle of, in cervical rib .. 492	— exaggerated in amyotrophic lateral sclerosis .. 554
— gastritis .. 297	— in brachial neuralgia .. 491	— brachial monoplegia .. 546
— heart disease .. 783	— from tuberculous gland .. 420	— in subacute combined degeneration of the cord .. 493
— liver disease .. 779	— of nerve trunks in multiple neuritis .. 489	— loss of, in atrophic paralysis of arm .. 549
— lung disease .. 783	— nerves and muscles, absent in tabes dorsalis .. 507	— in spastic paralysis of one leg .. 539, 540
— phosphorus poisoning .. 373	— palmus in erythema keratodes .. 451	— unequal and exaggerated, in hemiplegia .. 337
— stone in gall-bladder .. 486	— over pancreas in acute pancreatitis .. 846	— sheaths, gonococcal inflammation of .. 376
— subphrenic abscess .. 720	— on percussion in spinal caries .. 181	— inflammation in gout .. 382
— the eye from retrobulbar neuritis .. 840	— in peripheral neuritis .. 661	— rheumatic nodules in .. 452
— of eyebrow from frontal sinus inflammation .. 255	— of prostate, acute .. 207	Tenesmus in abdominal angina .. 486
— feet from cheilopompholyx .. 654	— pudic .. 221	— carcinoma of sigmoid colon .. 731
— in erythema keratodes .. 451	— per rectum from obturator hernia .. 740	— dysentery .. 90, 196, 501
— erythromalgia .. 490	— prostatic .. 631	— intussusception .. 727
— of front of thigh in anterior crural neuralgia .. 488	— rectal abscess .. 635	— rectal .. 473
— over gall-bladder in carcinoma of the gall-bladder .. 499	TENDERNESS IN SCALP .. 780	— tuberculous sigmoid colon .. 731
— in cholecystitis .. 499	— in organic cerebral disease .. 328	— in ulcerative colitis .. 91
— from gall-stones .. 280, 499	— secondary syphilis .. 672	— vesical, in acute cystitis .. 312
— in typhoid fever .. 371	— over sciatic notch in sciatica .. 487	Tenosynovitis, crepitus in .. 179
— in gluteal region in sciatica .. 487	— shoulder from gall-bladder disease .. 779	— egg-shell cracking in .. 177
— of gums from abscess of antrum of Highmore .. 502	— liver disease .. 779	— simulating occupation neuroses .. 178
— septic tooth .. 502	— of skull, local, with organic intracranial disease .. 327, 328	Tenotomy, diplopia after .. 200
— hands from cheilopompholyx .. 654	— soles in erythema keratodes .. 451	Tension of eye in differentiation of conjunctivitis, iritis, and glaucoma .. 257
— in hyoid area in ear disease .. 498	TENDERNESS IN SPINE .. 784	— raised in herpes frontalis .. 807
— hypocondrium from gall-bladder disease .. 779	— in carcinoma of cardiac end of stomach .. 474	Tensor fasciae femoris, spinal nerve-root supplying .. 543
— gastric disorders .. 779	— gall-stones .. 474	— nerve supply of .. 542
— liver disease .. 779	— gastric ulcer .. 474	Teres major and T. minor, spinal nerve-roots supplying .. 556
— phosphorus poisoning .. 373	— hydatid disease of vertebrae .. 785, 786	— nerve supply of .. 550
— subphrenic abscess .. 720	— neurasthenia .. 788	Terror in patient after epileptic convulsions .. 169
— (and see Pain in Hypochondrium)	— Pott's disease .. 134	Tertian fever (see Malaria)
— hypogastrium from perforated gastric ulcer .. 780	— proso abscess .. 739	Test for acetone .. 4
— duodenal ulcer .. 780	— spinal caries .. 134, 474, 564	— albuminuria .. 5
TENDERNESS IN ILIAC FOSSA .. 780	— vertebral arthritis .. 785	— albumosuria .. 20, 21
— from appendicitis .. 135, 736	— spleen in fungating endocarditis .. 237	— alkali, for alkaptonuria .. 822
— over inflamed frontal sinus .. 205	— spots of, in trigeminal neuralgia .. 495	— for arsenic .. 92
— intercostal space in pleurisy .. 479	— of sternum in acute mediastinitis .. 483, 777	— barium chloride, for carbocuria .. 823
— intercostal neuralgia .. 478	— from aortic aneurysm .. 777	— for bile in stools .. 197
— of joint (see Arthritis; Synovitis; and Joints, Affections of)	— behind, referred from oesophagus .. 779	— bleaching powder, for indican .. 821
— over kidney with bacteriuria .. 84	— mediastinal inflammation .. 777	— blood in faeces .. 89
— renal calculus .. 500	— tumour .. 777	— boiling, for albumin, method of avoiding fallacies of .. 472
— tuberculosis .. 515	— suprapubic, with cystitis .. 306	— phosphate fallacy of .. 574
— in limbs (see Pain in Limbs, General; and Sensation, Abnormalities of)	— in syphilitic pseudo-paralysis .. 387	— bromine water, for melanuria .. 821
— neuromyositis .. 504	— of syphilitic swellings on tibia .. 752	— in Camidge's pancreatic reaction .. 115
— peripheral neuritis .. 505	— of temporal region from disease of upper bicuspid .. 783	— for carboxyhaemoglobin .. 138
— over liver (localized) in abscess of liver .. 409, 651	— heart disease .. 783	— caustic soda, for elastic fibres .. 701
— cholangitis .. 369	— lung disease .. 783	— chyluria .. 126
— cirrhosis .. 368	— stomach disease .. 783	— cystin .. 187
— from gall-stones .. 300	— of testis .. 518	
— in general congestion .. 61, 370, 371, 407	— exquisite in acute epididymo-orchitis .. 518	
— from heart failure .. 61, 370, 407		
— suppurative pyelophlebitis .. 649		
— in loins in pyelitis .. 625		

Test, contd.

- diacetic acid in urine ..	196
- diazo-reaction ..	197
- ferments in gastric juice ..	355
- ferric chloride for alkapton ..	822
- - - melanuria ..	821
- fluorescein, for corneal ulceration ..	806
- for free HCl ..	355
- Gmelin's, for bile pigment ..	819
- for hearing ..	188
- Huppert's, for bile pigment ..	819
- for indican in urine ..	348, 821
- iodine for bile pigment ..	819
- for lactic acid ..	355
- lactose in urine ..	290
- lead in urine ..	77
- liquor potassæ, for pus ..	623
- meal in chronic diarrhoea ..	196
- - in examination of disorders of the stomach ..	355
- - gastritis ..	50
- for methylene blue in urine ..	823
- nitric acid, for bile pigment ..	819
- - - indican ..	821
- for nucleoproteid ..	5, 6
- Nylander's, effects in alkaptonuria ..	822
- occult blood ..	94, 197
- ozonic ether, for pus ..	623
- for pancreatic disease ..	364
- paralysis of upper extremity ..	545
- pentose in urine ..	290
- the phenylhydrazine and fermentation, in confirmation of glycosuria ..	818
- for phosphates, acetic acid ..	208

 - - tachycardia from .. 773
 - Thyroidectomy, tetany after .. 3, 178, 802
- Tibia**, affection in yaws .. 449
 - - bedsores over .. 285
 - - deformities in congenital syphilis .. 260
 - - necrosis of, talipes from .. 132
 - - overgrowth after injury .. 132
 - - sarcoma of (Fig. 196) 754, 756, 763

Tibia, contd.

- swelling on, in secondary syphilis ..	752
- tuberculous disease of ..	752
Tibial muscle affection in infantile paralysis 131, 132	
- - paralysis, talipes from ..	132
Tibialis anticus muscle, spinal nerve root supplying ..	543
- - nerve supply of ..	542
- - posticus, nerve supply of ..	542
Tic, convulsive, mild chorea simulating ..	156
- douloureux (and see Trigeminal Neuralgia, Major) ..	495
- - absence of anæsthesia with ..	783
- - pain relieved by pressure ..	783
- - and tenderness due to ..	782
- - paroxysm brought on by pressure ..	783
- - relation of pytalorrhœa to ..	592
- - spasmodic, a cause of convulsions ..	169
- - muscle twitching in ..	159
Ticking, hiccough, from ..	342
Tight lacing , furrow on liver from ..	405
- - liver depressed by ..	404, 405
- - passive hyperæmia of uterus from ..	428, 430
- - Riedel's lobe from ..	404, 405
- - shape of liver in ..	405
Tightness in chest , from bronchitis ..	480
- - chronic mediastinitis ..	484
- - mediastinal growth ..	483
- - œsophagismus ..	484
Tilbury Pox, re impetigo contagiosa ..	446, 601, 654
Tinea circinata (and see Ringworm; and Fungous Affections of Skin) ..	274
- - diagnosis from circinate tubercular syphiloderm ..	275
- - - macular syphilide ..	426
- - - pityriasis rosea ..	668
- - - tinea imbricata ..	276
- - - involvement of lips in ..	403
- - decalvans ..	274
- - imbricata , description of ..	275
- - - diagnosis from ichthyosis ..	276
- - - tinea circinata ..	276
- - - parasitology of ..	276
- - marginata in bathing-drawers area ..	447
- - - pruritus caused by ..	588
- - sycosis (see Ringworm of the Beard)	
- - tonsurans (see Ringworm)	
- - scales in ..	655
- versicolor , contagiousness low of ..	276
- - currant-like masses of spores in ..	276
- - description of ..	276
- - diagnosis from chloasma ..	276, 575
- - - eczema seborrhœicum ..	276
- - - erythrasma ..	276
- - - leprosy ..	276
- - - pityriasis rosea ..	276
- - - syphilides ..	276, 426
- - - distribution of ..	276
- - - macules in ..	424
- - - microsporon furfur in ..	276
- - - scales in ..	276, 426, 655
Tingling in acroparesthesia ..	493
- - miliaria rubra ..	831
- - peripheral neuritis ..	505, 661
- - preceding apoplexy ..	173
- - pruritus described as ..	588
- - in ringworm ..	275
- - tabes dorsalis ..	661

Tinkling, metallic, with pneumothorax ..	193
TINNITUS ..	793
- - associated with flushing ..	268
- - epistaxis relieving ..	252
- - good influence of open air in ..	793
- - increased by tobacco ..	793
- - in Ménière's disease ..	828
- - middle-ear deafness ..	190
- - nuclear facial paralysis ..	536
- - otitis media ..	470
- - otosclerosis ..	829
- - syphilitic ear disease ..	828
- - tuberculous otitis media ..	469
- - varieties of ..	793
- - from wax in ears ..	467
Tiredness at onset of phthisis ..	620
Tobacco , amblyopia with ..	836
- - - optic disc changes in ..	836
- - central scotoma from ..	836, 837
- - colour blindness from ..	836, 837, 840
- - diminished appetite from ..	49
- - dry cough from ..	175
- - dyspepsia from ..	354
- - gastritis from ..	352
- - headache from ..	328
- - hemeralopia from ..	841
- - undue increase of pulse-rate on exertion from ..	527
- - infantilism from ..	215
- - insomnia from ..	356
- - intermittent claudication from ..	489
- - loss of weight due to ..	848
- - nerve deafness from ..	191
- - palpitation from ..	525, 527
- - pseudo-angina in ..	482
- - retinal cones affected by ..	841
- - susceptibility of different people to ..	527
- - tachycardia from ..	772
- - tinnitus increased by ..	793
- - tremor from ..	795
- - vertigo from ..	827
- - violent thumpings of heart on getting into bed from ..	527
- - vomiting from ..	843
Toes in acute gout ..	832
- - affected by scabies ..	832
- - athletic contractions of ..	154
- - deformity from boots ..	132
- - dragging of in spastic monoplegia ..	510
- - examination of, in obscure pyrexia ..	620
- - exostosis of ..	754
- - hyperextended, in paralytic talipes ..	130
- - pain in, in Morton's disease ..	488
- - in Raynaud's disease ..	490
- - Toe-nail, ingrowing ..	486
Tokelau ringworm (see Tinea Imbricata)	
Tolnylenediamine poisoning, blood destruction in ..	374
- - jaundice in ..	362
Tomatoes, oxaluria from ..	311, 471
Tongue , affections of anterior portion, referred pain in mental area in ..	498
- - - of dorsum, referred pain in occipital area in ..	498
- - - lateral portions, referred pain in hyoid area in ..	498
- - - in sprue ..	197
- - angio-neurotic œdema of ..	457
- - atrophy of ..	69, 75
- - in bulbar paralysis ..	521, 641
- - - myasthenia gravis ..	687
- - - "bald," in scarlet fever ..	674
- - not bitten in hysterical convulsions ..	160

Tongue, contd.

- biting of, in epilepsy ..	171, 646
- - convulsions ..	168
- - carcinoma of (see Carcinoma of Tongue)	
- - chancre of, discussed ..	813
- - cornet-player's cramp of ..	177
- - deep-red colour in diabetes ..	292
- - deficiency of deep tenderness in locomotor ataxy ..	562
- - dental ulcer of ..	812, 814
- - difficulty in using, a cause of dysphagia ..	225
- - dry , from belladonna ..	773
- - - and brown, in acute yellow atrophy ..	302, 370
- - - with lardaceous disease ..	48
- - - pyelonephritis ..	48
- - - renal tuberculosis ..	48
- - - and furred in peritonitis ..	431
- - - in tropical abscess of liver ..	369
- - - in uræmia ..	45
- - dyspeptic ulcer of ..	812
- - electrical reactions of, in bulbar paralysis ..	687
- - enlargement in acromegaly ..	263
- - epithelioma of (see Carcinoma of Tongue)	
- - fibrillary contractions of, in bulbar paralysis ..	159, 686
- - - in disease of central nervous system ..	158
- - fissured in syphilis ..	813
- - furred in alcoholism ..	136, 243
- - - alveolar abscess ..	747
- - - appendicitis ..	736
- - - foul taste due to ..	774
- - - in gastritis ..	49, 297
- - - loss of taste due to ..	774
- - - in peritonitis ..	774
- - - pneumonia ..	774
- - - septicæmia ..	774
- - - severe fevers ..	774
- - - typhoid fever ..	774
- - - and indented, in active congestion of liver ..	371
- - - and tremulous, in chronic alcoholism ..	59
- - gangrene of, in Raynaud's disease ..	284
- - glazed in pyelitis ..	625
- - gumma of ..	279, 814
- - - median position of ..	420
- - herpes zoster of ..	831
- - indented in acromegaly ..	263
- - - chronic gastritis ..	297
- - - congestion of liver ..	371
- - leukoplakia of (<i>Plate XI</i>) ..	814
- - movements in chorea ..	548
- - mucous patches on in secondary syphilis ..	813
- - paresis of, in bulbar paralysis ..	641
- - progressive weakness of in bulbar paralysis ..	224
- - protrusion in cretinism ..	258
- - Mongolian idiocy ..	263
- - sore, with papular syphiloderms ..	533
- - - in secondary syphilis ..	605
- - strawberry appearance of, in scarlet fever and erythema scarlatiniforme ..	253
- - swelling of, due to mercury ..	86
- - swollen, dysphagia due to ..	225
- - syphilis of ..	237, 279, 420, 812, 813
- - taste nerves of ..	775
- - tremor of ..	795
- - - alcoholic ..	238, 243, 368, 797
- - - cirrhosis of liver ..	368, 410
- - - in general paralysis ..	172, 796
- - - lead poisoning ..	797
- - - paralysis agitans ..	796
- - trichinosis parasites in ..	801

- Tongue, contd.*
- **tuberculous** .. 812, 814
 - ulceration of (see Ulceration of Tongue)
 - unilateral palsy of, absence of articulatory defect in .. 687
 - white spots on in aphthous stomatitis .. 815
 - Tonic contraction of uterus .. 229
 - spasms (see Contractions, Tonic)
 - Tonsillectomy, death from lymphatism after .. 423
 - palate paralysis after .. 640
 - Tonsillitis, acute, albuminuria in** .. 17, 18
 - aortic disease after .. 237
 - dysphagia with .. 591
 - earache from .. 230
 - endocarditis complicating .. 239
 - enlarged glands from .. 419, 708
 - foul breath due to .. 99
 - pains in the limbs in .. 503, 505
 - in peliosis rheumatica .. 600
 - with pharyngitis .. 673
 - pleurmonous .. 419
 - pythemia with .. 591
 - pyrexia in .. 620, 622, 672
 - rigors in .. 647
 - sore throat from .. 670
 - spinal arthritis in .. 708
 - spondylitis deformans after .. 787
 - stiff neck from .. 708
 - trismus simulated by .. 801
 - various micro-organisms causing .. 670
 - **chronic, diphtheritic** .. 672
 - syphilitic .. 672
 - from Vincent's angina .. 672
 - **follicular, albuminuria in** .. 17
 - constitutional disturbances .. 672
 - diphtheria bacilli in .. 671
 - distinction of Vincent's angina from .. 672
 - foul breath in .. 99
 - high fever in .. 672
 - leucocytosis in .. 400
 - simulating syphilis .. 672
 - sore throat from .. 670
 - **rheumatic** .. 239, 374, 504, 671
 - age incidence of .. 504, 671
 - enlarged submaxillary lymphatic glands in .. 419
 - nature of some cases of .. 374
 - recurrent .. 121, 671
 - Tonsils and adenoids, mouth-breathing causing** .. 672
 - carcinoma of (see Carcinoma of Tonsils)
 - chancre of .. 670, 672
 - **enlarged, association with adenoids** .. 670
 - deafness from .. 190
 - enuresis cured by removing .. 248
 - insomnia from .. 357
 - in lymphatism .. 423
 - night terrors with .. 448
 - with rhinitis .. 204
 - stertor from .. 707
 - epithelioma of (see Carcinoma of Tonsils)
 - gumma of, simulating carcinoma .. 672
 - sore throat from .. 670
 - list of various acute and chronic affections of the mucous patch on, in secondary syphilis .. 675
 - sarcoma of (see Sarcoma of Tongue)
 - syphilis of .. 425, 670, 672, 675, 813
 - tuberculous .. 672
 - ulceration of (see Ulceration of Tonsils)
 - Tooth's peroneal atrophy** .. 71
 - ankle-clonus in .. 560
 - atrophy of leg muscles with .. 128
 - Babinski's sign in .. 81
 - claw-hand in .. 127, 128
 - commencing in one leg .. 545
 - diagnosis of transverse myelitis from .. 74
 - familial character of (Figs. 8, 9, p. 71) .. 132, 560
 - following whooping-cough or measles .. 560
 - paralysis of arm in .. 554
 - paraplegia from .. 557, 559, 560
 - plantar reflex in .. 81
 - reaction of degeneration in .. 132, 560
 - reflexes in .. 560
 - talipes in .. 71, 132, 560
 - Tooth-ache, abscess with .. 747
 - Tooth-brush, bleeding gums due to .. 86, 87
 - retracted gums from .. 641
 - Tooth-plate ill-fitting, hemorrhage due to .. 87
 - obstructing oesophagus .. 222
 - in oesophagus, hæmatemesis from .. 297
 - opening into pericardium .. 711
 - pythemia due to defective .. 591
 - Tophi in ear, in gout** .. 381, 507
 - about joints .. 507
 - sodium urate crystals in .. 381
 - Torsio testis (see Testis, Torsion of)
 - Torticollis, clonic contractions** .. 161
 - contracture in .. 167
 - description of .. 708
 - due to disuse .. 163
 - hemiatrophy of face with .. 167, 537
 - hysterical .. 166
 - due to injury at birth .. 708
 - retraction of the head in .. 641
 - scoliosis in .. 180, 181, 708
 - spasmodic .. 708
 - Torula in vomit .. 134
 - Trachea, aneurysm rupturing into** .. 140, 318, 482
 - displaced by thyroid gland .. 792
 - epithelioma of, stridor from .. 710
 - irruption of caseating gland into .. 465
 - ulceration of, hæmoptysis in .. 318
 - from malignant thyroid gland .. 792
 - **obstruction by aneurysm** .. 482
 - causes of .. 465, 709
 - diagnosis of .. 465
 - by enlarged thymus gland .. 710
 - epithelioma of oesophagus .. 710
 - intercostal retraction in .. 465
 - malignant glands in neck .. 710
 - mediastinal new growth .. 483, 710
 - orthopnea in .. 465
 - stridor from .. 709
 - sucking in above the clavicles in .. 465
 - syphilitic .. 710
 - by thyroid tumour .. 792
 - after tracheotomy .. 710
 - Tracheal tugging .. 222
 - Tracheotomy, hæmoptysis after** .. 318
 - stenosis of trachea after .. 710
 - stridor after .. 710
 - surgical emphysema after .. 231
 - urgent, from acute suffocative oedema of larynx .. 185, 539
 - in bilateral laryngeal paralysis .. 539
 - for oedema of larynx .. 673
 - Trachoma, corneal ulceration in .. 807
 - pannus in .. 807
 - ptosis in .. 590
 - Training, lack of, tachycardia from .. 772
 - Trance, hysterical .. 137, 140
 - Transfusion, acute nephritis simulated after .. 458
 - universal oedema from .. 458, 460
 - Transillumination of antrum of Highmore (Fig. 62, p. 205) .. 502, 749
 - Transitional corpuscles .. 2
 - Translucency test for cysts of testis .. 52
 - in hydrocele .. 521, 522, 741
 - of psosa bursa .. 741
 - Transposition of great vessels .. 184
 - liver .. 404
 - viscera .. 184, 224
 - Transverse myelitis (see Myelitis, Transverse)
 - Trachee's space, definition of .. 668
 - Trauma (see Injury)
 - Traumatic arthritis .. 375
 - Treadler's cramp .. 177
 - TREMOR** .. 794
 - in acquired infantile paralysis .. 155
 - alcoholism .. 136, 172, 238, 258, 368
 - of arm (see Arm)
 - associated with flushing .. 268
 - causes of .. 795
 - in congenital diplegia .. 154, 795, 800
 - differentiation of choreiform movements from .. 156
 - of eyes (see Nystagmus)
 - fibrillary in intermittent claudication .. 490
 - in Graves' disease .. 244, 253, 772, 792, 849
 - head (see Head, Tremor of)
 - with hysterical chorea .. 157
 - influence of sleep on .. 795
 - intention (see Intention Tremor)
 - in Little's disease .. 154
 - mercurial .. 37, 77
 - in occupation cramp .. 177
 - paralysis agitans .. 548
 - peripheral neuritis .. 77, 285
 - post-hemiplegic .. 157
 - rate of various .. 795
 - tongue (see Tongue, Tremor of)
 - unilateral, from tumour of subthalamic region .. 798
 - Trephining, indications for in cases of coma .. 137
 - Treponema pallidum (see Spirochaeta Pallida)
 - Triceps, nerve supply of .. 550
 - pseudo-hypertrophy of .. 560
 - spinal nerve-root supplying .. 556
 - Trichinosis, acute general pains in the limbs in** .. 503
 - albuminuria in .. 17
 - blood-changes due to .. 33
 - cachexia in .. 115
 - diagnosis from acute gastroenteritis .. 504
 - polymyositis .. 504
 - cholera .. 504
 - enteric fever .. 504
 - rheumatism .. 504
 - eosinophilia in .. 249, 504, 801
 - epidemic .. 801
 - gastro-enteritis from .. 504
 - high fever in .. 504, 801
 - infection from pork .. 504, 801
 - leucocytosis in .. 504
 - muscles affected by .. 504, 801
 - oedema of face and eyes in .. 504
 - pain and stiffness in the muscles from .. 504, 801
 - profuse perspiration in .. 504
 - rarity in Great Britain .. 504
 - severe constitutional disturbances in .. 801

Trichinosis, contd.

tenderness of the spine in ..	785
trichinelæ in muscles in ..	504
-- in stools in ..	504
-- trismus from ..	801
<i>Tricocephalus dispar</i> (Fig. 154) ..	569
-- no blood changes with ..	33
-- as cause of eosinophilia ..	249
<i>Trichophyton acuminatum</i> ..	272
-- crateriforme ..	272
-- cultures, classification ..	273
-- sulphureum ..	272
-- violaceum ..	272
<i>Trichophytosis</i> (and see Ringworm and Tinea) ..	272, 273, 275
Tricuspid area , systolic bruits over ..	106
regurgitation , absence of ..	
-- bruit with ..	106
-- from alcoholism ..	243
-- bruits of ..	239
-- in chronic bronchitis and emphysema ..	246
-- pain and tenderness in the back from ..	789
-- pulsation of liver in ..	407
-- secondary to mitral ..	239
-- thrill with ..	791
-- stenosis, presystolic bruit in ..	110
-- thrill with ..	791
-- valve, fungating endocarditis of ..	321
Trigeminal nerve , tumour of, neuralgic pain and tenderness due to ..	783
neuralgia from a carious tooth ..	495
-- coryza in ..	203
-- earache associated with ..	230
-- from Gasserian ganglion disease ..	496
-- in glaucoma ..	838
-- gummatous meningitis ..	496
-- perioritis ..	496
-- herpes zoster ..	496
-- persistence of pain for months in some cases ..	496
-- iritis ..	495
-- scars of old herpes in ..	496
-- from tumours at base of brain ..	496
-- of 5th nerve ..	496, 783
major ..	495, 496
-- absence of sensibility in ..	496
-- muscular paresis in ..	496
-- age incidence of ..	495
-- cutaneous flushing in ..	495
-- idiopathic, diagnosis from symptomatic trigeminal neuralgia ..	496
-- lachrymation in ..	495
-- photophobia in ..	495
-- points in diagnosis of ..	495
-- reflex spasm of muscles of affected side in ..	495
-- salivation in ..	495
-- subjective sensation of swelling in ..	495
-- trophic changes in hair and skin in ..	495
-- no wasting in ..	496
Trigonal region of bladder, affection of, causing penile pain ..	441
Trigonal, coma due to ..	137
Triple phosphate crystals in urine (Fig. 155) ..	573
Triplesia , infantile ..	155
TRISMUS ..	801
-- absent in hydrophobia ..	162
-- or late in strychnine poisoning ..	162
-- from alveolar abscess ..	747
-- in hysteria ..	162

Trismus, contd.

-- tetanus ..	162, 178, 463, 709
-- various conditions simulating ..	801
Trochanter , great, bed sore over ..	285
Trommer's test for glycosuria ..	289
Trophic changes in skin, nails, and joints in syringomyelia ..	128, 285
-- lesions in acquired infantile paralysis ..	155
-- -- infantile paralysis ..	131
-- ulcers in paralytic talipes ..	130
Trophedema , hereditary (see Milroy's Disease) ..	
Trophoneurosis , gangrene from macules in ..	284, 423
Tropical abscess of liver (see Abscess, Hepatic) ..	
-- climate, dengue in ..	506
-- effect in producing active congestion of liver ..	371
-- -- yellow fever in ..	372
-- diseases, cachexia from ..	459, 461
-- -- loss of weight in ..	848
-- -- oedema of legs in ..	459, 461
-- -- severe anæmia from ..	459
Trousseau's sign ..	586
Trouseaut's sign ..	3, 178
Truss , enlarged groin glands from ..	738
-- ill-fitting, testicular atrophy from ..	78
Trypanosoma gambiense (Plate XII, Fig. G, p. 696) ..	34
-- in cerebrospinal fluid ..	340
Trypanosomiasis , blood changes in ..	31
-- lymphocytosis in cerebrospinal fluid in ..	339
-- trypanosomes in cerebrospinal fluid in ..	340
Tubal abortion (see Abortion, Tubal) ..	
-- disease, referred pain in the area of 10th dorsal nerve in ..	509
-- gestation (see Gestation, Ectopic; and Abortion, Tubal) ..	
-- ruptured (see Gestation, Ectopic; and Abortion, Tubal) ..	
Tube-casts (see Casts, Renal) ..	
Tubes , distended Fallopiian, causing dyschezia ..	150
Tubercle bacilli (see Bacillus) ..	
Tubercles , choroidal (and see Choroid), with Cheyne-Stokes respiration ..	125
-- in meningitis ..	341, 699
-- ophthalmoscopic appearance of (Plate VIII) ..	463
-- unilateral exophthalmos due to ..	254, 255
-- (and see Nodules) ..	
Tuberculides (see Scrofuloderma) ..	
Tuberculin in exclusion of tuberculous peritonitis ..	719
-- injections in diagnosing chronic abscess of bone ..	752
-- -- Addison's disease ..	38
-- -- latent tuberculosis ..	848
-- -- lupus vulgaris ..	812
-- -- tuberculosis ..	612, 808, 814
-- -- tuberculous cæcum ..	736
-- reaction absent in lung lesions due to oidium tropicale ..	705
-- eosinophilia in positive stage of ..	249
-- (and see Calmette's Reaction; and von Pirquet's Reaction) ..	

Tuberculosis, absence of clinical signs for some time in ..

-- acetonuria in ..	4
-- albuminuria in ..	17
-- amenorrhœa in ..	23
-- anæmia in ..	37, 459, 616
-- axillary abscess in ..	731
-- of bladder (see Cystitis, Tuberculous) ..	
-- blood changes in ..	450
-- of breast (see Breast, Tuberculosis of) ..	
-- cachexia from ..	17, 114, 459, 461
-- Calmette's reaction for, fallacies of ..	621
-- cell changes in ..	450
-- characteristic temperature curve of ..	612
-- in children, anorexia in ..	50
-- chloasma in ..	574
-- of colon (see Colon, Tuberculosis of) ..	
-- diagnosis from fungating endocarditis ..	613
-- -- influenza ..	610
-- -- paratyphoid fever ..	611
-- -- yaws ..	450
-- empyema resulting from ..	120
-- enlarged glands in groin in ..	758
-- -- cervical glands in ..	421
-- -- fatty liver in ..	414
-- functional bruits in ..	106
-- general, cerebral type of ..	699
-- -- absence of leucocytosis in ..	614
-- -- acute, leucopenia in ..	401
-- -- choroid tubercles in ..	463
-- -- diagnosis from bronchitis ..	344
-- -- typhoid fever ..	699
-- frequent origin in a tuberculous bronchial gland ..	427
-- hyperpyrexia in ..	343
-- purpura in ..	596, 598
-- pyrexia with weakness and anorexia at onset of ..	612
-- rigors in ..	647
-- severe headache in ..	699
-- splenic enlargement in ..	692, 699
-- tuberculous meningitis a part of ..	612
-- genito-urinary, pyrexia in ..	621
-- guinea-pig inoculation in diagnosis of ..	719
-- hæmatoporphyria in ..	820
-- histological diagnosis of ..	814
-- iritis and cyclitis in ..	256
of joints (see Arthritis, Tuberculous; and for Tuberculosis of the Viscera see under the different organs, e.g., Kidney; Liver; Prostate; Thyroid Gland, etc.) ..	
-- latent, loss of weight from ..	847
-- pleuritic effusion in ..	121
-- von Pirquet's and Calmette's reaction in diagnosing ..	847
-- leucocytosis absent in ..	620, 699
-- uncommon in, except in advanced phthisis and meningitis ..	400
-- lichen scrofulosorum with ..	529
-- of Lung (see Phthisis; and Lung) ..	
-- lymphatic gland enlargement in (see Lymphatic Glands) ..	
-- marasmus in ..	427
-- milk in relationship to ..	818
-- multiple serositis in ..	123
-- oedema of legs in ..	459, 461
-- onychia in ..	415
-- pancreatitis from ..	116
-- perforation of palate in ..	640
-- peripheral neuritis in ..	506

<i>Tuberculosis, contd.</i>		<i>Typanites, contd.</i>		<i>Typhoid fever, contd.</i>	
- pyrexia prolonged in ..	609	- carcinoma of colon ..	367	- - differential leucocyte	
- - the only symptom for		- cirrhosis of liver ..	410	- - count in diagnosis from	
weeks in some cases of	612	- diagnosis of ascites from ..	52	- - suppuration ..	402
- recrudescence following		- displacement of cardiac im-		- - distribution of spots in ..	607
measles ..	427	- pulse by ..	330, 332	- - dryness of the mouth in ..	774
- shortness of breath in ..	101	- gastric, over thorax ..	668	- - Eberth's bacillus in faeces	610
- simulation by alcoholism	849	- in acute hæmorrhagic pan-		- - empyema of gall-bladder in	369
- anorexia nervosa ..	850	- creatitis ..	646	- - enlarged mesenteric glands	
- of spine (see Caries of Spine)		- Hirschsprung's disease ..	148, 152	- - in ..	422
- testicular atrophy in ..	79, 80	- loss of liver dullness from ..	404	- - epididymo-orchitis in ..	517, 518
- tuberculin injection test of ..	814	- orthopnea from ..	465, 467	- - epistaxis in ..	90, 251, 697
- - tests for ..	612	- palpitation from ..	526, 528	- - exaggeration of knee-jerks	
- ulceration of palate in ..	640	- in general peritonitis ..	644	- - in convalescence from ..	397
- rectum in ..	635	- physical signs of ..	52	- - fatty heart following ..	241
- vertebrae (see Caries of Spine)		- in pneumothorax ..	480	- - stools in ..	265
- visceral, multiple benign		- pyloric obstruction ..	134	- - fewness of physical signs in	697
sarcoid with ..	452	- thoracic, due to stomach or		- - foul breath in ..	98
- von Pirquet's cutaneous		colon ..	668	- - taste in ..	774
reaction for ..	612, 814, 847	Typanum, effect of nuclear		- - frontal headache at onset of	610
- wasting with ..	69	facial paralysis on ..	536	- - fullness of abdomen in ..	90
Tuberculous lymphatic glands		Type-setters, plumbism in ..	136	- - furred tongue in ..	774
(see Lymphatic Glands)		Typhilitis, pain in right iliac		- - gall-bladder enlarged in	
- meningitis (see Meningitis)		fossa from ..	155, 501	- - gangrene in ..	280, 281, 371
- otitis media (see Otitis		Typhoid bacilli (see Bacillus		- - gradual onset with lassitu-	282
Media, Tuberculous)		Typhosus)		- - tude and anorexia in ..	697
- peritonitis (see Peritonitis,		- carriers, infected bile in ..	281	- - hæmorrhage in, blanching	
Tuberculous)		- fever, absence of clinical		- - due to ..	622
- ulcer (see Ulceration, Tuber-		signs in some cases of ..	610	- - sudden drop in tem-	
culous)		- - leucocytosis in ..	614, 620	- - perature from ..	622
Tugging, tracheal, due to		- - acute diarrhoea in ..	196	- - hæmoglobinuria in ..	315
aneurysm ..	222	- - dilatation of heart from	243	- - headache in ..	90, 610, 620, 697, 699
Tumours (and see Carcinoma;		- - peritonitis from ..	55	- - lasting several days,	
Sarcoma; Swellings; and		- agglutination reaction in		- - with pyrexia, at onset	620
under the various organs)		(see Typhoid Fever,		- - heavy sweats in ..	648
- pelvic (see Swelling, Pelvic;		Widal's Reaction in)		- - hyperpyrexia in ..	343, 622
and Pelvis, Tumour of)		- - albuminuria in ..	17	- - hypothermia in conva-	
- phantom (see Phantom		- - albumosuria in ..	20	- - lesence from ..	346
Tumour)		- - amnesia after ..	26	- - indicanuria in ..	319
- pulsatile (see Swelling, Pul-		- - arthritis in ..	376	- - inflammation of bile-pas-	
satile)		- - asymmetrical œdema fol-		- - sages by typhoid bacilli	371
TUMOURS OF THE SKIN ..	802	- - lowing ..	456	- - intestinal bleeding in ..	90
- spinal (see Spinal Cord Tumours)		- - bacilli in blood in ..	650	- - jaundice in ..	362, 369, 371
Tunica vaginalis, various		- - backache with ..	787	- - leucocyte count in diag-	
swellings affecting ..	765	- - bacteriuria in ..	83	- - nosis of deep suppur-	
Tuning-fork tests for hearing	188, 189	- - Cheyne-Stokes respira-		- - tion from ..	401
Turkish bath, capillary pulsa-		- - tion in ..	125	- - leucocytosis uncommon in	400
tion induced by ..	106	- - coma in ..	136	- - leucopenia in ..	90, 196, 372, 401, 697
Turpentine, anuria from ..	45, 48	- - due to hæmorrhage in	140	- - lymphocytes increased in	
- hæmaturia from ..	304	- - confinement to bed at end		- - 402, 615, 697	
- leucocytosis from ..	490	- - of first week in ..	610	- - menorrhagia in ..	428
- priapism from ..	586	- - constipation in ..	610, 648	- - meteorism in ..	432
- workers, bulke in ..	110	- - continued pyrexia in ..	697	- - diagnosis from perfora-	
Twelfth nerve (see Hypoglossal)		- - cramps in ..	179	- - tion ..	432
Twins, antenatal recognition of	228	- - cultivation of typhoid		- - mild polyarticular ar-	
- dystocia due to ..	227, 228	bacilli from blood in ..	610	- - thritis as precursor of	376
Twisting of pedicle of ovarian		- - delirium in ..	90, 194	- - muscular atrophy in ..	76
cyst, pain simulating renal		- - diagnosis in absence of		- - nerve deafness after ..	190
colic ..	392	Widal's reaction and		- - œdema of legs after ..	459
Twitch, muscular, caused by		rash ..	611	- - orchitis from ..	79, 765
fatigue, etc. ..	159	- - from appendicitis, signi-		- - osteitis of head and neck in	376
Twitchings before apoplectic		fificance of leucopenia	401	- - otitis media in ..	648
stroke ..	157	- - fungating endocarditis ..	611, 613	- - pancreatitis from ..	116
- of face during rigors ..	646	- - general tuberculosis ..	699	- - perforation in ..	648, 711
- muscular, in meningitis ..	642	- - influenza ..	610, 611, 699	- - diagnosis from meteor-	
- in strychnine poisoning ..	802	- - malaria ..	615	- - ism ..	432
Tympanic attic, caries of		- - Malta fever ..	612	- - severe abdominal pain	
ossicles in suppuration in	470	- - paratyphoid fever ..	611	- - from ..	622
- perforation in Shrapnell's		- - pulmonary tuberculosis	611	- - sudden drop in tem-	
membrane in suppura-		- - pyosalpinx, significance		- - perature from ..	432, 622
tion in ..	470	of leucopenia in ..	401	- - rise in pulse-rate in	432
- cavity, bloody purulent dis-		- - - septicæmia ..	611	- - periosteal abscess in ..	752
charge from ..	468	- - - small-pox ..	607	- - nodes in ..	752
- - erosion of internal carotid		- - - suppurative pyelophlebitis	614	- - periostitis in ..	648, 776
artery from chronic sup-		- - - trichinosis ..	504	- - of rib after ..	744
puration in ..	468	- - - tuberculous disease of		- - peripheral neuritis from ..	76
- - of lateral sinus from	468	the kidney ..	612	- - peritonitis in ..	431, 648
- opened in fractured base	467	- - - meningitis ..	611, 612, 699	- - pleurisy in ..	648
- - (and see Otitis Media)		- - - typhus ..	597, 610, 698	- - pneumonia in ..	648
Typanites (and see Meteorism)	431	- - - ulcerative colitis ..	91	- - pneumoperitoneum in ..	711
- abdominal distention great		- - diarrhoea in ..	90		
from ..	467	- - at onset of ..	610		
- in atonic constipation ..	143	- - diazo-reaction in ..	198		

typhoid fever, contd.

- polyuria after ..	582, 583
- primary infection of gall-bladder in ..	372
- pulse in ..	372, 611, 697
- pulse-rate relatively slow in ..	610, 697, 771
- pulse-temperature ratio in ..	372, 697
- purpura in ..	596, 598, 607
- very rare in ..	598
- pus in stools in ..	601
- pyelitis in ..	625
- pyrexia the earliest symptom in many cases of ..	620
- prolonged in ..	609
- rash in ..	697
- rhonchi in chest in ..	697
- rigors in (<i>Fig.</i> 162, p. 611)	614, 647, 648, 650, 651, 698
- indicating complication in ..	648, 651
- rare in ..	647, 650
- rose-red spots in ..	90, 372, 607, 610
- the most conclusive evidence of ..	610
- rupture of gall-bladder in ..	281
- simulated by pyæmia ..	650
- sloughs from Peyer's patches in the stools in ..	697
- spine, painful and stiff in ..	376
- spleen soft in ..	697
- enlarged in ..	90, 196, 372, 610, 615, 692, 697
- spondylitis deformans after ..	787
- stiffness of hip joint in ..	376
- submammary abscess after ..	744
- swelling of thyroid gland in ..	792
- talipes in ..	183
- technically a septicæmia ..	650
- temperature curve of (<i>Fig.</i> 162) ..	611, 697
- tenderness of spine after ..	784
- testicular abscess in ..	680
- atrophy after ..	79
- tetany in ..	178
- tinnitus after ..	791
- transverse myelitis from ..	565
- typhoid spine with ..	787
- without ulceration of intestine ..	372
- ulceration of larynx after ..	226, 318, 466, 710
- Widal's reaction in ..	90, 196, 372, 610, 620, 697
- spine, general account of ..	376, 787
- state in typhus fever ..	699

typhoid fever, absence of

- sloughs in stools in ..	699
- Widal's reaction in ..	699
- acute dilatation of heart from ..	243
- onset in ..	698
- coma in ..	136
- cyanosis in ..	187
- diagnosis from fungating endocarditis ..	610, 614
- typhoid fever ..	597, 610, 698
- diazo-reaction in ..	198
- early prostration in ..	371, 698
- hyperpyrexia in ..	343
- inspiration of blood in ..	187
- jaundice in ..	362, 371
- leucocytosis uncommon in ..	400
- marked nervous symptoms ..	699
- mulberry and petechial rashes in ..	371
- occasional outbreaks in poorer parts of large cities ..	698
- purpura in ..	371, 596, 597
- pyrexia in ..	343, 698

Typhus fever, contd.

- pyrexia over by twelfth or fourteenth day in ..	610
- prolonged in ..	609, 610
- rarity of ..	597, 698
- rash of ..	371, 610, 699
- retention of urine in ..	699
- rigors in ..	647, 698
- severe vomiting in ..	699
- slight leucocytosis in ..	698
- splenic enlargement in ..	692, 699
- sudden onset in ..	371
- termination by crisis ..	371
- typhoid state in ..	699
- Typist's cramp ..	177, 494
- Tyrosin, absent from urine in phosphorus poisoning ..	373
- in acute yellow atrophy of the liver ..	302, 370, 843
- relation of alkaptonuria to ..	822
- UFFELMANN'S reagent for testing gastric acidity ..	355
- Uganda, trypanosomiasis in ..	34
- Ulceration, anal, causing spasm of sphincter ..	150
- of bladder in acute cystitis ..	627
- bilharzia infection ..	630
- from cystitis ..	629, 630
- cystoscopy in diagnosis of ..	630
- frequency of micturition in ..	630
- hæmaturia from ..	630
- from injury ..	629
- intestinal ulceration ..	633
- malignant disease ..	620, 630
- painful micturition in ..	630
- phosphaturia in ..	630
- pyuria in ..	623, 629, 630
- rarity of ..	630
- simple ..	629, 630
- surgical emphysema from ..	231
- in vesical tuberculosis ..	629
- carcinoma of tonsil ..	672
- Ulceration of CORNEA ..	806
- anterior polar cataract from ..	806
- catarrhal ..	806
- conjunctivitis due to ..	256
- dendritic ..	807
- diphtheritic ..	807
- epiphora from ..	250
- with exophthalmos ..	807
- from fifth nerve paralysis ..	807
- fluorescein detection of ..	806
- gonococcal ..	255, 256, 807
- in Graves' disease ..	807
- herpes frontalis ..	807
- hypopyon from ..	806
- iridocyclitis from ..	806
- iritis from ..	806
- irregularity of pupil from ..	594
- lachrymation from ..	806
- in ophthalmia neonatorum ..	255
- pain in the eye from ..	806
- panophthalmitis from ..	806
- phlyctenular ..	806
- photophobia from ..	574, 806
- progressive stages in ..	806
- in trachoma ..	807
- duodenum (see Duodenum, Ulcer of)	
- Ulceration of the FACE ..	
- (and see Rodent Ulcer; and Carcinoma) ..	808
- in fibroma molluscum ..	781
- of fingers in diabetes ..	266
- from epithelioma ..	266
- frostbite ..	266
- leprosy ..	266
- lupus vulgaris ..	266
- in Raynaud's disease ..	266
- scleroderma ..	266
- from x-rays ..	266

ULCERATION OF THE FOOT

(and see Foot, Perforating Ulcer of) ..	809
- from diabetes mellitus ..	809
- general paralysis of insane ..	809
- leprosy ..	809
- locomotor ataxy ..	562
- perforating (<i>Fig.</i> 207) ..	809
- from peripheral neuritis ..	809
- syphilis ..	809
- tabes dorsalis ..	809
- of frænum lingæ in whooping-cough ..	814
- gastric (see Gastric Ulcer) ..	
- of glans penis from balanitis ..	674
- gummatous (<i>Fig.</i> 208) ..	811
- of intestine, hæmataria in ..	305, 313
- cæcum, surgical emphysema from ..	231
- colon, blood per anum in ..	92
- involvement of bladder in ..	313
- pneumoperitoneum from perforation of ..	711
- septic arthritis from ..	375
- or stomach, abdominal tenderness in ..	134
- stricture due to ..	146
- subphrenic abscess due to ..	721
- varieties causing bleeding ..	90
- of larynx, cyanosis from ..	185
- dysphagia due to ..	226
- earache from ..	230
- hæmoptysis in ..	318
- œdema of ..	466
- stridor from ..	710
- varieties of ..	226, 710
- variolous ..	226
- Ulceration of the LEG ..	810
- due to anthrax ..	811
- atheroma ..	810
- badly united fracture ..	810
- Bazin's disease ..	450
- burns ..	810
- cold ..	810
- in diabetes mellitus ..	811
- from diphtheria bacilli ..	811
- in elephantiasis ..	810
- epitheliomatous ..	812
- from excessive standing ..	450
- glanders ..	811
- hemiplegia ..	811
- infantile paralysis ..	811
- ochronosis from carbolic dressings on ..	822
- old age ..	810
- phagedæna ..	811
- relationship of injury to ..	810
- syphilitic ..	449, 811
- tuberculous ..	811
- varicose, characters of ..	810
- in yaws ..	449
- Mooren's ..	807
- of the mouth (and see Stomatitis) ..	86, 88
- bleeding gums in ..	86, 88
- mucous membranes from herpes ..	830
- multiple, in tuberculous laryngitis ..	325
- nose, epistaxis in ..	250
- œsophagus, surgical emphysema from ..	231
- palate in syphilis ..	237
- penis (see Penis, Ulceration of)	
- peptic, of gums ..	87
- perforating, distinction from suppurating corn ..	809
- originating from a corn ..	809
- painlessness of ..	809
- in tabes ..	285, 811
- of pharynx, earache from ..	230
- snail-track, in secondary syphilis ..	672

Ulceration, contd.

- of rectum	473
- bearing-down pain in	473
- due to dysentery	635
- gummatous	635
- hæmorrhage in	93
- often impalpable	635
- sacralgia from	510
- speculum in diagnosis of	635
- surgical emphysema from	231
- traumatic	635
- tuberculous	635
- due to ulcerative colitis	635
- venereal, hæmorrhage in	93
- rodent (see Rodent Ulcer)	
- of scrotum in tuberculous testis	680
- due to epithelioma	679, 765
- syphilitic	680, 681, 766
- rounded with sharp edges and yellowish base in gumma	681
- tuberculous	518, 680, 766, 767
- septum nasi, epistaxis from	251
- of skin, over chondromata	755
- in epithelioma	803
- erythema induratum scrofulosorum	450
- glands	603
- granular scrofulous, in scrofuloderma	603
- from herpes	830
- iodides in diagnosing syphilitic	449
- in Jacquet's erythema	446
- leprosy	75, 450, 654
- lichen scrofulosorum associated with	529
- in lupus vulgaris	448
- originating in papules	528
- pain from	476
- rupia	653
- sarcoma starting in	803
- syphilitic endarteritis	338
- scarring in	811
- iodides in diagnosis of	449
- trophic, in paralytic talipes	130
- tuberculous	449, 450
- in xeroderma pigmentosum	804
- yaws	449
- stomach (see Gastric Ulcer)	
- superficial in small flat pustular syphilide	604
- of tertiary syphilis, diagnosis of lupus from	449
- throat (see Sore Throat)	
ULCERATION OF TONGUE	812
- in dyspepsia	814
- dysphagia due to	225
- microscope in diagnosis of	814
- simple, with stomatitis	812
- in syphilis	237, 812, 813
- tuberculous, age incidence of	814
- rare	814
- simulating epithelioma	814
- gumma	814
- in whooping-cough	814
- tonsil in Vincent's angina	670, 672
- phlegmonous sore throat from	670
- sarcomatous	672
- syphilitic, sore throat from	670
- tuberculous	672
- of trachea, hæmoptysis in	318
- from malignant thyroid	792
- tuberculous (Fig. 209)	811
- of bladder, frequency of micturition in	581
- bowel, acute peritonitis from	55
- abdominal pain and tenderness with	90

Ulceration, tuberculous, contd.

- of bowel, albumosuria in	20
- bleeding per anum in	90
- larynx, cyanosis from	185
- nose, epistaxis in	250
- from tuberculous cervical glands	420
- of urethra, causing epididymo-orchitis	517
- from gummata	209
- vagina, discharge from	210
- vocal cords, diagnosis of laryngeal paralysis from	537
- vulva due to epithelioma	769
- due to syphilis	769
Ulcerative colitis (see Colitis, Ulcerative)	
- endocarditis (see Fungating Endocarditis)	
- various, affections of larynx	185, 466
Ulcus serpens	806, 807
Ulna, affection in yaws	449
Ulnar deflection of hand in rheumatoid arthritis	380
- limited significance of in diagnosis	385
- in osteo-arthritis (Fig. 108, p. 379)	385
- nerve, effects of division of (Fig. 176)	661
- insensitiveness of in tabes dorsalis	665
- muscles supplied by	550
- skin distribution of	659
- spinal roots derived from	550
- tenderness over, in brachial neuralgia	491
- paralysis (see Paralysis, Ulnar)	
Umbilical cord infection, blood per anum in	90
- short, dystocia due to	227
- region, bulging of, by enlarged spleen	688
- definition of	722
- duodenal carcinoma felt in	725
- organs normally contained in	722
- urachal tumours in	728
- various tumours felt in	727, 728
- veins, dilatation in cirrhosis of liver	409
Umbilication of growth in liver	279, 368, 412
- papules in lichen planus	530
- pustules in syphilis	604
- in small-pox eruptions	655, 829
UMBILICUS, PAIN ROUND	524
- affected by scabies	832
- tuberculous peritonitis	716
- bloody sweat of	715
- eczema intertrigo at	524, 716
- flattened out from ascites	472
- secondary growths at	351, 524, 716, 718
- hæmorrhage from, in congenital obliteration of bile-ducts	365
- hernia of (see Hernia, Umbilical)	
- inflammation of, in new-born	715
- from subphrenic abscess	716
- intertrigo of	716
- lymphatic drainage of	738
- pain at onset of intestinal colic at	473
- protrusion of, by ascites	50
- reddening of, in tuberculous peritonitis	50, 57, 472
- sebaceous cyst of	524
- diagnosis from small irreducible hernia	524
- stretching of by ascites	50

Uncinate gyrus, centre for smell	669
- lesion of, anosmia from	669
- olfactory aura in tumour of	80
- tumour of, loss of taste due to	774
Unconsciousness (see Coma)	
Unequal pulses (see Pulses, Unequal)	
- pupils (see Pupils, Abnormalities of)	
Urachal cysts	730, 767
- pelvic swelling due to	757
- simulated by distended bladder	730
- ovarian cyst	730
- tuberculous peritonitis	730
Urachus, infiltration by new growth	57, 718
- normal condition of	730
- situation of	722
- tumour of, in umbilical region	728
- tumours of	728
Uræmia , absence of albuminuria in	350
- acetoneuria in	4
- albuminuria in	329, 350, 464, 647
- albuminuric retinitis in	350
- amaurosis in	836, 838
- amblyopia in	834
- appetite lost in	354
- Babinski's sign in	82
- bromidrosis with	714
- casts in urine with	329, 464
- characteristic odour of breath in	350
- Cheyne-Stokes respiration in	124
- in chronic nephritis	4
- coma in	82, 136, 137, 463
- contracted pupils in	191
- convulsions in	14, 45, 48, 464, 647
- delirium in	191
- diagnosis of indigestion from	329
- drowsiness in	329
- dyspnoea in	329
- epileptiform convulsions in	160, 169, 172, 64
- frontal headache in	326, 328, 329
- hæmaturia in	329
- severe hæmorrhage simulating	14
- high arterial tension in	35
- hyperpyrexia in	34
- grave significance of	62
- hypothermia in	34
- increase of urea in cerebro-spinal fluid in	33
- latent	4
- opisthotonos in	463, 46
- pyelonephritis	82
- reaction of pupils in	83
- retinal changes in	329, 83
- shortness of breath in	10
- simulating a rigor	64
- symptoms of	4
- tremor in	79
- trismus simulated by	80
- uridrosis in	71
- visual defects in	32
- vomiting in	329, 350, 34
Uræmic asthma, mistaken for spasmodic asthma	58
Urate fallacy in albumin test - of sodium (see Sodium Urate)	38
- in gout	81
Urates , amorphous	81
- cleared by warming	65
- microscopical appearances of	81
- normally white	81
- simulated by mucus	81
- phosphates	623, 81
- pus	81
- tests for	81
- thorn-apple and hedgehog crystals of	81

<i>Urates, contd.</i>		<i>Urethra, contd.</i>		<i>Urethritis, bacteriuria in</i>	83
- thorn-apple in cirrhosis	410	- carcinoma of (see Carcinoma, Urethral)		- causes for	206
- - - sacralgia from excess of	510	- caruncle of, dyspareunia		- chordee in	516, 675
URATES, DEPOSIT OF	815	- from	221	- cystitis from	627, 631
- - after biliary colic	500	- - general account of	770	- diagnosis from cystitis	631
- - diarrhoea	815	- - confusion of	308	- dyspareunia from	221
- - in distinguishing varieties of heart failure	815	- discharges from (see Discharge, Urethral)		- epididymo-orchitis from	517, 765
- - fever	815	- the use of the endoscope in	208	- fistula of urethra in	677
- - with heart failure	815	- epithelioma of (see Carcinoma)		- frequency of micturition in	631
- - in hot weather	815	- evidence of bleeding from	305	- gonorrhoea the commonest cause of	510
- - indicative of concentrated urine	815	- examination of, in obscure pyrexia	620	- hamaturia in	304, 313
- - - lobar pneumonia	815	- fistulae of (see Fistulae, Urethral)		- herpetic, irritation during micturition in	209
- - - pink colour of	623, 815	- foreign bodies in	210	- history of infection in	675
- - - rheumatic fever	815	- gonococci in female	211, 769	- due to impacted calculus	766
- - after much sweating	815	- gumma in	209	- importance of uric acid crystals in	817
- - uroerythrin in	815	- hard chancre of	209	- inflammation of spermatic cord in	523
- - after vomiting	815	- herpes of	209	- leucocytosis in	400
Urea in acute Bright's disease	12	- impaction of vesical growth in	441	- occasionally due to septic infection	511
- cerebrospinal fluid	339	- injections into, epididymo-orchitis from	517, 518	- pain in the penis in	515
- diminution in urine in acute yellow atrophy of liver	370	- injury of, bleeding from external meatus in	511	- - - during micturition in	510, 675
- nitrate fallacy in albumin test	6	- - extravasation of urine in	511	- priapism from	585, 586
Ureter, calculus in (see Calculus, Ureteric)		- - faulty passage of instruments	511	- prostatic abscess due to	207, 511, 627, 631
- dilatation of, cystoscopic appearances in	625	- - fracture of pelvis	511	- after prostatectomy	767
- diseases of, referred pain in area of 10th dorsal nerve in	509	- - great care needed in instrumentation in	511	- prostatitis from	511, 627, 631
- fistula of, causing pneumaturia	576	- - hamaturia in	304	- purulent urethral discharge in	511
- inflammatory affections of, cystoscopic appearances in	624	- - from kick or blow	511	- pyrexia with	207
- kinking of, in movable kidney	500	- - pain in the penis during micturition in	510	- pyuria due to	630
- - pain due to, simulating biliary colic	500	- - perineum in	516	- retention of urine in	207
- obstruction of	11	- - instrumentation of, epididymo-orchitis after	517, 518	- smarting and tingling in terminal urethra at onset of suppuration of glandular follicle in	510, 677
- - in bladder tumours	311	- irrigation of, in diagnosis between anterior and posterior urethritis	631	- testicular abscess due to	679
- - by calculus (see Calculus, Ureteric)		- - - of posterior urethritis	628, 631	- due to ulceration near a stricture	766
- - complete, atrophy of kidney due to	627	- narrowing of, following soft sores	209	- urethral abscess in	679
- - hydronephrosis in	395	- normal bacteria of	82	- - irrigation in diagnosis of chronic, gonococci often difficult to detect	209
- - incomplete, ureo- or pyonephrosis due to	627	- obstruction of, bilateral hydronephrosis in	395	- - when does infection cease	209
- palpation of lower end per rectum	307, 394, 513, 515	- - by bladder tumour	514	- - pyuria due to	631
- papilloma of vesical orifice in papilloma of kidney	308	- - due to epithelioma	767	- gonorrhoeal (see Gonorrhoea) gouty	818
- tuberculosis of, association with vesical tuberculosis	513	- pain in, with discharge	441	- - priapism from	585, 586
- cystoscopic appearances in (Plate V, Fig. D, p. 308)	515, 625	- palpable tumour of	209	- pyuria due to	623
- - kidney enlarged and tender in	515	- papillomata of	209	- non-gonococcal, epididymitis from	766
- - pain and frequency of micturition in	515	- passage of faeces through, in carcinoma of rectum	633	- - due to instrumentation	766
- - - in penis after micturition in	513	- - gas through (see Pneumaturia)		- posterior, diagnosis from chronic cystitis	628
- - palpation per rectum	394, 513, 515, 626	- pigmented in Addison's disease	571	- - history of urethral infection in	628
- - - vaginam	394	- polypus of, discharge due to	208	- - urethral irrigation in diagnosis of	628
- - secondary to renal tuberculosis 310, 312, 394, 515, 626		- - shown by the endoscope	208	- septic, acute prostatitis and prostatic abscess from	515
- - T. bacilli in urine in	515	- prolapse of mucous membrane simulating urethral caruncle	770	- - epididymo-orchitis in	517, 518
Ureteritis, bacteriuria in	83	- - vulval swelling due to	768	- due to infection from simple leucorrhoea	518
- descending, due to B. coli and to staphylococcus	515	- prostatic, infection in gonorrhoea	518	- from self-catheterization	680
- - frequency of micturition in	515	- rupture of	308	- pyuria due to	623, 631
- - non-tuberculous, cystoscopic appearance of ureteral orifice in (Plate V, Fig. C, p. 308)	515	- - extravasation of urine in	308	- testicular abscess in	680
- - tuberculous	515	- - inability to micturate in	308	- staphylococcal	631
- pain in penis after micturition in	513, 515	- smarting and tingling at end of, in onset of acute urethritis	510	Urethroscope (see Endoscope)	
Urethra, abscess of (see Abscess, Urethral)		- soft sores in	209	Urethrotomy, anuria after	49
- calculus in (see Calculus, Urethral)		- stricture of (see Stricture of Urethra)		Uric acid and calcium oxalate, relationships between	471, 817
		- suppuration round, perineal sore from	677	- - cayenne pepper deposits of	816
		- tuberculosis of	210	- the clinker of metabolism	817
		- ulceration of, acute epididymo-orchitis in	517, 518	- diminution in urine in acute yellow atrophy	370
		Urethral crises of locomotor ataxy	562	- effect of biliousness on	817
				- - deficient exercise on	817
				- - excessive eating on	817
				- excretion in birds	817

<i>Uric acid, contd.</i>	<i>Urine, abnormal colour of, contd.</i>	<i>Urine, changes, contd.</i>
-- exogenous and endogenous sources of .. 817	-- orange-yellow from urobilin .. 818	-- myxedema .. 43
-- in fevers .. 817	-- pink , on addition of alkali after drugs .. 819	-- phosphorus poisoning .. 373
-- gravel from .. 816	-- from chrysophanic acid .. 819, 820	-- pyelitis .. 500, 625, 628
-- in heart disease .. 817	-- eosin .. 819, 820	-- pyuria .. 624
-- leukemia .. 817	-- hæmatoporphyrin .. 819	-- renal colic .. 500
-- by no means indicative of gout .. 816	-- hæmaturia .. 819	-- tuberculosis .. 626
-- in pernicious anæmia .. 817	-- hæmoglobinuria .. 819	-- tumour .. 391
-- physiology of precipitation 816	-- and red, from rhubarb .. 820	-- in the stream .. 438
-- reduction of Fehling's solution by .. 290, 818	-- rosaniline .. 819, 820	-- due to vesical calculus .. 512
-- in urine .. 290	-- santonin .. 820	-- crystals in, in vesical calculus 629
-- care required in interpretation of .. 817	-- uroerythrin .. 818	-- cystine in (see Cystinuria)
-- crystals (<i>Fig.</i> 212) .. 816	-- port-wine-coloured from hæmatoporphyrin .. 819	-- deposit in, in bacilluria .. 615
-- brown colour of, due to urochrome .. 816	-- red , from chrysophanic acid .. 819, 820	-- of pus in, in cystitis .. 628
-- glycosuria with .. 817	-- eosin .. 819	-- diacetic acid in .. 4, 292
-- importance in frequent micturition .. 817	-- hæmatoporphyrin .. 819, 820	-- in cyclical vomiting of infants .. 426
-- urethritis .. 817	-- hæmaturia .. 819	-- diminution of chlorides in phosphorus poisoning .. 373
-- mucus with .. 816	-- hæmoglobinuria .. 819	-- in pneumonia .. 372
-- oxalate of lime with .. 816	-- rosaniline .. 819	-- total solids in, in nephritis .. 626
-- in relation to renal calculus .. 817, 818	-- smoky tint from carboloria .. 822	-- in pyelitis .. 625
URIC ACID DEPOSIT IN URINE .. 816	-- yellow , from chrysophanic acid .. 819	-- urea and uric acid in acute yellow atrophy .. 370
Uridrosis in cholera .. 715	-- and orange-coloured, pigments producing 818	-- dribbling of, after cessation of stream in urethral stricture .. 511
-- in uræmia .. 715	-- rhubarb .. 819	-- dumb-bell crystals in (see Oxaluria) (<i>Fig.</i> 130) .. 470
Urinary fistulæ (see <i>Fistulæ, Urinary</i>)	-- santonin .. 819, 820	-- envelope crystals in (see Oxaluria) (<i>Fig.</i> 130) .. 470
-- meatus, small, enuresis with 248	-- senna .. 819	-- examination in Bright's disease .. 12 et seq.
URINE, ABNORMAL COLOUR OF .. 818	-- absence of bile pigment in tropical abscess of liver 369	-- epistaxis .. 251
-- black , from alkaptonuria .. 820, 822	-- chlorides in pneumonia 186, 321	-- oxaluria .. 470
-- carboloria .. 820, 822	-- abundant and pale after angina pectoris .. 481	-- shortness of breath .. 101
-- after certain drugs .. 820	-- acetone in (see Acetonuria)	-- excessive (see Polyuria)
-- from choluria .. 819	-- agglomeration of oxalate crystals indicative of oxalate calculus .. 471	-- extravasation of, in injuries of the urethra .. 511
-- gallic acid .. 820	-- albumin in (see Albuminuria)	-- pain in perineum in .. 516
-- hæmatoporphyrin .. 819, 820, 821	-- albumose in (see Albumosuria)	-- in ruptured urethra .. 308
-- hæmaturia .. 820	-- ammoniacal, source of error in Fehling's test .. 290	-- scrotal fistula due to .. 679
-- hæmoglobinuria .. 314, 820, 821	-- amphoteric and neutral reactions of .. 572	-- faces in (see Faces passed per Urethram)
-- indicanuria .. 820, 821	-- analysis in chronic plumbism 173	-- fat in (see Chyluria)
-- jaundice .. 820, 821	-- B. coli in (see Bacteriuria)	-- filaments in, from chronic gonorrhœa .. 207
-- melanuria .. 820, 821	-- bacteria in (see Bacteriuria)	-- fluorescence in, due to eosin 820
-- methæmoglobin .. 821	-- Bence Jones bodies in (see Albumosuria)	-- fragments of new growth in 306
-- resorcin .. 820	-- bile-pigmented (see Jaundice; and Urine, Abnormal Colour of)	-- in papilloma of bladder 630
-- salicylates .. 820, 823	-- bilharzia ova in (<i>Fig.</i> 13, p. 93) .. 514, 630	-- gas passed with (see Pneumaturia)
-- after salol .. 820	-- black (see Urine, Abnormal Colour of)	-- glycuronic acid in .. 290
-- uva ursi .. 820	-- bladder epithelium in, in bacilluria .. 615	-- gravel in, in renal colic .. 500
blue , from indigo blue 823	-- blood-stained (see Hæmaturia)	-- hæmoglobin in (see Hæmoglobinuria)
-- indoxyl glycuronic acid .. 823	-- calcium oxalate crystals in (see Oxaluria)	-- heat loss due to evacuation of .. 619
-- methylene blue .. 823	-- Cammidge's pancreatic reaction in (see Cammidge)	-- hippuric acid in .. 290
brown , from alkaptonuria .. 820, 822	-- casts in (see Albuminuria; and Casts)	-- hyperacidity of, frequency of micturition from .. 438
-- carboloria .. 820, 822	-- causes of turbidity .. 82	-- incontinence of (see Incontinence of Urine; and Micturition, Abnormalities of)
-- certain drugs .. 820	-- cayenne-pepper deposit in 816	-- increase in quantity in pyelitis .. 625
-- gallic acid .. 820	-- cells in, similarity of those derived from different sources .. 624	-- of solids in, in diabetes 584
-- hæmatoporphyrin .. 820	-- changes in acute cystitis .. 512	-- indican in (see Indicanuria) 290
-- hæmaturia .. 820	-- associated with biliary colic 500	-- iodides in .. 87
-- hæmoglobinuria .. 314, 820	-- in carcinoma of liver .. 413	-- lactose in .. 290
-- indican .. 820, 821	-- cirrhosis of liver .. 410	-- lavulose in .. 291
-- jaundice .. 820, 821	-- cystic disease of kidneys .. 15	-- lead in .. 38, 87, 136
-- melanuria .. 820, 821	-- cystinuria .. 187	-- leucin and tyrosin in acute yellow atrophy of liver .. 370
-- resorcin .. 820	-- cystitis .. 628	-- lithates in (see Urates)
-- salicylates .. 820	-- gastritis .. 297	-- microscopic characters of pus cells in .. 623
-- salol .. 820	-- hydatid cyst of kidney .. 396	-- milky (see Chyluria)
-- uva ursi .. 820	-- impacted uterual calculus 514	-- physiological causes of .. 573
green .. 187		-- mucus in (see Mucus in Urine)
-- from bile .. 819, 823		-- normal amount passed 437, 581
-- carboloria .. 822		-- in early tuberculosis of kidney .. 309
-- methylene blue .. 823		
-- in hæmaturia .. 305, 820		
-- hæmoglobinuria 304, 314, 819		
-- in jaundice .. 360		
-- method of precipitation 820		
-- orange-red from uroerythrin .. 818		

Urine, contd.

- nucleo-proteid in (see Nucleo-proteid in Urine) ..
- offensive in bacilluria .. 615
- opalescence in pyelitis .. 625
- - and turbidity of in renal tuberculosis .. 626
- overflow incontinence of, in retroverted gravid uterus .. 759
- oxalate deposit in .. 470
- oxybutyric acid in .. 4, 292
- pale in renal tuberculosis .. 626
- pancreatic reaction in, in affection of the pancreas .. 486
- pentose in .. 290
- phosphates in (see Phosphaturia) ..
- powdered wig deposit of oxalates in .. 470
- pus in (see Pyuria) ..
- reaction of, in bacterial infections .. 83
- - hematuria .. 306
- - with uric acid deposit .. 816
- per rectum, from ulceration of new growth .. 632
- reducing bodies, other than glucose, in .. 290
- renal cells in, in bacilluria .. 615
- retention of (and see Micturition) 45, 207, 440, 631, 699
- - in acute prostatitis .. 207, 631
- - with bladder tumour .. 311
- - causes of .. 440
- - chronic cystitis from .. 627, 628
- - differentiation from anuria .. 45, 440
- - dribbling per urethram in .. 440
- - in general peritonitis .. 614
- - hysterical .. 441
- - in impacted urethral calculus .. 313
- - nervous causes of .. 440, 441
- - after operations .. 49
- - pain and stranguy in .. 410
- - from paralysis of detrusor .. 413
- - primary lateral sclerosis .. 567
- - prostatic abscess .. 207, 621
- - enlargement .. 440
- - prostatitis .. 631
- - retroverted gravid uterus .. 759
- - typhus fever .. 699
- - urethral calculus .. 313, 441
- - stricture .. 440
- - urethritis .. 207
- - vesical irritability .. 443
- scanty and high-coloured in active congestion of liver .. 371
- specific gravity in acute nephritis .. 12, 13
- - chronic nephritis .. 15
- - diabetes insipidus .. 584
- - mellitus .. 581
- - high in cirrhosis .. 410
- - lardaceous disease .. 10
- low in amyloid disease .. 197
- - polycystic disease of kidneys .. 396
- - in pyelitis .. 625
- - renal tuberculosis .. 626
- - in mitral regurgitation .. 240
- spermatozoa in, from bladder irritation in oxaluria .. 471
- spontaneous coagulation in chyluria .. 126
- stream feeble in urethral stricture .. 511
- sudden stoppage in flow .. 439
- - from impaction of calculus in urethra .. 511
- - with vesical calculus .. 312
- sugar in (see Glycosuria) ..
- sulphuretted hydrogen in .. 187
- suppression of (see Anuria)

Urine, contd.

- sweetbriar odour of .. 187
- tests applied to (see Tests)
- tube-casts in (see Casts)
- tubercle bacilli in (and see Bacillus Tuberculosis) .. 310
- - in renal tuberculosis .. 394, 515, 626
- - vesical tuberculosis .. 312, 513, 628
- turbid from phosphates .. 208
- - causes of .. 82
- twisted stream of, little significance of .. 438
- urates in (see Urates)
- uric acid in (see Uric acid)
- per vaginam .. 313
- vesical cellular elements without casts in, in cystitis .. 628
- white deposits in, oxalates .. 470
- worm-like clots in, in kidney tumours .. 307
- Urobilin, presence in normal faeces .. 818
- - spectroscopic band of (*Fig.* 23) 95, 361, 818
- traces in normal urine .. 818
- Urobilinuria, causes of .. 818
- - in cholangitis .. 116
- - cirrhosis of the liver .. 818
- - colour in .. 818
- - from excessive bacterial action in the intestines .. 818
- - in intestinal affections .. 818
- - liver diseases .. 818
- - pancreatitis .. 116
- - pernicious anæmia 303, 361, 818
- Urochrome, causing brown coloration of uric acid crystals .. 816
- normal urine colour due to .. 818
- Uroerythrin in cirrhosis of the liver .. 819
- colour of urate deposit due to .. 815, 818
- effect of alkali on .. 818
- in heart disease .. 819
- high colour of urine due to increased in hepatic disease .. 819
- simulating hematuria .. 818
- Urotropine, hæmoglobinuria from .. 314
- Urticaria from absorption of fluid from hydatid cyst .. 415
- affecting fingers .. 266
- age incidence of .. 531
- due to antitoxic sera (see Serum Rashes)
- bullæ in .. 850
- and bullous dermatoses .. 114
- burning sensation in .. 850
- desquamation in .. 656
- diagnosis from angio-neurotic oedema .. 746
- - erythema simplex .. 252
- - prurigo .. 531
- distribution of .. 531
- due to eating fish or pork .. 746
- involvement of lips in .. 403
- itching in .. 531, 588, 850
- simulating erysipelas .. 850
- papular erythema .. 531
- prurigo ferox .. 531
- scarlet fever .. 850
- tache cérébrale in .. 771
- wheals in .. 850
- bullosa simulating dermatitis herpetiformis .. 850
- - pemphigus .. 850
- factitious, hæmoglobinuria in relation of epidermolysis bullosa to .. 113, 114
- hæmorrhagic, hæmosiderin in macules following .. 424

Urticaria, contd.

- papulosa (see Strophulus)
- pigmentosa, distinction from xanthoma multiplex .. 805
- - itching in .. 805
- - sea nigricans .. 575
- - wheals in .. 805
- Uterine sound (see Sound, Uterine)
- Uterus, abnormalities causing amenorrhœa .. 23
- absence of, sterility due to .. 705, 706
- anteversion of due to pendulous belly .. 227
- backward displacement, bearing-down pain from .. 473
- bimanual examination for fibromyoma of .. 429
- cachexia from lesions of .. 114
- carcinoma of (see Carcinoma of Uterus)
- changes in, in pregnancy .. 437
- chorion-epithelioma of (see Chorion-epithelioma)
- - coehlate of Pozzi .. 219
- - sterility due to .. 706
- congenital closure of cervix .. 705
- congestion of, absence of enlargement in .. 429
- - backache in .. 429
- - causes of .. 428
- - from certain occupations .. 430
- - from constipation .. 430
- - dysmenorrhœa from .. 219
- - general venous back-pressure causing .. 430
- - leucorrhœa in .. 429
- - menorrhagia from .. 428, 430
- - metrorrhagia from .. 435
- - occurrence usually in married women .. 429
- - in retroflexion of uterus .. 429
- - sacralgia in .. 509
- - salpingo-oöphoritis .. 429
- - subinvolution .. 429
- - tight lacing .. 430
- contraction of, spasmodic pelvic pain from .. 509
- - diagnosis from pains of tubal gestation .. 509
- - weak, dystocia from .. 227
- defective muscle development of .. 219
- dilated in subinvolution .. 429
- dilatation and curettage of, in diagnosing cause of metrorrhœa .. 436
- discharge from, with salpingo-oöphoritis .. 760
- disease of, anemia in .. 36
- - causing amenorrhœa .. 24
- - pain in the back due to (*Fig.* 204, p. 788) 476, 788
- - lower extremity from .. 491
- - referred pain in area of 10th dorsal nerve in .. 509
- displaced, causing albuminuria .. 10
- - forwards by pelvic hæmatocele .. 760
- - nephritis from .. 8
- - sacralgia in .. 509
- enlarged .. 429
- - asymmetrically in fibromyoma .. 429
- - amenorrhœa .. 22, 23
- - from endometritis .. 220
- - pregnancy .. 350
- - recognition in rectal examination .. 638
- fibromyoma of (see Fibromyoma of Uterus)
- fixation in central position by pelvic abscess .. 760

Uterus, contd.

- fixation in lateral position, by pelvic cellulitis ..	760
- by salpingo-oöphoritis ..	220
- growths, histology in diagnosis of ..	433, 434, 435
- metrorrhagia from ..	433
- simulating prolapse ..	587
- hæmorrhage from, abnormal (see Menorrhagia; Metrorrhagia; Metrostaxis) ..	435, 436
- post-climacteric (see Metrostaxis) ..	760
- in tubal abortion ..	760
- rupture ..	760
- hour-glass contraction, dystocia due to ..	227
- hyperinvolution of, account of ..	706
- amenorrhœa with 23, 24, 706 ..	705, 706
- sterility due to ..	705, 706
- infantile, sterility due to ..	705, 706
- infection of in puerperal fever ..	619
- inflammatory affections of, pain and tenderness in back from ..	789
- inversion of, acute, great shock in ..	587
- hæmorrhage in ..	587
- chronic, simulating poly-poid fibromyoma ..	587
- simulating prolapse ..	587
- vulval swelling due to ..	768
- misplacements of, menorrhagia in ..	428
- muscle deficient, dysmenorrhœa from ..	219
- relaxation in subinvolution ..	429
- normal secretion from ..	210
- pigmentation in lesions of ..	114
- polyoïf, sterility due to ..	706
- pregnant (see Pregnancy) ..	
- prolapse of (and see Prolapse of Uterus) ..	
- rectocele simulating ..	587
- puerperal infection of, septicæmia from ..	698
- rapid enlargement of, from sarcoma ..	434
- retroflexion of ..	429, 508
- dysmenorrhœa from ..	219
- menorrhagia from ..	428
- pelvic pain from ..	508
- uterine congestion in ..	429
- retroversion of ..	429, 473, 508
- diagnosis of sciatica from pain due to ..	487
- dysmenorrhœa from ..	219
- dyspareunia from ..	221
- menorrhagia from ..	428
- pelvic pain from ..	508
- recognition of ..	220
- per rectum ..	638
- not sufficient cause of dyschezia ..	150
- tender prolapsed ovaries with ..	221
- uterine congestion in ..	429
- vomiting from ..	844
- retroverted gravid, amenorrhœa with ..	759
- bearing down pain in ..	473
- bladder distention in ..	52, 730, 758
- catheter in diagnosis of ..	759
- chronic cystitis in ..	628
- difficult micturition from ..	439
- frequent micturition in ..	438
- incontinence of urine in ..	759
- physical signs of ..	758, 759
- retention of urine with ..	45
- urine dribbling in ..	759
- vaginal examination in ..	758

Uterus, contd.

- rupture of, in obstructed labour ..	229
- sarcoma of (see Sarcoma of Uterus) ..	
- small adult type, sterility due to ..	706
- spasm of, dystocia due to ..	227
- subinvolution of, metrostaxis from ..	436
- tuberculosis of, histology in diagnosis of ..	434
- metrorrhagia from ..	433, 435
- tumours of, breaking-down, anæmia in ..	39
- diagnosis from renal tumour ..	392
- fluid thrill from cystic degeneration of fibroid ..	429
- hardness in fibromyoma ..	429
- histological examination of ..	434
- irregular outline in fibromyoma ..	429
- jaundice in ..	362, 367
- metrostaxis from ..	436
- microscopic examination of, curetting in diagnosis of malignancy of ..	759
- sacralgia in impaction of ..	509
- soft or cystic in some degenerating fibroids ..	429
- swelling in hypogastrium from ..	730
- (and see Carcinoma, Fibromyoma) ..	
- unduly small ..	219
- Uva ursi, dark urine from ..	820
- polyuria after ..	582
- Uvula, carcinoma of ..	670, 673
- gumma of ..	670, 673
- pendulous, dry cough with ..	175
- suggested by cough on getting in to bed ..	176
- sore throat from affections of ..	670
- tuberculosis of ..	673
- VACCINIA, swelling on face due to ..	746
- on face, diagnosis from anthrax pustule ..	746
- papules, vesicles and pustules in ..	834
- Vacciniform ecthyma of infants ..	446
- Vagabond's disease, chloasma in ..	574
- Vagina, absent, imperforate, or stenosed ..	22, 23, 705
- affection by bullous eruptions ..	88
- carcinoma of (see Carcinoma of Vagina) ..	
- closure of, sterility due to ..	706
- diphtheria of ..	211
- distention of, in amenorrhœa ..	22, 23
- by menstrual fluid in hæmatocolpos ..	761
- epithelioma of (see Carcinoma of Vagina) ..	
- fibromyoma of ..	587, 768
- growth of, dystocia due to ..	227
- felt per rectum ..	638
- hæmorrhage from (see Hæmorrhage, Vaginal) ..	
- malformed, dyspareunia from ..	221
- micturition through fistula into ..	442
- pemphigus, etc., of ..	111
- rigidity of, dystocia due to ..	227
- shortness of, in pseudo-hermaphroditism ..	706
- stenosis by kraurosis ..	221, 770

Vagina, contd.

- swelling at orifice of (see Prolapse of Uterus) ..	
- various tumours presenting through the ..	587
- Vaginal casts described ..	211
- discharge (see Discharge, Vaginal) ..	
- examination in appendicitis ..	729
- ascites ..	717
- in asymmetrical œdema of the leg ..	456
- bearing-down pain ..	474
- bladder tumours ..	512
- chyluria ..	126
- dysmenorrhœa ..	220
- dyspareunia ..	221
- ectopic gestation ..	500, 760
- loss of weight ..	847
- obscure pyrexia ..	620
- obturator hernia ..	740
- ovarian cyst ..	438
- tumour ..	367, 691
- palpability of large cystic renal tumours by ..	393
- pelvic abscess ..	760
- cellulitis ..	760
- growth ..	487, 761
- hæmatocele ..	760
- inflammation ..	487
- in pregnancy, method of ..	223
- pus in stools from ..	600
- pyosalpinx ..	652, 638, 737
- retroverted gravid uterus ..	438, 758
- salpingitis ..	500
- sciatica ..	487
- for separability of uterus from pelvic swelling ..	758
- some causes of frequent micturition ..	438
- tuberculous ureter ..	394, 629
- twisted ovarian pedicle ..	500
- ureteral calculus impacted near bladder ..	627
- uterine fibroid ..	428
- growths, metrostaxis from ..	436
- simulating uterine prolapse ..	587
- hæmorrhage in new-born infants ..	435, 436
- secretions, normal and abnormal ..	210
- reaction of ..	210
- tumour simulating prolapse of uterus ..	587
- Vaginismus associated with dyspareunia ..	221
- spasmodic ..	222
- sterility due to ..	706
- Vaginitis, acute, pain in perineum in ..	516
- nature of discharge due to ..	210
- senile adhesive, metrostaxis from ..	436
- Vagus nerve, branches of ..	174
- inflammation after diphtheria ..	772, 773
- after influenza ..	772, 773
- irritation by caseous gland ..	772, 773
- aneurysm ..	482, 772
- general account of ..	773
- hicough in ..	342, 343
- by mediastinal fibrosis ..	772
- new growth ..	772
- tachycardia from ..	772
- neuritis of ..	77
- pressure of thyroid gland tumour on ..	792
- supplying stomach ..	842
- various ways in which related to cough ..	174, 175
- nuclei degeneration, paralysis of vocal cords due to ..	538

- Valerian, foul taste from .. 774
 Valetudinarians, hepatoptosis in 407
 Valvular disease (see under Heart)
 Varicella (see Chicken-pox)
Varicocele associated with renal tumour .. 391, 395
 - diagnosis of .. 523
 - from omental hernia .. 767
 - omental inguinal hernia .. 741
 - hernia with .. 742
 - impulse on coughing in .. 523
 - pain in the testicle in .. 523
 - reducibility of .. 741
 - testicular atrophy from .. 78, 79
 - of vulva .. 768
 - in association with pregnancy .. 770
 - rupture of veins in .. 770
Varicose eczema, hæmosiderin in macules following .. 424
 - veins (see Veins, Varicose)
 Variola (see Small-pox)
 Varnish-workers, bullæ in .. 110
Vas deferens, infection in gonorrhœa .. 518
 - thickening of in acute epididymo-orchitis .. 518
 - tuberculous, with tuberculous bladder .. 441
 - in tuberculous testis 519, 680, 765, 767
 Vasodilatation, good effects of in abdominal angina 351
Vasomotor affections, ptylorhœa in .. 592
 - changes in arm due to cervical rib .. 128, 493
 - syringomyelia .. 128
 - lesions in infantile paralysis 131, 555
 - neuroses, albuminuria in .. 16
 - causing swelling of hands or feet .. 459
 - phenomena in extremities in neuromyositis .. 504
 - system, œdema of legs in affections of .. 459
 Vater, ampulla of (see Ampulla of Vater)
Veins on cheeks, dilated, in cirrhosis of liver .. 300
 - of chest, progressive distention in chronic mediastinitis 484
 - diastolic collapse of, with adherent pericardium .. 242
 - dilated abdominal, in portal obstruction .. 300
 - frontal and orbital, in cavernous sinus thrombosis 253
 - mammary, in pregnancy / and lactation .. 743
 - precordial, in adherent pericardium .. 242
 - thoracic, from mediastinal growth .. 296
 - umbilical, in cirrhosis .. 59
 - innominate (see Innominate Veins)
 - method of determining direction of flow in 824, 825
 - of neck, pulsation in cases of pulsation of liver .. 407
 - in tricuspid regurgitation 106
 - popliteal, thrombosis in .. 456
 - retinal, dilated and tortuous 462
 - rupture of, purpura from 596, 597
 - thrombosed, leucocytosis in 400
 - varicose, asymmetrical œdema in .. 456
VEINS, VARICOSE, ABDOMINAL (Plate XVI, p. 824)
 - in ascites .. 51
Veins, varicose, abdominal, contd.
 - inferior vena cava
 - thrombosis .. 61
 - asymmetrical œdema in 455
 - in new growth of lung 322
 - superior vena cava
 - obstruction .. 458
 - on legs .. 733
 - nasal mucosa, epistaxis from .. 251
 - nodular swellings with .. 450
 - œsophageal, in cirrhosis 296
 - orbital, intermittent exophthalmos from .. 255
 - pain in the leg from .. 486
 - pelvic, dystocia due to .. 227
 - due to popliteal aneurysm 762
 - relation to saphena varix 733
 - rupture of vulval .. 768
 - simulated by erythema nodosum .. 450
VEINS, VARICOSE, THORACIC (Fig. 73)
 - from aneurysm .. 236
 - due to mediastinal new growth 121, 343, 773
 - thrombosis in .. 456
 - ulceration of the leg from 810
 Vena cava obstruction, inferior (see Inferior Vena Cava)
 - superior (see Superior Vena Cava)
 Venesection, blood changes after 37
 - coma as indication for .. 137
 - leucocytosis after .. 400
 Venous congestion of liver (see Liver, Congestion of, Venous)
 - thrombosis (see Thrombosis)
 Ventilation, headache from bad 328
 - sore throat from bad .. 673
 Ventral herniation of laparotomy scar, visible peristalsis in .. 570
 Ventricle (see Heart)
 Veratria, influence on muscle tone .. 161, 163
 Vermiform appendix, normal situation of (and see Appendicitis, and Abscess, Appendicular) .. 722
 Vermin killers, strychnine poisoning from .. 464
 Vermis, tumour in, effects of gait on .. 643
 Veronal, coma due to .. 137
 - poisoning, Cheyne-Stokes respiration in .. 125
 - purpura from .. 596
 Verruca necrogenica .. 266
 - plana, character of papule of .. 528
 - distinction from lichen planus .. 530
 - vulgaris (see Wart)
 Vertebrae (see Spine)
 - carcinoma of (see Carcinoma of Vertebrae)
VERTIGO .. 827
 - associated with flushing .. 268
 - peripheral facial paralysis 536
 - in cerebellar lesions .. 69
 - cerebral tumour and abscess 336, 341
 - epidemic jaundice .. 372
 - from intracranial gumma .. 336
 - lesions of semi-circular canal 827
 - Menière's disease .. 847
 - in meningitis .. 642
 - non-obstructive anuria .. 46
 - nystagmus with .. 453, 827
 - objective and subjective .. 827
 - in otitis media .. 470
 - preceding apoplexy .. 173
 - hæmatemesis .. 316
Vertigo, contd.
 - due to syphilitic ear disease 828
 - uræmic .. 48
 - from wax in ears .. 467
Vesical calculus (see Calculus, Vesical)
 - crises of locomotor ataxy .. 562
 - disease, cystoscopic appearances in .. 624
 - simulation by appendicitis 632
 - epithelioma (see Carcinoma of Bladder)
 - irritability .. 313
 - sphincter lesions, incontinence from .. 440
 - tuberculous (see Bladder, Tuberculosis of; and Cystitis, Tuberculous)
 - tumours .. 441
 - ulceration, pyuria due to 623, 629
 Vesicants, bullæ from application of .. 110, 111
 - causing chloasma .. 574
 - used by malingereis 111, 112
VESICLES .. 829
 - in acute rheumatism .. 375
 - anthrax .. 746
 - cerebrospinal meningitis .. 643
 - cheilopompholyx .. 654
 - dermatitis herpetiformis .. 781
 - development into pustule 601, 602
 - differentiation from papules 528
 - bullæ from .. 110
 - in eczema .. 714
 - erythema multiforme .. 531
 - herpes frontalis .. 807
 - progenerialis .. 675
 - zoster .. 479
 - herpetic urethritis .. 209
 - with hydrocystoma 714, 829
 - impetigo .. 602, 608
 - from insect bites .. 834
 - in the mouth in stomatitis 815
 - napkin region .. 446
 - perlèche with .. 404
 - ring of, in anthrax .. 603
 - scabies .. 608, 654
 - small-pox .. 605
 - syphilides .. 532
 Vesico-colic fistula .. 146
Vesiculae seminales, gonocœcal infection of .. 207
 - gonorrhœal thickening of .. 628
 - inflammation of, pain in perineum in .. 516
 - pain in the back from diseases of the .. 476
 - not palpable per rectum normally .. 638
 - palpation per rectum 307, 519, 638
 - tuberculous .. 394
 - association with other genito-urinary tuberculosis 307, 312, 513, 519, 626, 629, 638, 767
 - deposits in .. 630
 - nodules felt on rectal examination 519, 638
 - pain in perineum in .. 516
 - with tuberculous bladder 441
 - testis .. 680
Vesicular murmur, absent in pneumothorax .. 480
 - lung compression .. 331
 - affected in a unilaterally enlarged chest .. 192
 - deficient in bronchiectasis 703
 - emphysema .. 186, 246
 - with fibroid lung .. 324
 - fluid in chest .. 193
 - from growth of lung .. 322
 - obstructed bronchus .. 296
 - in pneumothorax 193, 577

Vesicular murmur, contd.

- - deficient on right side in large hydatid cyst of liver	415
Vibices in purpura	595
Vibrio in cholera	301
Vicarious menstruation (see Menstruation)	220
Villi, chorionic	220
Villous carcinoma of bladder (see Carcinoma of bladder)	93
- - of rectum, hemorrhage in	93
Vincent's angina, bacteriological diagnosis of	672
- - distinction from diphtheria and follicular tonsillitis	672
- - enlargement of submaxillary lymphatic glands less common in	419
- - factor of breath in	99, 672
- - fusiform bacilli and spirilla in	670, 672
- - laryngitis from	670
- - pharyngitis from	670
- - prognosis good in	672
- - resistance to treatment	672
- - sore throat from	670
- - tonsillitis from	670, 672
- - ulceration of tonsil in	670, 672
Violinist's cramp	177
Visceroptosis, constipation due to (<i>Fig. 39</i>)	147
- displacement of kidney in	473
- liver in	473
- stomach in	473
- dull dragging abdominal pain in	473
- illustrated	147
- insufficient defæcation due to	148
- profile of abdomen in	473
- x-rays and bismuth meal in diagnosis of	473
Visible peristalsis (see Peristalsis)	
VISION, DEFECTS OF	834
- double (see Diplopia)	
- loss of, in glaucoma	257
- normal characters of	834, 835
- peripheral constriction of field of, causes of	666, 838
- spiral or concentric limitations of in hysteria	837
Visual disturbance transitory in migraine	329
- word centre	683
- - - agraphia in lesions of	685
Visuals, definition of	685
Vitiligo, diagnosis of chloasma from	575
Vitreous, hemorrhage into, erythroptosis due to	840
- - sudden blindness from	839, 840
- - hazy in glaucoma	838
Vocal cords, ataxy of	69
- - inflammation and ulceration of, diagnosis of laryngeal paralysis from	537
- - paralysis (see Paralysis of Vocal Cord)	
- - fremitus decreased or lost in a deformed chest	192
- - in emphysema	192
- - with pneumothorax	193
- - in fibroid lung	193
- - tactile, absent in pneumothorax	480
- - - decreased in bronchial obstruction	296, 322
- - - increased in emphysema	246
- - - fibroid lung	246, 332
- - unequal in phthisis	319

Voice, abnormalities of (see Speech, Abnormalities of)

- - with cough	176
- - in laryngitis	226, 673
- - laryngeal paralysis	538, 539
- - mediastinal growth	483
- - excessive use of, chronic pharyngitis from	673
- - lost, with normal cough, in hysterical aphonia	687
- - monotonous in paralysis agitans	796
- - nasal, after diphtheria	77, 181, 559
- - in myasthenia gravis	687
- - with paralysis of palate	640, 687
- - ready tiring of, from chronic pharyngitis	673
- - - myasthenia gravis	687
- - reduction to whisper in hysterical aphonia	687
- - sounds absent in bronchiectasis	703
- - - lung compression	331
- - deficient, from obstructed bronchus	296
- - - or absent in pneumothorax	577
- - - in fibroid lung	324
- - increased in emphysema	246
- - test, for hearing, whispered	188
Voices, hearing of, as epileptic aura	80
Volatile oils, bulle in workers among	110
Volkman's contracture	132, 165
- - of forearm (<i>Fig. 43</i> , p. 166)	72, 166, 552
Volvulus, great abdominal distention from	152
- intestinal obstruction from	431
- pain in left iliac fossa in	501
- of sigmoid colon	713
- vomiting with	153
Vomit, absence of free HCl in, in new growth of stomach (and see Gastric Contents)	691
- black, in acute yellow atrophy	302
- - phosphorus poisoning	373
- - yellow fever	301, 373
- hepatic pus in, from rupture of liver abscess into stomach	409
- - sarcine in, in new growth of stomach (<i>Fig. 92</i> , p. 267)	691
VOMITING	841
- in abdominal angina	351
- acetoneuria in	4
- in active congestion of liver	371
- acute encephalitis	139, 547
- - general peritonitis	431
- - meningitis	472, 644, 718
- - pancreatitis	139, 563
- - poliomyelitis	292, 616, 724
- - rheumatism	128, 555
- - without diarrhoea, marasmus from	671
- - yellow atrophy of liver	426
- in Addison's disease	302, 370
- - anemic	38
- - from appendicitis	40
- - in arsenical poisoning	135, 729, 736
- - arteriosclerosis	87, 92, 297
- - associated with flushing	328
- - with bacteriuria	268
- in biliary colic	84
- from carcinoma of caecum	135
- - colon	729
- - duodenum	367
- - stomach	725
- - - 299, 351, 485, 691	
- central causes of	843, 844

Vomiting, contd.

- in cerebellar abscess	651
- cerebral abscess	547, 651, 686
- cerebral, account of	341, 847
- - absence of nausea in	847
- - tumour	173, 292, 477, 547, 686, 782
- of cerebral type	328, 585, 686
- of children, tetany in	178
- in chronic intestinal obstruction	350
- - peritonitis	56
- from colic	133, 363, 500, 645
- collapse after severe	346
- due to colon inflammation	727
- with constipation, in hypertrophic stenosis of the pylorus	845
- copious, from carcinoma of pylorus	737
- - in gastrectasis	737
- - pyloric obstruction	353
- cyclical, of infants	426, 843
- with cystic kidneys	48
- definition of	841
- in distoma hepaticum infection	364
- duodenal ulcer	300
- early phthisis	350
- effortless, in cerebral tumour and abscess	341
- in excluding gastric atony	713
- exhaustion of obstructed labour	229
feculent	153
- in appendicitis	846
- gastro-colic fistula	845
- general peritonitis	644
- hysteria	847
- intestinal obstruction	134, 151, 431, 845, 846
- - sex incidence of	692
- of fermenting fluid in pyloric or duodenal obstruction	571
- in gall-stone colic	363
- gastric causes of	843
- in gastric crises of tabes	350, 485
- from gastric fermentation	267
- ulcer	40, 89, 298, 352, 485
- gastritis	297, 352
- - relief of pain by	484
- glaucoma	494, 838
- Henoch's purpura	90, 380, 600
- hypothermia after severe	346
- hysterical, carcinoma of stomach mistaken for	508
- - diagnosis of indigestion from	350
- in influenza	505
- intestinal obstruction	133, 151, 153, 431, 571, 645, 727, 733, 736, 741, 845, 846
- - peritoneal, and general visceral causes of	844
- intracranial gumma or tumour	336
- intractable, in acute yellow atrophy of liver	302
- in intussusception	727, 736
- irritant or corrosive poisoning	674
- lead poisoning	77
- Menière's disease	828
- meningitis	341, 350, 359, 622, 642, 699
- migraine	329, 837, 838, 840, 847
- morning, in alcoholism	238, 243, 368, 797
- - in pregnancy	437
- neuro-muscular mechanism of	842
- non-obstructive anuria	46
- at onset of scarlet fever	843
- in otitis media in children	229

Vomiting, contd.

- pancreatic hemorrhage	292, 646
- paroxysmal in tabetic crises	350
- phosphorus poisoning	373
- pneumonia	622
- portal obstruction	300
- of pregnancy (see Pregnancy)	
- in ptomaine poisoning	196
- with puerperal eclampsia	172
- pyæmia	649
- with pyloric obstruction	134, 353, 713
- recurrent periodical or cyclical of children	426, 843
- extreme thirst from	789
- in renal colic	500
- rickets	171
- severe, in cerebellar abscess or tumour	565
- in infants	426
- loss of fluid from tissues due to	579
- polycythæmia in	579, 580
- in pregnancy	579
- typhus fever	699
- simulated by bronchiectasis	842
- merysimus	842
- with sinus thrombosis	139, 558, 650, 651
- strangulated hernia	741
- suppurative nephritis	646
- in pylephlebitis	649
- tenderness in epigastrium from	779
- from torsion of retained testis	742
- in tropical abscess of liver	369
- ulcerative colitis	727
- undue abdominal aortic pulsation	592
- uræmia	45, 329, 350
- urate deposit after	815
- in variola	301
- wasting with	69
- in whooping-cough	467
- Von Basedow's disease (see Exophthalmic Goitre)	
- Von Graefe's sign	244, 253, 792
- Von Jaksch's disease (see Pseudo-leukæmia)	
- Von Pirquet's reaction	38
- in diagnosis of chronic abscess of bone	752
- latent tuberculosis	847
- lupus vulgaris	812
- marasmus from obscure tuberculosis	427
- negative in anorexia nervosa	850
- not very trustworthy	736
- in pleuritic effusion	121
- for tuberculosis	612, 814
- tuberculous disease of testis	519, 765
- peritonitis	691
- Von Recklinghausen's disease, affection of scalp in	781
- distinction from fibroma molluscum	781
- neuro-fibromata in	781
- nodules in	804
- pigmentation of skin in	781, 804
- scalp tender from	780, 781
- thickening of nerves in	804
- Vulva, angioma of	768
- carcinoma of (see Carcinoma of Vulva)	
- chancre of	768
- circinate syphiloderm of	532
- condyloma of, diagnosis from soft chancre	768
- cracked and fissured from leukoplakia	221
- dermoid cyst of	768

Vulva, contd.

- implantation cyst of	768
- kraurosis of (see Kraurosis Vulvæ)	
- cysts affecting	768
- diabetic eczema starting in	447
- elephantiasis of	770
- endothelioma of	768

Wasting, contd.

- vomiting and constipation in hypertrophic stenosis of the pylorus ..	815
- (and see Weight, Loss of; and Marasmus)	
Watch test for hearing ..	188
Watchmaker's cramp ..	177
Water, insufficient consumption of, as cause of constipation ..	145
Water-brash (see Heartburn)	
Water-drinking, plumbism from	136
Water-hammer pulse in aortic regurgitation 106, 107, 233, 234	
Watering of eyes from error of refraction ..	328
Wax in ear, deafness from ..	467
- - dry cough from ..	174, 175
- - eczema of external auditory meatus from ..	468
- - purulent discharge due to ..	467
- - tinnitus from ..	467
- - vertigo from ..	467, 828
Waxy renal tube-casts ..	7
- - spleen in lardaceous disease	696
Weakness of back muscles, scoliosis from ..	180
- in Bright's disease ..	90
- carcinoma of colon ..	91
- of the limbs in chronic alcoholism ..	797
- muscular, in general paralysis ..	172
- - paralysis agitans ..	796
- in neurasthenia ..	506
- at onset of phthisis ..	620
- progressive, from growth of lung ..	322
- - in pernicious anemia ..	30
- - tremor from ..	795
Weather, effects on chronic rheumatic pains ..	507
- - quantity of urine ..	581
- - sore throat ..	672, 673
- pain in chest in phthisis varying with ..	480
Weber's test for hearing ..	189
Weeping (see Epiphora)	
- in eczema ..	714, 831
Weichselbaum, meningococci of (see Meningococci)	
Weight carrying, scoliosis from ..	180, 181
- in hypochondrium, feeling of, in catarrhal jaundice ..	365
- increasing, in myxœdema ..	585
- lifting, subconjunctival hæmorrhage from ..	256
WEIGHT, LOSS OF ..	847
- - from carcinoma 147, 150, 295, 299, 322, 351, 718, 724, 725, 736	
- - due to change of surroundings ..	848
- - Graves' disease ..	244, 797
- - Hirschsprung's disease ..	718
- - in infants (see Marasmus)	
- - methods of examining in cases of ..	847
- - in pernicious anemia ..	30
- - rheumatoid arthritis ..	39
- - sarcoma ..	756
- - ulcerative colitis ..	727
- sense of, in gastritis ..	352
Weil's disease ..	372
- - albuminuria in ..	17
- - jaundice in ..	362
- - purpura in ..	596
- - rigors in ..	647
Weir-Mitchell treatment in functional wasting ..	850
Werdnig-Hoffmann progressive muscular atrophy of infants ..	158

Werlhof's disease ..	596, 600
West Indies, yellow fever in	372
WHEELS ..	850
- in dermatitis herpetiformis ..	831
- lichen planus ..	832
- mode of production of ..	850
- relation to erythema ..	850
- - nodules ..	850
- - papules ..	850
- in urticaria ..	252
- - pigmentosa ..	805
- - vesicles on ..	850
Wheezing in emphysema ..	526
Whetstone crystals ..	816
Whip-worm (<i>Fig. 154</i>) ..	569
Whiskers, extension of pediculus pubis to ..	447
Whisky-drinking, polyuria from	581
Whispered voice test for hearing ..	188
Whistle, inability to, from facial paralysis ..	534
- - in myopathy ..	260
White corpuscles (see Leucocytes)	
- tongue, or cachexia aquosa	115
White-leg (see Phlegmasia alba dolens)	
Whitlow, axillary abscess due to ..	731
- causes of ..	445
- leucocytosis in ..	400
- œdema of face, neck, and arms from ..	458
- painless, in Morvan's disease	285
- septicæmia from ..	698
- with syringomyelia ..	128, 285
- thrombosis of veins from ..	826
Whooping-cough ..	400, 465
- abrasion of frenum lingue in	320
- bacilli in sputum in ..	705
- bronchitis simulated by ..	705
- cough after ..	175, 176
- hæmoptysis in ..	317, 320
- hernia of lung from ..	194
- infantile convulsions in ..	170
- leucocytosis in ..	400
- orthopnea in ..	465
- paroxysmal cough in ..	467
- rupture of cortical veins in	131
- subconjunctival hæmorrhage in ..	256
- swelling of eyes and face in	459
- Tooth's peroneal atrophy developing after ..	71, 560
- ulceration of frænum of the tongue from ..	814
- vomiting in ..	467, 844
Widal's test in diagnosing ..	
- cause of prolonged pyrexia ..	609
- - - typhoid fever from pyæmia ..	650
- - - frequent failure of ..	610
- - - negative fallacies of ..	610
- - in paratyphoid fever ..	697
- - positive, not necessarily indicative of typhoid ..	611
- - in typhoid fever 90, 196, 281, 372, 620, 650, 697	
Wind (see Flatulence; and Meteorism)	
Winged appearance of scapula in paralysis of serratus magnus ..	551
Winking, absence of, in paralysis agitans ..	262
- diminished, in Graves' disease ..	253, 261
- involuntary, in facial paralysis (<i>Fig. 139</i>) ..	534, 537
Winter, bronchitis with emphysema in ..	186
- cough (see Cough)	
Wisdom tooth impaction simulating tetanus	801, 802

Wolf bite, hydrophobia from	801
Wolffian body, retroperitoneal cysts derived from ..	725
Wool-workers, anthrax in	603, 746
Word blindness, hemianopia with ..	684
- - inability to read in ..	684
- - lesions causing ..	684
- - relationship to defects of vision, speech, etc.	684, 685
- - varying degrees, and difficulty of analysis of ..	684
- - with word deafness ..	684
- - centre, auditory, importance in acquirement of speech ..	683
- - - lesion of, word deafness from ..	684
- - - and visual, situation of (<i>Fig. 185</i>) ..	683
- deafness from destruction of centre ..	684
- - examination of a case of ..	684
- - lesions causing ..	684
- - relation to power of speech, writing, etc. ..	684
WORMS, INTESTINAL ..	567
- - bile-duct obstruction from ..	364
- - causing increased appetite ..	49
- - enuresis with ..	248
- - eosinophilia with ..	249
- - insomnia from ..	357
- - grinding of teeth with ..	293
- - infantile convulsions from ..	170
- - leucocytosis with ..	620
- - micturition frequent from ..	438
- - night terrors from ..	357, 448
- - priapism in infancy from ..	585
- - vomiting with ..	844, 846
- - (see also Tape-worms, etc.)	
Worry as cause of functional dyspepsia ..	355
- constipation due to ..	144
- ill-effect on neurasthenia ..	788
- influence on trigeminal neuralgia ..	495
- insomnia from ..	357
- loss of weight due to ..	848
- malarial relapses due to ..	36
- neurasthenia from ..	506
- and professional cramp ..	177
- pytalorrhœa caused by ..	592
Wounds of the abdomen, infective peritonitis from ..	644
- in the chest, surgical emphysema from ..	716
- infection of tetanus through ..	162
- on the neck, surgical emphysema from ..	716
- pneumothorax after ..	577, 578
- pyæmia from ..	372, 649
- septicæmia from ..	698
- of thigh, talipes from ..	132
- in the trachea, surgical emphysema from ..	716
Wriggling, mild choreiform movements causing ..	156
Wrinkles, diminution of in facial paralysis ..	533
- flexion of, in brachial monoplegia ..	546
- - in paralysis from chorea ..	548
- flexor contracture of in arsenical neuritis ..	165
- gonococcal arthritis of ..	376
- gout in ..	382
- hypertrophic osteoarthropathy in ..	290
- lichen planus affecting ..	657
- multiple benign sarcoïd of ..	451
- osteo-arthritis of ..	384
- pruritus of ..	588
- scabies of ..	447, 588, 832
- tuberculous disease of ..	385

Wrist-drop from plumbism .. 38, 77, 507, 551, 798	<i>X-rays, contd.</i>	<i>X-rays, contd.</i>
Wrist-jerks, unequal in hemiplegia .. 337	- egg-shell crackling .. 177, 179	- unerupted teeth .. 501
Writer's cramp .. 177, 494	- endosteal sarcoma (<i>Figs.</i> 197, 199, pp. 755, 756) 757, 763	- uterine calculus 47, 135, 311, 627
Writing, difficulty in, in supra-scapular nerve paralysis .. 551	- erythema from exposure to .. 252	- vesical calculus (<i>Fig.</i> 98, p. 312) .. 629
- effect of word-deafness or word-blindness on power of .. 634, 685	- excluding aortic aneurysm 593	- visceroptosis .. 147, 473
Wry-neck (see Torticollis)	- exostosis (<i>Fig.</i> 194, p. 753) 754	
	- of frontal bone .. 255	
	- foreign body in oesophagus 297	
	- fracture .. 179	
	- of jaw .. 747	
	- of vertebrae .. 787	
	- gastroptosis (<i>Fig.</i> 105) .. 353	
XANTHELASMA planum .. 360	- gout (<i>Fig.</i> 113) .. 383	
- tuberosum in jaundice .. 360	- growth of spine .. 182	
Xanthin bases, uric acid derived from .. 817	- hæmoptysis .. 318	
- in urine, reduction by .. 290	- Hirschsprung's disease .. 433	
Xanthoma character of papule .. 528	- hydatid cyst of lung (<i>Fig.</i> 100) .. 323	
- diabeticorum .. 805	- impacted ureteral calculus 514	
- macules in .. 424	- locating pus in chest .. 119	
- multiplex .. 805	- mediastinal growth .. 465	
- planum .. 805	- lesions .. 185	
Xanthopsia from amyl nitrite .. 840	- tumour .. 422, 474, 582	
- cannabis indica .. 840	- mediastinitis and new growth 61	
- from jaundice .. 360, 840	- mottled shadows in phthisis 319	
- picric acid .. 840	- movable kidney and renal calculus .. 583	
- santonin poisoning .. 840	- necrosis of jaw .. 748	
Xeroderma, distinction from lichen scrofulosorum .. 530	- odontomata .. 749	
- papules of .. 530	- oesophageal obstruction .. 223	
- scales in .. 655	- pouch .. 842	
pigmentosum, age incidence .. 801	- orbital periostitis .. 254	
- characters of .. 802, 804	- organic stricture of intestine 146	
- diagnosis from freckles .. 424	- osteo-arthritis .. 380	
- influence of season on .. 804	- osteosarcoma .. 179	
- macules in .. 424	- pain in the arm .. 491	
- superficial ulcers in .. 804	- back .. 476	
- telangiectases in .. 804	- chest .. 479	
- wart-like tumours in .. 804	- paralysis from spinal cord lesions .. 543	
- white atrophic spots in .. 804	- periosteal sarcoma (<i>Fig.</i> 196, p. 754) .. 756	
- yellow crusts in .. 804	- phthisis .. 319, 736	
Xerosis of the conjunctiva in keratomalacia .. 807	- early (<i>Fig.</i> 27) .. 120, 847	
X-rays in abdominal aneurysm .. 486	- pneumonia (<i>Fig.</i> 99) .. 321	
- acromegaly .. 585	- pneumothorax 480, 577, 578	
- acute secondary arthritis .. 378	- popliteal swellings .. 763	
- affections of antrum of Highmore .. 502	- pyloric obstruction 134, 144, 571	
- aneurysm, aortic (<i>Fig.</i> 74, p. 236; <i>Fig.</i> 131, p. 483) 107, 223, 236, 322, 422, 463, 474, 477, 483, 582, 786, 790	- pyonephrosis (<i>Fig.</i> 97, p. 309) 396	
- of external iliac artery .. 741	- renal calculus (<i>Fig.</i> 97, p. 309) .. 500, 626	
- fusiform .. 238	- tuberculosis .. 626	
- popliteal .. 762	- rheumatoid arthritis (<i>Fig.</i> 110) 380	
- asthma .. 582	- sarcoma (<i>Figs.</i> 196, 197, 198) 179, 754, 757, 763	
- atony of pelvic colon .. 149	- of lower jaw .. 748	
- bone growths or caries .. 270	- pelvis .. 741	
- bronchial or mediastinal lymphatic gland enlargement 617	- scar, epithelioma starting in .. 803	
- calculous anuria .. 47	- in sciatica to exclude organic disease .. 488	
- callus .. 757	- similarity of sarcoma and chondroma under .. 755	
- cardiac displacement .. 332	- sore fingers from .. 266	
- cause of cough .. 176	- spinal caries .. 181, 474	
- radicular pain in arm .. 494	- splenomedullary leukaemia .. 31	
- cervical caries .. 477, 708	- spondylitis deformans .. 787	
- rib .. 75, 128, 493, 554	- sterility caused by .. 80	
- chronic abscess of bone .. 752	- in stomach disorders 712, 727	
- congenital dislocation of hip .. 183	- subphrenic abscess 501, 578, 720, 721	
- constipation 142, 144, 145, 146, 147	- talipes .. 132	
- diaphragmatic hernia .. 712	- testicular atrophy from .. 79, 80	
- dilatation of stomach .. 352	- thorax examinations .. 37	
- disease of lumbo-sacral spine 488	- in paralysis of vocal cord 538	
- distinguishing empyema from subphrenic abscess 721	- tumour or aneurysm of .. 75	
- mediastinal growth from aneurysm .. 483	- thymus gland enlargement 465	
- oxaluria from calculus .. 311	- transparency of bones in rheumatoid arthritis (<i>Fig.</i> 110) .. 380	
- sarcoma from periostitis 751, 763	- tropical abscess of liver .. 409	
- subphrenic abscess from pyopneumothorax .. 712	- tuberculosis of kidney .. 310	
- duodenal obstruction .. 571	- tumour of pelvic bones 737, 741	
- dysphagia .. 224	- of spine .. 525	
		- functional and organic paralysis of arm .. 549
		- Yaws .. 449
		- absence of giant cells in .. 450
